int Fl_Text_Display::scroll_ (
 int topLineNum,
 int horizOffset) [protected]
```

Scrolls the current buffer to start at the specified line and column.

## Parameters

<i>topLineNum</i>	top line number
<i>horizOffset</i>	in pixels

## Returns

0 if nothing changed, 1 if we scrolled

**13.136.4.72 scroll\_timer\_cb()**

```
void Fl_Text_Display::scroll_timer_cb (
 void * user_data) [static], [protected]
```

Timer callback for scroll events.

This timer event scrolls the text view proportionally to how far the mouse pointer has left the text area. This allows for smooth scrolling without "wiggeling" the mouse.

**13.136.4.73 scrollbar\_align()** [1/2]

```
Fl_Align Fl_Text_Display::scrollbar_align () const [inline]
```

Gets the scrollbar alignment type.

## Returns

scrollbar alignment

**13.136.4.74 scrollbar\_align()** [2/2]

```
void Fl_Text_Display::scrollbar_align (
 Fl_Align a) [inline]
```

Sets the scrollbar alignment type.

## Parameters

<i>a</i>	new scrollbar alignment
----------	-------------------------

**13.136.4.75 scrollbar\_size()** [1/2]

```
int Fl_Text_Display::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

## Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

## See also

[Fl::scrollbar\\_size\(int\)](#)

**13.136.4.76 scrollbar\_size()** [2/2]

```
void Fl_Text_Display::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare. Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

#### Parameters

<code>in</code>	<code>newSize</code>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
-----------------	----------------------	-----------------------------------------------------------------------------------------------------------------------------

#### See also

[Fl::scrollbar\\_size\(\)](#)

#### 13.136.4.77 scrollbar\_width() [1/2]

```
int Fl_Text_Display::scrollbar_width () const [inline]
```

Returns the global value [Fl::scrollbar\\_size\(\)](#) unless a specific `scrollbar_width_` has been set.

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed.

**Deprecated** "since 1.4.0 - use scrollbar\_size() instead"

#### 13.136.4.78 scrollbar\_width() [2/2]

```
void Fl_Text_Display::scrollbar_width (
 int width) [inline]
```

Sets the global [Fl::scrollbar\\_size\(\)](#), and forces this instance of the widget to use it.

**Deprecated** Use [scrollbar\\_size\(\)](#) instead.

**Todo** This method should eventually be removed

**Deprecated** "since 1.4.0 - use scrollbar\_size() instead"

#### 13.136.4.79 secondary\_selection\_color() [1/2]

```
Fl_Color Fl_Text_Display::secondary_selection_color () const [inline]
```

Gets the background color for the secondary selection block.

#### Returns

background color color

#### 13.136.4.80 secondary\_selection\_color() [2/2]

```
void Fl_Text_Display::secondary_selection_color (
 Fl_Color color) [inline]
```

Sets the background color for the secondary selection block.

#### Parameters

<code>color</code>	background color
--------------------	------------------

**13.136.4.81 shortcut()** [1/2]

```
int Fl_Text_Display::shortcut () const [inline]
```

**Todo** FIXME : get set methods pointing on shortcut\_ have no effects as shortcut\_ is unused in this class and derived!

**Returns**

the current shortcut key

**13.136.4.82 shortcut()** [2/2]

```
void Fl_Text_Display::shortcut (
 int s) [inline]
```

**Todo** FIXME : get set methods pointing on shortcut\_ have no effects as shortcut\_ is unused in this class and derived!

**Parameters**

<i>s</i>	the new shortcut key
----------	----------------------

**13.136.4.83 show\_cursor()**

```
void Fl_Text_Display::show_cursor (
 int b = 1)
```

Shows the text cursor.

This function may trigger a redraw.

**Parameters**

<i>b</i>	show(1) or hide(0) the text cursor (caret).
----------	---------------------------------------------

**13.136.4.84 show\_insert\_position()**

```
void Fl_Text_Display::show_insert_position ()
```

Scrolls the text buffer to show the current insert position.

This function triggers a complete recalculation, ending in a call to [Fl\\_Text\\_Display::display\\_insert\(\)](#)

**13.136.4.85 skip\_lines()**

```
int Fl_Text_Display::skip_lines (
 int startPos,
 int nLines,
 bool startPosIsLineStart)
```

Skip a number of lines forward.

Same as `Fl_Text_Buffer::skip_lines(startPos, nLines)`, but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

**Parameters**

<i>startPos</i>	index to starting character
<i>nLines</i>	number of lines to skip ahead
<i>startPosIsLineStart</i>	avoid scanning back to the line start

**Returns**

new position as index

**13.136.4.86 spelling\_underline\_color() [1/2]**

```
Fl_Color Fl_Text_Display::spelling_underline_color () const [inline]
```

Gets the underline color for style attribute ATTR\_SPELLING.

**Returns**

underline color

**13.136.4.87 spelling\_underline\_color() [2/2]**

```
void Fl_Text_Display::spelling_underline_color (
 Fl_Color color) [inline]
```

Sets the underline color for style attribute ATTR\_SPELLING.

**Parameters**

<i>color</i>	underline color
--------------	-----------------

**13.136.4.88 string\_width()**

```
double Fl_Text_Display::string_width (
 const char * string,
 int length,
 int style) const [protected]
```

Find the width of a string in the font of a particular style.

**Parameters**

<i>string</i>	the text
<i>length</i>	number of bytes in string
<i>style</i>	index into style table

**Returns**

width of text segment in pixels

**13.136.4.89 style\_buffer()**

```
Fl_Text_Buffer * Fl_Text_Display::style_buffer () const [inline]
```

Gets the current style buffer associated with the text widget.

Multiple text widgets can be associated with the same style buffer.

**Returns**

current style buffer

**See also**

[Fl\\_Text\\_Display::highlight\\_data\(\)](#)

**13.136.4.90 textcolor()** [1/2]

```
Fl_Color Fl_Text_Display::textcolor () const [inline]
```

Gets the default color of text in the widget.

**Returns**

text color unless overridden by a style

**13.136.4.91 textcolor()** [2/2]

```
void Fl_Text_Display::textcolor (
 Fl_Color n) [inline]
```

Sets the default color of text in the widget.

**Parameters**

<i>n</i>	new text color
----------	----------------

**13.136.4.92 textfont()** [1/2]

```
Fl_Font Fl_Text_Display::textfont () const [inline]
```

Gets the default font used when drawing text in the widget.

**Returns**

current text font face unless overridden by a style

**13.136.4.93 textfont()** [2/2]

```
void Fl_Text_Display::textfont (
 Fl_Font s) [inline]
```

Sets the default font used when drawing text in the widget.

**Parameters**

<i>s</i>	default text font face
----------	------------------------

**13.136.4.94 textsize()** [1/2]

```
Fl_Fontsize Fl_Text_Display::textsize () const [inline]
```

Gets the default size of text in the widget.

**Returns**

current text height unless overridden by a style

**13.136.4.95 textsize()** [2/2]

```
void Fl_Text_Display::textsize (
 Fl_Fontsize s) [inline]
```

Sets the default size of text in the widget.

**Parameters**

<i>s</i>	new text size
----------	---------------

**13.136.4.96 update\_h\_scrollbar()**

```
void Fl_Text_Display::update_h_scrollbar () [protected]
```

Update horizontal scrollbar.

Update the minimum, maximum, slider size, page increment, and value for the horizontal scrollbar.

**13.136.4.97 update\_line\_starts()**

```
void Fl_Text_Display::update_line_starts (
 int pos,
 int charsInserted,
 int charsDeleted,
 int linesInserted,
 int linesDeleted,
 int * scrolled) [protected]
```

Update line start arrays and variables.

Update the line starts array, mTopLineNum, mFirstChar and lastChar for this text display after a modification to the text buffer, given by the position *pos* where the change began, and the numbers of characters and lines inserted and deleted.

**Parameters**

	<i>pos</i>	index into buffer of recent changes
	<i>charsInserted</i>	number of bytes(!) inserted
	<i>charsDeleted</i>	number of bytes(!) deleted
	<i>linesInserted</i>	number of lines
	<i>linesDeleted</i>	number of lines
out	<i>scrolled</i>	set to 1 if the text display needs to be scrolled

**13.136.4.98 update\_v\_scrollbar()**

```
void Fl_Text_Display::update_v_scrollbar () [protected]
```

Update vertical scrollbar.

Update the minimum, maximum, slider size, page increment, and value for the vertical scrollbar.

**13.136.4.99 vline\_length()**

```
int Fl_Text_Display::vline_length (
 int visLineNum) const [protected]
```

Count number of bytes in a visible line.

Return the length of a line (number of bytes) by examining entries in the line starts array rather than by scanning for newlines.

**Parameters**

<i>visLineNum</i>	index of line in visible line array
-------------------	-------------------------------------

**Returns**

number of bytes in this line

**13.136.4.100 word\_end()**

```
int Fl_Text_Display::word_end (
 int pos) const [inline]
```

Moves the insert position to the end of the current word.

## Parameters

<i>pos</i>	start calculation at this index
------------	---------------------------------

## Returns

index of first character after the end of the word

**13.136.4.101 word\_start()**

```
int Fl_Text_Display::word_start (
 int pos) const [inline]
```

Moves the insert position to the beginning of the current word.

## Parameters

<i>pos</i>	start calculation at this index
------------	---------------------------------

## Returns

beginning of the words

**13.136.4.102 wrap\_mode()**

```
void Fl_Text_Display::wrap_mode (
 int wrap,
 int wrapMargin)
```

Set the new text wrap mode.

If `wrap` mode is not zero, this call enables automatic word wrapping at column `wrapMargin`. Word-wrapping does not change the text buffer itself, only the way the text is displayed. Different Text Displays can have different wrap modes, even if they share the same Text Buffer.

Valid wrap modes are:

- `WRAP_NONE` : don't wrap text at all
- `WRAP_AT_COLUMN` : wrap text at the given text column
- `WRAP_AT_PIXEL` : wrap text at a pixel position
- `WRAP_AT_BOUNDS` : wrap text so that it fits into the widget width

## Parameters

<i>wrap</i>	new wrap mode (see above)
<i>wrapMargin</i>	in <code>WRAP_AT_COLUMN</code> mode, text will wrap at the n'th character. For variable width fonts, an average character width is calculated. The column width is calculated using the current textfont or the first style when this function is called. If the font size changes, this function must be called again. In <code>WRAP_AT_PIXEL</code> mode, this is the pixel position.

**13.136.4.103 wrap\_uses\_character()**

```
int Fl_Text_Display::wrap_uses_character (
 int lineEndPos) const [protected]
```

Check if the line break is caused by a newline or by line wrapping.

Line breaks in continuous wrap mode usually happen at newlines (`\n`) or whitespace. This line-terminating character

is not included in line width measurements and has a special status as a non-visible character. However, lines with no whitespace are wrapped without the benefit of a line terminating character, and this distinction causes endless trouble with all of the text display code which was originally written without continuous wrap mode and always expects to wrap at a newline character.

Given the position of the end of the line, as returned by [Fl\\_Text\\_Display::line\\_end\(\)](#) or [Fl\\_Text\\_Buffer::line\\_end\(\)](#), this returns true if there is a line terminating character, and false if there's not. On the last character in the buffer, this function can't tell for certain whether a trailing space was used as a wrap point, and just guesses that it wasn't. So if an exact accounting is necessary, don't use this function.

#### Parameters

<i>lineEndPos</i>	index of character where the line wraps
-------------------	-----------------------------------------

#### Returns

1 if a \n character causes the line wrap

### 13.136.4.104 wrapped\_column()

```
int Fl_Text_Display::wrapped_column (
 int row,
 int column) const
```

Nobody knows what this function does.

Correct a column number based on an unconstrained position (as returned by [TextDXYToUnconstrainedPosition](#)) to be relative to the last actual newline in the buffer before the row and column position given, rather than the last line start created by line wrapping. This is an adapter for rectangular selections and code written before continuous wrap mode, which thinks that the unconstrained column is the number of characters from the last newline. Obviously this is time consuming, because it involves character re-counting.

#### Parameters

<i>row</i>	
<i>column</i>	

#### Returns

something unknown

**Todo** What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function [TextDXYToUnconstrainedPosition](#) does not exist (nedit port?)

**Todo** Unicode?

### 13.136.4.105 wrapped\_line\_counter()

```
void Fl_Text_Display::wrapped_line_counter (
 Fl_Text_Buffer * buf,
 int startPos,
 int maxPos,
 int maxLines,
 bool startPosIsLineStart,
 int styleBufOffset,
 int * retPos,
 int * retLines,
 int * retLineStart,
 int * retLineEnd,
 bool countLastLineMissingNewLine = true) const [protected]
```

Wrapping calculations.

Count forward from startPos to either maxPos or maxLines (whichever is reached first), and return all relevant positions and line count. The provided textBuffer may differ from the actual text buffer of the widget. In that case it must be a (partial) copy of the actual text buffer and the styleBufOffset argument must indicate the starting position of the copy, to take into account the correct style information.

#### Parameters

in	<i>buf</i>	The text buffer to operate on
in	<i>startPos</i>	Starting index position into the buffer
in	<i>maxPos</i>	Maximum index position into the buffer we'll reach
in	<i>maxLines</i>	Maximum number of lines we'll reach
in	<i>startPosIsLineStart</i>	Flag indicating if startPos is start of line. (If set, prevents our having to find the line start)
in	<i>styleBufOffset</i>	Offset index position into style buffer.
out	<i>retPos</i>	Position where counting ended. When counting lines, the position returned is the start of the line "maxLines" lines beyond "startPos".
out	<i>retLines</i>	Number of line breaks counted
out	<i>retLineStart</i>	Start of the line where counting ended
out	<i>retLineEnd</i>	End position of the last line traversed
out	<i>countLastLineMissingNewLine</i>	

#### 13.136.4.106 wrapped\_row()

```
int Fl_Text_Display::wrapped_row (
 int row) const
```

Nobody knows what this function does.

Correct a row number from an unconstrained position (as returned by TextDXYToUnconstrainedPosition) to a straight number of newlines from the top line of the display. Because rectangular selections are based on newlines, rather than display wrapping, and anywhere a rectangular selection needs a row, it needs it in terms of un-wrapped lines.

#### Parameters

<i>row</i>	
------------	--

#### Returns

something unknown

**Todo** What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

#### 13.136.4.107 x\_to\_col()

```
double Fl_Text_Display::x_to_col (
 double x) const
```

Convert an x pixel position into a column number.

#### Parameters

<i>x</i>	number of pixels from the left margin
----------	---------------------------------------

**Returns**

an approximate column number based on the main font

**13.136.4.108 xy\_to\_position()**

```
int Fl_Text_Display::xy_to_position (
 int X,
 int Y,
 int posType = CHARACTER_POS) const [protected]
```

Translate a pixel position into a character index.

Translate window coordinates to the nearest (insert cursor or character cell) text position. The parameter `posType` specifies how to interpret the position: `CURSOR_POS` means translate the coordinates to the nearest cursor position, and `CHARACTER_POS` means return the position of the character closest to (X, Y).

**Parameters**

<i>X,Y</i>	pixel position
<i>posType</i>	CURSOR_POS or CHARACTER_POS

**Returns**

index into text buffer

**13.136.4.109 xy\_to\_rowcol()**

```
void Fl_Text_Display::xy_to_rowcol (
 int X,
 int Y,
 int * row,
 int * column,
 int posType = CHARACTER_POS) const [protected]
```

Translate pixel coordinates into row and column.

Translate window coordinates to the nearest row and column number for positioning the cursor. This, of course, makes no sense when the font is proportional, since there are no absolute columns. The parameter `posType` specifies how to interpret the position: `CURSOR_POS` means translate the coordinates to the nearest position between characters, and `CHARACTER_POS` means translate the position to the nearest character cell.

**Parameters**

	<i>X,Y</i>	pixel coordinates
<i>out</i>	<i>row,column</i>	nearest row and column
	<i>posType</i>	CURSOR_POS or CHARACTER_POS

The documentation for this class was generated from the following files:

- Fl\_Text\_Display.H
- Fl\_Text\_Display.cxx

**13.137 Fl\_Text\_Editor Class Reference**

This is the FLTK text editor widget.

```
#include <Fl_Text_Editor.H>
```

Inheritance diagram for Fl\_Text\_Editor:

*Attach (or remove) highlight information in text display and redisplay.*
- int [in\\_selection](#) (int x, int y) const

*Check if a pixel position is within the primary selection.*
- void [insert](#) (const char \*text)

*Inserts "text" at the current cursor location.*
- int [insert\\_position](#) () const

*Gets the position of the text insertion cursor for text display.*
- void [insert\\_position](#) (int newPos)

*Sets the position of the text insertion cursor for text display.*
- int [line\\_end](#) (int startPos, bool startPosIsLineStart) const

*Returns the end of a line.*
- int [line\\_start](#) (int pos) const

*Return the beginning of a line.*
- [FI\\_Align](#) **linenumber\_align** () const

*Returns the alignment used for line numbers (if enabled).*
- void [linenumber\\_align](#) ([FI\\_Align](#) val)

*Set alignment for line numbers (if enabled).*
- [FI\\_Color](#) **linenumber\_bgcolor** () const

*Returns the background color used for line numbers (if enabled).*
- void [linenumber\\_bgcolor](#) ([FI\\_Color](#) val)

*Set the background color used for line numbers (if enabled).*
- [FI\\_Color](#) **linenumber\_fgcolor** () const

*Return the foreground color used for line numbers (if enabled).*
- void [linenumber\\_fgcolor](#) ([FI\\_Color](#) val)

*Set the foreground color used for line numbers (if enabled).*
- [FI\\_Font](#) **linenumber\_font** () const

*Return the font used for line numbers (if enabled).*
- void [linenumber\\_font](#) ([FI\\_Font](#) val)

*Set the font used for line numbers (if enabled).*
- const char \* **linenumber\_format** () const

*Returns the line number printf() format string.*
- void [linenumber\\_format](#) (const char \*val)

*Sets the printf() style format string used for line numbers.*
- [FI\\_Fontsize](#) **linenumber\_size** () const

*Return the font size used for line numbers (if enabled).*
- void [linenumber\\_size](#) ([FI\\_Fontsize](#) val)

*Set the font size used for line numbers (if enabled).*
- int **linenumber\_width** () const

*Return the screen area width provided for line numbers.*
- void [linenumber\\_width](#) (int width)

*Set width of screen area for line numbers.*
- int [move\\_down](#) ()

*Moves the current insert position down one line.*
- int [move\\_left](#) ()

- Moves the current insert position left one character.*

  - int `move_right` ()
- Moves the current insert position right one character.*

  - int `move_up` ()
- Moves the current insert position up one line.*

  - void `next_word` (void)
- Moves the current insert position right one word.*

  - void `overstrike` (const char \*text)
- Replaces text at the current insert position.*

  - int `position_style` (int lineStartPos, int lineLen, int lineIndex) const
- Find the correct style for a character.*

  - int `position_to_xy` (int pos, int \*x, int \*y) const
- Convert a character index into a pixel position.*

  - void `previous_word` (void)
- Moves the current insert position left one word.*

  - virtual void `recalc_display` ()
- Recalculate the display's visible lines and scrollbar sizes.*

  - void `redisplay_range` (int start, int end)
- Marks text from start to end as needing a redraw.*

  - void `resize` (int X, int Y, int W, int H) override
- Change the size of the displayed text area.*

  - int `rewind_lines` (int startPos, int nLines)
- Skip a number of lines back.*

  - void `scroll` (int topLineNum, int horizOffset)
- Scrolls the current buffer to start at the specified line and column.*

  - int `scroll_col` () const
  - int `scroll_row` () const
  - `Fl_Align scrollbar_align` () const
- Gets the scrollbar alignment type.*

  - void `scrollbar_align` (`Fl_Align` a)
- Sets the scrollbar alignment type.*

  - int `scrollbar_size` () const
- Gets the current size of the scrollbars' troughs, in pixels.*

  - void `scrollbar_size` (int newSize)
- Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*

  - int `scrollbar_width` () const
- Returns the global value `Fl::scrollbar_size()` unless a specific scrollbar\_width\_ has been set.*

  - void `scrollbar_width` (int width)
- Sets the global `Fl::scrollbar_size()`, and forces this instance of the widget to use it.*

  - `Fl_Color secondary_selection_color` () const
- Gets the background color for the secondary selection block.*

  - void `secondary_selection_color` (`Fl_Color` color)
- Sets the background color for the secondary selection block.*

  - int `shortcut` () const
  - void `shortcut` (int s)
  - void `show_cursor` (int b=1)
- Shows the text cursor.*

  - void `show_insert_position` ()
- Scrolls the text buffer to show the current insert position.*

  - int `skip_lines` (int startPos, int nLines, bool startPosIsLineStart)
- Skip a number of lines forward.*

- [FL\\_Color spelling\\_underline\\_color](#) () const  
*Gets the underline color for style attribute ATTR\_SPELLING.*
- void [spelling\\_underline\\_color](#) (FL\_Color color)  
*Sets the underline color for style attribute ATTR\_SPELLING.*
- [FL\\_Text\\_Buffer \\* style\\_buffer](#) () const  
*Gets the current style buffer associated with the text widget.*
- [FL\\_Color textcolor](#) () const  
*Gets the default color of text in the widget.*
- void [textcolor](#) (FL\_Color n)  
*Sets the default color of text in the widget.*
- [FL\\_Font textfont](#) () const  
*Gets the default font used when drawing text in the widget.*
- void [textfont](#) (FL\_Font s)  
*Sets the default font used when drawing text in the widget.*
- [FL\\_Fontsize textsize](#) () const  
*Gets the default size of text in the widget.*
- void [textsize](#) (FL\_Fontsize s)  
*Sets the default size of text in the widget.*
- int [word\\_end](#) (int pos) const  
*Moves the insert position to the end of the current word.*
- int [word\\_start](#) (int pos) const  
*Moves the insert position to the beginning of the current word.*
- void [wrap\\_mode](#) (int wrap, int wrap\_margin)  
*Set the new text wrap mode.*
- int [wrapped\\_column](#) (int row, int column) const  
*Nobody knows what this function does.*
- int [wrapped\\_row](#) (int row) const  
*Nobody knows what this function does.*
- double [x\\_to\\_col](#) (double x) const  
*Convert an x pixel position into a column number.*
- [~FL\\_Text\\_Display](#) ()  
*Free a text display and release its associated memory.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget \\*& \\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void [add](#) (FL\_Widget &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void [add](#) (FL\_Widget \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void [add\\_resizable](#) (FL\_Widget &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget \\*const \\* array](#) () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group const \\* as\\_group](#) () const override
- [FL\\_Group \\* as\\_group](#) () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void [begin](#) ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget \\* child](#) (int n) const

- Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \*==0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*
- [FL\\_Widget](#) \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) &o)  
*Sets the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual **~FL\_Group** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const

- Returns whether the widget and all of its parents are active.*
- `Fl_Align align () const`  
*Gets the label alignment.*
- `void align (Fl_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `Fl_Gl_Window * as_gl_window ()`  
*Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.*
- virtual class `Fl_Gl_Window const * as_gl_window () const`
- virtual `Fl_Window * as_window ()`  
*Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.*
- virtual `Fl_Window const * as_window () const`
- `void bind_deimage (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `Fl_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (Fl_Boxtype new_box)`  
*Sets the box type for the widget.*
- `Fl_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (Fl_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*
- `void callback (Fl_Callback *cb, void *p)`  
*Sets the current callback function and data for the widget.*
- `void callback (Fl_Callback0 *cb)`  
*Sets the current callback function for the widget.*
- `void callback (Fl_Callback1 *cb, long p=0)`  
*Sets the current callback function for the widget.*
- `unsigned int changed () const`  
*Checks if the widget value changed since the last callback.*
- `void clear_active ()`  
*Marks the widget as inactive without sending events or changing focus.*
- `void clear_changed ()`  
*Marks the value of the widget as unchanged.*
- `void clear_damage (uchar c=0)`  
*Clears or sets the damage flags.*
- `void clear_output ()`  
*Sets a widget to accept input.*
- `void clear_visible ()`  
*Hides the widget.*

- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()

- Gets the image that is used as part of the widget label when in the active state.*

  - const [Fl\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([Fl\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([Fl\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [Fl\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([Fl\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [Fl\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([Fl\\_Color](#) c)
- Sets the label color.*

  - [Fl\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([Fl\\_Font](#) f)
- Sets the font to use.*

  - [Fl\\_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([Fl\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [Fl\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([Fl\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [Fl\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([Fl\\_Group](#) \*p)
- Internal use only - "for hacks only".*

- void **position** (int X, int Y)  
*Repositions the window or widget.*
- void **redraw** ()  
*Schedules the drawing of the widget.*
- void **redraw\_label** ()  
*Schedules the drawing of the label.*
- **Fl\_Color selection\_color** () const  
*Gets the selection color.*
- void **selection\_color** (**Fl\_Color** a)  
*Sets the selection color.*
- int **send** (int event)  
*Sends the specified event to the widget.*
- void **set\_active** ()  
*Marks the widget as active without sending events or changing focus.*
- void **set\_changed** ()  
*Marks the value of the widget as changed.*
- void **set\_output** ()  
*Sets a widget to output only.*
- void **set\_visible** ()  
*Makes the widget visible.*
- void **set\_visible\_focus** ()  
*Enables keyboard focus navigation with this widget.*
- int **shortcut\_label** () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void **shortcut\_label** (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void **show** ()  
*Makes a widget visible.*
- void **size** (int W, int H)  
*Changes the size of the widget.*
- int **take\_focus** ()  
*Gives the widget the keyboard focus.*
- unsigned int **takeevents** () const  
*Returns if the widget is able to take events.*
- int **test\_shortcut** ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* **tooltip** () const  
*Gets the current tooltip text.*
- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window \* top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window \* top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar type** () const  
*Gets the widget type.*
- void **type** (**uchar** t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const

- Gets the user data for this widget.*
- void **user\_data** ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*
- void **user\_data** (void \*v)
- Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const
- Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const
- Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)
- Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const
- Returns whether a widget and all its parents are visible.*
- int [w](#) () const
- Gets the widget width.*
- [Fl\\_When](#) [when](#) () const
- Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)
- Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const
- Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const
- Gets the widget position in its window.*
- int [y](#) () const
- Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()
- Destroys the widget.*

### Static Public Member Functions

- static int [kf\\_backspace](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Does a backspace for key 'c' in the current buffer of editor 'e'.*
- static int [kf\\_c\\_s\\_move](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Extends the current selection in the direction indicated by control key 'c' in editor 'e'.*
- static int [kf\\_copy](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Does a copy of selected text or the current character in the current buffer of editor 'e'.*
- static int [kf\\_ctrl\\_move](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.*
- static int [kf\\_cut](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Does a cut of selected text in the current buffer of editor 'e'.*
- static int [kf\\_default](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Inserts the text associated with key 'c' in editor 'e'.*
- static int [kf\\_delete](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Does a delete of selected text or the current character in the current buffer of editor 'e'.*
- static int [kf\\_down](#) (int c, [Fl\\_Text\\_Editor](#) \*e)
- Moves the text cursor one line down for editor 'e'.*
- static int [kf\\_end](#) (int c, [Fl\\_Text\\_Editor](#) \*e)

- Moves the text cursor to the end of the current line in editor 'e'.*
- static int [kf\\_enter](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Inserts a newline for key 'c' at the current cursor position in editor 'e'.*
- static int [kf\\_home](#) (int, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor to the beginning of the current line in editor 'e'.*
- static int [kf\\_ignore](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Ignores the key 'c' in editor 'e'.*
- static int [kf\\_insert](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Toggles the insert mode for editor 'e'.*
- static int [kf\\_left](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one character to the left in editor 'e'.*
- static int [kf\\_m\\_s\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.*
- static int [kf\\_meta\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.*
- static int [kf\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor in the direction indicated by key 'c' in editor 'e'.*
- static int [kf\\_page\\_down](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor down one page for editor 'e'.*
- static int [kf\\_page\\_up](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor up one page for editor 'e'.*
- static int [kf\\_paste](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Does a paste of selected text in the current buffer of editor 'e'.*
- static int [kf\\_redo](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Redo last undo action.*
- static int [kf\\_right](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one character to the right for editor 'e'.*
- static int [kf\\_select\\_all](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Selects all text in the current buffer in editor 'e'.*
- static int [kf\\_shift\\_move](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Extends the current selection in the direction of key 'c' in editor 'e'.*
- static int [kf\\_undo](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Undo last edit in the current buffer of editor 'e'.*
- static int [kf\\_up](#) (int c, [FI\\_Text\\_Editor](#) \*e)  
*Moves the text cursor one line up for editor 'e'.*

### Static Public Member Functions inherited from [FI\\_Group](#)

- static [FI\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*
- static void [current](#) ([FI\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

**Protected Member Functions**

- int **handle\_key** ()  
*Handles a key press in the editor.*
- void **maybe\_do\_callback** (FI\_Callback\_Reason reason=FL\_REASON\_CHANGED)  
*does or does not a callback according to [changed\(\)](#) and [when\(\)](#) settings*

**Protected Member Functions inherited from FI\_Text\_Display**

- void **absolute\_top\_line\_number** (int oldFirstChar)  
*Re-calculate absolute top line number for a change in scroll position.*
- void **calc\_last\_char** ()  
*Update last display character index.*
- void **calc\_line\_starts** (int startLine, int endLine)  
*Update the line starts array.*
- void **clear\_rect** (int style, int x, int y, int width, int height) const  
*Clear a rectangle with the appropriate background color for *style*.*
- void **display\_insert** ()  
*Scroll the display to bring insertion cursor into view.*
- void **draw** () override  
*Draw the widget.*
- void **draw\_cursor** (int, int)  
*Draw a cursor with top center at X, Y.*
- void **draw\_line\_numbers** (bool clearAll)  
*Refresh the line number area.*
- void **draw\_range** (int start, int end)  
*Draw a range of text.*
- void **draw\_string** (int style, int x, int y, int toX, const char \*string, int nChars) const  
*Draw a text segment in a single style.*
- void **draw\_text** (int X, int Y, int W, int H)  
*Refresh a rectangle of the text display.*
- void **draw\_vline** (int visLineNum, int leftClip, int rightClip, int leftCharIndex, int rightCharIndex)  
*Draw a single line of text.*
- int **empty\_vlines** () const  
*Return true if there are lines visible with no corresponding buffer text.*
- void **extend\_range\_for\_styles** (int \*start, int \*end)  
*I don't know what this does!*
- void **find\_line\_end** (int pos, bool start\_pos\_is\_line\_start, int \*lineEnd, int \*nextLineStart) const  
*Finds both the end of the current line and the start of the next line.*
- void **find\_wrap\_range** (const char \*deletedText, int pos, int nInserted, int nDeleted, int \*modRangeStart, int \*modRangeEnd, int \*linesInserted, int \*linesDeleted)  
*Wrapping calculations.*
- int **find\_x** (const char \*s, int len, int style, int x) const  
*Find the index of the character that lies at the given x position / closest cursor position.*
- int **handle\_rmb** (int readonly)  
*Handle right mouse button down events.*
- int **handle\_vline** (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const  
*Universal pixel machine.*
- int **longest\_vline** () const  
*Find the longest line of all visible lines.*

### 13.137.1 Detailed Description

This is the FLTK text editor widget.

It allows the user to edit multiple lines of text and supports highlighting and scrolling. The buffer that is displayed in the widget is managed by the [FL\\_Text\\_Buffer](#) class.

### 13.137.2 Member Function Documentation

#### 13.137.2.1 `add_key_binding()`

```
void Fl_Text_Editor::add_key_binding (
 int key,
 int state,
 Key_Func function,
 Key_Binding ** list)
```

Adds a key of state `state` with the function `function` to an arbitrary key binding list `list`.

This can be used in derived classes to add global key bindings by using the global (static) [Key\\_Binding](#) list [Fl\\_Text\\_Editor::global\\_key\\_bindings](#).

#### 13.137.2.2 `handle()`

```
int Fl_Text_Editor::handle (
 int e) [override], [virtual]
```

Event handling.

Reimplemented from [Fl\\_Text\\_Display](#).

#### 13.137.2.3 `insert_mode()` [1/2]

```
int Fl_Text_Editor::insert_mode () const [inline]
```

Gets the current insert mode; if non-zero, new text is inserted before the current cursor position.

Otherwise, new text replaces text at the current cursor position.

#### 13.137.2.4 `insert_mode()` [2/2]

```
void Fl_Text_Editor::insert_mode (
 int b) [inline]
```

Sets the current insert mode; if non-zero, new text is inserted before the current cursor position.

Otherwise, new text replaces text at the current cursor position.

#### 13.137.2.5 `kf_backspace()`

```
int Fl_Text_Editor::kf_backspace (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a backspace for key '`c`' in the current buffer of editor '`e`'.

Any current selection is deleted. Otherwise, the character left is deleted and the cursor moved. The key value '`c`' is currently unused.

#### 13.137.2.6 `kf_c_s_move()`

```
int Fl_Text_Editor::kf_c_s_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction indicated by control key '`c`' in editor '`e`'.

See also

[kf\\_ctrl\\_move\(\)](#).

**13.137.2.7 kf\_copy()**

```
int Fl_Text_Editor::kf_copy (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a copy of selected text or the current character in the current buffer of editor 'e'.  
The key value 'c' is currently unused.

**13.137.2.8 kf\_ctrl\_move()**

```
int Fl_Text_Editor::kf_ctrl_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the current text cursor in the direction indicated by control key 'c' in editor 'e'.

Supported values for 'c' are currently:

```
FL_Home -- moves the cursor to the beginning of the document
FL_End -- moves the cursor to the end of the document
FL_Left -- moves the cursor left one word
FL_Right -- moves the cursor right one word
FL_Up -- scrolls up one line, without moving cursor
FL_Down -- scrolls down one line, without moving cursor
FL_Page_Up -- moves the cursor to the beginning of the top line on the current page
FL_Page_Down -- moves the cursor to the beginning of the last line on the current page
```

**13.137.2.9 kf\_cut()**

```
int Fl_Text_Editor::kf_cut (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a cut of selected text in the current buffer of editor 'e'.  
The key value 'c' is currently unused.

**13.137.2.10 kf\_default()**

```
int Fl_Text_Editor::kf_default (
 int c,
 Fl_Text_Editor * e) [static]
```

Inserts the text associated with key 'c' in editor 'e'.  
Honors the current selection and insert/overstrike mode.

**13.137.2.11 kf\_delete()**

```
int Fl_Text_Editor::kf_delete (
 int c,
 Fl_Text_Editor * e) [static]
```

Does a delete of selected text or the current character in the current buffer of editor 'e'.  
The key value 'c' is currently unused.

**13.137.2.12 kf\_down()**

```
int Fl_Text_Editor::kf_down (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one line down for editor 'e'.  
Same as kf\_move(FL\_Down, e). The key value 'c' is currently unused.

**13.137.2.13 kf\_end()**

```
int Fl_Text_Editor::kf_end (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor to the end of the current line in editor 'e'.  
Same as kf\_move(FL\_End, e). The key value 'c' is currently unused.

**13.137.2.14 kf\_enter()**

```
int Fl_Text_Editor::kf_enter (
 int c,
 Fl_Text_Editor * e) [static]
```

Inserts a newline for key 'c' at the current cursor position in editor 'e'.  
The key value 'c' is currently unused.

**13.137.2.15 kf\_home()**

```
int Fl_Text_Editor::kf_home (
 int ,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor to the beginning of the current line in editor 'e'.  
Same as kf\_move(FL\_Home, e). The key value 'c' is currently unused.

**13.137.2.16 kf\_ignore()**

```
int Fl_Text_Editor::kf_ignore (
 int c,
 Fl_Text_Editor * e) [static]
```

Ignores the key 'c' in editor 'e'.

This method can be used as a keyboard binding to disable a key that might otherwise be handled or entered as text.  
An example would be disabling FL\_Escape, so that it isn't added to the buffer when invoked by the user.

**13.137.2.17 kf\_insert()**

```
int Fl_Text_Editor::kf_insert (
 int c,
 Fl_Text_Editor * e) [static]
```

Toggles the insert mode for editor 'e'.  
The key value 'c' is currently unused.

**13.137.2.18 kf\_left()**

```
int Fl_Text_Editor::kf_left (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one character to the left in editor 'e'.  
Same as kf\_move(FL\_Left, e). The key value 'c' is currently unused.

**13.137.2.19 kf\_m\_s\_move()**

```
int Fl_Text_Editor::kf_m_s_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction indicated by meta key 'c' in editor 'e'.

See also

[kf\\_meta\\_move\(\)](#).

**13.137.2.20 kf\_meta\_move()**

```
int Fl_Text_Editor::kf_meta_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the current text cursor in the direction indicated by meta key 'c' in editor 'e'.  
Supported values for 'c' are currently:

```
FL_Up -- moves cursor to the beginning of the current document
```

```

FL_Down -- moves cursor to the end of the current document
FL_Left -- moves the cursor to the beginning of the current line
FL_Right -- moves the cursor to the end of the current line

```

### 13.137.2.21 kf\_move()

```

int Fl_Text_Editor::kf_move (
 int c,
 Fl_Text_Editor * e) [static]

```

Moves the text cursor in the direction indicated by key 'c' in editor 'e'.

Supported values for 'c' are currently:

```

FL_Home -- moves the cursor to the beginning of the current line
FL_End -- moves the cursor to the end of the current line
FL_Left -- moves the cursor left one character
FL_Right -- moves the cursor right one character
FL_Up -- moves the cursor up one line
FL_Down -- moves the cursor down one line
FL_Page_Up -- moves the cursor up one page
FL_Page_Down -- moves the cursor down one page

```

### 13.137.2.22 kf\_page\_down()

```

int Fl_Text_Editor::kf_page_down (
 int c,
 Fl_Text_Editor * e) [static]

```

Moves the text cursor down one page for editor 'e'.

Same as kf\_move(FL\_Page\_Down, e). The key value 'c' is currently unused.

### 13.137.2.23 kf\_page\_up()

```

int Fl_Text_Editor::kf_page_up (
 int c,
 Fl_Text_Editor * e) [static]

```

Moves the text cursor up one page for editor 'e'.

Same as kf\_move(FL\_Page\_Up, e). The key value 'c' is currently unused.

### 13.137.2.24 kf\_paste()

```

int Fl_Text_Editor::kf_paste (
 int c,
 Fl_Text_Editor * e) [static]

```

Does a paste of selected text in the current buffer of editor 'e'.

Any current selection is replaced with the pasted content. The key value 'c' is currently unused.

### 13.137.2.25 kf\_redo()

```

int Fl_Text_Editor::kf_redo (
 int c,
 Fl_Text_Editor * e) [static]

```

Redo last undo action.

Also deselects previous selection. The key value 'c' is currently unused.

### 13.137.2.26 kf\_right()

```

int Fl_Text_Editor::kf_right (
 int c,
 Fl_Text_Editor * e) [static]

```

Moves the text cursor one character to the right for editor 'e'.

Same as kf\_move(FL\_Right, e). The key value 'c' is currently unused.

**13.137.2.27 kf\_select\_all()**

```
int Fl_Text_Editor::kf_select_all (
 int c,
 Fl_Text_Editor * e) [static]
```

Selects all text in the current buffer in editor 'e'.

The key value 'c' is currently unused.

**13.137.2.28 kf\_shift\_move()**

```
int Fl_Text_Editor::kf_shift_move (
 int c,
 Fl_Text_Editor * e) [static]
```

Extends the current selection in the direction of key 'c' in editor 'e'.

See also

[kf\\_move\(\)](#)

**13.137.2.29 kf\_undo()**

```
int Fl_Text_Editor::kf_undo (
 int c,
 Fl_Text_Editor * e) [static]
```

Undo last edit in the current buffer of editor 'e'.

Also deselects previous selection. The key value 'c' is currently unused.

**13.137.2.30 kf\_up()**

```
int Fl_Text_Editor::kf_up (
 int c,
 Fl_Text_Editor * e) [static]
```

Moves the text cursor one line up for editor 'e'.

Same as `kf_move(FL_Up, e)`. The key value 'c' is currently unused.

**13.137.2.31 remove\_key\_binding()**

```
void Fl_Text_Editor::remove_key_binding (
 int key,
 int state,
 Key_Binding ** list)
```

Removes the key binding associated with the key `key` of state `state` from the [Key\\_Binding](#) list `list`.

This can be used in derived classes to remove global key bindings by using the global (static) [Key\\_Binding](#) list `Fl_Text_Editor::global_key_bindings`.

**13.137.2.32 tab\_nav()** [1/2]

```
int Fl_Text_Editor::tab_nav () const
```

Check if Tab focus navigation is enabled.

If disabled (default), hitting Tab inserts a tab character into the editor buffer.

If enabled, hitting Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget.

Returns

if Tab inserts tab characters or moves the focus

Return values

0	Tab inserts tab characters (default)
1	Tab navigation is enabled.

See also

[tab\\_nav\(int\)](#), [Fl::OPTION\\_ARROW\\_FOCUS](#).

Version

1.3.4 ABI feature

### 13.137.2.33 tab\_nav() [2/2]

```
void Fl_Text_Editor::tab_nav (
 int val)
```

Enables or disables Tab key focus navigation.

When disabled (default), tab characters are inserted into [Fl\\_Text\\_Editor](#). Only the mouse can change focus. This behavior is desirable when [Fl\\_Text\\_Editor](#) is used, e.g. in a source code editor.

When enabled, Tab navigates focus to the next widget, and Shift-Tab navigates focus to the previous widget. This behavior is desirable when [Fl\\_Text\\_Editor](#) is used e.g. in a database input form.

Currently, this method is implemented as a convenience method that adjusts the key bindings for the Tab key. This implementation detail may change in the future. Know that changing the editor's key bindings for Tab and Shift-Tab may affect tab navigation.

Parameters

in	val	If val is 0, Tab inserts a tab character (default). If val is 1, Tab navigates widget focus.
----	-----	-------------------------------------------------------------------------------------------------

See also

[tab\\_nav\(\)](#), [Fl::OPTION\\_ARROW\\_FOCUS](#).

Version

1.3.4 ABI feature

## 13.137.3 Member Data Documentation

### 13.137.3.1 global\_key\_bindings

```
Key_Binding* Fl_Text_Editor::global_key_bindings [static], [protected]
```

Global key binding list.

Derived classes can add key bindings for all [Fl\\_Text\\_Editor](#) widgets by adding a [Key\\_Binding](#) to this list.

See also

[add\\_key\\_binding\(int key, int state, Key\\_Func f, Key\\_Binding\\*\\* list\);](#)

The documentation for this class was generated from the following files:

- [Fl\\_Text\\_Editor.H](#)
- [Fl\\_Text\\_Editor.cxx](#)

## 13.138 Fl\_Text\_Selection Class Reference

This is an internal class for [Fl\\_Text\\_Buffer](#) to manage text selections.

```
#include <Fl_Text_Buffer.H>
```

**Public Member Functions**

- [int end \(\) const](#)

- Returns the byte offset to the character after the last selected character.*
- int `includes` (int pos) const  
*Returns true if position pos is in the `FI_Text_Selection`.*
- int `length` () const  
*Returns the size in bytes of the selection.*
- int `position` (int \*startpos, int \*endpos) const
- bool `selected` () const  
*Returns true if any text is selected.*
- void `selected` (bool b)  
*Modifies the 'selected' flag.*
- int `selected` (int \*startpos, int \*endpos) const  
*Returns the status and the positions of this selection.*
- void `set` (int startpos, int endpos)  
*Sets the selection range.*
- int `start` () const  
*Returns the byte offset to the first selected character.*
- void `update` (int pos, int nDeleted, int nInserted)  
*Updates a selection after text was modified.*

### Protected Attributes

- int `mEnd`  
*byte offset to the character after the last selected character*
- bool `mSelected`  
*this flag is set if any text is selected*
- int `mStart`  
*byte offset to the first selected character*

### Friends

- class `FI_Text_Buffer`

## 13.138.1 Detailed Description

This is an internal class for `FI_Text_Buffer` to manage text selections.

All methods use byte (not UTF-8 character) offsets and start at 0. This class works correctly with UTF-8 strings assuming that the parameters for all calls are on character boundaries.

If the selection is inactive (not currently used), then `selected()` returns `false` and `start()` and `end()` return 0 (zero).

The stored offsets are in ascending order, hence the following conditions are true (pseudo code):

```
if (!selected()) : (start() == 0) && (end() == 0) && (start() == end())
if (selected()) : start() < end()
always : 0 <= start() <= end()
always : length() == end() - start()
```

The selection size in bytes can always (unconditionally) be computed by

```
int size = sel->end() - sel->start();
```

### See also

`length()`

### Note

The **protected** member variables `mStart` and `mEnd` are not necessarily 0 (zero) if `mSelected == false` because they are not cleared when `selected(false)` is called (as of Jul 2017). This may be changed in the future.

## 13.138.2 Member Function Documentation

### 13.138.2.1 end()

```
int Fl_Text_Selection::end () const [inline]
```

Returns the byte offset to the character after the last selected character.

The returned offset is only valid if [selected\(\)](#) returns true (non-zero). The offset is 0 if no text is selected (since FLTK 1.4.0).

#### Note

In FLTK 1.3.x the returned offset could be non-zero even if [selected\(\)](#) would have returned 0.

#### Returns

byte offset or 0 if not selected.

### 13.138.2.2 includes()

```
int Fl_Text_Selection::includes (
 int pos) const
```

Returns true if position `pos` is in the [Fl\\_Text\\_Selection](#).

`pos` must be at a character boundary.

### 13.138.2.3 length()

```
int Fl_Text_Selection::length () const [inline]
```

Returns the size in bytes of the selection.

This is a convenience method. It always returns the same as

`end() - start()`

and it returns 0 if [selected\(\)](#) == false.

#### Returns

size in bytes or 0 if not selected.

#### Since

FLTK 1.4.0

### 13.138.2.4 position()

```
int Fl_Text_Selection::position (
 int * startpos,
 int * endpos) const [inline]
```

**Deprecated** "since 1.4.0 - use `selected(startpos, endpos)` instead"

### 13.138.2.5 selected() [1/3]

```
bool Fl_Text_Selection::selected () const [inline]
```

Returns true if any text is selected.

#### Returns

true if any text has been selected, or false if no text is selected.

### 13.138.2.6 selected() [2/3]

```
void Fl_Text_Selection::selected (
 bool b) [inline]
```

Modifies the 'selected' flag.

## Parameters

<i>b</i>	new flag
----------	----------

**13.138.2.7 selected()** [3/3]

```
int Fl_Text_Selection::selected (
 int * startpos,
 int * endpos) const
```

Returns the status and the positions of this selection.

This method returns the same as [selected\(\)](#) as an `int` (0 or 1) in its return value and the offsets to the start of the selection in `startpos` and to the byte after the last selected character in `endpos`, if [selected\(\)](#) is `true`. If [selected\(\)](#) is `false`, both offsets are set to 0.

## Note

In FLTK 1.3.x `startpos` and `endpos` were **not modified** if [selected\(\)](#) was `false`.

## Parameters

<i>startpos</i>	return byte offset to first selected character
<i>endpos</i>	return byte offset pointing after last selected character

## Returns

whether the selection is active ([selected\(\)](#)) or not

## Return values

<i>0</i>	if not selected
<i>1</i>	if selected

## See also

[selected\(\)](#), [start\(\)](#), [end\(\)](#)

**13.138.2.8 set()**

```
void Fl_Text_Selection::set (
 int startpos,
 int endpos)
```

Sets the selection range.

`startpos` and `endpos` must be at a character boundary.

If `startpos != endpos` [selected\(\)](#) is set to `true`, else to `false`.

If `startpos` is greater than `endpos` they are swapped so that `startpos <= endpos`.

## Parameters

in	<i>startpos</i>	byte offset to first selected character
in	<i>endpos</i>	byte offset pointing after last selected character

**13.138.2.9 start()**

```
int Fl_Text_Selection::start () const [inline]
```

Returns the byte offset to the first selected character.

The returned offset is only valid if [selected\(\)](#) returns true. If the selection is not valid the returned offset is 0 since FLTK 1.4.0.

#### Note

In FLTK 1.3.x the returned offset could be non-zero even if [selected\(\)](#) would have returned 0.

#### Returns

byte offset or 0 if not selected.

### 13.138.2.10 update()

```
void Fl_Text_Selection::update (
 int pos,
 int nDeleted,
 int nInserted)
```

Updates a selection after text was modified.

Updates an individual selection for changes in the corresponding text.

#### Parameters

<i>pos</i>	byte offset into text buffer at which the change occurred
<i>nDeleted</i>	number of bytes deleted from the buffer
<i>nInserted</i>	number of bytes inserted into the buffer

The documentation for this class was generated from the following files:

- [Fl\\_Text\\_Buffer.H](#)

## 13.139 Fl\_Tile Class Reference

The [Fl\\_Tile](#) class lets you resize its children by dragging the border between them.

Inheritance diagram for [Fl\\_Tile](#):

#### Classes

- struct [Size\\_Range](#)

#### Public Member Functions

- virtual void [drag\\_intersection](#) (int oldx, int oldy, int newx, int newy)  
*Drags the intersection at (oldx,oldy) to (newx,newy).*
- [Fl\\_Tile](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Tile](#) widget using the given position, size, and label string.*
- int [handle](#) (int event) override

- Handles the specified event.*
- void [init\\_size\\_range](#) (int default\_min\_w=-1, int default\_min\_h=-1)  
*Initialize the size range mode of [FL\\_Tile](#) and set the default minimum width and height.*
- virtual void [move\\_intersection](#) (int oldx, int oldy, int newx, int newy)  
*Drags the intersection at (oldx,oldy) to (newx,newy).*
- void [position](#) (int oldx, int oldy, int newx, int newy)
- void **position** (int x, int y)
- void [resize](#) (int X, int Y, int W, int H) override  
*Resizes the [FL\\_Tile](#) widget and its children.*
- void [size\\_range](#) ([FL\\_Widget](#) \*w, int minw, int minh, int maxw=0x7FFFFFFF, int maxh=0x7FFFFFFF)  
*Set the allowed size range for the give child widget.*
- void [size\\_range](#) (int index, int minw, int minh, int maxw=0x7FFFFFFF, int maxh=0x7FFFFFFF)  
*Set the allowed size range for the child at the given index.*
- [~FL\\_Tile](#) () override  
*Destructor.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*& **\_ddfdesign\_kludge** ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*

- [FL\\_Group](#) (int, int, int, int, const char \*s=0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void [init\\_sizes](#) ()  
*Resets the internal array of widget sizes and positions.*
- void [insert](#) ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void [insert](#) ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does insert(w, find(before)).*
- void [remove](#) ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void [remove](#) ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void [remove](#) (int index)  
*Removes the widget at index from the group but does not delete it.*
- [FL\\_Widget](#) \* [resizable](#) () const  
*Returns the group's resizable widget.*
- void [resizable](#) ([FL\\_Widget](#) &o)  
*Sets the group's resizable widget.*
- void [resizable](#) ([FL\\_Widget](#) \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual [~FL\\_Group](#) ()  
*The destructor also deletes all the children.*

### Public Member Functions inherited from [FL\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align](#) align () const  
*Gets the label alignment.*
- void [align](#) ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* **as\_window** () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*

- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- uchar [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

- Sets the damage bits for the widget.*
- void **damage** (uchar c, int x, int y, int w, int h)
  - Sets the damage bits for an area inside the widget.*
- int **damage\_resize** (int, int, int, int)
  - Internal use only.*
- void **deactivate** ()
  - Deactivates the widget.*
- **FL\_Image** \* **deimage** ()
  - Gets the image that is used as part of the widget label when in the inactive state.*
- const **FL\_Image** \* **deimage** () const
  - Gets the image that is used as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** &img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- int **deimage\_bound** () const
  - Returns whether the inactive image is managed by the widget.*
- void **do\_callback** (**FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)
  - Calls the widget callback function with default arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, long arg, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)
  - Calls the widget callback function with arbitrary arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, void \*arg=0, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)
  - Calls the widget callback function with arbitrary arguments.*
- void **draw\_label** (int, int, int, int, **FL\_Align**) const
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int **h** () const
  - Gets the widget height.*
- virtual void **hide** ()
  - Makes a widget invisible.*
- int **horizontal\_label\_margin** ()
  - Get the spacing between the label and the horizontal edge of the widget.*
- void **horizontal\_label\_margin** (int px)
  - Set the spacing between the label and the horizontal edge of the widget.*
- **FL\_Image** \* **image** ()
  - Gets the image that is used as part of the widget label when in the active state.*
- const **FL\_Image** \* **image** () const
  - Gets the image that is used as part of the widget label when in the active state.*
- void **image** (**FL\_Image** &img)
  - Sets the image to use as part of the widget label when in the active state.*
- void **image** (**FL\_Image** \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- int **image\_bound** () const
  - Returns whether the image is managed by the widget.*
- int **inside** (const **FL\_Widget** \*wgt) const
  - Checks if this widget is a child of wgt.*
- int **is\_label\_copied** () const
  - Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* **label** () const
  - Gets the current label text.*
- void **label** (const char \*text)
  - Sets the current label pointer.*

- void [label](#) ([Fl\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [Fl\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([Fl\\_Color](#) c)  
*Sets the label color.*
- [Fl\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([Fl\\_Font](#) f)  
*Sets the font to use.*
- [Fl\\_Fontsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [Fl\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*

  - unsigned int [visible](#) () const
- Returns whether a widget is visible.*

  - unsigned int [visible\\_focus](#) () const
- Checks whether this widget has a visible focus.*

  - void [visible\\_focus](#) (int v)
- Modifies keyboard focus navigation.*

  - int [visible\\_r](#) () const
- Returns whether a widget and all its parents are visible.*

- `int w () const`  
*Gets the widget width.*
- `FI_When when () const`  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `FI_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FI_Widget ()`  
*Destroys the widget.*

### Protected Member Functions

- `FI_Cursor cursor (int n) const`  
*Returns the cursor for cursor index *n*.*
- `int on_insert (FI_Widget *, int) override`  
*Insert a new entry in the size range list.*
- `int on_move (int, int) override`  
*Move the entry in the size range list.*
- `void on_remove (int) override`  
*Remove the entry from the size range list.*
- `void request_grow_b (int old_b, int &new_b, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_grow_l (int old_l, int &new_l, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_grow_r (int old_r, int &new_r, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_grow_t (int old_t, int &new_t, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_shrink_b (int old_b, int &new_b, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_shrink_l (int old_l, int &new_l, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_shrink_r (int old_r, int &new_r, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void request_shrink_t (int old_t, int &new_t, FI_Rect *final_size)`  
*Request for children to change their layout.*
- `void set_cursor (int n)`  
*Set one of four cursors used for dragging etc. . .*

### Protected Member Functions inherited from `FI_Group`

- `FI_Rect * bounds ()`  
*Returns the internal array of widget sizes and positions.*
- `void draw () override`  
*Draws the widget.*
- `void draw_child (FI_Widget &widget) const`  
*Forces a child to redraw.*

- void **draw\_children** ()  
*Draws all children of the group.*
- void **draw\_outside\_label** (const [Fl\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- int \* **sizes** ()  
*Returns the internal array of widget sizes and positions.*
- void **update\_child** ([Fl\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [Fl\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Protected Attributes

- int **cursor\_**  
*current cursor index (0..3)*
- [FL\\_Cursor](#) \* **cursors\_**  
*points at the array of 4 cursors (may be overridden)*
- int **default\_min\_h\_**
- int **default\_min\_w\_**
- [Size\\_Range](#) \* **size\_range\_**
- int **size\_range\_capacity\_**
- int **size\_range\_size\_**

### Additional Inherited Members

### Static Public Member Functions inherited from [FL\\_Group](#)

- static [FL\\_Group](#) \* **current** ()  
*Returns the currently active group.*
- static void **current** ([FL\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FL\\_Widget](#)

- static void **default\_callback** ([FL\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## 13.139.1 Detailed Description

The [FL\\_Tile](#) class lets you resize its children by dragging the border between them.

Figure 13.60 Fl\_Tile

For the tiling to work correctly, the children of an [Fl\\_Tile](#) **must** cover the entire area of the widget, but **must not** overlap. This means that all children must touch each other at their edges, and no gaps can be left inside the [Fl\\_Tile](#).

[Fl\\_Tile](#) does not normally draw any graphics of its own. The "borders" which can be seen in the snapshot above are actually part of the children. Their boxtypes have been set to `FL_DOWN_BOX` creating the impression of "ridges" where the boxes touch. What you see are actually two adjacent `FL_DOWN_BOX`'s drawn next to each other. All neighboring widgets share the same edge - the widget's thick borders make it appear as though the widgets aren't actually touching, but they are. If the edges of adjacent widgets do not touch, then it will be impossible to drag the corresponding edges.

#### Note

[Fl\\_Tile](#) works in two distinctive modes. In classic mode, the range of motion for edges and intersections is controlled using an invisible child that is marked as the [resizable\(\)](#) widget of the tile group. Classic mode is described in detail a few paragraphs down.

#### [Fl\\_Tile](#) size\_range mode

By assigning a default minimum size to all children with `Fl_Tile::init_size_range(int default_minimum_width, int default_minimum_height)`, or by assigning minimal sizes to individual children with `size_range(Fl_Widget *child, int minimum_width, int minimum_height)`, the tile group is put into `size_range` operation mode.

In this mode, the child that is marked [resizable\(\)](#) will behave as it would in a regular [Fl\\_Group](#) widget. When dragging edges or intersections with the mouse, [Fl\\_Tile](#) will ensure that none of the children shrinks to a size that is smaller than requested. When resizing the [Fl\\_Tile](#) group, size ranges are not enforced by the tile. Instead, the size range of the enclosing window should be limited to a valid range.

Tile does not differentiate between visible and invisible children. If children are created smaller than their assigned minimum size, dragging intersections may cause unexpected jumps in size. Zero width or height widget are not harmful, but should be avoided.

Example for a center document tile and two tool boxes on the left and right

```
Fl_Window win(400, 300, "My App");

Fl_Tile tile(0, 0, 400, 300);

Fl_Box left_tool_box(0, 0, 100, 300, "Tools");
left_tool_box.box(FL_DOWN_BOX);
tile.size_range(&left_tool_box, 50, 50);

Fl_Box document(100, 0, 200, 300, "Document");
document.box(FL_DOWN_BOX);
tile.size_range(&document, 100, 50);

Fl_Box right_tool_box(300, 0, 400, 300, "More\nTools");
right_tool_box.box(FL_DOWN_BOX);
tile.size_range(&right_tool_box, 50, 50);

tile.end();
tile.resizable(document);

win.end();
win.resizable(tile);
win.show(argc, argv);
win.size_range(200, 50);
```

## Fl\_Tile classic mode

[Fl\\_Tile](#) allows objects to be resized to zero dimensions. To prevent this you can use the [resizable\(\)](#) to limit where corners can be dragged to. For more information see note below.

Even though objects can be resized to zero sizes, they must initially have non-zero sizes so the [Fl\\_Tile](#) can figure out their layout. If desired, call [position\(\)](#) after creating the children but before displaying the window to set the borders where you want.

**Note on [resizable\(Fl\\_Widget &w\)](#):** The "resizable" child widget (which should be invisible) limits where the borders can be dragged to. All dragging will be limited inside the resizable widget's borders. If you don't set it, it will be possible to drag the borders right to the edges of the [Fl\\_Tile](#) widget, and thus resize objects on the edges to zero width or height. When the entire [Fl\\_Tile](#) widget is resized, the [resizable\(\)](#) widget will keep its border distance to all borders the same (this is normal resize behavior), so that you can effectively set a border width that will never change. To ensure correct event delivery to all child widgets the [resizable\(\)](#) widget must be the first child of the [Fl\\_Tile](#) widget group. Otherwise some events (e.g. FL\_MOVE and FL\_ENTER) might be consumed by the [resizable\(\)](#) widget so that they are lost for widgets covered (overlapped) by the [resizable\(\)](#) widget.

### Note

You can still resize widgets **inside** the [resizable\(\)](#) to zero width and/or height, i.e. box **2b** above to zero width and box **3a** to zero height.

### See also

`void Fl\_Group::resizable\(Fl\_Widget &w\)`

Example for resizable with 20 pixel border distance:

```
int dx = 20, dy = dx;
Fl_Tile tile(50,50,300,300);
// create resizable() box first
Fl_Box r(tile.x()+dx, tile.y()+dy, tile.w()-2*dx, tile.h()-2*dy);
tile.resizable(r);
// ... create widgets inside tile (see test/tile.cxx) ...
tile.end();
```

See also the complete example program in test/tile.cxx.

## 13.139.2 Constructor & Destructor Documentation

### 13.139.2.1 Fl\_Tile()

```
Fl_Tile::Fl_Tile (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Tile](#) widget using the given position, size, and label string.

The default boxtype is FL\_NO\_BOX.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl\\_Tile](#) and all of its children can be automatic (local) variables, but you must declare the [Fl\\_Tile](#) *first*, so that it is destroyed last.

### See also

`class Fl\_Group`

## 13.139.3 Member Function Documentation

### 13.139.3.1 cursor()

```
Fl_Cursor Fl_Tile::cursor (
 int n) const [inline], [protected]
```

Returns the cursor for cursor index n.

### See also

`Fl\_Tile::set\_cursor\(int\)`

### 13.139.3.2 drag\_intersection()

```
void Fl_Tile::drag_intersection (
 int oldx,
 int oldy,
 int newx,
 int newy) [virtual]
```

Drags the intersection at (oldx,oldy) to (newx,newy).

See also

[Fl\\_Tile::move\\_intersection\(int oldx, int oldy, int newx, int newy\)](#) , but this method does not call [init\\_sizes\(\)](#) and is used for interactive [children](#) layout using the mouse.

#### Parameters

in	<i>oldx,oldy</i>	move the intersection at this coordinate, pass zero to disable drag in that direction.
in	<i>newx,newy</i>	move the intersection as close to this new coordinate as possible

### 13.139.3.3 handle()

```
int Fl_Tile::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

### 13.139.3.4 init\_size\_range()

```
void Fl_Tile::init_size_range (
 int default_min_w = -1,
 int default_min_h = -1)
```

Initialize the size range mode of [Fl\\_Tile](#) and set the default minimum width and height.

The default minimum width and height is the size of the mouse pointer grab area at about 4 pixel units.

#### Parameters

in	<i>default_min_w, default_min_h</i>	default size range for widgets that don't have an individual range assigned
----	-------------------------------------	-----------------------------------------------------------------------------

#### 13.139.3.5 move\_intersection()

```
void Fl_Tile::move_intersection (
 int oldx,
 int oldy,
 int newx,
 int newy) [virtual]
```

Drags the intersection at (oldx,oldy) to (newx,newy).

This redraws all the necessary children.

If no size ranges are set, the new intersection position is limited to the size of the tile group. The [resizable\(\)](#) option is not taken into account here.

If size ranges are set, the actual new position of the intersection will depend on the size range of every individual child. No child will be smaller than their minw and minh. After the new position is found, [move\\_intersection\(\)](#) will call [init\\_sizes\(\)](#). The [resizable\(\)](#) range is ignored.

#### Parameters

in	<i>oldx,oldy</i>	move the intersection at this coordinate, pass zero to disable drag in that direction.
in	<i>newx,newy</i>	move the intersection as close to this new coordinate as possible

#### 13.139.3.6 on\_insert()

```
int Fl_Tile::on_insert (
 Fl_Widget * candidate,
 int index) [override], [protected], [virtual]
```

Insert a new entry in the size range list.

Reimplemented from [Fl\\_Group](#).

#### 13.139.3.7 on\_move()

```
int Fl_Tile::on_move (
 int oldIndex,
 int newIndex) [override], [protected], [virtual]
```

Move the entry in the size range list.

Reimplemented from [Fl\\_Group](#).

#### 13.139.3.8 on\_remove()

```
void Fl_Tile::on_remove (
 int index) [override], [protected], [virtual]
```

Remove the entry from the size range list.

Reimplemented from [Fl\\_Group](#).

#### 13.139.3.9 position()

```
void Fl_Tile::position (
 int oldx,
 int oldy,
 int newx,
 int newy) [inline]
```

**Deprecated** "since 1.4.0 - use `move_intersection(p)` instead"

### 13.139.3.10 request\_grow\_b()

```
void Fl_Tile::request_grow_b (
 int old_b,
 int & new_b,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

#### Parameters

in	<i>old_b</i>	grow all children with this current bottom edge toward the bottom edge of this tile
in, out	<i>new_b</i>	try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to new_b)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

### 13.139.3.11 request\_grow\_l()

```
void Fl_Tile::request_grow_l (
 int old_l,
 int & new_l,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

#### Parameters

in	<i>old_l</i>	grow all children with this current left edge toward the left edge of this tile
in, out	<i>new_l</i>	try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_l)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

### 13.139.3.12 request\_grow\_r()

```
void Fl_Tile::request_grow_r (
 int old_r,
 int & new_r,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

#### Parameters

in	<i>old_r</i>	grow all children with this current right edge toward the right edge of this tile
in, out	<i>new_r</i>	try to grow to this coordinate, return the maximum possible growth (currently maxw is ignored, so we always grow to new_r)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

### 13.139.3.13 request\_grow\_t()

```
void Fl_Tile::request_grow_t (
 int old_t,
 int & new_t,
```

```
Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

#### Parameters

in	<i>old_t</i>	grow all children with this current top edge toward the top edge of this tile
in, out	<i>new_t</i>	try to grow to this coordinate, return the maximum possible growth (currently maxh is ignored, so we always grow to new_t)
in, out	<i>final_size</i>	write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 13.139.3.14 request\_shrink\_b()

```
void Fl_Tile::request_shrink_b (
 int old_b,
 int & new_b,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

#### See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

#### Parameters

in	<i>old_b</i>	shrink all children with this current bottom edge toward the top edge of this tile
in, out	<i>new_b</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 13.139.3.15 request\_shrink\_l()

```
void Fl_Tile::request_shrink_l (
 int old_l,
 int & new_l,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

`drag_intersection` requests that all children with the left edge at `old_l` to shrink to `new_l` towards the right side of the tile. If the child can not shrink by that amount, it will ask all other children that touch its right side to shrink by the remainder (recursion). `new_l` will return the the maximum possible value while maintaining minimum width for all children involved.

`request_shrink_r` asks children to shrink toward the left, so that their right edge is as close as possible to `new_r`.

`request_shrink_t` and `request_shrink_b` provide the same functionality for vertical resizing.

#### Parameters

in	<i>old_l</i>	shrink all children with this current left edge
in, out	<i>new_l</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 13.139.3.16 request\_shrink\_r()

```
void Fl_Tile::request_shrink_r (
 int old_r,
 int & new_r,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

#### Parameters

in	<i>old_r</i>	shrink all children with this current right edge toward the left edge of this tile
in, out	<i>new_r</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 13.139.3.17 request\_shrink\_t()

```
void Fl_Tile::request_shrink_t (
 int old_t,
 int & new_t,
 Fl_Rect * final_size) [protected]
```

Request for children to change their layout.

See also

[Fl\\_Tile::request\\_shrink\\_l\(int old\\_l, int &new\\_l, Fl\\_Rect \\*final\\_size\)](#)

#### Parameters

in	<i>old_t</i>	shrink all children with this current top edge toward the bottom edge of this tile
in, out	<i>new_t</i>	try to shrink to this coordinate, return the maximum possible shrinkage
in, out	<i>final_size</i>	if not NULL, write the new position and size of all affected children into this list of <a href="#">Fl_Rect</a>

#### 13.139.3.18 resize()

```
void Fl_Tile::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Tile](#) widget and its children.

[Fl\\_Tile](#) implements its own [resize\(\)](#) method. It does not use [Fl\\_Group::resize\(\)](#) to resize itself and its children.

In [size\\_range](#) mode, the child marked [resizable\(\)](#) is resized first. Only if its minimum size is reached, other widgets in the tile will resize too.

In classic mode or when no resizable child is set, enlarging works by moving the lower-right corner and resizing the bottom and right border widgets accordingly.

Shrinking the [Fl\\_Tile](#) works in the opposite way by shrinking the bottom and right border widgets, unless they are reduced to zero width or height, resp. or to their minimal sizes defined by the [resizable\(\)](#) widget. In this case other widgets will be shrunk as well.

See the [Fl\\_Tile](#) class documentation about how the [resizable\(\)](#) works.

Reimplemented from [Fl\\_Group](#).

#### 13.139.3.19 set\_cursor()

```
void Fl_Tile::set_cursor (
 int n) [protected]
```

Set one of four cursors used for dragging etc. . .

[Fl\\_Tile](#) uses an array of four cursors that are set depending on user actions:

- 0: normal cursor
- 1: horizontal dragging
- 2: vertical dragging
- 3: dragging an intersection

This method sets the window cursor for the given index *n*.

### 13.139.3.20 `size_range()` [1/2]

```
void Fl_Tile::size_range (
 Fl_Widget * w,
 int minw,
 int minh,
 int maxw = 0x7FFFFFFF,
 int maxh = 0x7FFFFFFF)
```

Set the allowed size range for the give child widget.

`Fl_Tile` currently supports only the minimal width and height setting.

#### Parameters

in	<i>w</i>	set the range for this child widget
in	<i>minw,minh</i>	minimum width and height for that child
in	<i>maxw,maxh</i>	maximum size, defaults to infinite, currently ignored

### 13.139.3.21 `size_range()` [2/2]

```
void Fl_Tile::size_range (
 int index,
 int minw,
 int minh,
 int maxw = 0x7FFFFFFF,
 int maxh = 0x7FFFFFFF)
```

Set the allowed size range for the child at the given index.

`Fl_Tile` currently supports only the minimal width and height setting.

#### Parameters

in	<i>index</i>	set the range for the child at this index
in	<i>minw,minh</i>	minimum width and height for that child
in	<i>maxw,maxh</i>	maximum size, defaults to infinite, currently ignored

The documentation for this class was generated from the following files:

- `Fl_Tile.H`
- `Fl_Tile.cxx`

## 13.140 `Fl_Tiled_Image` Class Reference

This class supports tiling of images over a specified area.

```
#include <Fl_Tiled_Image.H>
```

Inheritance diagram for `Fl_Tiled_Image`:

### Public Member Functions

- void [color\\_average](#) ([FL\\_Color](#) c, float i) override  
*The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.*
- [FL\\_Image](#) \* [copy](#) () const
- [FL\\_Image](#) \* [copy](#) (int W, int H) const override  
*Creates a resized copy of the image.*
- void [desaturate](#) () override  
*The [desaturate\(\)](#) method converts an image to grayscale.*
- void [draw](#) (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draws a tiled image.*
- [FL\\_Tiled\\_Image](#) ([FL\\_Image](#) \*i, int W=0, int H=0)  
*The constructors create a new tiled image containing the specified image.*
- [FL\\_Image](#) \* [image](#) () const  
*Gets The image that is tiled.*
- virtual ~[FL\\_Tiled\\_Image](#) ()  
*The destructor frees all memory and server resources that are used by the tiled image.*

### Public Member Functions inherited from [FL\\_Image](#)

- virtual class [FL\\_Shared\\_Image](#) \* [as\\_shared\\_image](#) ()  
*Returns whether an image is an [FL\\_Shared\\_Image](#) or not.*
- [FL\\_Image](#) \* [copy](#) () const  
*Creates a copy of the image in the same size.*
- int [count](#) () const  
*Returns the number of data values associated with the image.*
- int [d](#) () const  
*Returns the image depth.*
- const char \*const \* [data](#) () const  
*Returns a pointer to the current image data array.*
- int [data\\_h](#) () const  
*Returns the height of the image data.*
- int [data\\_w](#) () const  
*Returns the width of the image data.*
- void [draw](#) (int X, int Y)  
*Draws the image to the current drawing surface.*
- int [fail](#) () const  
*Returns a value that is not 0 if there is currently no image available.*
- [FL\\_Image](#) (int W, int H, int D)  
*The constructor creates an empty image with the specified width, height, and depth.*
- int [h](#) () const  
*Returns the current image drawing height in FLTK units.*
- void [inactive](#) ()  
*The [inactive\(\)](#) method calls [color\\_average\(FL\\_BACKGROUND\\_COLOR, 0.33f\)](#) to produce an image that appears grayed out.*

- virtual void `label` (`FI_Menu_Item` \*m)  
*This method is an obsolete way to set the image attribute of a menu item.*
- virtual void `label` (`FI_Widget` \*w)  
*This method is an obsolete way to set the image attribute of a widget or menu item.*
- int `ld` () const  
*Returns the current line data size in bytes.*
- virtual void `release` ()  
*Releases an `FI_Image` - the same as 'delete this'.*
- virtual void `scale` (int width, int height, int proportional=1, int can\_expand=0)  
*Sets the drawing size of the image.*
- virtual void `uncache` ()  
*If the image has been cached for display, delete the cache data.*
- int `w` () const  
*Returns the current image drawing width in FLTK units.*
- virtual `~FI_Image` ()  
*The destructor is a virtual method that frees all memory used by the image.*

### Protected Attributes

- static void **labeltype** (const [Fl\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [Fl\\_Align](#) la)
- static void **measure** (const [Fl\\_Label](#) \*lo, int &lw, int &lh)

### 13.140.1 Detailed Description

This class supports tiling of images over a specified area.

The source (tile) image is **not** copied unless you call the [color\\_average\(\)](#), [desaturate\(\)](#), or [inactive\(\)](#) methods.

### 13.140.2 Constructor & Destructor Documentation

#### 13.140.2.1 [Fl\\_Tiled\\_Image\(\)](#)

```
Fl_Tiled_Image::Fl_Tiled_Image (
 Fl_Image * i,
 int W = 0,
 int H = 0)
```

The constructors create a new tiled image containing the specified image.

Use a width and height of 0 to tile the whole window/widget.

#### Note

Due to implementation constraints in FLTK 1.3.3 and later width and height of 0 may not work as expected when used as background image in widgets other than windows. You may need to center and clip the image (label) and set the label type to `FL_NORMAL_LABEL`. Doing so will let the tiled image fill the whole widget as its background image. Other combinations of label flags may or may not work.

```
#include "bg.xpm"
Fl_Pixmap *bg_xpm = new Fl_Pixmap(bg_xpm);
Fl_Tiled_Image *bg_tiled = new Fl_Tiled_Image(bg_xpm,0,0);

Fl_Box *box = new Fl_Box(40,40,300,100,"");
box->box(FL_UP_BOX);
box->labeltype(FL_NORMAL_LABEL);
box->align(FL_ALIGN_INSIDE | FL_ALIGN_CENTER | FL_ALIGN_CLIP);
box->image(bg_tiled);
```

#### Note

Setting an image (label) for a window may not work as expected due to implementation constraints in FLTK 1.3.x and maybe later. The reason is the way [Fl::scheme\(\)](#) initializes the window's label type and image. A possible workaround is to use another [Fl\\_Group](#) as the only child widget and to set the background image for this group as described above.

**Todo** Fix [Fl\\_Tiled\\_Image](#) as background image for widgets and windows and fix the implementation of [Fl::scheme\(const char \\*\)](#).

### 13.140.3 Member Function Documentation

#### 13.140.3.1 [color\\_average\(\)](#)

```
void Fl_Tiled_Image::color_average (
 Fl_Color c,
 float i) [override], [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 13.140.3.2 copy()

```
Fl_Image * Fl_Tiled_Image::copy (
 int W,
 int H) const [override], [virtual]
```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl\\_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- $w() == \text{data\_w}() == W$
- $h() == \text{data\_h}() == H$

#### Parameters

in	$W, H$	Requested width and height of the new image
----	--------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

### 13.140.3.3 desaturate()

```
void Fl_Tiled_Image::desaturate () [override], [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 13.140.3.4 draw()

```
void Fl_Tiled_Image::draw (
 int X,
 int Y,
 int W,
```

```
int H,
int cx = 0,
int cy = 0) [override], [virtual]
```

Draws a tiled image.

Tiled images can be used as background images for widgets and windows. However, due to implementation constraints, you must take care when setting label types and alignment flags. Only certain combinations work as expected, others may yield unexpected results and undefined behavior.

This draw method can draw multiple copies of one image in an area given by X, Y, W, H.

The optional arguments `cx` and `cy` can be used to crop the image starting at offsets (`cx`, `cy`). `cx` and `cy` must be  $\geq 0$  (negative values are ignored). If one of the values is greater than the image width or height resp. (`cx`  $\geq$  `image()->w()` or `cy`  $\geq$  `image()->h()`) nothing is drawn, because the resulting image would be empty.

After calculating the resulting image size the image is drawn as often as necessary to fill the given area, starting at the top left corner.

If both `W` and `H` are 0 the image is repeated as often as necessary to fill the entire window, unless there is a valid clip region. If you want to fill only one particular widget's background, then you should either set a clip region in your `draw()` method or use the label alignment flags `FL_ALIGN_INSIDE`|`FL_ALIGN_CLIP` to make sure the image is clipped.

This may be improved in a later version of the library.

Reimplemented from [FI\\_Image](#).

The documentation for this class was generated from the following files:

- `FI_Tiled_Image.H`
- `FI_Tiled_Image.cxx`

## 13.141 FI\_Timeout Class Reference

The internal class [FI\\_Timeout](#) handles all timeout related functions.

```
#include <FI_Timeout.h>
```

### Static Public Member Functions

## 13.141.1 Detailed Description

The internal class `FI_Timeout` handles all timeout related functions.

All code is platform independent except retrieving a timestamp which requires calling a system driver function and potentially results in different timer resolutions (from milliseconds to microseconds).

Related user documentation:

- `FI_Timeout_Handler`
- `FI::add_timeout(double time, FI_Timeout_Handler cb, void *data)`
- `FI::repeat_timeout(double time, FI_Timeout_Handler cb, void *data)`
- `FI::has_timeout(FI_Timeout_Handler cb, void *data)`
- `FI::remove_timeout(FI_Timeout_Handler cb, void *data)`
- `FI::remove_next_timeout(FI_Timeout_Handler cb, void *data, void **data_return)`

## 13.141.2 Member Function Documentation

### 13.141.2.1 add\_timeout()

```
void Fl_Timeout::add_timeout (
 double time,
 Fl_Timeout_Handler cb,
 void * data) [static]
```

Adds a one-shot timeout callback.

The callback function *cb* will be called by [Fl::wait\(\)](#) at *time* seconds after this function is called.

## Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

## Implements:

```
void Fl::add_timeout(double time, Fl_Timeout_Handler cb, void *data)
```

## See also

[Fl::add\\_timeout\(double time, Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

**13.141.2.2 current()**

```
Fl_Timeout * Fl_Timeout::current () [static], [protected]
```

Returns the first (top-most) timeout from the current timeout stack.

This returns a pointer to the timeout but does not remove it from the list of current timeouts. This should be the timeout that is currently executing its callback.

## Returns

Fl\_Timeout\* The current timeout whose callback is running.

## Return values

NULL	if no callback is currently running.
------	--------------------------------------

**13.141.2.3 elapse\_timeouts()**

```
void Fl_Timeout::elapse_timeouts () [static]
```

Elapse all timers w/o calling their callbacks.

All timer values are adjusted by the delta time since the last call. This method does **NOT** call timer callbacks if timers are expired.

This must be called before new timers are added to the timer queue to make sure that the next timer decrement does not count down too much time.

## See also

[Fl\\_Timeout::do\\_timeouts\(\)](#)

**13.141.2.4 get()**

```
Fl_Timeout * Fl_Timeout::get (
 double time,
 Fl_Timeout_Handler cb,
 void * data) [static], [protected]
```

Get an [Fl\\_Timeout](#) instance for further handling.

The timer object will be initialized with the input parameters as given by [Fl::add\\_timeout\(\)](#) or [Fl::repeat\\_timeout\(\)](#).

[Fl\\_Timeout](#) objects are maintained in three queues:

- active timer queue
- list (stack, i.e. LIFO) of currently executing timer callbacks
- free timer entries.

When the FLTK program is launched all queues are empty. Whenever a new timer object is required the [get\(\)](#) method is called and a timer object is either found in the queue of free timer entries or a new timer object is created (operator new).

Active timer entries are inserted into the "active timer queue" until they expire and their callback is called.

Before the callback is called the timer entry is inserted into the list of current timers, i.e. it becomes the [Fl\\_Timeout::current\(\)](#) timeout. This can be used in [Fl::repeat\\_timeout\(\)](#) to find out if and how long the current timeout has been delayed.

When a timer is no longer used it is popped from the `current` list and inserted into the "free timer" list so it can be reused later.

Timer queue entries are never returned to the system, there's no garbage collection. The total number of timer objects is determined by the largest number of concurrently active timers.

#### Parameters

in	<i>time</i>	requested delta time
in	<i>cb</i>	timer callback
in	<i>data</i>	userdata for timer callback

#### Returns

Fl\_Timeout\* Timer entry

#### See also

[Fl::add\\_timeout\(\)](#), [Fl::repeat\\_timeout\(\)](#)

#### 13.141.2.5 has\_timeout()

```
int Fl_Timeout::has_timeout (
 Fl_Timeout_Handler cb,
 void * data) [static]
```

Returns true if the timeout exists and has not been called yet.

#### Parameters

in	<i>cb</i>	Timer callback (must match)
in	<i>data</i>	Callback user data (must match)

#### Returns

whether the timer was found in the queue

#### Return values

0	not found
1	found

#### Implements:

```
int Fl::has_timeout(Fl_Timeout_Handler cb, void *data)
```

#### See also

[Fl::has\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

**13.141.2.6 insert()**

```
void Fl_Timeout::insert () [protected]
```

Insert this timer entry into the active timer queue.

The timer is inserted at the required position so the timer queue is always ordered by due time.

**13.141.2.7 make\_current()**

```
void Fl_Timeout::make_current () [protected]
```

Remove the timeout from the active timer queue and push it onto the stack of currently running callbacks.

This becomes the [current\(\)](#) timeout which can be used in [Fl::repeat\\_timeout\(\)](#).

See also

[Fl\\_Timeout::current\(\)](#)

**13.141.2.8 release()**

```
void Fl_Timeout::release () [protected]
```

Remove the top-most timeout from the stack of currently running timeout callbacks and insert it into the list of free timers.

Typical code in the library would look like:

```
// The timeout \p Fl_Timeout *t has expired, run its callback
t->make_current();
(t->callback) (t->data);
t->release();
```

**13.141.2.9 remove\_next\_timeout()**

```
int Fl_Timeout::remove_next_timeout (
 Fl_Timeout_Handler cb,
 void * data = NULL,
 void ** data_return = NULL) [static]
```

Remove the next matching timeout callback and return its `data` pointer.

Implements:

```
int Fl::remove_next_timeout(Fl_Timeout_Handler cb, void *data, void **data_return)
```

**Parameters**

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL, must match otherwise
in, out	<i>data_return</i>	pointer to void * to receive the data value

**Returns**

non-zero if a timer was found and removed

**Return values**

0	no matching timer was found
1	the last matching timeout was found and removed
$N > 1$	a matching timeout was removed and there are (N - 1) matching timeouts pending

For details

See also

[Fl::remove\\_next\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data, void \\*\\*data\\_return\)](#)

### 13.141.2.10 remove\_timeout()

```
void Fl_Timeout::remove_timeout (
 Fl_Timeout_Handler cb,
 void * data) [static]
```

Remove a timeout callback.

This method removes all matching timeouts, not just the first one. This may change in the future.

#### Parameters

in	<i>cb</i>	Timer callback to be removed (must match)
in	<i>data</i>	Wildcard if NULL, must match otherwise

Implements:

```
void Fl::remove_timeout(Fl_Timeout_Handler cb, void *data)
```

See also

[Fl::remove\\_timeout\(Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

### 13.141.2.11 repeat\_timeout()

```
void Fl_Timeout::repeat_timeout (
 double time,
 Fl_Timeout_Handler cb,
 void * data) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.

#### Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

Implements:

```
void Fl::repeat_timeout(double time, Fl_Timeout_Handler cb, void *data)
```

See also

[Fl::repeat\\_timeout\(double time, Fl\\_Timeout\\_Handler cb, void \\*data\)](#)

### 13.141.2.12 time\_to\_wait()

```
double Fl_Timeout::time_to_wait (
 double ttw) [static]
```

Returns the delay in seconds until the next timer expires, limited by *ttw*.

This function calculates the time to wait for the FLTK event queue processing, depending on the given value *ttw*.

If at least one timer is active and its timeout value is smaller than *ttw* then this value is returned. [Fl::wait\(\)](#) will wait no longer than until the next timer expires.

If no timer is active this returns the input value *ttw* unchanged.

If at least one timer is expired this returns 0.0 so the event processing does not wait.

## Parameters

<code>in</code>	<code>ttw</code>	time to wait from <a href="#">Fl::wait()</a> etc. (upper limit)
-----------------	------------------	-----------------------------------------------------------------

## Returns

delay until next timeout or 0.0 (see description)

### 13.141.3 Member Data Documentation

#### 13.141.3.1 `current_timeout`

```
Fl_Timeout * Fl_Timeout::current_timeout = 0 [static], [protected]
```

The list of current timeouts is used to store the timeout whose callback is called while the callback is executed.

This is used like a stack, the current timeout is pushed to the front of the list and once the callback is finished, that timeout is removed and entered into the free list.

Background: [Fl::repeat\\_timeout\(\)](#) needs to know which timeout triggered it and the exact schedule time and/or the delay of that timeout, i.e. how long the scheduled time was missed before the callback was called. A static, global variable is not sufficient since the user code can call other functions, e.g. dialogs, that run a nested event loop which can run another timeout callback. Hence this list of "current" timeouts is used like a stack (last in, first out).

## See also

[Fl\\_Timeout::push\(\)](#) Member function (method)

#### 13.141.3.2 `first_timeout`

```
Fl_Timeout * Fl_Timeout::first_timeout = 0 [static], [protected]
```

List of active timeouts.

These timeouts can be triggered when due, which calls their callbacks. The lifetime of a timeout:

- active, in this queue
- callback running, in queue `current_timeout`
- done, in list of free timeouts, ready to be reused.

#### 13.141.3.3 `free_timeout`

```
Fl_Timeout * Fl_Timeout::free_timeout = 0 [static], [protected]
```

List of free timeouts after use.

Timeouts can be reused many times.

The documentation for this class was generated from the following files:

- [Fl\\_Timeout.h](#)
- [Fl\\_Timeout.cxx](#)

## 13.142 `Fl_Timer` Class Reference

This is provided only to emulate the Forms Timer widget.

```

*Checks if this widget is a child of wgt.*
- int **is\_label\_copied** () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* **label** () const  
*Gets the current label text.*
- void **label** (const char \*text)  
*Sets the current label pointer.*
- void **label** (**Fl\_Labeltype** a, const char \*b)

- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()

*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*
- [FI\\_Color](#) [labelcolor](#) () const

*Gets the label color.*
- void [labelcolor](#) ([FI\\_Color](#) c)

*Sets the label color.*
- [FI\\_Font](#) [labelfont](#) () const

*Gets the font to use.*
- void [labelfont](#) ([FI\\_Font](#) f)

*Sets the font to use.*
- [FI\\_Fontsize](#) [labelsize](#) () const

*Gets the font size in pixels.*
- void [labelsize](#) ([FI\\_Fontsize](#) pix)

*Sets the font size in pixels.*
- [FI\\_Labeltype](#) [labeltype](#) () const

*Gets the label type.*
- void [labeltype](#) ([FI\\_Labeltype](#) a)

*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const

*Returns if a widget is used for output only.*
- [FI\\_Group](#) \* [parent](#) () const

*Returns a pointer to the parent widget.*
- void [parent](#) ([FI\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [FI\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*

- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

- Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **FL\_When** when () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- **FL\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~**FL\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

### Protected Member Functions inherited from **FL\_Widget**

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **FL\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)

*Internal use only.*

- void `x` (int v)

*Internal use only.*

- void `y` (int v)

*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget` \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from `Fl_Widget`

- enum {

*flags possible values enumeration.*

### 13.142.1 Detailed Description

This is provided only to emulate the Forms Timer widget.

It works by making a timeout callback every 1/5 second. This is wasteful and inaccurate if you just want something to happen a fixed time in the future. You should directly call `Fl::add_timeout()` instead.

### 13.142.2 Constructor & Destructor Documentation

#### 13.142.2.1 `Fl_Timer()`

```
Fl_Timer::Fl_Timer (
 uchar t,
 int X,
 int Y,
 int W,
 int H,
 const char * l)
```

Creates a new `Fl_Timer` widget using the given type, position, size, and label string.

The type parameter can be any of the following symbolic constants:

- `FL_NORMAL_TIMER` - The timer just does the callback and displays the string "Timer" in the widget.
- `FL_VALUE_TIMER` - The timer does the callback and displays the current timer value in the widget.
- `FL_HIDDEN_TIMER` - The timer just does the callback and does not display anything.

### 13.142.3 Member Function Documentation

#### 13.142.3.1 direction() [1/2]

```
char Fl_Timer::direction () const [inline]
```

Gets or sets the direction of the timer.

If the direction is zero then the timer will count up, otherwise it will count down from the initial [value\(\)](#).

#### 13.142.3.2 direction() [2/2]

```
void Fl_Timer::direction (
 char d) [inline]
```

Gets or sets the direction of the timer.

If the direction is zero then the timer will count up, otherwise it will count down from the initial [value\(\)](#).

#### 13.142.3.3 draw()

```
void Fl_Timer::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 13.142.3.4 handle()

```
int Fl_Timer::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

##### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

##### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

##### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

### 13.142.3.5 suspended()

```
char Fl_Timer::suspended () const [inline]
```

Gets or sets whether the timer is suspended.

The documentation for this class was generated from the following files:

- Fl\_Timer.H
- forms\_timer.cxx

## 13.143 Fl\_Toggle\_Button Class Reference

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

```
#include <Fl_Toggle_Button.H>
```

Inheritance diagram for Fl\_Toggle\_Button:

### Public Member Functions

- [Fl\\_Toggle\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)  
Creates a new [Fl\\_Toggle\\_Button](#) widget using the given position, size, and label string.

### Public Member Functions inherited from [Fl\\_Button](#)

- int [clear](#) ()  
Same as `value(0)`.
- [uchar compact](#) () const  
Return true if buttons are rendered as compact buttons.
- void [compact](#) ([uchar](#) v)  
Decide if buttons should be rendered in compact mode.
- [Fl\\_Boxtype down\\_box](#) () const  
Returns the current down box type, which is drawn when `value()` is non-zero.
- void [down\\_box](#) ([Fl\\_Boxtype](#) b)  
Sets the down box type.
- [Fl\\_Color down\\_color](#) () const  
(for backwards compatibility)
- void [down\\_color](#) (unsigned c)  
(for backwards compatibility)
- [Fl\\_Button](#) (int X, int Y, int W, int H, const char \*L=0)  
The constructor creates the button using the given position, size, and label.
- int [handle](#) (int) override  
Handles the specified event.
- int [set](#) ()  
Same as `value(1)`.
- void [setonly](#) ()  
Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).

- int [shortcut](#) () const  
*Returns the current shortcut key for the button.*
- void **shortcut** (const char \*s)  
*(for backwards compatibility)*
- void [shortcut](#) (int s)  
*Sets the shortcut key to s.*
- char **value** () const  
*Returns the current value of the button (0 or 1).*
- int [value](#) (int v)  
*Sets the current value of the button.*

## Public Member Functions inherited from [Fl\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [Fl\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([Fl\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [Fl\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).*
- virtual class [Fl\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [Fl\\_Group](#) \* [as\\_group](#) ()  
*Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).*
- virtual [Fl\\_Group](#) const \* **as\_group** () const
- virtual [Fl\\_Window](#) \* [as\\_window](#) ()  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- virtual [Fl\\_Window](#) const \* **as\_window** () const
- void [bind\\_deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([Fl\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [Fl\\_Callback\\_p](#) [callback](#) () const

- Gets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*

  - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

  - void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_damage](#) ([uchar](#) c=0)
- Clears or sets the damage flags.*

  - void [clear\\_output](#) ()
- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()
- Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

  - [FI\\_Color](#) [color](#) () const
- Gets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg)
- Sets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)
- Sets the background and selection color of the widget.*

  - int [contains](#) (const [FI\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*

  - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*

  - void [deactivate](#) ()
- Deactivates the widget.*

  - [FI\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const [FI\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

- void [deimage](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FI\\_Widget](#) \*widget, long arg, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FI\\_Widget](#) \*widget, void \*arg=0, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FI\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FI\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FI\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FI\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FI\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FI\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FI\\_Color](#) c)  
*Sets the label color.*
- [FI\\_Font](#) [labelfont](#) () const

- Gets the font to use.*

  - void [labelfont](#) ([Fl\\_Font](#) f)
- Sets the font to use.*

  - [Fl\\_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([Fl\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [Fl\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([Fl\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [Fl\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([Fl\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()
- Schedules the drawing of the label.*

  - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

  - [Fl\\_Color](#) [selection\\_color](#) () const
- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

- Gets the widget position in its window.*  
 • int **y** () const  
*Gets the widget position in its window.*
- virtual ~FI\_Widget ()  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void **default\_callback** (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from FI\_Widget

- void `x` (int v)  
*Internal use only.*
- void `y` (int v)  
*Internal use only.*

## Static Protected Member Functions inherited from `Fl_Button`

- static void `key_release_timeout` (void \*)

## Static Protected Attributes inherited from `Fl_Button`

- static `Fl_Widget_Tracker` \* `key_release_tracker` = 0

### 13.143.1 Detailed Description

The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off.

The `Fl_Toggle_Button` subclass displays the "on" state by drawing a pushed-in button.

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for `type()` and `when()`.

### 13.143.2 Constructor & Destructor Documentation

#### 13.143.2.1 `Fl_Toggle_Button()`

```
Fl_Toggle_Button::Fl_Toggle_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Toggle_Button` widget using the given position, size, and label string.

The constructor creates the button using the given position, size, and label.

The inherited destructor deletes the toggle button.

The Button `type()` is set to `FL_TOGGLE_BUTTON`.

#### Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

The documentation for this class was generated from the following files:

- Fl\_Toggle\_Button.H
- Fl\_Button.cxx

## 13.144 Fl\_Tooltip Class Reference

The [Fl\\_Tooltip](#) class provides tooltip support for all FLTK widgets.

```
#include <Fl_Tooltip.H>
```

### Static Public Member Functions

- static [Fl\\_Color](#) [color](#) ()  
*Gets the background color for tooltips.*
- static void [color](#) ([Fl\\_Color](#) c)  
*Sets the background color for tooltips.*
- static [Fl\\_Widget](#) \* [current](#) ()  
*Gets the current widget target.*
- static void [current](#) ([Fl\\_Widget](#) \*)  
*Sets the current widget target.*
- static [Fl\\_Window](#) \* [current\\_window](#) (void)  
*Returns the window that is used for tooltips.*
- static float [delay](#) ()  
*Gets the tooltip delay.*
- static void [delay](#) (float f)  
*Sets the tooltip delay.*
- static void [disable](#) ()  
*Same as enable(0), disables tooltips on all widgets.*
- static void [enable](#) (int b=1)  
*Enables tooltips on all widgets (or disables if b is false).*
- static int [enabled](#) ()  
*Returns non-zero if tooltips are enabled.*
- static void [enter\\_area](#) ([Fl\\_Widget](#) \*w, int X, int Y, int W, int H, const char \*tip)  
*You may be able to use this to provide tooltips for internal pieces of your widget.*
- static [Fl\\_Font](#) [font](#) ()  
*Gets the typeface for the tooltip text.*
- static void [font](#) ([Fl\\_Font](#) i)  
*Sets the typeface for the tooltip text.*
- static float [hidedelay](#) ()  
*Gets the time until an open tooltip hides again.*
- static void [hidedelay](#) (float f)  
*Sets the time until an open tooltip hides again.*
- static float [hoverdelay](#) ()  
*Gets the tooltip hover delay, the delay between tooltips.*
- static void [hoverdelay](#) (float f)  
*Sets the tooltip hover delay, the delay between tooltips.*
- static int [margin\\_height](#) ()  
*Gets the amount of extra space above and below the tooltip's text.*
- static void [margin\\_height](#) (int v)  
*Sets the amount of extra space above and below the tooltip's text.*
- static int [margin\\_width](#) ()  
*Gets the amount of extra space left/right of the tooltip's text.*

- static void `margin_width` (int v)  
*Sets the amount of extra space left/right of the tooltip's text.*
- static int `override_text` (const char \*new\_text)  
*Temporarily Override Tooltip Text during an FL\_BEFORE\_TOOLTIP event.*
- static `FL_Fonsize` `size` ()  
*Gets the size of the tooltip text.*
- static void `size` (`FL_Fonsize` s)  
*Sets the size of the tooltip text.*
- static `FL_Color` `textcolor` ()  
*Gets the color of the text in the tooltip.*
- static void `textcolor` (`FL_Color` c)  
*Sets the color of the text in the tooltip.*
- static int `wrap_width` ()  
*Gets the maximum width for tooltip's text before it word wraps.*
- static void `wrap_width` (int v)  
*Sets the maximum width for tooltip's text before it word wraps.*

### Static Public Attributes

- static void(\* `enter` )(`FL_Widget` \*w) = nothing
- static void(\* `exit` )(`FL_Widget` \*w) = nothing

- void `FL_Widget::tooltip` (const char \*)

## 13.144.1 Detailed Description

The `FL_Tooltip` class provides tooltip support for all FLTK widgets. It contains only static methods.

Figure 13.61 `FL_Tooltip` Options

## 13.144.2 Member Function Documentation

### 13.144.2.1 color() [1/2]

```
static Fl_Color Fl_Tooltip::color () [inline], [static]
```

Gets the background color for tooltips.

The default background color is a pale yellow.

### 13.144.2.2 color() [2/2]

```
static void Fl_Tooltip::color (
 Fl_Color c) [inline], [static]
```

Sets the background color for tooltips.

The default background color is a pale yellow.

### 13.144.2.3 current()

```
void Fl_Tooltip::current (
 Fl_Widget * w) [static]
```

Sets the current widget target.

Acts as though enter(widget) was done but does not pop up a tooltip. This is useful to prevent a tooltip from reappearing when a modal overlapping window is deleted. FLTK does this automatically when you click the mouse button.

### 13.144.2.4 delay() [1/2]

```
static float Fl_Tooltip::delay () [inline], [static]
```

Gets the tooltip delay.

The default delay is 1.0 seconds.

### 13.144.2.5 delay() [2/2]

```
static void Fl_Tooltip::delay (
 float f) [inline], [static]
```

Sets the tooltip delay.

The default delay is 1.0 seconds.

### 13.144.2.6 disable()

```
static void Fl_Tooltip::disable () [inline], [static]
```

Same as enable(0), disables tooltips on all widgets.

### 13.144.2.7 enable()

```
static void Fl_Tooltip::enable (
 int b = 1) [inline], [static]
```

Enables tooltips on all widgets (or disables if *b* is false).

### 13.144.2.8 enabled()

```
static int Fl_Tooltip::enabled () [inline], [static]
```

Returns non-zero if tooltips are enabled.

### 13.144.2.9 enter\_area()

```
void Fl_Tooltip::enter_area (
 Fl_Widget * wid,
 int x,
 int y,
 int w,
 int h,
 const char * t) [static]
```

You may be able to use this to provide tooltips for internal pieces of your widget.

Call this after setting [Fl::belowmouse\(\)](#) to your widget (because that calls the above enter() method). Then figure out what thing the mouse is pointing at, and call this with the widget (this pointer is used to remove the tooltip if the widget is deleted or hidden, and to locate the tooltip), the rectangle surrounding the area, relative to the top-left corner of the widget (used to calculate where to put the tooltip), and the text of the tooltip (which must be a pointer to static data as it is not copied).

### 13.144.2.10 font() [1/2]

```
static Fl_Font Fl_Tooltip::font () [inline], [static]
```

Gets the typeface for the tooltip text.

### 13.144.2.11 font() [2/2]

```
static void Fl_Tooltip::font (
 Fl_Font i) [inline], [static]
```

Sets the typeface for the tooltip text.

### 13.144.2.12 hidedelay() [1/2]

```
static float Fl_Tooltip::hidedelay () [inline], [static]
```

Gets the time until an open tooltip hides again.

The default delay is 12.0 seconds.

### 13.144.2.13 hidedelay() [2/2]

```
static void Fl_Tooltip::hidedelay (
 float f) [inline], [static]
```

Sets the time until an open tooltip hides again.

The default delay is 12.0 seconds.

### 13.144.2.14 hoverdelay() [1/2]

```
static float Fl_Tooltip::hoverdelay () [inline], [static]
```

Gets the tooltip hover delay, the delay between tooltips.

The default delay is 0.2 seconds.

### 13.144.2.15 hoverdelay() [2/2]

```
static void Fl_Tooltip::hoverdelay (
 float f) [inline], [static]
```

Sets the tooltip hover delay, the delay between tooltips.  
The default delay is 0.2 seconds.

#### 13.144.2.16 `margin_height()` [1/2]

```
static int Fl_Tooltip::margin_height () [inline], [static]
```

Gets the amount of extra space above and below the tooltip's text.  
Default is 3.

#### 13.144.2.17 `margin_height()` [2/2]

```
static void Fl_Tooltip::margin_height (
 int v) [inline], [static]
```

Sets the amount of extra space above and below the tooltip's text.  
Default is 3.

#### 13.144.2.18 `margin_width()` [1/2]

```
static int Fl_Tooltip::margin_width () [inline], [static]
```

Gets the amount of extra space left/right of the tooltip's text.  
Default is 3.

#### 13.144.2.19 `margin_width()` [2/2]

```
static void Fl_Tooltip::margin_width (
 int v) [inline], [static]
```

Sets the amount of extra space left/right of the tooltip's text.  
Default is 3.

#### 13.144.2.20 `override_text()`

```
int Fl_Tooltip::override_text (
 const char * new_text) [static]
```

Temporarily Override Tooltip Text during an FL\_BEFORE\_TOOLTIP event.

Use this method to temporarily change the tooltip text before it is displayed.

When FLTK sends an FL\_BEFORE\_TOOLTIP event to the widget under the mouse pointer, you can handle this event to modify the tooltip text dynamically. The provided text will be copied into a local buffer. To apply the override, the event handler must return 1.

To disable the tooltip for the current event, set the override text to nullptr or an empty string ("") and return 1.

##### Parameters

<code>in</code>	<code>new_text</code>	a C string that will be copied into a buffer
-----------------	-----------------------	----------------------------------------------

##### Returns

always 1, so this call can finish the FL\_BEFORE\_TOOLTIP event handling.

##### See also

void [Fl\\_Widget::tooltip\(const char \\*text\)](#).

`test/color_chooser.cxx` for a usage example.

#### 13.144.2.21 `size()` [1/2]

```
static Fl_Fontsize Fl_Tooltip::size () [inline], [static]
```

Gets the size of the tooltip text.

**13.144.2.22 size()** [2/2]

```
static void Fl_Tooltip::size (
 Fl_Fontsize s) [inline], [static]
```

Sets the size of the tooltip text.

**13.144.2.23 textcolor()** [1/2]

```
static Fl_Color Fl_Tooltip::textcolor () [inline], [static]
```

Gets the color of the text in the tooltip.

The default is black.

**13.144.2.24 textcolor()** [2/2]

```
static void Fl_Tooltip::textcolor (
 Fl_Color c) [inline], [static]
```

Sets the color of the text in the tooltip.

The default is black.

**13.144.2.25 wrap\_width()** [1/2]

```
static int Fl_Tooltip::wrap_width () [inline], [static]
```

Gets the maximum width for tooltip's text before it word wraps.

Default is 400.

**13.144.2.26 wrap\_width()** [2/2]

```
static void Fl_Tooltip::wrap_width (
 int v) [inline], [static]
```

Sets the maximum width for tooltip's text before it word wraps.

Default is 400.

The documentation for this class was generated from the following files:

- [Fl\\_Tooltip.H](#)
- [Fl.cxx](#)
- [Fl\\_Tooltip.cxx](#)

**13.145 FL\_Tree Class Reference**

Tree widget.

```
#include <Fl_Tree.H>
```

Inheritance diagram for FL\_Tree:

**Public Member Functions**

- [Fl\\_Tree\\_Item](#) \* **add** (const char \*path, [Fl\\_Tree\\_Item](#) \*newitem=0)  
*Adds a new item, given a menu style 'path'.*

- **Fl\_Tree\_Item** \* **add** (**Fl\_Tree\_Item** \*parent\_item, const char \*name)  
*Add a new child item labeled 'name' to the specified 'parent\_item'.*
- int **auto\_resize\_children** ()  
*Returns whether auto resizing of children is active.*
- void **auto\_resize\_children** (int mode)  
*Set mode to resize children when the **Fl\_Tree** container widget is resized.*
- void **calc\_dimensions** ()  
*Recalculate widget dimensions and scrollbar visibility, normally managed automatically.*
- void **calc\_tree** ()  
*Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.*
- **Fl\_Tree\_Item** \* **callback\_item** ()  
*Gets the item that caused the callback.*
- void **callback\_item** (**Fl\_Tree\_Item** \*item)  
*Sets the item that was changed for this callback.*
- **Fl\_Tree\_Reason** **callback\_reason** () const  
*Gets the reason for this callback.*
- void **callback\_reason** (**Fl\_Tree\_Reason** reason)  
*Sets the reason for this callback.*
- void **clear** ()  
*Clear the entire tree's children, including the root.*
- void **clear\_children** (**Fl\_Tree\_Item** \*item)  
*Clear all the children for 'item'.*
- int **close** (const char \*path, int docallback=1)  
*Closes the item specified by 'path'.*
- int **close** (**Fl\_Tree\_Item** \*item, int docallback=1)  
*Closes the specified 'item'.*
- **Fl\_Image** \* **closeicon** () const  
*Returns the icon to be used as the 'close' icon.*
- void **closeicon** (**Fl\_Image** \*val)  
*Sets the icon to be used as the 'close' icon.*
- **Fl\_Color** **connectorcolor** () const  
*Get the connector color used for tree connection lines.*
- void **connectorcolor** (**Fl\_Color** val)  
*Set the connector color used for tree connection lines.*
- **Fl\_Tree\_Connector** **connectorstyle** () const  
*Returns the line drawing style for inter-connecting items.*
- void **connectorstyle** (**Fl\_Tree\_Connector** val)  
*Sets the line drawing style for inter-connecting items.*
- int **connectorwidth** () const  
*Gets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*
- void **connectorwidth** (int val)  
*Sets the width of the horizontal connection lines (in pixels) that appear to the left of each tree item's label.*
- int **deselect** (const char \*path, int docallback=1)  
*Deselect an item specified by 'path'.*
- int **deselect** (**Fl\_Tree\_Item** \*item, int docallback=1)  
*Deselect the specified item.*
- int **deselect\_all** (**Fl\_Tree\_Item** \*item=0, int docallback=1)  
*Deselect 'item' and all its children.*
- void **display** (**Fl\_Tree\_Item** \*item)  
*Displays 'item', scrolling the tree as necessary.*
- int **displayed** (**Fl\_Tree\_Item** \*item)

- See if 'item' is currently displayed on-screen (visible within the widget).*

  - int `extend_selection` (`Fl_Tree_Item` \*from, `Fl_Tree_Item` \*to, int val=1, bool visible=false)

*Extend a selection between 'from' and 'to' depending on 'visible'.*
- int `extend_selection_dir` (`Fl_Tree_Item` \*from, `Fl_Tree_Item` \*to, int dir, int val, bool visible)

*Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.*
- `Fl_Tree_Item` \* `find_clicked` (int yonly=0)

*Non-const version of `Fl_Tree::find_clicked(int yonly) const`.*
- const `Fl_Tree_Item` \* `find_clicked` (int yonly=0) const

*Find the item that was last clicked on.*
- `Fl_Tree_Item` \* `find_item` (const char \*path)

*Non-const version of `Fl_Tree::find_item(const char *path) const`.*
- const `Fl_Tree_Item` \* `find_item` (const char \*path) const

*Find the item, given a menu style path, e.g.*
- `Fl_Tree_Item` \* `first` ()

*Returns the first item in the tree, or 0 if none.*
- `Fl_Tree_Item` \* `first_selected_item` ()

*Returns the first selected item in the tree.*
- `Fl_Tree_Item` \* `first_visible` ()

*Returns the first `open()`, visible item in the tree, or 0 if none.*
- `Fl_Tree_Item` \* `first_visible_item` ()

*Returns the first `open()`, visible item in the tree, or 0 if none.*
- `Fl_Tree` (int X, int Y, int W, int H, const char \*L=0)

*Constructor.*
- `Fl_Tree_Item` \* `get_item_focus` () const

*Get the item that currently has keyboard focus.*
- int `get_selected_items` (`Fl_Tree_Item_Array` &items)

*Returns the currently selected items as an array of 'ret\_items'.*
- int `handle` (int e) override

*Standard FLTK event handler for this widget.*
- int `hposition` () const

*Returns the horizontal scroll position as a pixel offset.*
- void `hposition` (int pos)

*Sets the horizontal scroll offset to position 'pos'.*
- `Fl_Tree_Item` \* `insert` (`Fl_Tree_Item` \*item, const char \*name, int pos)

*Insert a new item 'name' into 'item's children at position 'pos'.*
- `Fl_Tree_Item` \* `insert_above` (`Fl_Tree_Item` \*above, const char \*name)

*Inserts a new item 'name' above the specified `Fl_Tree_Item` 'above'.*
- int `is_close` (const char \*path) const

*See if item specified by 'path' is closed.*
- int `is_close` (`Fl_Tree_Item` \*item) const

*See if the specified 'item' is closed.*
- int `is_hscroll_visible` () const

*See if the horizontal scrollbar is currently visible.*
- int `is_open` (const char \*path) const

*See if item specified by 'path' is open.*
- int `is_open` (`Fl_Tree_Item` \*item) const

*See if 'item' is open.*
- int `is_scrollbar` (`Fl_Widget` \*w)

*See if widget 'w' is one of the `Fl_Tree` widget's scrollbars.*
- int `is_selected` (const char \*path)

- See if item specified by 'path' is selected.*

  - int **is\_selected** (Fl\_Tree\_Item \*item) const
- See if the specified 'item' is selected.*

  - int **is\_vscroll\_visible** () const
- See if the vertical scrollbar is currently visible.*

  - Fl\_Tree\_Item \* **item\_clicked** ()
- Return the item that was last clicked.*

  - Fl\_Tree\_Item\_Draw\_Mode **item\_draw\_mode** () const
- Get the 'item draw mode' used for the tree.*

  - void **item\_draw\_mode** (Fl\_Tree\_Item\_Draw\_Mode mode)
- Set the 'item draw mode' used for the tree to 'mode'.*

  - void **item\_draw\_mode** (int mode)
- Set the 'item draw mode' used for the tree to integer 'mode'.*

  - void **item\_labelbgcolor** (Fl\_Color val)
- Set the default label background color used for creating new items.*

  - Fl\_Color **item\_labelbgcolor** (void) const
- Get the default label background color used for creating new items.*

  - void **item\_labelfgcolor** (Fl\_Color val)
- Set the default label foreground color used for creating new items.*

  - Fl\_Color **item\_labelfgcolor** (void) const
- Get the default label foreground color used for creating new items.*

  - Fl\_Font **item\_labelfont** () const
- Get the default font face used for creating new items.*

  - void **item\_labelfont** (Fl\_Font val)
- Set the default font face used for creating new items.*

  - Fl\_Fonsize **item\_labelsize** () const
- Get the default label fontsize used for creating new items.*

  - void **item\_labelsize** (Fl\_Fonsize val)
- Set the default label font size used for creating new items.*

  - int **item\_pathname** (char \*pathname, int pathnamelen, const Fl\_Tree\_Item \*item) const
- Return 'pathname' of size 'pathnamelen' for the specified 'item'.*

  - Fl\_Tree\_Item\_Reselect\_Mode **item\_reselect\_mode** () const
- Returns the current item re/selection mode.*

  - void **item\_reselect\_mode** (Fl\_Tree\_Item\_Reselect\_Mode mode)
- Sets the item re/selection mode.*

  - int **labelmarginleft** () const
- Get the amount of white space (in pixels) that should appear to the left of the label text.*

  - void **labelmarginleft** (int val)
- Set the amount of white space (in pixels) that should appear to the left of the label text.*

  - Fl\_Tree\_Item \* **last** ()
- Returns the last item in the tree.*

  - Fl\_Tree\_Item \* **last\_selected\_item** ()
- Returns the last selected item in the tree.*

  - Fl\_Tree\_Item \* **last\_visible** ()
- Returns the last [open\(\)](#), visible item in the tree.*

  - Fl\_Tree\_Item \* **last\_visible\_item** ()
- Returns the last [open\(\)](#), visible item in the tree.*

  - int **linespacing** () const
- Get the amount of white space (in pixels) that should appear between items in the tree.*

  - void **linespacing** (int val)
- Sets the amount of white space (in pixels) that should appear between items in the tree.*

- void **load** (class [Fl\\_Preferences](#) &)  
*Load FLTK preferences.*
- int **marginbottom** () const  
*Get the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.*
- void **marginbottom** (int val)  
*Sets the amount of white space (in pixels) that should appear below the last visible item when the vertical scroller is scrolled to the bottom.*
- int **marginleft** () const  
*Get the amount of white space (in pixels) that should appear between the widget's left border and the tree's contents.*
- void **marginleft** (int val)  
*Set the amount of white space (in pixels) that should appear between the widget's left border and the left side of the tree's contents.*
- int **margin** () const  
*Get the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.*
- void **margin** (int val)  
*Sets the amount of white space (in pixels) that should appear between the widget's top border and the top of the tree's contents.*
- [Fl\\_Tree\\_Item](#) \* **next** ([Fl\\_Tree\\_Item](#) \*item=0)  
*Return the next item after 'item', or 0 if no more items.*
- [Fl\\_Tree\\_Item](#) \* **next\_item** ([Fl\\_Tree\\_Item](#) \*item, int dir=[FL\\_Down](#), bool visible=false)  
*Returns next item after 'item' in direction 'dir' depending on 'visible'.*
- [Fl\\_Tree\\_Item](#) \* **next\_selected\_item** ([Fl\\_Tree\\_Item](#) \*item=0, int dir=[FL\\_Down](#))  
*Returns the next selected item above or below 'item', depending on 'dir'.*
- [Fl\\_Tree\\_Item](#) \* **next\_visible\_item** ([Fl\\_Tree\\_Item](#) \*start, int dir)  
*Returns next [open\(\)](#), visible item above (dir==[FL\\_Up](#)) or below (dir==[FL\\_Down](#)) the specified 'item', or 0 if no more items.*
- int **open** (const char \*path, int docallback=1)  
*Opens the item specified by 'path'.*
- int **open** ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)  
*Open the specified 'item'.*
- void **open\_toggle** ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)  
*Toggle the open state of 'item'.*
- int **openchild\_marginbottom** () const  
*Get the amount of white space (in pixels) that should appear below an open child tree's contents.*
- void **openchild\_marginbottom** (int val)  
*Set the amount of white space (in pixels) that should appear below an open child tree's contents.*
- [Fl\\_Image](#) \* **openicon** () const  
*Returns the icon to be used as the 'open' icon.*
- void **openicon** ([Fl\\_Image](#) \*val)  
*Sets the icon to be used as the 'open' icon.*
- const [Fl\\_Tree\\_Prefs](#) & **prefs** () const
- [Fl\\_Tree\\_Item](#) \* **prev** ([Fl\\_Tree\\_Item](#) \*item=0)  
*Return the previous item before 'item', or 0 if no more items.*
- void **recalc\_tree** ()  
*Schedule tree to recalc the entire tree size.*
- int **remove** ([Fl\\_Tree\\_Item](#) \*item)  
*Remove the specified 'item' from the tree.*
- void **resize** (int, int, int, int) override  
*Resizes the [Fl\\_Group](#) widget and all of its children.*
- [Fl\\_Tree\\_Item](#) \* **root** ()

- Returns the root item.*
- void [root](#) ([Fl\\_Tree\\_Item](#) \*newitem)
  - Sets the root item to 'newitem'.*
- void [root\\_label](#) (const char \*new\_label)
  - Set the label for the root item to 'new\_label'.*
- int [scrollbar\\_size](#) () const
  - Gets the default size of scrollbars' troughs for this widget in pixels.*
- void [scrollbar\\_size](#) (int size)
  - Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.*
- int [select](#) (const char \*path, int docallback=1)
  - Select the item specified by 'path'.*
- int [select](#) ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)
  - Select the specified 'item'.*
- int [select\\_all](#) ([Fl\\_Tree\\_Item](#) \*item=0, int docallback=1)
  - Select 'item' and all its children.*
- int [select\\_only](#) ([Fl\\_Tree\\_Item](#) \*selitem, int docallback=1)
  - Select only the specified item, deselecting all others that might be selected.*
- void [select\\_toggle](#) ([Fl\\_Tree\\_Item](#) \*item, int docallback=1)
  - Toggle the select state of the specified 'item'.*
- [Fl\\_Boxtype](#) [selectbox](#) () const
  - Sets the style of box used to draw selected items.*
- void [selectbox](#) ([Fl\\_Boxtype](#) val)
  - Gets the style of box used to draw selected items.*
- [Fl\\_Tree\\_Select](#) [selectmode](#) () const
  - Gets the tree's current selection mode.*
- void [selectmode](#) ([Fl\\_Tree\\_Select](#) val)
  - Sets the tree's selection mode.*
- void [set\\_item\\_focus](#) ([Fl\\_Tree\\_Item](#) \*item)
  - Set the item that currently should have keyboard focus.*
- void [show\\_item](#) ([Fl\\_Tree\\_Item](#) \*item)
  - Adjust the vertical scrollbar to show 'item' at the top of the display IF it is currently off-screen (for instance [show\\_item\\_top\(\)](#)).*
- void [show\\_item](#) ([Fl\\_Tree\\_Item](#) \*item, int yoff)
  - Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the [Fl\\_Tree](#) widget's display.*
- void [show\\_item\\_bottom](#) ([Fl\\_Tree\\_Item](#) \*item)
  - Adjust the vertical scrollbar so that 'item' is at the bottom of the display.*
- void [show\\_item\\_middle](#) ([Fl\\_Tree\\_Item](#) \*item)
  - Adjust the vertical scrollbar so that 'item' is in the middle of the display.*
- void [show\\_item\\_top](#) ([Fl\\_Tree\\_Item](#) \*item)
  - Adjust the vertical scrollbar so that 'item' is at the top of the display.*
- void [show\\_self](#) ()
  - Print the tree as 'ascii art' to stdout.*
- int [showcollapse](#) () const
  - Returns 1 if the collapse icon is enabled, 0 if not.*
- void [showcollapse](#) (int val)
  - Set if we should show the collapse icon or not.*
- int [showroot](#) () const
  - Returns 1 if the root item is to be shown, or 0 if not.*
- void [showroot](#) (int val)
  - Set if the root item should be shown or not.*
- [Fl\\_Tree\\_Sort](#) [sortorder](#) () const

- Set the default sort order used when items are added to the tree.*

  - void **sortorder** ([FL\\_Tree\\_Sort](#) val)

*Gets the sort order used to add items to the tree.*
- [FL\\_Image](#) \* **usericon** () const

*Returns the [FL\\_Image](#) being used as the default user icon for all newly created items.*
- void **usericon** ([FL\\_Image](#) \*val)

*Sets the [FL\\_Image](#) to be used as the default user icon for all newly created items.*
- int **usericonmarginleft** () const

*Get the amount of white space (in pixels) that should appear to the left of the usericon.*
- void **usericonmarginleft** (int val)

*Set the amount of white space (in pixels) that should appear to the left of the usericon.*
- int **vposition** () const

*Returns the vertical scroll position as a pixel offset.*
- void **vposition** (int pos)

*Sets the vertical scroll offset to position 'pos'.*
- int **widgetmarginleft** () const

*Get the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).*
- void **widgetmarginleft** (int val)

*Set the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).*
- ~[FL\\_Tree](#) ()

*Destructor.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*& **\_ddfdesign\_kludge** ()

*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)

*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)

*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)

*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const

*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override

*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()

*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const

*Returns the n'th child.*
- int **children** () const

*Returns how many child widgets the group has.*
- void **clear** ()

*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const

*Returns the current clipping mode.*
- void **clip\_children** (int c)

*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)

*Removes the widget at *index* from the group and deletes it.*

- void **end** ()  
*Exactly the same as current(this->parent()).*
- int **find** (const FL\_Widget &o) const  
*See int FL\_Group::find(const FL\_Widget \*w) const.*
- int **find** (const FL\_Widget \*) const  
*Searches the children for the widget and returns the index.*
- FL\_Group (int, int, int, int, const char \*s=0)  
*Creates a new FL\_Group widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** (FL\_Widget &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** (FL\_Widget &o, FL\_Widget \*before)  
*This does insert(w, find(before)).*
- void **remove** (FL\_Widget &)  
*Removes a widget from the group but does not delete it.*
- void **remove** (FL\_Widget \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at index from the group but does not delete it.*
- FL\_Widget \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (FL\_Widget &o)  
*Sets the group's resizable widget.*
- void **resizable** (FL\_Widget \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual ~FL\_Group ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from FL\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- FL\_Align **align** () const  
*Gets the label alignment.*
- void **align** (FL\_Align alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class FL\_Gl\_Window \* **as\_gl\_window** ()  
*Returns an FL\_Gl\_Window pointer if this widget is an FL\_Gl\_Window.*

- virtual class [FI\\_GL\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FI\\_Window](#) \* **as\_window** ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) **box** () const  
*Gets the box type of the widget.*
- void **box** ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) **callback** () const  
*Gets the current callback function for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void **callback** ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void **callback** ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int **changed** () const  
*Checks if the widget value changed since the last callback.*
- void **clear\_active** ()  
*Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()  
*Marks the value of the widget as unchanged.*
- void **clear\_damage** (uchar c=0)  
*Clears or sets the damage flags.*
- void **clear\_output** ()  
*Sets a widget to accept input.*
- void **clear\_visible** ()  
*Hides the widget.*
- void **clear\_visible\_focus** ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) **color** () const  
*Gets the background color of the widget.*
- void **color** ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void **color** ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int **contains** (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void **copy\_label** (const char \*new\_label)

- Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)
  - Sets the current tooltip text.*
- [uchar damage](#) () const
  - Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)
  - Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)
  - Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)
  - Internal use only.*
- void [deactivate](#) ()
  - Deactivates the widget.*
- [Fl\\_Image \\* deimage](#) ()
  - Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image \\* deimage](#) () const
  - Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const
  - Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, long arg, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*arg=0, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [Fl\\_Align](#)) const
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
  - Gets the widget height.*
- virtual void [hide](#) ()
  - Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()
  - Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)
  - Set the spacing between the label and the horizontal edge of the widget.*
- [Fl\\_Image \\* image](#) ()
  - Gets the image that is used as part of the widget label when in the active state.*
- const [Fl\\_Image \\* image](#) () const
  - Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) &img)
  - Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const
  - Returns whether the image is managed by the widget.*
- int [inside](#) (const [Fl\\_Widget](#) \*wgt) const
  - Checks if this widget is a child of wgt.*

- `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`  
*Gets the current label text.*
- `void label (const char *text)`  
*Sets the current label pointer.*
- `void label (FI_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*
- `FI_Color labelcolor () const`  
*Gets the label color.*
- `void labelcolor (FI_Color c)`  
*Sets the label color.*
- `FI_Font labelfont () const`  
*Gets the font to use.*
- `void labelfont (FI_Font f)`  
*Sets the font to use.*
- `FI_Fonsize labelsz () const`  
*Gets the font size in pixels.*
- `void labelsz (FI_Fonsize pix)`  
*Sets the font size in pixels.*
- `FI_Labeltype labeltype () const`  
*Gets the label type.*
- `void labeltype (FI_Labeltype a)`  
*Sets the label type.*
- `void measure_label (int &ww, int &hh) const`  
*Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`  
*Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`  
*Sets whether this widget needs a keyboard.*
- `unsigned int output () const`  
*Returns if a widget is used for output only.*
- `FI_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (FI_Group *p)`  
*Internal use only - "for hacks only".*
- `void position (int X, int Y)`  
*Repositions the window or widget.*
- `void redraw ()`  
*Schedules the drawing of the widget.*
- `void redraw_label ()`  
*Schedules the drawing of the label.*
- `FI_Color selection_color () const`  
*Gets the selection color.*
- `void selection_color (FI_Color a)`  
*Sets the selection color.*
- `int send (int event)`

- Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) type () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*

- unsigned int `visible_focus` () const  
*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `Fl_When` when () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()  
*Destroys the widget.*

### Protected Member Functions

- void `do_callback_for_item` (`Fl_Tree_Item` \*item, `Fl_Tree_Reason` reason)  
*Do the callback for the specified 'item' using 'reason', setting the `callback_item()` and `callback_reason()`.*
- void `draw` () override  
*Standard FLTK `draw()` method, handles drawing the tree widget.*
- void `item_clicked` (`Fl_Tree_Item` \*val)  
*Set the item that was last clicked.*

### Protected Member Functions inherited from `Fl_Group`

- `Fl_Rect` \* `bounds` ()  
*Returns the internal array of widget sizes and positions.*
- void `draw_child` (`Fl_Widget` &widget) const  
*Forces a child to redraw.*
- void `draw_children` ()  
*Draws all children of the group.*
- void `draw_outside_label` (const `Fl_Widget` &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int `on_insert` (`Fl_Widget` \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int `on_move` (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void `on_remove` (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* `sizes` ()  
*Returns the internal array of widget sizes and positions.*
- void `update_child` (`Fl_Widget` &widget) const  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from [Fl\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

## Protected Attributes

- [Fl\\_Scrollbar](#) \* **\_hscroll**

## 13.145.1 Detailed Description

Tree widget.

Figure 13.62 Fl\_Tree example program

```

Fl_Tree // Top level widget
|--- Fl_Tree_Item // Items in the tree
|--- Fl_Tree_Prefs // Preferences for the tree
| |--- Fl_Tree_Connector (enum) // Connection modes
| |--- Fl_Tree_Select (enum) // Selection modes
| |--- Fl_Tree_Sort (enum) // Sort behavior

```

Similar to [Fl\\_Browser](#), [Fl\\_Tree](#) is a browser of [Fl\\_Tree\\_Item](#)'s arranged in a parented hierarchy, or 'tree'. Subtrees can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered.

The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.

The [callback\(\)](#) is invoked depending on the value of [when\(\)](#):

- [FL\\_WHEN\\_RELEASE](#) – callback invoked when left mouse button is released on an item
- [FL\\_WHEN\\_CHANGED](#) – callback invoked when left mouse changes selection state

The simple way to define a tree:

```

#include <FL/Fl_Tree.H>
[...]
Fl_Tree tree(X,Y,W,H);
tree.begin();
 tree.add("Flintstones/Fred");
 tree.add("Flintstones/Wilma");
 tree.add("Flintstones/Pebbles");
 tree.add("Simpsons/Homer");
 tree.add("Simpsons/Marge");
 tree.add("Simpsons/Bart");
 tree.add("Simpsons/Lisa");
tree.end();

```

## FEATURES

Items can be added with [add\(\)](#),  
 removed with [remove\(\)](#),  
 completely cleared with [clear\(\)](#),  
 inserted with [insert\(\)](#) and [insert\\_above\(\)](#),  
 selected/deselected with [select\(\)](#) and [deselect\(\)](#),  
 open/closed with [open\(\)](#) and [close\(\)](#),  
 positioned on the screen with [show\\_item\\_top\(\)](#), [show\\_item\\_middle\(\)](#) and [show\\_item\\_bottom\(\)](#),  
 item children can be swapped around with [Fl\\_Tree\\_Item::swap\\_children\(\)](#),  
 items can be moved around with [Fl\\_Tree\\_Item::move\(\)](#),  
 an item's children can be walked with [Fl\\_Tree\\_Item::first\(\)](#) and [Fl\\_Tree\\_Item::next\(\)](#), an item's children can be indexed directly with [Fl\\_Tree\\_Item::child\(\)](#) and [Fl\\_Tree\\_Item::children\(\)](#),  
 items can be moved from one subtree to another with [Fl\\_Tree\\_Item::deparent\(\)](#) and [Fl\\_Tree\\_Item::reparent\(\)](#),  
 sorting can be controlled when items are [add\(\)](#)ed via [sortorder\(\)](#).  
 You can walk the entire tree with [first\(\)](#) and [next\(\)](#).  
 You can walk visible items with [first\\_visible\\_item\(\)](#) and [next\\_visible\\_item\(\)](#).  
 You can walk selected items with [first\\_selected\\_item\(\)](#) and [next\\_selected\\_item\(\)](#).  
 Items can be found by their pathname using [find\\_item\(const char\\*\)](#), and an item's pathname can be found

with [item\\_pathname\(\)](#).

The selected items' colors are controlled by [selection\\_color\(\)](#) (inherited from [Fl\\_Widget](#)).

A hook is provided to allow you to redefine how item's labels are drawn via [Fl\\_Tree::item\\_draw\\_callback\(\)](#).

Items can be interactively dragged using [FL\\_TREE\\_SELECT\\_SINGLE\\_DRAGGABLE](#).

## SELECTION OF ITEMS

The tree can have different selection behaviors controlled by [selectmode\(\)](#). The background color used for selected items is the [Fl\\_Tree::selection\\_color\(\)](#). The foreground color for selected items is controlled internally with [fl\\_contrast\(\)](#).

## CHILD WIDGETS

FLTK widgets (including custom widgets) can be assigned to tree items via [Fl\\_Tree\\_Item::widget\(\)](#).

When an [Fl\\_Tree\\_Item::widget\(\)](#) is defined, the default behavior is for the widget() to be shown in place of the item's label (if it has one). Only the widget()'s width will be used; the widget()'s [x\(\)](#) and [y\(\)](#) position will be managed by the tree, and the [h\(\)](#) will track the item's height. This default behavior can be altered (ABI 1.3.1): Setting [Fl\\_Tree::item\\_draw\\_mode\(\)](#)'s [FL\\_TREE\\_ITEM\\_DRAW\\_LABEL\\_AND\\_WIDGET](#) flag causes the label + widget to be displayed together in that order, and adding the [FL\\_TREE\\_ITEM\\_HEIGHT\\_FROM\\_WIDGET](#) flag causes widget's height to define the widget()'s height.

## ICONS

The tree's open/close icons can be redefined with [Fl\\_Tree::openicon\(\)](#), [Fl\\_Tree::closeicon\(\)](#). User icons can either be changed globally with [Fl\\_Tree::usericon\(\)](#), or on a per-item basis with [Fl\\_Tree\\_Item::usericon\(\)](#).

Various default preferences can be globally manipulated via [Fl\\_Tree\\_Prefs](#), including colors, margins, icons, connection lines, etc.

## FONTS AND COLORS

When adding new items to the tree, the new items get the defaults for fonts and colors from:

- [Fl\\_Tree::item\\_labelfont\(\)](#) – The default item label font (default: [FL\\_HELVETICA](#))
- [Fl\\_Tree::item\\_labelsize\(\)](#) – The default item label size (default: [FL\\_NORMAL\\_SIZE](#))
- [Fl\\_Tree::item\\_labelfgcolor\(\)](#) – The default item label foreground color (default: [FL\\_FOREGROUND\\_COLOR](#))
- [Fl\\_Tree::item\\_labelbgcolor\(\)](#) – The default item label background color (default: 0xffffffff, which tree uses as 'transparent')

Each item ([Fl\\_Tree\\_Item](#)) inherits a copy of these font/color attributes when created, and each item has its own methods to let the app change these values on a per-item basis using methods of the same name:

- [Fl\\_Tree\\_Item::labelfont\(\)](#) – The item's label font (default: [FL\\_HELVETICA](#))
- [Fl\\_Tree\\_Item::labelsize\(\)](#) – The item's label size (default: [FL\\_NORMAL\\_SIZE](#))
- [Fl\\_Tree\\_Item::labelfgcolor\(\)](#) – The item's label foreground color (default: [FL\\_FOREGROUND\\_COLOR](#))
- [Fl\\_Tree\\_Item::labelbgcolor\(\)](#) – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

## CALLBACKS

The tree's `callback()` will be invoked when items change state or are open/closed. `when()` controls when mouse/keyboard events invoke the callback. `callback_item()` and `callback_reason()` can be used to determine the cause of the callback. e.g.

```
void MyTreeCallback(Fl_Widget *w, void *data) {
 Fl_Tree *tree = (Fl_Tree*)w;
 Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item(); // get selected item
 switch (tree->callback_reason()) {
 case FL_TREE_REASON_SELECTED: [...]
 case FL_TREE_REASON_DESELECTED: [...]
 case FL_TREE_REASON_RESELECTED: [...]
 case FL_TREE_REASON_OPENED: [...]
 case FL_TREE_REASON_CLOSED: [...]
 }
 :
}
```

## SIMPLE EXAMPLES

To find all the selected items:

```
for (Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i))
 printf("Item %s is selected\n", i->label());
```

To get an item's full menu pathname, use `Fl_Tree::item_pathname()`, e.g.

```
[...]
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item); // eg. "Parent/Child/Item"
[...]
```

To walk all the items of the tree from top to bottom:

```
// Walk all the items in the tree, and print their labels
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item)) {
 printf("Item: %s\n", item->label());
}
```

To recursively walk all the children of a particular item, define a function that uses recursion:

```
// Find all of the item's children and print an indented report of their labels
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
 for (int t=0; t<item->children(); t++) {
 printf("%*s Item: %s\n", indent, "", item->child(t)->label());
 my_print_all_children(item->child(t), indent+4); // recurse
 }
}
```

To change the default label font and color when creating new items:

```
tree = new Fl_Tree(..);
tree->item_labelfont(FL_COURIER); // Use Courier font for all new items
tree->item_labelbgcolor(FL_RED); // Use red color for labels of all new items
[...]
```

// Now create the items in the tree using the above defaults.

```
tree->add("Aaa");
tree->add("Bbb");
```

To change the font and color of all existing items in the tree:

```
// Change the font and color of all items currently in the tree
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item)) {
 item->labelfont(FL_COURIER);
 item->labelcolor(FL_RED);
}
```

## DISPLAY DESCRIPTION

The following image shows the tree's various visual elements and the methods that control them:

Figure 13.63 Fl\_Tree elements

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

Figure 13.64 Fl\_Tree inner/outer dimensions

## KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:

Keyboard	FL_TREE_SELECT↵ _MULTI	FL_TREE_SELECT↵ _SINGLE	FL_TREE_SELECT↵ _NONE
----------	---------------------------	----------------------------	--------------------------

Keyboard	FL_TREE_SELECT↵ _MULTI	FL_TREE_SELECT↵ _SINGLE	FL_TREE_SELECT↵ _NONE
Ctrl-A (Linux/Windows)	Select all items	N/A	N/A
Command-A (Mac)	Select all items	N/A	N/A
Space	Selects item	Selects item	N/A
Ctrl-Space	Toggle item	Toggle item	N/A
Shift-Space	Extends selection	Selects item	N/A
Enter	Toggles open/close	Toggles open/close	Toggles open/close
Ctrl-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Shift-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Right / Left	Open/Close item	Open/Close item	Open/Close item
Up / Down	Move focus box up/down	Move focus box up/down	N/A
Shift-Up / Shift-Down	Extend selection up/down	Move focus up/down	N/A
Home / End	Move to top/bottom of tree	Move to top/bottom of tree	Move to top/bottom of tree
PageUp / PageDown	Page up/down	Page up/down	Page up/down

## 13.145.2 Member Function Documentation

### 13.145.2.1 add() [1/2]

```
Fl_Tree_Item * Fl_Tree::add (
 const char * path,
 Fl_Tree_Item * item = 0)
```

Adds a new item, given a menu style 'path'.

Any parent nodes that don't already exist are created automatically. Adds the item based on the value of [sortorder\(\)](#).

If 'item' is NULL, a new item is created.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010"); // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp"); // Adds item "c:\Program Files\MyApp"
:
```

#### Parameters

in	<i>path</i>	The path to the item, e.g. "Flintstone/Fred".
in	<i>item</i>	The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'.

#### Returns

The new item added, or 0 on error.

#### Version

1.3.3

**13.145.2.2 add()** [2/2]

```
Fl_Tree_Item * Fl_Tree::add (
 Fl_Tree_Item * parent_item,
 const char * name)
```

Add a new child item labeled 'name' to the specified 'parent\_item'.

**Parameters**

in	<i>parent_item</i>	The parent item the new child item will be added to. Must not be NULL.
in	<i>name</i>	The label for the new item

**Returns**

The new item added.

**Version**

1.3.0 release

**13.145.2.3 auto\_resize\_children()** [1/2]

```
int Fl_Tree::auto_resize_children () [inline]
```

Returns whether auto resizing of children is active.

**Returns**

0 (auto resizing **off**) or 1 ( **on**)

**Since**

1.5.0

**See also**

void [auto\\_resize\\_children\(int mode\)](#) for details

**13.145.2.4 auto\_resize\_children()** [2/2]

```
void Fl_Tree::auto_resize_children (
 int mode) [inline]
```

Set mode to resize children when the [Fl\\_Tree](#) container widget is resized.

The default value is `false`, meaning that child widgets within [Fl\\_Tree](#) widgets are not automatically resized.

This default behavior was changed in version 1.5.0 because resizing children automatically led to unpredictable behavior depending on their positions and sizes. This was caused by using the default resizing mechanism, [Fl\\_Group::resize\(\)](#), and was fixed in version 1.5.0 by disabling automatic resizing of children.

This method can be used to restore the 1.4.x behavior to resize children automatically for backwards compatibility by calling `Fl_Tree::auto_resize_children(1)`. See example below.

**Note:** use with care and only if required for strict backwards compatibility. The resulting resize behavior can be *surprising*. If your development target is FLTK 1.4 or lower you can't use this method (you may include it inside conditional compilation for FLTK 1.5 and higher).

Example code for strict backwards compatibility to 1.4.x or lower:

```
#include <FL/Fl_Tree.H>
Fl_Tree *tree = new Fl_Tree(0, 0, 400, 400);
#if FL_API_VERSION >= 10500
 tree->auto_resize_children(1);
#endif
```

**Parameters**

in	<i>mode</i>	enable auto resizing if true (non-zero)
----	-------------	-----------------------------------------

Since

1.5.0

See also

int [auto\\_resize\\_children\(\)](#)

### 13.145.2.5 calc\_dimensions()

```
void Fl_Tree::calc_dimensions ()
```

Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data.

Assumes that either the tree's size in `_tree_w/_tree_h` are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet.

This method is called when the widget is [resize\(\)](#)ed or if the scrollbar's sizes are changed (affects tree widget's inner dimensions `tix/y/w/h`), and also used by [calc\\_tree\(\)](#).

Version

1.3.3 ABI feature

### 13.145.2.6 calc\_tree()

```
void Fl_Tree::calc_tree ()
```

Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

On return:

- `_tree_w` will be the overall pixel width of the entire viewable tree
- `_tree_h` will be the overall pixel height ""
- scrollbar visibility and pan sizes are updated
- internal `_tix/_tiy/_tiw/_tih` dimensions are updated

`_tree_w/_tree_h` include the tree's margins (e.g. [marginleft\(\)](#)), whether items are open or closed, label contents and font sizes, etc.

The tree hierarchy's size is managed separately from the widget's size as an optimization; this way [resize\(\)](#) on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.

The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.

This calculation involves walking the *entire* tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly.

For this reason, [recalc\\_tree\(\)](#) is used as a way to /schedule/ calculation when changes affect the tree hierarchy's size.

Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recalc) occurs. (This use by an app should only rarely be needed)

### 13.145.2.7 callback\_item() [1/2]

```
Fl_Tree_Item * Fl_Tree::callback_item ()
```

Gets the item that caused the callback.

The [callback\(\)](#) can use this value to see which item changed.

### 13.145.2.8 callback\_item() [2/2]

```
void Fl_Tree::callback_item (
 Fl_Tree_Item * item)
```

Sets the item that was changed for this callback.

Used internally to pass the item that invoked the callback.

**13.145.2.9 callback\_reason()** [1/2]

`Fl_Tree_Reason` `Fl_Tree::callback_reason ( )` const

Gets the reason for this callback.

The [callback\(\)](#) can use this value to see why it was called. Example:

```

:
void MyTreeCallback(Fl_Widget *w, void *userdata) {
 Fl_Tree *tree = (Fl_Tree*)w;
 Fl_Tree_Item *item = tree->callback_item(); // the item changed (can be NULL if more than one
 item was changed!)
 switch (tree->callback_reason()) { // reason callback was invoked
 case FL_TREE_REASON_OPENED: ..item was opened..
 case FL_TREE_REASON_CLOSED: ..item was closed..
 case FL_TREE_REASON_SELECTED: ..item was selected..
 case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
 case FL_TREE_REASON_DESELECTED: ..item was deselected..
 }
}
:

```

See also

[item\\_reselect\\_mode\(\)](#) – enables `FL_TREE_REASON_RESELECTED` events

**13.145.2.10 callback\_reason()** [2/2]

`void` `Fl_Tree::callback_reason (`  
     `Fl_Tree_Reason` *reason* `)`

Sets the reason for this callback.

Used internally to pass the reason the callback was invoked.

**13.145.2.11 clear()**

`void` `Fl_Tree::clear (`  
     `void` `)`

Clear the entire tree's children, including the root.

The tree will be left completely empty.

**13.145.2.12 clear\_children()**

`void` `Fl_Tree::clear_children (`  
     `Fl_Tree_Item` \* *item* `)`

Clear all the children for '*item*'.

Item may not be NULL.

**13.145.2.13 close()** [1/2]

`int` `Fl_Tree::close (`  
     const char \* *path*,  
     int *docalback* = 1 `)`

Closes the item specified by '*path*'.

Invokes the callback depending on the value of optional parameter '*docalback*'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `close("Holidays/12\25\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------

## Parameters

in	<i>docalcallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - <a href="#">callback()</a> is not invoked     • 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_CLOSED
----	----------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Returns

- 1 – OK: item closed
- 0 – OK: item was already closed, no change
- -1 – ERROR: item was not found

## See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**13.145.2.14 close()** [2/2]

```
int Fl_Tree::close (
 Fl_Tree_Item * item,
 int docalcallback = 1)
```

Closes the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docalcallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be closed. Must not be NULL.
in	<i>docalcallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - <a href="#">callback()</a> is not invoked     • 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_CLOSED

## Returns

- 1 – item was closed
- 0 – item was already closed, no change

## See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

**13.145.2.15 closeicon()** [1/2]

```
Fl_Image * Fl_Tree::closeicon () const
```

Returns the icon to be used as the 'close' icon.

If none was set, the internal default is returned, a simple '[-]' icon.

**13.145.2.16 closeicon()** [2/2]

```
void Fl_Tree::closeicon (
 Fl_Image * val)
```

Sets the icon to be used as the 'close' icon.  
This overrides the built in default '[-]' icon.

**Parameters**

in	val	– The new image, or zero to use the default '[-]' icon.
----	-----	---------------------------------------------------------

**13.145.2.17 connectorstyle()**

```
void Fl_Tree::connectorstyle (
 Fl_Tree_Connector val)
```

Sets the line drawing style for inter-connecting items.  
See [Fl\\_Tree\\_Connector](#) for possible values.

**13.145.2.18 deselect()** [1/2]

```
int Fl_Tree::deselect (
 const char * path,
 int docallback = 1)
```

Deselect an item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `deselect("← Holidays/12\\25\\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	path	– the tree item's pathname (e.g. "Flintstones/Fred")
in	docallback	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked if item changed state (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_DESELECTED</code>

**Returns**

- 1 - OK: item's state was changed
- 0 - OK: item was already deselected, no change was made
- -1 - ERROR: item was not found

**13.145.2.19 deselect()** [2/2]

```
int Fl_Tree::deselect (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Deselect the specified item.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	– the item to be deselected. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked if item changed state (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_DESELECTED

## Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

**13.145.2.20** `deselect_all()`

```
int Fl_Tree::deselect_all (
 Fl_Tree_Item * item = 0,
 int docallback = 1)
```

Deselect 'item' and all its children.

If item is NULL, [first\(\)](#) is used.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

## Parameters

in	<i>item</i>	The item that will be deselected (along with all its children). If NULL, <a href="#">first()</a> is used.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked for each item that changed state (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_DESELECTED

## Returns

Count of how many items were actually changed to the deselected state.

**13.145.2.21** `display()`

```
void Fl_Tree::display (
 Fl_Tree_Item * item)
```

Displays 'item', scrolling the tree as necessary.

## Parameters

in	<i>item</i>	The item to be displayed. If NULL, <a href="#">first()</a> is used.
----	-------------	---------------------------------------------------------------------

**13.145.2.22** `displayed()`

```
int Fl_Tree::displayed (
 Fl_Tree_Item * item)
```

See if 'item' is currently displayed on-screen (visible within the widget).

This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)](#) / [show\(\)](#) or [open\(\)](#) / [close\(\)](#) status of the item.

#### Parameters

in	<i>item</i>	The item to be checked. If NULL, <a href="#">first()</a> is used.
----	-------------	-------------------------------------------------------------------

#### Returns

1 if displayed, 0 if scrolled off screen or no items are in tree.

### 13.145.2.23 draw()

```
void Fl_Tree::draw (
 void) [override], [protected], [virtual]
```

Standard FLTK [draw\(\)](#) method, handles drawing the tree widget.

Reimplemented from [Fl\\_Group](#).

### 13.145.2.24 extend\_selection()

```
int Fl_Tree::extend_selection (
 Fl_Tree_Item * from,
 Fl_Tree_Item * to,
 int val = 1,
 bool visible = false)
```

Extend a selection between 'from' and 'to' depending on 'visible'.

Similar to the more efficient [extend\\_selection\\_dir\(Fl\\_Tree\\_Item\\*,Fl\\_Tree\\_Item\\*,int dir,int val,bool vis\)](#) method, but direction (up or down) doesn't need to be known.

We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient method avoids the "search", but necessitates a direction to be specified to find 'to'.

Used by SHIFT-click to extend a selection between two items inclusive.

Handles calling [redraw\(\)](#) if anything changed.

#### Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>val</i>	Select or deselect items (0=deselect, 1=select, 2=toggle)
in	<i>visible</i>	true=affect only <a href="#">open()</a> , visible items, false=affect open or closed items (default)

#### Returns

The number of items whose selection states were changed, if any.

#### Version

1.3.3 ABI feature

### 13.145.2.25 extend\_selection\_dir()

```
int Fl_Tree::extend_selection_dir (
 Fl_Tree_Item * from,
 Fl_Tree_Item * to,
```

```

 int dir,
 int val,
 bool visible)

```

Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

Efficient: does not walk entire tree; starts with 'from' and stops at 'to' while moving in direction 'dir'. Dir must be specified though.

If dir cannot be known in advance, such as during SHIFT-click operations, the method [extend\\_selection\(Fl\\_Tree\\_Item\\*,Fl\\_Tree\\_Item\\*,int\)](#) should be used.

Handles calling [redraw\(\)](#) if anything changed.

#### Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>dir</i>	Direction to extend selection (FL_Up or FL_Down)
in	<i>val</i>	0=deselect, 1=select, 2=toggle
in	<i>visible</i>	true=affect only <a href="#">open()</a> , visible items, false=affect open or closed items (default)

#### Returns

The number of items whose selection states were changed, if any.

#### Version

1.3.3

#### 13.145.2.26 find\_clicked()

```

const Fl_Tree_Item * Fl_Tree::find_clicked (
 int yonly = 0) const

```

Find the item that was last clicked on.

You should use [callback\\_item\(\)](#) instead, which is fast, and is meant to be used within a callback to determine the item clicked.

This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)

Use this method /only/ if you've subclassed [Fl\\_Tree](#), and are receiving events before [Fl\\_Tree](#) has been able to process and update [callback\\_item\(\)](#).

#### Parameters

in	<i>yonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.
----	--------------	----------------------------------------------------------------------------------------------

#### Returns

The item clicked, or NULL if no item was under the current event.

#### Version

1.3.0

1.3.3 ABI feature: added yonly parameter

#### 13.145.2.27 find\_item()

```

const Fl_Tree_Item * Fl_Tree::find_item (
 const char * path) const

```

Find the item, given a menu style path, e.g.

"/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010"); // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp"); // Adds item "c:\Program Files\MyApp"
:
```

#### Parameters

in	<i>path</i>	– the tree item's pathname to be found (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------------------

#### Returns

The item, or NULL if not found.

#### See also

[item\\_pathname\(\)](#)

#### 13.145.2.28 first()

```
Fl_Tree_Item * Fl_Tree::first ()
```

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```
:
for (Fl_Tree_Item *item = tree->first(); item; item = tree->next(item))
 printf("Item: %s\n", item->label());
:
```

#### Returns

First item in tree, or 0 if none (tree empty).

#### See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

#### 13.145.2.29 first\_selected\_item()

```
Fl_Tree_Item * Fl_Tree::first_selected_item ()
```

Returns the first selected item in the tree.

Use this to walk the tree from top to bottom looking for all the selected items, e.g.

```
:
// Walk tree forward, from top to bottom
for (Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i))
 printf("Selected item: %s\n", i->label());
:
```

#### Returns

The first selected item, or 0 if none.

#### See also

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**13.145.2.30 first\_visible()**

```
Fl_Tree_Item * Fl_Tree::first_visible ()
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

**Deprecated** in 1.3.3 ABI – use [first\\_visible\\_item\(\)](#) instead.

**13.145.2.31 first\_visible\_item()**

```
Fl_Tree_Item * Fl_Tree::first_visible_item ()
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

**Returns**

First visible item in tree, or 0 if none.

**See also**

[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#)

**Version**

1.3.3

**13.145.2.32 get\_selected\_items()**

```
int Fl_Tree::get_selected_items (
 Fl_Tree_Item_Array & ret_items)
```

Returns the currently selected items as an array of 'ret\_items'.

Example:

```

:
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for (int t=0; t<items.total(); t++) {
 Fl_Tree_Item &item = items[t];
 ..do stuff with each selected item..
}
:
```

**Parameters**

out	<i>ret_items</i>	The returned array of selected items.
-----	------------------	---------------------------------------

**Returns**

The number of items in the returned array.

**See also**

[first\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**Version**

1.3.3 ABI feature

**13.145.2.33 handle()**

```
int Fl_Tree::handle (
 int e) [override], [virtual]
```

Standard FLTK event handler for this widget.

**Todo** add [Fl\\_Widget\\_Tracker](#) (see `Fl_Browser_.cxx::handle()`)

Reimplemented from [Fl\\_Group](#).

### 13.145.2.34 `hposition()` [1/2]

```
int Fl_Tree::hposition () const
```

Returns the horizontal scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the left edge of the screen.

See also

[hposition\(int\)](#), [vposition\(\)](#), [vposition\(int\)](#)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

### 13.145.2.35 `hposition()` [2/2]

```
void Fl_Tree::hposition (
 int pos)
```

Sets the horizontal scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the left edge of the screen.

Parameters

<code>in</code>	<code>pos</code>	The vertical position (in pixels) to scroll the tree to.
-----------------	------------------	----------------------------------------------------------

See also

[hposition\(\)](#), [vposition\(\)](#), [vposition\(int\)](#)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

### 13.145.2.36 `insert()`

```
Fl_Tree_Item * Fl_Tree::insert (
 Fl_Tree_Item * item,
 const char * name,
 int pos)
```

Insert a new item 'name' into 'item's children at position 'pos'.

If pos is out of range the new item is

- prepended if `pos < 0` or
- appended if `pos > item->children()`.

Note: `pos == children()` is not considered out of range: the item is appended to the child list.

Example:

```
:
tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
:
// How to use insert() to insert a new item between Aaa/111 + Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa"); // get parent item Aaa
if (item) tree->insert(item, "New item", 2); // insert as a child of Aaa at index #2
:
```

## Parameters

in	<i>item</i>	The existing item to insert new child into. Must not be NULL.
in	<i>name</i>	The label for the new item
in	<i>pos</i>	The position of the new item in the child list

## Returns

The new item added.

## See also

[insert\\_above\(\)](#)

**13.145.2.37 insert\_above()**

```
Fl_Tree_Item * Fl_Tree::insert_above (
 Fl_Tree_Item * above,
 const char * name)
```

Inserts a new item 'name' above the specified [Fl\\_Tree\\_Item](#) 'above'.

Example:

```
:
tree->add("Aaa/000"); // "000" is index 0 in Aaa's children
tree->add("Aaa/111"); // "111" is index 1 in Aaa's children
tree->add("Aaa/222"); // "222" is index 2 in Aaa's children
..
// How to use insert_above() to insert a new item above Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa/222"); // get item Aaa/222
if (item) tree->insert_above(item, "New item"); // insert new item above it
:
```

## Parameters

in	<i>above</i>	– the item above which to insert the new item. Must not be NULL.
in	<i>name</i>	– the name of the new item

## Returns

The new item added, or 0 if 'above' could not be found.

## See also

[insert\(\)](#)

**13.145.2.38 is\_close() [1/2]**

```
int Fl_Tree::is_close (
 const char * path) const
```

See if item specified by 'path' is closed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_close("Holidays/12\25\2010")`.

## Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------

**Returns**

- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

**13.145.2.39 is\_close() [2/2]**

```
int Fl_Tree::is_close (
 Fl_Tree_Item * item) const
```

See if the specified 'item' is closed.

**Parameters**

<i>in</i>	<i>item</i>	– the item to be tested. Must not be NULL.
-----------	-------------	--------------------------------------------

**Returns**

- 1 : item is closed
- 0 : item is open

**13.145.2.40 is\_hscroll\_visible()**

```
int Fl_Tree::is_hscroll_visible () const
```

See if the horizontal scrollbar is currently visible.

**Returns**

1 if scrollbar visible, 0 if not.

**Note**

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

**13.145.2.41 is\_open() [1/2]**

```
int Fl_Tree::is_open (
 const char * path) const
```

See if item specified by 'path' is open.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_open("← Holidays/12\25\2010")`.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

<i>in</i>	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
-----------	-------------	------------------------------------------------------

**Returns**

- 1 - OK: item is open
- 0 - OK: item is closed
- -1 - ERROR: item was not found

**See also**

[Fl\\_Tree\\_Item::visible\\_r\(\)](#)

**13.145.2.42 is\_open()** [2/2]

```
int Fl_Tree::is_open (
 Fl_Tree_Item * item) const
```

See if 'item' is open.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

**Parameters**

in	<i>item</i>	– the item to be tested. Must not be NULL.
----	-------------	--------------------------------------------

**Returns**

- 1 : item is open
- 0 : item is closed

**13.145.2.43 is\_scrollbar()**

```
int Fl_Tree::is_scrollbar (
 Fl_Widget * w)
```

See if widget 'w' is one of the [Fl\\_Tree](#) widget's scrollbars.

Use this to skip over the scrollbars when walking the [child\(\)](#) array. Example:

```

:
for (int i=0; i<tree->children(); i++) { // walk children
 Fl_Widget *w = tree->child(i);
 if (tree->is_scrollbar(w)) continue; // skip scrollbars
 ..do work here..
}
:
```

**Parameters**

in	<i>w</i>	Widget to test
----	----------	----------------

**Returns**

1 if w is a scrollbar, 0 if not.

**Todo** should be const

**13.145.2.44 is\_selected()** [1/2]

```
int Fl_Tree::is_selected (
 const char * path)
```

See if item specified by 'path' is selected.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_selected("Holidays/12\25\2010")`.

**Parameters**

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
----	-------------	------------------------------------------------------

**Returns**

- 1 : item selected
- 0 : item deselected

- -1 : item was not found

#### 13.145.2.45 is\_selected() [2/2]

```
int Fl_Tree::is_selected (
 Fl_Tree_Item * item) const
```

See if the specified 'item' is selected.

##### Parameters

in	item	– the item to be tested. Must not be NULL.
----	------	--------------------------------------------

##### Returns

- 1 : item selected
- 0 : item deselected

#### 13.145.2.46 is\_vscroll\_visible()

```
int Fl_Tree::is_vscroll_visible () const
```

See if the vertical scrollbar is currently visible.

##### Returns

1 if scrollbar visible, 0 if not.

#### 13.145.2.47 item\_clicked() [1/2]

```
Fl_Tree_Item * Fl_Tree::item_clicked ()
```

Return the item that was last clicked.

Valid only from within the [callback\(\)](#).

##### Returns

The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

**Deprecated** in 1.3.3 ABI – use [callback\\_item\(\)](#) instead.

#### 13.145.2.48 item\_clicked() [2/2]

```
void Fl_Tree::item_clicked (
 Fl_Tree_Item * item) [protected]
```

Set the item that was last clicked.

Should only be used by subclasses needing to change this value. Normally [Fl\\_Tree](#) manages this value.

**Deprecated** in 1.3.3 ABI – use [callback\\_item\(\)](#) instead.

#### 13.145.2.49 item\_draw\_mode() [1/3]

```
Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode () const
```

Get the 'item draw mode' used for the tree.

##### Version

1.3.1 ABI feature

**13.145.2.50 item\_draw\_mode()** [2/3]

```
void Fl_Tree::item_draw_mode (
 Fl_Tree_Item_Draw_Mode mode)
```

Set the 'item draw mode' used for the tree to 'mode'.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl\\_Tree\\_Item\\_Draw\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**13.145.2.51 item\_draw\_mode()** [3/3]

```
void Fl_Tree::item_draw_mode (
 int mode)
```

Set the 'item draw mode' used for the tree to integer 'mode'.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl\\_Tree\\_Item\\_Draw\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**13.145.2.52 item\_labelbgcolor()** [1/2]

```
void Fl_Tree::item_labelbgcolor (
 Fl_Color val)
```

Set the default label background color used for creating new items.

A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color on a per-item basis, use [Fl\\_Tree\\_Item::labelbgcolor\(Fl\\_Color\)](#)

**13.145.2.53 item\_labelbgcolor()** [2/2]

```
Fl_Color Fl_Tree::item_labelbgcolor (
 void) const
```

Get the default label background color used for creating new items.

If the color is 0xffffffff, it is 'transparent'.

**13.145.2.54 item\_labelfgcolor()**

```
void Fl_Tree::item_labelfgcolor (
 Fl_Color val)
```

Set the default label foreground color used for creating new items.

To change the foreground color on a per-item basis, use [Fl\\_Tree\\_Item::labelfgcolor\(Fl\\_Color\)](#)

**13.145.2.55 item\_labelfont()**

```
void Fl_Tree::item_labelfont (
 Fl_Font val)
```

Set the default font face used for creating new items.

To change the font face on a per-item basis, use [Fl\\_Tree\\_Item::labelfont\(Fl\\_Font\)](#)

**13.145.2.56 item\_labelsize()**

```
void Fl_Tree::item_labelsize (
 Fl_Fontsize val)
```

Set the default label font size used for creating new items.

To change the font size on a per-item basis, use [Fl\\_Tree\\_Item::labelsize\(Fl\\_Fontsize\)](#)

**13.145.2.57 item\_pathname()**

```
int Fl_Tree::item_pathname (
 char * pathname,
 int pathnamelen,
 const Fl_Tree_Item * item) const
```

Return '*pathname*' of size '*pathnamelen*' for the specified '*item*'.

If '*item*' is NULL, [root\(\)](#) is used.

The tree's root will be included in the pathname if [showroot\(\)](#) is on.

Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash. This is symmetrical with the [add\(\)](#) function which uses the same escape pattern to set names.

**Parameters**

out	<i>pathname</i>	The string to use to return the pathname
in	<i>pathnamelen</i>	The maximum length of the string (including NULL). Must not be zero.
in	<i>item</i>	The item whose pathname is to be returned.

**Returns**

- 0 : OK (*pathname* returns the item's pathname)
- -1 : item not found (*pathname*="")
- -2 : *pathname* not large enough (*pathname*="")

**See also**

[find\\_item\(\)](#)

**13.145.2.58 item\_reselect\_mode()** [1/2]

```
Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode () const
```

Returns the current item re/selection mode.

**Version**

1.3.1 ABI feature

**13.145.2.59 item\_reselect\_mode()** [2/2]

```
void Fl_Tree::item_reselect_mode (
 Fl_Tree_Item_Reselect_Mode mode)
```

Sets the item re/selection mode.

See [Fl\\_Tree\\_Item\\_Reselect\\_Mode](#) for possible values.

**Version**

1.3.1 ABI feature

**13.145.2.60 last()**

```
Fl_Tree_Item * Fl_Tree::last ()
```

Returns the last item in the tree.

This can be used to walk the tree in reverse, e.g.

```
for (Fl_Tree_Item *item = tree->last(); item; item = tree->prev())
 printf("Item: %s\n", item->label());
```

**Returns**

Last item in the tree, or 0 if none (tree empty).

**See also**

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

**13.145.2.61 last\_selected\_item()**

```
Fl_Tree_Item * Fl_Tree::last_selected_item ()
```

Returns the last selected item in the tree.

Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.

```

:
// Walk tree in reverse, from bottom to top
for (Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up))
 printf("Selected item: %s\n", i->label());
:

```

**Returns**

The last selected item, or 0 if none.

**See also**

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

**Version**

1.3.3

**13.145.2.62 last\_visible()**

```
Fl_Tree_Item * Fl_Tree::last_visible ()
```

Returns the last [open\(\)](#), visible item in the tree.

**Deprecated** in 1.3.3 – use [last\\_visible\\_item\(\)](#) instead.

**13.145.2.63 last\_visible\_item()**

```
Fl_Tree_Item * Fl_Tree::last_visible_item ()
```

Returns the last [open\(\)](#), visible item in the tree.

**Returns**

Last visible item in the tree, or 0 if none.

**See also**

[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#)

**Version**

1.3.3

**13.145.2.64 load()**

```
void Fl_Tree::load (
 class Fl_Preferences & prefs)
```

Load FLTK preferences.

Read a preferences database into the tree widget.

A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

## Parameters

in	<i>prefs</i>	the <a href="#">Fl_Preferences</a> database
----	--------------	---------------------------------------------

**13.145.2.65 next()**

```
Fl_Tree_Item * Fl_Tree::next (
 Fl_Tree_Item * item = 0)
```

Return the next item after 'item', or 0 if no more items.

Use this code to walk the entire tree:

```
:
for (Fl_Tree_Item *i = tree->first(); i; i = tree->next(i))
 printf("Item: %s\n", i->label());
:
```

## Parameters

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.
----	-------------	------------------------------------------------------------

## Returns

Next item in tree, or 0 if at last item.

## See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

**13.145.2.66 next\_item()**

```
Fl_Tree_Item * Fl_Tree::next_item (
 Fl_Tree_Item * item,
 int dir = FL_Down,
 bool visible = false)
```

Returns next item after 'item' in direction 'dir' depending on 'visible'.

Next item will be above (if dir==FL\_Up) or below (if dir==FL\_Down). If 'visible' is true, only items whose parents are [open\(\)](#) will be returned. If 'visible' is false, even items whose parents are [close\(\)](#)ed will be returned.

If item is 0, the return value will be the result of this truth table:

	visible=true	visible=false
	-----	-----
dir=FL_Up:	<a href="#">last_visible_item()</a>	<a href="#">last()</a>
dir=FL_Down:	<a href="#">first_visible_item()</a>	<a href="#">first()</a>

## Example use:

```
:
// Walk down the tree showing open(), visible items
for (Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true))
 printf("Item: %s\n", i->label());

// Walk up the tree showing open(), visible items
for (Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true))
 printf("Item: %s\n", i->label());

// Walk down the tree showing all items (open or closed)
for (Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false))
 printf("Item: %s\n", i->label());

// Walk up the tree showing all items (open or closed)
for (Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false))
 printf("Item: %s\n", i->label());
:
```

## Parameters

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.
in	<i>dir</i>	Can be FL_Up or FL_Down (default=FL_Down or 'next')
in	<i>visible</i>	true=return only <a href="#">open()</a> , visible items, false=return open or closed items (default)

## Returns

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

## See also

[first\(\)](#), [last\(\)](#), [next\(\)](#),  
[first\\_visible\\_item\(\)](#), [last\\_visible\\_item\(\)](#), [next\\_visible\\_item\(\)](#),  
[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

## Version

1.3.3

## 13.145.2.67 next\_selected\_item()

```
Fl_Tree_Item * Fl_Tree::next_selected_item (
 Fl_Tree_Item * item = 0,
 int dir = FL_Down)
```

Returns the next selected item above or below 'item', depending on 'dir'.

If 'item' is 0, search starts at either [first\(\)](#) or [last\(\)](#), depending on 'dir': [first\(\)](#) if 'dir' is FL\_Down (default), [last\(\)](#) if 'dir' is FL\_Up.

Use this to walk the tree looking for all the selected items, e.g.

```
:
// Walk down the tree (forwards)
for (Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down))
 printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for (Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up))
 printf("Item: %s\n", i->label());
:
```

## Parameters

in	<i>item</i>	The item above or below which we'll find the next selected item. If NULL, <a href="#">first()</a> is used if FL_Down, <a href="#">last()</a> if FL_Up. (default=NULL)
in	<i>dir</i>	The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default)

## Returns

The next selected item, or 0 if there are no more selected items.

## See also

[first\\_selected\\_item\(\)](#), [last\\_selected\\_item\(\)](#), [next\\_selected\\_item\(\)](#)

## Version

1.3.3

**13.145.2.68 next\_visible\_item()**

```
Fl_Tree_Item * Fl_Tree::next_visible_item (
 Fl_Tree_Item * item,
 int dir)
```

Returns next [open\(\)](#), visible item above (`dir==FL_Up`) or below (`dir==FL_Down`) the specified 'item', or 0 if no more items.

If 'item' is 0, returns [last\(\)](#) if 'dir' is `FL_Up`, or [first\(\)](#) if `dir` is `FL_Down`.

```
:
// Walk down the tree (forwards)
for (Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_visible_item(i, FL_Down))
 printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for (Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_visible_item(i, FL_Up))
 printf("Item: %s\n", i->label());
:
```

**Parameters**

in	<i>item</i>	The item above/below which we'll find the next visible item
in	<i>dir</i>	The direction to search. Can be <code>FL_Up</code> or <code>FL_Down</code> .

**Returns**

The item found, or 0 if there's no visible items above/below the specified `item`.

**Version**

1.3.3

**13.145.2.69 open() [1/2]**

```
int Fl_Tree::open (
 const char * path,
 int docallback = 1)
```

Opens the item specified by 'path'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `open("Holidays/12\W25\W2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - <a href="#">callback()</a> is not invoked     • 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be <code>FL_TREE_REASON_OPENED</code>

**Returns**

- 1 – OK: item opened
- 0 – OK: item was already open, no change

- -1 – ERROR: item was not found

See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

### 13.145.2.70 open() [2/2]

```
int Fl_Tree::open (
 Fl_Tree_Item * item,
 int docalldback = 1)
```

Open the specified 'item'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter 'docalldback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	– the item to be opened. Must not be NULL.
in	<i>docalldback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - <a href="#">callback()</a> is not invoked     • 1 - <a href="#">callback()</a> is invoked if item changed (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_OPENED

#### Returns

- 1 – item was opened
- 0 – item was already open, no change

See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

### 13.145.2.71 open\_toggle()

```
void Fl_Tree::open_toggle (
 Fl_Tree_Item * item,
 int docalldback = 1)
```

Toggle the open state of 'item'.

Invokes the callback depending on the value of optional parameter 'docalldback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	– the item whose open state is to be toggled. Must not be NULL.
in	<i>docalldback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - <a href="#">callback()</a> is not invoked     • 1 - <a href="#">callback()</a> is invoked (default), <a href="#">callback_reason()</a> will be either FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED

See also

[open\(\)](#), [close\(\)](#), [is\\_open\(\)](#), [is\\_close\(\)](#), [callback\\_item\(\)](#), [callback\\_reason\(\)](#)

### 13.145.2.72 openicon() [1/2]

```
Fl_Image * Fl_Tree::openicon () const
```

Returns the icon to be used as the 'open' icon.

If none was set, the internal default is returned, a simple '[+]' icon.

### 13.145.2.73 openicon() [2/2]

```
void Fl_Tree::openicon (
 Fl_Image * val)
```

Sets the icon to be used as the 'open' icon.

This overrides the built in default '[+]' icon.

Parameters

<i>in</i>	<i>val</i>	– The new image, or zero to use the default '[+]' icon.
-----------	------------	---------------------------------------------------------

### 13.145.2.74 prev()

```
Fl_Tree_Item * Fl_Tree::prev (
 Fl_Tree_Item * item = 0)
```

Return the previous item before 'item', or 0 if no more items.

This can be used to walk the tree in reverse, e.g.

```
:
for (Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item))
 printf("Item: %s\n", item->label());
:
```

Parameters

<i>in</i>	<i>item</i>	The item to use to find the previous item. If NULL, returns 0.
-----------	-------------	----------------------------------------------------------------

Returns

Previous item in tree, or 0 if at first item.

See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

### 13.145.2.75 recalc\_tree()

```
void Fl_Tree::recalc_tree ()
```

Schedule tree to recalc the entire tree size.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

### 13.145.2.76 remove()

```
int Fl_Tree::remove (
 Fl_Tree_Item * item)
```

Remove the specified 'item' from the tree.

item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will have focus.

#### Returns

0 if done, -1 if 'item' not found.

#### 13.145.2.77 resize()

```
void Fl_Tree::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Group](#) widget and all of its children.

The [Fl\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

#### See also

[Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Group](#).

#### 13.145.2.78 root()

```
void Fl_Tree::root (
 Fl_Tree_Item * newitem)
```

Sets the root item to 'newitem'.

If a root item already exists, [clear\(\)](#) is called first to clear it before replacing it with newitem.

Use this to install a custom item (derived from [Fl\\_Tree\\_Item](#)) as the root of the tree. This allows the derived class to implement custom drawing by overriding [Fl\\_Tree\\_Item::draw\\_item\\_content\(\)](#).

#### Version

1.3.3

#### 13.145.2.79 root\_label()

```
void Fl_Tree::root_label (
 const char * new_label)
```

Set the label for the root item to 'new\_label'.

Makes an internally managed copy of 'new\_label'.

#### 13.145.2.80 scrollbar\_size() [1/2]

```
int Fl_Tree::scrollbar_size () const
```

Gets the default size of scrollbars' troughs for this widget in pixels.

If this value is zero (default), this widget will use the global [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

#### Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

#### See also

[Fl::scrollbar\\_size\(int\)](#)

**13.145.2.81 scrollbar\_size()** [2/2]

```
void Fl_Tree::scrollbar_size (
 int size)
```

Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.

Normally you should not need this method, and should use the global [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior. Normally this is what you want.

Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)

Setting size to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

**Parameters**

in	size	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	------	-----------------------------------------------------------------------------------------------------------------------------

**See also**

[Fl::scrollbar\\_size\(\)](#)

**13.145.2.82 select()** [1/2]

```
int Fl_Tree::select (
 const char * path,
 int docallback = 1)
```

Select the item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `select("← Holidays/12\25\2010")`.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

**Parameters**

in	path	– the tree item's pathname (e.g. "Flintstones/Fred")
in	docallback	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked if item changed state (default), <a href="#">callback_reason()</a> will be FL_TREE_REASON_SELECTED

**Returns**

- 1 : OK: item's state was changed
- 0 : OK: item was already selected, no change was made
- -1 : ERROR: item was not found

**13.145.2.83 select()** [2/2]

```
int Fl_Tree::select (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Select the specified 'item'.

Use `'deselect()'` to deselect it.

Invokes the callback depending on the value of optional parameter `docalcallback`.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
in	<i>docalcallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not:      • 0 - the <code>callback()</code> is not invoked     • 1 - the <code>callback()</code> is invoked if item changed state, <code>callback_reason()</code> will be <code>FL_TREE_REASON_SELECTED</code>

#### Returns

- 1 - item's state was changed
- 0 - item was already selected, no change was made

### 13.145.2.84 select\_all()

```
int Fl_Tree::select_all (
 Fl_Tree_Item * item = 0,
 int docalcallback = 1)
```

Select '*item*' and all its children.

If item is NULL, `first()` is used.

Invokes the callback depending on the value of optional parameter '`docalcallback`'.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	The item that will be selected (along with all its children). If NULL, <code>first()</code> is used.
in	<i>docalcallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not:      • 0 - the <code>callback()</code> is not invoked     • 1 - the <code>callback()</code> is invoked for each item that changed state (default), <code>callback_reason()</code> will be <code>FL_TREE_REASON_SELECTED</code>

#### Returns

Count of how many items were actually changed to the selected state.

### 13.145.2.85 select\_only()

```
int Fl_Tree::select_only (
 Fl_Tree_Item * selitem,
 int docalcallback = 1)
```

Select only the specified item, deselecting all others that might be selected.

If '*selitem*' is 0, `first()` is used.

Invokes the callback depending on the value of optional parameter '`docalcallback`'.

Handles calling `redraw()` if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>selitem</i>	The item to be selected. If NULL, <a href="#">first()</a> is used.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked for each item that changed state (default), <a href="#">callback_reason()</a> will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED

#### Returns

The number of items whose selection states were changed, if any.

### 13.145.2.86 [select\\_toggle\(\)](#)

```
void Fl_Tree::select_toggle (
 Fl_Tree_Item * item,
 int docallback = 1)
```

Toggle the select state of the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback\\_item\(\)](#) and [callback\\_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

#### Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <a href="#">callback()</a> is invoked or not:      • 0 - the <a href="#">callback()</a> is not invoked     • 1 - the <a href="#">callback()</a> is invoked (default), <a href="#">callback_reason()</a> will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED

### 13.145.2.87 [selectbox\(\)](#) [1/2]

```
Fl_Boxtype Fl_Tree::selectbox () const
```

Sets the style of box used to draw selected items.

This is an fltk [Fl\\_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

### 13.145.2.88 [selectbox\(\)](#) [2/2]

```
void Fl_Tree::selectbox (
 Fl_Boxtype val)
```

Gets the style of box used to draw selected items.

This is an fltk [Fl\\_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

### 13.145.2.89 [selectmode\(\)](#) [1/2]

```
Fl_Tree_Select Fl_Tree::selectmode () const
```

Gets the tree's current selection mode.

See [Fl\\_Tree\\_Select](#) for possible values.

**13.145.2.90 selectmode()** [2/2]

```
void Fl_Tree::selectmode (
 Fl_Tree_Select val)
```

Sets the tree's selection mode.

See [Fl\\_Tree\\_Select](#) for possible values.

**13.145.2.91 set\_item\_focus()**

```
void Fl_Tree::set_item_focus (
 Fl_Tree_Item * item)
```

Set the item that currently should have keyboard focus.

Handles calling [redraw\(\)](#) to update the focus box (if it is visible).

**Parameters**

in	<i>item</i>	The item that should take focus. If NULL, none will have focus.
----	-------------	-----------------------------------------------------------------

**13.145.2.92 show\_item()** [1/2]

```
void Fl_Tree::show_item (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar to show '*item*' at the top of the display IF it is currently off-screen (for instance [show\\_item\\_top\(\)](#)).

If it is already on-screen, no change is made.

**Parameters**

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
----	-------------	-----------------------------------------------------------------

**See also**

[show\\_item\\_top\(\)](#), [show\\_item\\_middle\(\)](#), [show\\_item\\_bottom\(\)](#)

**13.145.2.93 show\_item()** [2/2]

```
void Fl_Tree::show_item (
 Fl_Tree_Item * item,
 int yoff)
```

Adjust the vertical scrollbar so that '*item*' is visible '*yoff*' pixels from the top of the [Fl\\_Tree](#) widget's display.

For instance, *yoff*=0 will position the item at the top.

If *yoff* is larger than the vertical scrollbar's limit, the value will be clipped. So if *yoff*=100, but scrollbar's max is 50, then 50 will be used.

**Parameters**

in	<i>item</i>	The item to be shown. If NULL, <a href="#">first()</a> is used.
in	<i>yoff</i>	The pixel offset from the top for the displayed position.

**See also**

[show\\_item\\_top\(\)](#), [show\\_item\\_middle\(\)](#), [show\\_item\\_bottom\(\)](#)

**13.145.2.94 show\_item\_bottom()**

```
void Fl_Tree::show_item_bottom (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that 'item' is at the bottom of the display.

#### Parameters

<code>in</code>	<code>item</code>	The item to be shown. If NULL, <a href="#">first()</a> is used.
-----------------	-------------------	-----------------------------------------------------------------

#### 13.145.2.95 show\_item\_middle()

```
void Fl_Tree::show_item_middle (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that 'item' is in the middle of the display.

#### Parameters

<code>in</code>	<code>item</code>	The item to be shown. If NULL, <a href="#">first()</a> is used.
-----------------	-------------------	-----------------------------------------------------------------

#### 13.145.2.96 show\_item\_top()

```
void Fl_Tree::show_item_top (
 Fl_Tree_Item * item)
```

Adjust the vertical scrollbar so that 'item' is at the top of the display.

#### Parameters

<code>in</code>	<code>item</code>	The item to be shown. If NULL, <a href="#">first()</a> is used.
-----------------	-------------------	-----------------------------------------------------------------

#### 13.145.2.97 show\_self()

```
void Fl_Tree::show_self ()
```

Print the tree as 'ascii art' to stdout.  
Used mainly for debugging.

**Todo** should be const

#### Version

1.3.0

#### 13.145.2.98 showcollapse() [1/2]

```
int Fl_Tree::showcollapse () const
```

Returns 1 if the collapse icon is enabled, 0 if not.

#### See also

[showcollapse\(int\)](#)

#### 13.145.2.99 showcollapse() [2/2]

```
void Fl_Tree::showcollapse (
 int val)
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via [open\(\)](#) and [close\(\)](#).

## Parameters

<i>in</i>	<i>val</i>	1: shows collapse icons (default), 0: hides collapse icons.
-----------	------------	----------------------------------------------------------------

**13.145.2.100 showroot()**

```
void Fl_Tree::showroot (
 int val)
```

Set if the root item should be shown or not.

## Parameters

<i>in</i>	<i>val</i>	1 – show the root item (default) 0 – hide the root item.
-----------	------------	-------------------------------------------------------------

**13.145.2.101 sortorder()**

```
Fl_Tree_Sort Fl_Tree::sortorder () const
```

Set the default sort order used when items are added to the tree.

See [Fl\\_Tree\\_Sort](#) for possible values.

**13.145.2.102 usericon() [1/2]**

```
Fl_Image * Fl_Tree::usericon () const
```

Returns the [Fl\\_Image](#) being used as the default user icon for all newly created items.

Returns zero if no icon has been set, which is the default.

**13.145.2.103 usericon() [2/2]**

```
void Fl_Tree::usericon (
 Fl_Image * val)
```

Sets the [Fl\\_Image](#) to be used as the default user icon for all newly created items.

If you want to specify user icons on a per-item basis, use [Fl\\_Tree\\_Item::usericon\(\)](#) instead.

## Parameters

<i>in</i>	<i>val</i>	– The new image to be used, or zero to disable user icons.
-----------	------------	------------------------------------------------------------

**13.145.2.104 vposition() [1/2]**

```
int Fl_Tree::vposition () const
```

Returns the vertical scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the top edge of the screen.

## See also

[vposition\(int\)](#), [hposition\(\)](#), [hposition\(int\)](#)

**13.145.2.105 vposition() [2/2]**

```
void Fl_Tree::vposition (
 int pos)
```

Sets the vertical scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the top edge of the screen.

## Parameters

<code>in</code>	<code>pos</code>	The vertical position (in pixels) to scroll the tree to.
-----------------	------------------	----------------------------------------------------------

## See also

[vposition\(\)](#), [hposition\(\)](#), [hposition\(int\)](#)

The documentation for this class was generated from the following files:

- [Fl\\_Tree.H](#)
- [Fl\\_Tree.cxx](#)

## 13.146 Fl\_Tree\_Item Class Reference

Tree widget item.

```
#include <Fl_Tree_Item.H>
```

*Set item's label background color.*
- `FI\_Color labelcolor () const`  
*Return item's label text color. Alias for [labelfgcolor\(\)](#) const).*
- `void labelcolor (FI\_Color val)`  
*Set item's label text color. Alias for [labelfgcolor\(FI\\_Color\)](#).*
- `FI\_Color labelfgcolor () const`  
*Return item's label foreground text color.*
- `void labelfgcolor (FI\_Color val)`  
*Set item's label foreground text color.*
- `FI\_Font labelfont () const`  
*Get item's label font face.*
- `void labelfont (FI\_Font val)`  
*Set item's label font face.*
- `FI\_Fontsize labelsiz () const`  
*Get item's label font size.*
- `void labelsiz (FI\_Fontsize val)`  
*Set item's label font size.*
- `int move (FI\_Tree\_Item *item, int op=0, int pos=0)`  
*Move the current item above/below/into the specified 'item', where 'op' determines the type of move:*
- `int move (int to, int from)`  
*Move an item within its parent using index numbers.*
- `int move_above (FI\_Tree\_Item *item)`  
*Move the current item above the specified 'item'.*
- `int move_below (FI\_Tree\_Item *item)`  
*Move the current item below the specified 'item'.*
- `int move_into (FI\_Tree\_Item *item, int pos=0)`  
*Parent the current item as a child of the specified 'item'.*
- `FI\_Tree\_Item * next ()`

- Return the next item in the tree.*

  - [FI\\_Tree\\_Item](#) \* [next\\_displayed](#) ([FI\\_Tree\\_Prefs](#) &[prefs](#))

*Same as [next\\_visible\(\)](#).*
- [FI\\_Tree\\_Item](#) \* [next\\_sibling](#) ()

*Return this item's next sibling.*
- [FI\\_Tree\\_Item](#) \* [next\\_visible](#) ([FI\\_Tree\\_Prefs](#) &[prefs](#))

*Return the next [open\(\)](#), [visible\(\)](#) item.*
- void **open** ()

*Open this item and all its children.*
- void **open\_toggle** ()

*Toggle the item's open/closed state.*
- [FI\\_Tree\\_Item](#) \* **parent** ()

*Return the parent for this item. Returns NULL if we are the root.*
- const [FI\\_Tree\\_Item](#) \* **parent** () const

*Return the const parent for this item. Returns NULL if we are the root.*
- void [parent](#) ([FI\\_Tree\\_Item](#) \*[val](#))

*Set the parent for this item.*
- const [FI\\_Tree\\_Prefs](#) & [prefs](#) () const

*Return the parent tree's prefs.*
- [FI\\_Tree\\_Item](#) \* [prev](#) ()

*Return the previous item in the tree.*
- [FI\\_Tree\\_Item](#) \* [prev\\_displayed](#) ([FI\\_Tree\\_Prefs](#) &[prefs](#))

*Same as [prev\\_visible\(\)](#).*
- [FI\\_Tree\\_Item](#) \* [prev\\_sibling](#) ()

*Return this item's previous sibling.*
- [FI\\_Tree\\_Item](#) \* [prev\\_visible](#) ([FI\\_Tree\\_Prefs](#) &[prefs](#))

*Return the previous [open\(\)](#), [visible\(\)](#) item.*
- int [remove\\_child](#) (const char \*[new\\_label](#))

*Remove immediate child (and its children) by its label 'name'.*
- int [remove\\_child](#) ([FI\\_Tree\\_Item](#) \*[item](#))

*Remove 'item' from the current item's children.*
- int [reparent](#) ([FI\\_Tree\\_Item](#) \*[newchild](#), int [index](#))

*Reparent specified item as a child of ourself at position 'pos'.*
- [FI\\_Tree\\_Item](#) \* [replace](#) ([FI\\_Tree\\_Item](#) \*[new\\_item](#))

*Replace the current item with a new item.*
- [FI\\_Tree\\_Item](#) \* [replace\\_child](#) ([FI\\_Tree\\_Item](#) \*[olditem](#), [FI\\_Tree\\_Item](#) \*[newitem](#))

*Replace existing child 'olditem' with 'newitem'.*
- void [select](#) (int [val](#)=1)

*Change the item's selection state to the optionally specified 'val'.*
- int [select\\_all](#) ()

*Select item and all its children.*
- void **select\_toggle** ()

*Toggle the item's selection state.*
- void [show\\_self](#) (const char \*[indent](#)="") const

*Print the tree as 'ascii art' to stdout.*
- int [swap\\_children](#) ([FI\\_Tree\\_Item](#) \*[a](#), [FI\\_Tree\\_Item](#) \*[b](#))

*Swap two of our immediate children, given item pointers.*
- void [swap\\_children](#) (int [ax](#), int [bx](#))

*Swap two of our children, given two child index values 'ax' and 'bx'.*
- [FI\\_Tree](#) \* [tree](#) ()

*Return the tree for this item.*

- const [FI\\_Tree](#) \* [tree](#) () const  
*Return the tree for this item.*
- void [update\\_prev\\_next](#) (int index)  
*Update our [\\_prev\\_sibling](#) and [\\_next\\_sibling](#) pointers to point to neighbors given [index](#) as being our current position in the parent's item array.*
- void \* [user\\_data](#) () const  
*Retrieve the user-data value that has been assigned to the item.*
- void [user\\_data](#) (void \*data)  
*Set a user-data value for the item.*
- [FI\\_Image](#) \* [userdeicon](#) () const  
*Return the deactivated version of the user icon, if any.*
- void [userdeicon](#) ([FI\\_Image](#) \*val)  
*Set the usericon to draw when the item is deactivated.*
- [FI\\_Image](#) \* [usericon](#) () const  
*Get the item's user icon as an [FI\\_Image](#). Returns '0' if disabled.*
- void [usericon](#) ([FI\\_Image](#) \*val)  
*Set the item's user icon to an [FI\\_Image](#).*
- int [visible](#) () const  
*See if the item is visible. Alias for [is\\_visible\(\)](#).*
- int [visible\\_r](#) () const  
*See if item and all its parents are [open\(\)](#) and [visible\(\)](#).*
- int [w](#) () const  
*The entire item's width to right edge of [FI\\_Tree](#)'s inner width within scrollbars.*
- [FI\\_Widget](#) \* [widget](#) () const  
*Return FLTK widget assigned to this item.*
- void [widget](#) ([FI\\_Widget](#) \*val)  
*Assign an FLTK widget to this item.*
- int [x](#) () const  
*The item's x position relative to the window.*
- int [y](#) () const  
*The item's y position relative to the window.*

### Protected Member Functions

- void [\\_Init](#) (const [FI\\_Tree\\_Prefs](#) &prefs, [FI\\_Tree](#) \*tree)
- int [calc\\_item\\_height](#) (const [FI\\_Tree\\_Prefs](#) &prefs) const  
*Return the item's 'visible' height.*
- virtual void [draw\\_horizontal\\_connector](#) (int x1, int x2, int y, const [FI\\_Tree\\_Prefs](#) &prefs)  
*Horizontal connector line based on preference settings.*
- virtual void [draw\\_vertical\\_connector](#) (int x, int y1, int y2, const [FI\\_Tree\\_Prefs](#) &prefs)  
*Vertical connector line based on preference settings.*
- [FI\\_Color](#) [drawbgcolor](#) () const  
*Returns the recommended background color used for drawing this item.*
- [FI\\_Color](#) [drawfgcolor](#) () const  
*Returns the recommended foreground color used for drawing this item.*
- void [hide\\_widgets](#) ()  
*Internal: Hide the FLTK [widget\(\)](#) for this item and all children.*
- int [is\\_flag](#) (unsigned short val) const  
*See if flag set. Returns 0 or 1.*
- void [recalc\\_tree](#) ()  
*Call this when our geometry is changed.*

- void **set\_flag** (unsigned short flag, int val)  
Set a flag to an on or off value. val is 0 or 1.
- void **show\_widgets** ()  
Internal: Show the FLTK [widget\(\)](#) for this item and all children.

### 13.146.1 Detailed Description

Tree widget item.

This class is a single tree item, and manages all of the item's attributes. [Fl\\_Tree\\_Item](#) is used by [Fl\\_Tree](#), which is comprised of many instances of [Fl\\_Tree\\_Item](#).

[Fl\\_Tree\\_Item](#) is hierarchical; it dynamically manages an [Fl\\_Tree\\_Item\\_Array](#) of children that are themselves instances of [Fl\\_Tree\\_Item](#). Each item can have zero or more children. When an item has children, [close\(\)](#) and [open\(\)](#) can be used to hide or show them.

Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.

When you make changes to items, you'll need to tell the tree to [redraw\(\)](#) for the changes to show up.

New 1.3.3 ABI feature: You can define custom items by either adding a custom widget to the item with [Fl\\_Tree\\_Item::widget\(\)](#), or override the [draw\\_item\\_content\(\)](#) method if you want to just redefine how the label is drawn.

The following shows the [Fl\\_Tree\\_Item](#)'s dimensions, useful when overriding the [draw\\_item\\_content\(\)](#) method:

Figure 13.65 [Fl\\_Tree\\_Item](#)'s internal dimensions.

### 13.146.2 Constructor & Destructor Documentation

#### 13.146.2.1 [Fl\\_Tree\\_Item\(\)](#) [1/2]

```
Fl_Tree_Item::Fl_Tree_Item (
 const Fl_Tree_Prefs & prefs)
```

Constructor.

Makes a new instance of [Fl\\_Tree\\_Item](#) using defaults from 'prefs'.

**Deprecated** in 1.3.3 ABI – you must use [Fl\\_Tree\\_Item\(Fl\\_Tree\\*\)](#) for proper horizontal scrollbar behavior.

#### 13.146.2.2 [Fl\\_Tree\\_Item\(\)](#) [2/2]

```
Fl_Tree_Item::Fl_Tree_Item (
 Fl_Tree * tree)
```

Constructor.

Makes a new instance of [Fl\\_Tree\\_Item](#) for 'tree' with an empty label (""). It's up to you to set the [label\(\)](#) of the item before adding it to the tree so that it draws the item's name, and helps methods like [Fl\\_Tree::find\\_item\(path\)](#) find the item by name.

This must be used instead of the older, deprecated [Fl\\_Tree\\_Item\(Fl\\_Tree\\_Prefs\)](#) constructor for proper horizontal scrollbar calculation.

Version

1.3.3 ABI feature

### 13.146.3 Member Function Documentation

#### 13.146.3.1 activate()

```
void Fl_Tree_Item::activate (
 int val = 1) [inline]
```

Change the item's activation state to the optionally specified 'val'.

When deactivated, the item will be 'grayed out'; the callback() won't be invoked if the user clicks on the label. If a [widget\(\)](#) is associated with the item, its activation state will be changed as well.

If 'val' is not specified, the item will be activated.

#### 13.146.3.2 add() [1/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 char ** arr)
```

Descend into the path specified by 'arr', and add a new child there.

Should be used only by [Fl\\_Tree](#)'s internals. Adds the item based on the value of prefs.sortorder().

##### Returns

the item added.

##### Version

1.3.0 release

#### 13.146.3.3 add() [2/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 char ** arr,
 Fl_Tree_Item * newitem)
```

Descend into path specified by 'arr' and add 'newitem' there.

Should be used only by [Fl\\_Tree](#)'s internals. If item is NULL, a new item is created. Adds the item based on the value of prefs.sortorder().

##### Returns

the item added.

##### Version

1.3.3 ABI feature

#### 13.146.3.4 add() [3/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 const char * new_label)
```

Add a new child to this item with the name 'new\_label' and defaults from 'prefs'.

An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

##### Returns

the item added

##### Version

1.3.0 release

**13.146.3.5 add()** [4/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
 const Fl_Tree_Prefs & prefs,
 const char * new_label,
 Fl_Tree_Item * item)
```

Add 'item' as immediate child with 'new\_label' and defaults from 'prefs'.

If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item based on the value of `prefs.sortorder()`.

**Returns**

the item added

**Version**

1.3.3

**13.146.3.6 calc\_item\_height()**

```
int Fl_Tree_Item::calc_item_height (
 const Fl_Tree_Prefs & prefs) const [protected]
```

Return the item's 'visible' height.

Takes into account the item's:

- visibility (if `!is_visible()`, returns 0)
- `labelfont()` height: if `label() != NULL`
- `widget()` height: if `widget() != NULL`
- `openicon()` height (if has children)
- `usericon()` height (if not NULL) Does NOT include `Fl_Tree::linespacing()`;

**Returns**

maximum pixel height

**13.146.3.7 child()**

```
const Fl_Tree_Item * Fl_Tree_Item::child (
 int t) const
```

Return the const child item for the given 'index'.

Return const child item for the specified 'index'.

**13.146.3.8 deactivate()**

```
void Fl_Tree_Item::deactivate () [inline]
```

Deactivate the item; the `callback()` won't be invoked when clicked.

Same as `activate(0)`

**13.146.3.9 deparent()**

```
Fl_Tree_Item * Fl_Tree_Item::deparent (
 int pos)
```

Deparent child at index position 'pos'.

This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want to immediately reparent the orphan elsewhere.

A successfully orphaned item will have its `parent()` and `prev_sibling()/next_sibling()` set to NULL.

## Returns

- pointer to orphaned item on success
- NULL on error (could not deparent the item)

## See also

[reparent\(\)](#)

**13.146.3.10 depth()**

```
int Fl_Tree_Item::depth () const
```

Returns how many levels deep this item is in the hierarchy.

For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for determining the horizontal indent of this item during drawing.

**13.146.3.11 deselect\_all()**

```
int Fl_Tree_Item::deselect_all () [inline]
```

Deselect item and all its children.

Returns count of how many items were in the 'selected' state, ie. how many items were "changed".

**13.146.3.12 draw()**

```
void Fl_Tree_Item::draw (
 int X,
 int & Y,
 int W,
 Fl_Tree_Item * itemfocus,
 int & tree_item_xmax,
 int lastchild = 1,
 int render = 1)
```

Draw this item and its children.

## Parameters

in	<i>X</i>	Horizontal position for item being drawn
in, out	<i>Y</i>	Vertical position for item being drawn, returns new position for next item
in	<i>W</i>	Recommended width for item
in	<i>itemfocus</i>	The tree's current focus item (if any)
in, out	<i>tree_item_xmax</i>	The tree's running xmax (right-most edge so far). Mainly used by parent tree when render==0 to calculate tree's max width.
in	<i>lastchild</i>	Is this item the last child in a subtree?
in	<i>render</i>	Whether or not to render the item: 0: no rendering, just calculate size w/out drawing. 1: render item as well as size calc

## Version

1.3.3 ABI feature: modified parameters

**13.146.3.13 draw\_horizontal\_connector()**

```
void Fl_Tree_Item::draw_horizontal_connector (
 int x1,
 int x2,
 int y,
 const Fl_Tree_Prefs & prefs) [protected], [virtual]
```

Horizontal connector line based on preference settings.

This method can be overridden to implement custom connection line drawing.

#### Parameters

in	<i>x1</i>	The left hand X position of the horizontal connector
in	<i>x2</i>	The right hand X position of the horizontal connector
in	<i>y</i>	The vertical position of the horizontal connector
in	<i>prefs</i>	The <a href="#">Fl_Tree</a> prefs

### 13.146.3.14 draw\_item\_content()

```
int Fl_Tree_Item::draw_item_content (
 int render) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the `label_[xywh]()` area with content.

A minimal example of how to override `draw_item_content()` and draw just a normal item's background and label ourselves:

```
class MyTreeItem : public Fl_Tree_Item {
public:
 MyTreeItem(Fl_Tree *tree_val) : Fl_Tree_Item(tree_val) { }
 // DRAW OUR CUSTOM CONTENT FOR THE ITEM
 int draw_item_content(int render) {
 // Our item's dimensions + text content
 int X=label_x(), Y=label_y(), W=label_w(), H=label_h();
 const char *text = label() ? label() : "";
 // Rendering? Do any drawing that's needed
 if (render) {
 // Draw bg -- a filled rectangle
 fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);
 // Draw label
 fl_font(labelfont(), labelsize()); // use item's label font/size
 fl_color(drawfgcolor()); // use recommended fg color
 fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT); // draw the item's label
 }
 // Rendered or not, we must calculate content's max X position
 int lw=0, lh=0;
 fl_measure(text, lw, lh); // get width of label text
 return X + lw; // return X + label width
 }
};
```

You can draw anything you want inside `draw_item_content()` using any of the `fl_draw.H` functions, as long as it's within the label's xywh area.

To add instances of your custom item to the tree, you can use, e.g.:

```
// Example #1: using add()
MyTreeItem *item = new MyTreeItem(tree); // class derived from Fl_Tree_Item
item->label("Bart");
tree->add("/Simpsons/.", item); // Adds custom item as "/Simpsons/Bart"
```

..or you can insert or replace existing items:

```
// Example #2: using replace()
MyTreeItem *marge = new MyTreeItem(tree); // class derived from Fl_Tree_Item
marge->label("Marge");
Fl_Tree_Item *item = tree->add("/Simpsons/Marge"); // create default item
item->replace(marge); // replace default item with custom item
```

#### Parameters

in	<i>render</i>	Whether we should render content (1), or just tally the geometry (0). <a href="#">Fl_Tree</a> may want only to find the widest item in the tree for scrollbar calculations.
----	---------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal scrollbar's size).

## Version

1.3.3 ABI feature

**13.146.3.15 draw\_vertical\_connector()**

```
void Fl_Tree_Item::draw_vertical_connector (
 int x,
 int y1,
 int y2,
 const Fl_Tree_Prefs & prefs) [protected], [virtual]
```

Vertical connector line based on preference settings.

This method can be overridden to implement custom connection line drawing.

## Parameters

in	<i>x</i>	The x position of the vertical connector
in	<i>y1</i>	The top of the vertical connector
in	<i>y2</i>	The bottom of the vertical connector
in	<i>prefs</i>	The <a href="#">Fl_Tree</a> prefs

**13.146.3.16 drawbgcolor()**

```
Fl_Color Fl_Tree_Item::drawbgcolor () const [protected]
```

Returns the recommended background color used for drawing this item.

## See also

[draw\\_item\\_content\(\)](#)

## Version

1.3.3 ABI

**13.146.3.17 drawfgcolor()**

```
Fl_Color Fl_Tree_Item::drawfgcolor () const [protected]
```

Returns the recommended foreground color used for drawing this item.

## See also

[draw\\_item\\_content\(\)](#)

## Version

1.3.3 ABI ABI

**13.146.3.18 find\_child() [1/2]**

```
int Fl_Tree_Item::find_child (
 const char * name)
```

Return the index of the immediate child of this item that has the label 'name'.

## Returns

index of found item, or -1 if not found.

## Version

1.3.0 release

**13.146.3.19 find\_child()** [2/2]

```
int Fl_Tree_Item::find_child (
 Fl_Tree_Item * item)
```

Find the index number for the specified 'item' in the current item's list of children.

**Returns**

the index, or -1 if not found.

**13.146.3.20 find\_child\_item()** [1/2]

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
 char ** arr) const
```

Find child item by descending array 'arr' of names.

Does not include self in search. Only [Fl\\_Tree](#) should need this method.

**Returns**

item, or 0 if not found

**Version**

1.3.0 release

**13.146.3.21 find\_child\_item()** [2/2]

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
 const char * name) const
```

Return the /immediate/ child of current item that has the label 'name'.

**Returns**

const found item, or 0 if not found.

**Version**

1.3.3

**13.146.3.22 find\_clicked()**

```
const Fl_Tree_Item * Fl_Tree_Item::find_clicked (
 const Fl_Tree_Prefs & prefs,
 int yonly = 0) const
```

Find the item that the last event was over.

If 'yonly' is 1, only check event's y value, don't care about x.

**Parameters**

in	<i>prefs</i>	The parent tree's <a href="#">Fl_Tree_Prefs</a>
in	<i>yonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.

**Returns**

pointer to clicked item, or NULL if none found

**Version**

1.3.3 ABI feature

**13.146.3.23 find\_item()**

```
const Fl_Tree_Item * Fl_Tree_Item::find_item (
 char ** names) const
```

Find item by descending array of 'names'.

Includes self in search. Only [Fl\\_Tree](#) should need this method. Use [Fl\\_Tree::find\\_item\(\)](#) instead.

**Returns**

const item, or 0 if not found

**13.146.3.24 hide\_widgets()**

```
void Fl_Tree_Item::hide_widgets () [protected]
```

Internal: Hide the FLTK [widget\(\)](#) for this item and all children.

Used by [close\(\)](#) to hide widgets.

**13.146.3.25 insert()**

```
Fl_Tree_Item * Fl_Tree_Item::insert (
 const Fl_Tree_Prefs & prefs,
 const char * new_label,
 int pos = 0)
```

Insert a new item named 'new\_label' into current item's children at a specified position 'pos'.

If pos is out of range the new item is

- prepended if pos < 0 or
- appended if pos > item->[children\(\)](#).

**Returns**

the new item inserted

**See also**

[Fl\\_Tree::insert\(\)](#)

**13.146.3.26 insert\_above()**

```
Fl_Tree_Item * Fl_Tree_Item::insert_above (
 const Fl_Tree_Prefs & prefs,
 const char * new_label)
```

Insert a new item named 'new\_label' above this item.

**Returns**

the new item inserted, or 0 if an error occurred.

**13.146.3.27 is\_visible\_r()**

```
int Fl_Tree_Item::is_visible_r () const
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

**Returns**

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item or one of its parents are either not [visible\(\)](#) or [close\(\)](#)ed.

**13.146.3.28 label()**

```
void Fl_Tree_Item::label (
 const char * name)
```

Set the label to 'name'.

Makes and manages an internal copy of 'name'.

**13.146.3.29 label\_h()**

```
int Fl_Tree_Item::label_h () const [inline]
```

The item's label height.

**Version**

1.3.3

**13.146.3.30 label\_w()**

```
int Fl_Tree_Item::label_w () const [inline]
```

The item's maximum label width to right edge of [Fl\\_Tree](#)'s inner width within scrollbars.

**Version**

1.3.3

**13.146.3.31 label\_x()**

```
int Fl_Tree_Item::label_x () const [inline]
```

The item's label x position relative to the window.

**Version**

1.3.3

**13.146.3.32 label\_y()**

```
int Fl_Tree_Item::label_y () const [inline]
```

The item's label y position relative to the window.

**Version**

1.3.3

**13.146.3.33 labelbgcolor() [1/2]**

```
Fl_Color Fl_Tree_Item::labelbgcolor () const [inline]
```

Return item's label background text color.

If the color is 0xffffffff, the default behavior is the parent tree's bg color will be used. (An overloaded [draw\\_item\\_content\(\)](#) can override this behavior.)

**13.146.3.34 labelbgcolor() [2/2]**

```
void Fl_Tree_Item::labelbgcolor (
 Fl_Color val) [inline]
```

Set item's label background color.

A special case is made for color 0xffffffff which uses the parent tree's bg color.

**13.146.3.35 move()** [1/2]

```
int Fl_Tree_Item::move (
 Fl_Tree_Item * item,
 int op = 0,
 int pos = 0)
```

Move the current item above/below/into the specified 'item', where 'op' determines the type of move:

- 0: move above 'item' ('pos' ignored)
- 1: move below 'item' ('pos' ignored)
- 2: move into 'item' as a child (at optional position 'pos')

..and 'pos' determines an optional index position after the move.

**Returns**

0 on success. a negative number on error:

- -1: one of the items has no parent
- -2: item's index could not be determined
- -3: bad 'op'
- -4: index range error
- -5: could not deparent
- -6: could not reparent at 'pos'
- (Other return values reserved for future use.)

**See also**

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#)

**13.146.3.36 move()** [2/2]

```
int Fl_Tree_Item::move (
 int to,
 int from)
```

Move an item within its parent using index numbers.

Item is moved 'to' its new position 'from' its old position.

**Returns**

- 0: Success
- -1: range error (e.g. if 'to' or 'from' out of range).
- (Other return values reserved for future use)

**See also**

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\\_into\(\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

**13.146.3.37 move\_above()**

```
int Fl_Tree_Item::move_above (
 Fl_Tree_Item * item)
```

Move the current item above the specified 'item'.

This is the equivalent of calling `move(item,0,0)`.

**Returns**

0 on success.

On error returns a negative value; see [move\(Fl\\_Tree\\_Item\\*,int,int\)](#) for possible error codes.

**See also**

[move\\_below\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 13.146.3.38 move\_below()

```
int Fl_Tree_Item::move_below (
 Fl_Tree_Item * item)
```

Move the current item below the specified 'item'.  
This is the equivalent of calling `move(item,1,0)`.

#### Returns

0 on success.  
On error returns a negative value; see `move(Fl_Tree_Item*,int,int)` for possible error codes.

#### See also

[move\\_above\(\)](#), [move\\_into\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 13.146.3.39 move\_into()

```
int Fl_Tree_Item::move_into (
 Fl_Tree_Item * item,
 int pos = 0)
```

Parent the current item as a child of the specified 'item'.  
This is the equivalent of calling `move(item,2,pos)`.

#### Returns

0 on success.  
On error returns a negative value; see `move(Fl_Tree_Item*,int,int)` for possible error codes.

#### See also

[move\\_above\(\)](#), [move\\_below\(\)](#), [move\(int,int\)](#), [move\(Fl\\_Tree\\_Item\\*,int,int\)](#)

### 13.146.3.40 next()

```
Fl_Tree_Item * Fl_Tree_Item::next ()
```

Return the next item in the tree.

This method can be used to walk the tree forward. For an example of how to use this method, see [Fl\\_Tree::first\(\)](#).

#### Returns

the next item in the tree, or 0 if there's no more items.

### 13.146.3.41 next\_displayed()

```
Fl_Tree_Item * Fl_Tree_Item::next_displayed (
 Fl_Tree_Prefs & prefs)
```

Same as [next\\_visible\(\)](#).

**Deprecated** in 1.3.3 for confusing name, use [next\\_visible\(\)](#) instead

### 13.146.3.42 next\_sibling()

```
Fl_Tree_Item * Fl_Tree_Item::next_sibling ()
```

Return this item's next sibling.

Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing [depth\(\)](#). effectively skipping over this item's children/descendents.

#### Returns

item's next sibling, or 0 if none.

**13.146.3.43 next\_visible()**

```
Fl_Tree_Item * Fl_Tree_Item::next_visible (
 Fl_Tree_Prefs & prefs)
```

Return the next [open\(\)](#), [visible\(\)](#) item.

(If this item has children and is closed, children are skipped)

This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.

**Returns**

the next [open\(\)](#) [visible\(\)](#) item below us, or 0 if there's no more items.

**Version**

1.3.3

**13.146.3.44 parent()**

```
void Fl_Tree_Item::parent (
 Fl_Tree_Item * val) [inline]
```

Set the parent for this item.

Should only be used by [Fl\\_Tree](#)'s internals.

**13.146.3.45 prefs()**

```
const Fl_Tree_Prefs & Fl_Tree_Item::prefs () const
```

Return the parent tree's prefs.

**Returns**

a reference to the parent tree's [Fl\\_Tree\\_Prefs](#)

**Version**

1.3.3 ABI feature

**13.146.3.46 prev()**

```
Fl_Tree_Item * Fl_Tree_Item::prev ()
```

Return the previous item in the tree.

This method can be used to walk the tree backwards. For an example of how to use this method, see [Fl\\_Tree::last\(\)](#).

**Returns**

the previous item in the tree, or 0 if there's no item above this one (hit the root).

**13.146.3.47 prev\_displayed()**

```
Fl_Tree_Item * Fl_Tree_Item::prev_displayed (
 Fl_Tree_Prefs & prefs)
```

Same as [prev\\_visible\(\)](#).

**Deprecated** in 1.3.3 for confusing name, use [prev\\_visible\(\)](#)

**13.146.3.48 prev\_sibling()**

```
Fl_Tree_Item * Fl_Tree_Item::prev_sibling ()
```

Return this item's previous sibling.

Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing [depth\(\)](#).

**Returns**

This item's previous sibling, or 0 if none.

**13.146.3.49 prev\_visible()**

```
Fl_Tree_Item * Fl_Tree_Item::prev_visible (
 Fl_Tree_Prefs & prefs)
```

Return the previous [open\(\)](#), [visible\(\)](#) item.

(If this item above us has children and is closed, its children are skipped)

This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

**Returns**

the previous [open\(\)](#) [visible\(\)](#) item above us, or 0 if there's no more items.

**13.146.3.50 recalc\_tree()**

```
void Fl_Tree_Item::recalc_tree () [protected]
```

Call this when our geometry is changed.

(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

**Version**

1.3.3 ABI

**13.146.3.51 remove\_child() [1/2]**

```
int Fl_Tree_Item::remove_child (
 const char * name)
```

Remove immediate child (and its children) by its label 'name'.

If more than one item matches 'name', only the first matching item is removed.

**Parameters**

<code>in</code>	<code>name</code>	The label name of the immediate child to remove
-----------------	-------------------	-------------------------------------------------

**Returns**

0 if removed, -1 if not found.

**Version**

1.3.3

**13.146.3.52 remove\_child() [2/2]**

```
int Fl_Tree_Item::remove_child (
 Fl_Tree_Item * item)
```

Remove 'item' from the current item's children.

**Returns**

0 if removed, -1 if item not an immediate child.

**13.146.3.53 reparent()**

```
int Fl_Tree_Item::reparent (
 Fl_Tree_Item * newchild,
 int pos)
```

Reparent specified item as a child of ourself at position 'pos'.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

**Returns**

- 0: on success
- -1: on error (e.g. if 'pos' out of range) with no changes made.

**See also**

[deparent\(\)](#)

**13.146.3.54 replace()**

```
Fl_Tree_Item * Fl_Tree_Item::replace (
 Fl_Tree_Item * newitem)
```

Replace the current item with a new item.

The current item is destroyed if successful. No checks are made to see if an item with the same name exists.

This method can be used to, for example, install 'custom' items into the tree derived from [Fl\\_Tree\\_Item](#); see [draw\\_item\\_content\(\)](#).

**Parameters**

in	<i>newitem</i>	The new item to replace the current item
----	----------------	------------------------------------------

**Returns**

*newitem* on success, NULL if could not be replaced.

**See also**

[Fl\\_Tree\\_Item::draw\\_item\\_content\(\)](#), [Fl\\_Tree::root\(Fl\\_Tree\\_Item\\*\)](#)

**Version**

1.3.3 ABI feature

**13.146.3.55 replace\_child()**

```
Fl_Tree_Item * Fl_Tree_Item::replace_child (
 Fl_Tree_Item * olditem,
 Fl_Tree_Item * newitem)
```

Replace existing child 'olditem' with 'newitem'.

The 'olditem' is destroyed if successful. Can be used to put custom items (derived from [Fl\\_Tree\\_Item](#)) into the tree. No checks are made to see if an item with the same name exists.

**Parameters**

in	<i>olditem</i>	The item to be found and replaced
in	<i>newitem</i>	The new item to take the place of 'olditem'

**Returns**

*newitem* on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

**See also**

[replace\(\)](#), [Fl\\_Tree\\_Item::draw\(\)](#)

## Version

1.3.3 ABI feature

**13.146.3.56 select()**

```
void Fl_Tree_Item::select (
 int val = 1) [inline]
```

Change the item's selection state to the optionally specified 'val'.  
If 'val' is not specified, the item will be selected.

**13.146.3.57 select\_all()**

```
int Fl_Tree_Item::select_all () [inline]
```

Select item and all its children.

Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

**13.146.3.58 show\_self()**

```
void Fl_Tree_Item::show_self (
 const char * indent = "") const
```

Print the tree as 'ascii art' to stdout.

Used mainly for debugging.

**13.146.3.59 show\_widgets()**

```
void Fl_Tree_Item::show_widgets () [protected]
```

Internal: Show the FLTK [widget\(\)](#) for this item and all children.

Used by [open\(\)](#) to re-show widgets that were hidden by a previous [close\(\)](#)

**13.146.3.60 swap\_children() [1/2]**

```
int Fl_Tree_Item::swap_children (
 Fl_Tree_Item * a,
 Fl_Tree_Item * b)
```

Swap two of our immediate children, given item pointers.

Use e.g. for sorting.

This method is SLOW because it involves linear lookups.

For speed, use [swap\\_children\(int,int\)](#) instead.

## Parameters

in	<i>a,b</i>	The item ptrs of the two items to swap. Both must be immediate children of the current item.
----	------------	----------------------------------------------------------------------------------------------

## Returns

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

**13.146.3.61 swap\_children() [2/2]**

```
void Fl_Tree_Item::swap_children (
 int ax,
 int bx)
```

Swap two of our children, given two child index values 'ax' and 'bx'.

Use e.g. for sorting.

This method is FAST, and does not involve lookups.

No range checking is done on either index value.

## Parameters

in	<i>ax,bx</i>	the index of the items to swap
----	--------------	--------------------------------

**13.146.3.62 tree()** [1/2]

```
Fl_Tree * Fl_Tree_Item::tree () [inline]
```

Return the tree for this item.

## Version

1.3.4

**13.146.3.63 tree()** [2/2]

```
const Fl_Tree * Fl_Tree_Item::tree () const [inline]
```

Return the tree for this item.

## Version

1.3.3

**13.146.3.64 update\_prev\_next()**

```
void Fl_Tree_Item::update_prev_next (
 int index)
```

Update our `_prev_sibling` and `_next_sibling` pointers to point to neighbors given `index` as being our current position in the parent's item array.

Call this whenever items in the array are added/removed/moved/swapped/etc.

## Parameters

in	<i>index</i>	Our index# in the parent. Special case if <code>index=-1</code> : become an orphan; null out all parent/sibling associations.
----	--------------	----------------------------------------------------------------------------------------------------------------------------------

**13.146.3.65 userdeicon()** [1/2]

```
Fl_Image * Fl_Tree_Item::userdeicon () const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

**13.146.3.66 userdeicon()** [2/2]

```
void Fl_Tree_Item::userdeicon (
 Fl_Image * val) [inline]
```

Set the usericon to draw when the item is deactivated.

Use '0' to disable. No internal copy is made; caller must manage icon's memory.

To create a typical 'grayed out' version of your usericon image, you can do the following:

```
// Create tree + usericon for items
Fl_Tree *tree = new Fl_Tree(..);
Fl_Image *usr_icon = new Fl_Pixmap(..); // your usericon
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..
de_icon->inactive(); // make it 'grayed out'
...
for (..) { // item loop..
 item = tree->add("..."); // create new item
 item->usericon(usr_icon); // assign usericon to items
 item->userdeicon(de_icon); // assign userdeicon to items
}
..
}
```

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)

Version

1.3.4

### 13.146.3.67 usericon()

```
void Fl_Tree_Item::usericon (
 Fl_Image * val) [inline]
```

Set the item's user icon to an [Fl\\_Image](#).

Use '0' to disable. No internal copy is made, caller must manage icon's memory.

Note, if you expect your items to be deactivated(), use [userdeicon\(Fl\\_Image\\*\)](#) to set up a 'grayed out' version of your icon to be used for display.

See also

[userdeicon\(Fl\\_Image\\*\)](#)

### 13.146.3.68 visible\_r()

```
int Fl_Tree_Item::visible_r () const [inline]
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

Alias for [is\\_visible\\_r\(\)](#).

Returns

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item (or one of its parents) are not visible or [close\(\)](#)ed.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Item.H](#)
- [Fl\\_Tree\\_Item.cxx](#)

## 13.147 Fl\_Tree\_Item\_Array Class Reference

Manages an array of [Fl\\_Tree\\_Item](#) pointers.

```
#include <Fl_Tree_Item_Array.H>
```

*Destructor. Calls each item's destructor, destroys internal `_items` array.*

### 13.147.1 Detailed Description

Manages an array of `Fl_Tree_Item` pointers.

Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage the arrays.

None of the methods do range checking on index values; the caller must be sure that index values are within the range  $0 < \text{index} < \text{total}()$  (unless otherwise noted).

### 13.147.2 Constructor & Destructor Documentation

#### 13.147.2.1 Fl\_Tree\_Item\_Array()

```
Fl_Tree_Item_Array::Fl_Tree_Item_Array (
 int new_chunksize = 10)
```

Constructor; creates an empty array.

The optional 'chunksize' can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

### 13.147.3 Member Function Documentation

#### 13.147.3.1 add()

```
void Fl_Tree_Item_Array::add (
 Fl_Tree_Item * val)
```

Add an item\* to the end of the array.

Assumes the item was created with 'new', and will remain allocated.. `Fl_Tree_Item_Array` will handle calling the item's destructor when the array is cleared or the item `remove()`'ed.

#### 13.147.3.2 clear()

```
void Fl_Tree_Item_Array::clear ()
```

Clear the entire array.

Each item will be deleted (destructors will be called), and the array will be cleared. `total()` will return 0.

**13.147.3.3 deparent()**

```
int Fl_Tree_Item_Array::deparent (
 int pos)
```

Deparent item at 'pos' from our list of children.

Similar to a [remove\(\)](#) without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere.

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

**13.147.3.4 insert()**

```
void Fl_Tree_Item_Array::insert (
 int pos,
 Fl_Tree_Item * new_item)
```

Insert an item at index position pos.

Handles enlarging array if needed, total increased by 1.

If \p pos \>= total(), the item is appended to the array.

If \p pos \< 0, the item is prepended (works like pos == 0).

**13.147.3.5 manage\_item\_destroy()**

```
void Fl_Tree_Item_Array::manage_item_destroy (
 int val) [inline]
```

Option to control if [Fl\\_Tree\\_Item\\_Array](#)'s destructor will also destroy the [Fl\\_Tree\\_Item](#)'s.

If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.

**13.147.3.6 move()**

```
int Fl_Tree_Item_Array::move (
 int to,
 int from)
```

Move item at 'from' to new position 'to' in the array.

Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:

- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

**Returns**

0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

**13.147.3.7 remove() [1/2]**

```
int Fl_Tree_Item_Array::remove (
 Fl_Tree_Item * item)
```

Remove the item from the array.

\returns 0 if removed, or -1 if the item was not in the array.

**13.147.3.8 remove() [2/2]**

```
void Fl_Tree_Item_Array::remove (
 int index)
```

Remove the item at.

## Parameters

in	index	from the array.  The item will be delete'd (if non-NULL), so its destructor will be called.
----	-------	---------------------------------------------------------------------------------------------------

**13.147.3.9 reparent()**

```
int Fl_Tree_Item_Array::reparent (
 Fl_Tree_Item * item,
 Fl_Tree_Item * newparent,
 int pos)
```

Reparent specified item as a child of ourself.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

**13.147.3.10 replace()**

```
void Fl_Tree_Item_Array::replace (
 int index,
 Fl_Tree_Item * newitem)
```

Replace the item at index with newitem.

Old item at index position will be destroyed, and the new item will take it's place, and stitched into the linked list.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Item\\_Array.H](#)
- [Fl\\_Tree\\_Item\\_Array.cxx](#)

**13.148 Fl\_Tree\_Prefs Class Reference**

Tree widget's preferences.

```
#include <Fl_Tree_Prefs.H>
```

*Set the widget's left margin value in pixels.*
- `~Fl_Tree_Prefs ()`  
*Fl\_Tree\_Prefs destructor.*

### 13.148.1 Detailed Description

Tree widget's preferences.

[Fl\\_Tree](#)'s Preferences class.

This class manages the [Fl\\_Tree](#)'s defaults. You should probably be using the methods in [Fl\\_Tree](#) instead of trying to accessing tree's preferences settings directly.

### 13.148.2 Member Function Documentation

#### 13.148.2.1 closedeicon()

```
Fl_Image * Fl_Tree_Prefs::closedeicon () const [inline]
```

Return the deactivated version of the close icon, if any.

Returns 0 if none.

#### 13.148.2.2 closeicon()

```
void Fl_Tree_Prefs::closeicon (
 Fl_Image * val)
```

Sets the icon to be used as the 'close' icon.

This overrides the built in default '[-]' icon.

##### Parameters

in	val	– The new image, or zero to use the default '[-]' icon.
----	-----	---------------------------------------------------------

#### 13.148.2.3 item\_draw\_mode()

```
void Fl_Tree_Prefs::item_draw_mode (
 Fl_Tree_Item_Draw_Mode val) [inline]
```

Set the 'item draw mode' used for the tree to val.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl\\_Tree\\_Item\\_Draw\\_Mode](#) for possible values.

#### 13.148.2.4 item\_labelbgcolor() [1/2]

```
Fl_Color Fl_Tree_Prefs::item_labelbgcolor () const [inline]
```

Get the default label background color.

This returns the [Fl\\_Tree::color\(\)](#) unless [item\\_labelbgcolor\(\)](#) has been set explicitly.

**13.148.2.5 item\_labelbgcolor()** [2/2]

```
void Fl_Tree_Prefs::item_labelbgcolor (
 Fl_Color val) [inline]
```

Set the default label background color.

Once set, overrides the default behavior of using [Fl\\_Tree::color\(\)](#).

**13.148.2.6 marginbottom()**

```
int Fl_Tree_Prefs::marginbottom () const [inline]
```

Get the bottom margin's value in pixels.

This is the extra distance the vertical scroller lets you travel.

**13.148.2.7 opendeicon()**

```
Fl_Image * Fl_Tree_Prefs::opendeicon () const [inline]
```

Return the deactivated version of the open icon, if any.

Returns 0 if none.

**13.148.2.8 openicon()** [1/2]

```
Fl_Image * Fl_Tree_Prefs::openicon () const [inline]
```

Get the current default 'open' icon.

Returns the [Fl\\_Image\\*](#) of the icon, or 0 if none.

**13.148.2.9 openicon()** [2/2]

```
void Fl_Tree_Prefs::openicon (
 Fl_Image * val)
```

Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.

This overrides the built in default '[+]' icon.

**Parameters**

in	val	– The new image, or zero to use the default '[+]' icon.
----	-----	---------------------------------------------------------

**13.148.2.10 selectmode()**

```
void Fl_Tree_Prefs::selectmode (
 Fl_Tree_Select val) [inline]
```

Set the selection mode used for the tree to *val*.

This affects how items in the tree are selected when clicked on and dragged over by the mouse. See [Fl\\_Tree\\_Select](#) for possible values.

**13.148.2.11 showcollapse()**

```
void Fl_Tree_Prefs::showcollapse (
 int val) [inline]
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via [open\(\)](#) and [close\(\)](#).

**Parameters**

in	val	1: shows collapse icons (default), 0: hides collapse icons.
----	-----	----------------------------------------------------------------

**13.148.2.12 showroot()**

```
void Fl_Tree_Prefs::showroot (
 int val) [inline]
```

Set if the root item should be shown or not.

**Parameters**

in	val	1 – show the root item (default) 0 – hide the root item.
----	-----	-------------------------------------------------------------

**13.148.2.13 sortorder()**

```
void Fl_Tree_Prefs::sortorder (
 Fl_Tree_Sort val) [inline]
```

Set the default sort order value.

Defines the order new items appear when add()ed to the tree. See Fl\_Tree\_Sort for possible values.

**13.148.2.14 userdeicon()**

```
Fl_Image * Fl_Tree_Prefs::userdeicon () const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

The documentation for this class was generated from the following files:

- [Fl\\_Tree\\_Prefs.H](#)
- [Fl\\_Tree\\_Prefs.cxx](#)

**13.149 Fl\_Valuator Class Reference**

The [Fl\\_Valuator](#) class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```
#include <Fl_Valuator.H>
```

Inheritance diagram for Fl\_Valuator:

**Public Member Functions**

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*

- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for [FI\\_Valuator::format\(char\\* buffer\)](#).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [FI\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [FI\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [FI\\_Valuator::step\(\)](#) const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- **~FI\_Valuator** () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) **align** () const  
*Gets the label alignment.*
- void **align** ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long **argument** () const

- Gets the current user data (long) argument that is passed to the callback function.*

  - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

  - virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()

*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

  - virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*

  - virtual [FI\\_Group](#) \* [as\\_group](#) ()

*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*

  - virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Window](#) \* [as\\_window](#) ()

*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [bind\\_deimage](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void [bind\\_deimage](#) (int f)

*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_image](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- Gets the box type of the widget.*

  - [FI\\_Boxtype](#) [box](#) () const

*Gets the box type of the widget.*

  - void [box](#) ([FI\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- Gets the current callback function for the widget.*

  - [FI\\_Callback\\_p](#) [callback](#) () const

*Gets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- Checks if the widget value changed since the last callback.*

  - unsigned int [changed](#) () const
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_active](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_changed](#) ()
- Clears or sets the damage flags.*

  - void [clear\\_damage](#) (uchar c=0)
- Sets a widget to accept input.*

  - void [clear\\_output](#) ()
- Hides the widget.*

  - void [clear\\_visible](#) ()
- Disables keyboard focus navigation with this widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

  - [FI\\_Color](#) [color](#) () const

- Gets the background color of the widget.*

  - void [color](#) ([FL\\_Color](#) bg)
- Sets the background color of the widget.*

  - void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)
- Sets the background and selection color of the widget.*

  - int [contains](#) (const [FL\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*

  - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*

  - void [deactivate](#) ()
- Deactivates the widget.*

  - [FL\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const [FL\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

  - void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

  - void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - virtual void [draw](#) ()=0
- Draws the widget.*

  - void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int [h](#) () const
- Gets the widget height.*

  - virtual int [handle](#) (int event)
- Handles the specified event.*

  - virtual void [hide](#) ()
- Makes a widget invisible.*

  - int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*

  - void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

- `FL_Image * image ()`  
*Gets the image that is used as part of the widget label when in the active state.*
- `const FL_Image * image () const`  
*Gets the image that is used as part of the widget label when in the active state.*
- `void image (FL_Image &img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void image (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`  
*Returns whether the image is managed by the widget.*
- `int inside (const FL_Widget *wgt) const`  
*Checks if this widget is a child of wgt.*
- `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`  
*Gets the current label text.*
- `void label (const char *text)`  
*Sets the current label pointer.*
- `void label (FL_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*
- `FL_Color labelcolor () const`  
*Gets the label color.*
- `void labelcolor (FL_Color c)`  
*Sets the label color.*
- `FL_Font labelfont () const`  
*Gets the font to use.*
- `void labelfont (FL_Font f)`  
*Sets the font to use.*
- `FL_Fonsize labelsize () const`  
*Gets the font size in pixels.*
- `void labelsize (FL_Fonsize pix)`  
*Sets the font size in pixels.*
- `FL_Labeltype labeltype () const`  
*Gets the label type.*
- `void labeltype (FL_Labeltype a)`  
*Sets the label type.*
- `void measure_label (int &ww, int &hh) const`  
*Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`  
*Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`  
*Sets whether this widget needs a keyboard.*
- `unsigned int output () const`  
*Returns if a widget is used for output only.*
- `FL_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (FL_Group *p)`

- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)  
*Repositions the window or widget.*
  - void [redraw](#) ()  
*Schedules the drawing of the widget.*
  - void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
  - virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
  - [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
  - void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
  - int [send](#) (int event)  
*Sends the specified event to the widget.*
  - void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
  - void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
  - void [set\\_output](#) ()  
*Sets a widget to output only.*
  - void [set\\_visible](#) ()  
*Makes the widget visible.*
  - void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
  - int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
  - void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
  - virtual void [show](#) ()  
*Makes a widget visible.*
  - void [size](#) (int W, int H)  
*Changes the size of the widget.*
  - int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
  - unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
  - int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
  - const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
  - void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
  - [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
  - [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
  - [uchar](#) [type](#) () const  
*Gets the widget type.*
  - void [type](#) ([uchar](#) t)  
*Sets the widget type.*

- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (FL\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- FL\_When **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- FL\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~**FL\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- **FL\_Valuator** (int X, int Y, int W, int H, const char \*L)  
*Creates a new FL\_Valuator widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*

- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value\_damage** ()  
*Asks for partial redraw.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void **default\_callback** ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

 USERFLAG1 = 1<<31 }

```

*flags possible values enumeration.*

### 13.149.1 Detailed Description

The [Fl\\_Valuator](#) class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

There are probably more of these classes in FLTK than any others:

Figure 13.66 Valuator derived from Fl\_Valuator

In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the [type\(\)](#) of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a [type\(0\)](#). For consistency the symbol `FL_VERTICAL` is defined as zero.

### 13.149.2 Constructor & Destructor Documentation

#### 13.149.2.1 Fl\_Valuator()

```
Fl_Valuator::Fl_Valuator (
 int X,
 int Y,
```

```

 int W,
 int H,
 const char * L) [protected]

```

Creates a new [Fl\\_Valuator](#) widget using the given position, size, and label string. The default boxtype is `FL_NO_BOX`.

### 13.149.3 Member Function Documentation

#### 13.149.3.1 `format()`

```

int Fl_Valuator::format (
 char * buffer) [virtual]

```

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a `%g` format is used. If the step value is non-zero, then a `%.*f` format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer.

This method is used by the `Fl_Valuator_...` group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into `buffer`. `buffer` should have space for at least 128 bytes.

You may override this function to create your own text formatting.

#### 13.149.3.2 `format_str()`

```

std::string Fl_Valuator::format_str () [virtual]

```

C++11 API for [Fl\\_Valuator::format\(char\\* buffer\)](#).

Users can override either version to change the format of the text output in the valuator.

#### Returns

the formatted text of the current value

#### See also

[Fl\\_Valuator::format\(char\\* buffer\)](#)

#### 13.149.3.3 `increment()`

```

double Fl_Valuator::increment (
 double v,
 int n)

```

Adds `n` times the step value to the passed value.

If step was set to zero it uses `fabs(maximum() - minimum()) / 100`.

#### 13.149.3.4 `maximum()` [1/2]

```

double Fl_Valuator::maximum () const [inline]

```

Gets the maximum value for the valuator.

#### 13.149.3.5 `maximum()` [2/2]

```

void Fl_Valuator::maximum (
 double a) [inline]

```

Sets the maximum value for the valuator.

### 13.149.3.6 minimum() [1/2]

```
double Fl_Valuator::minimum () const [inline]
```

Gets the minimum value for the valuator.

### 13.149.3.7 minimum() [2/2]

```
void Fl_Valuator::minimum (
 double a) [inline]
```

Sets the minimum value for the valuator.

### 13.149.3.8 precision()

```
void Fl_Valuator::precision (
 int digits)
```

Sets the step value to  $1.0 / 10^{\text{digits}}$ .

Precision `digits` is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

#### Note

For negative values of `digits` the step value is set to  $A = 1.0$  and  $B = 1$ , i.e.  $1.0/1 = 1$ .

### 13.149.3.9 range()

```
void Fl_Valuator::range (
 double a,
 double b) [inline]
```

Sets the minimum and maximum values for the valuator.

When the user manipulates the widget, the value is limited to this range. This clamping is done *after* rounding to the step value (this makes a difference if the range is not a multiple of the step).

The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values are in the opposite direction. This also switches which end of the filled sliders is filled.

Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs the control again and tries to move it further, it is allowed.

The range may affect the display. You must [redraw\(\)](#) the widget after changing the range.

### 13.149.3.10 round()

```
double Fl_Valuator::round (
 double v)
```

Round the passed value to the nearest step increment.

Does nothing if step is zero.

### 13.149.3.11 step()

```
double Fl_Valuator::step () const [inline]
```

Gets or sets the step value.

As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done *before* clamping it to the range. For most widgets the default step is zero.

For precision the step is stored as the ratio of a double  $A$  and an integer  $B = A/B$ . You can set these values directly. Currently setting a floating point value sets the nearest  $A/1$  or  $1/B$  value possible.

### 13.149.3.12 value() [1/2]

```
double Fl_Valuator::value () const [inline]
```

Gets the floating point(double) value.

See [int value\(double\)](#)

**13.149.3.13 value()** [2/2]

```
int Fl_Valuator::value (
 double v)
```

Sets the current value.

The new value is *not* clamped or otherwise changed before storing it. Use [clamp\(\)](#) or [round\(\)](#) to modify the value before calling [value\(\)](#). The widget is redrawn if the new value is different than the current one. The initial value is zero.

[changed\(\)](#) will return true if the user has moved the slider, but it will be turned off by [value\(x\)](#) and just before doing a callback (the callback can turn it back on if desired).

**13.149.3.14 value\_damage()**

```
void Fl_Valuator::value_damage () [protected], [virtual]
```

Asks for partial redraw.

Reimplemented in [Fl\\_Adjuster](#).

The documentation for this class was generated from the following files:

- [Fl\\_Valuator.H](#)
- [Fl\\_Valuator.cxx](#)

**13.150 Fl\_Value\_Input Class Reference**

The [Fl\\_Value\\_Input](#) widget displays a numeric value.

```
#include <Fl_Value_Input.H>
```

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FI_Color` c)  
*Sets the label color.*
- `FI_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FI_Font` f)  
*Sets the font to use.*
- `FI_Fonsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FI_Fonsize` pix)

- Sets the font size in pixels.*

  - `Fl_Labeltype labeltype () const`

*Gets the label type.*

  - `void labeltype (Fl_Labeltype a)`

*Sets the label type.*

  - `void measure_label (int &ww, int &hh) const`

*Sets width ww and height hh accordingly with the label size.*

  - `bool needs_keyboard () const`

*Returns whether this widget needs a keyboard.*

  - `void needs_keyboard (bool needs)`

*Sets whether this widget needs a keyboard.*

  - `unsigned int output () const`

*Returns if a widget is used for output only.*

  - `Fl_Group * parent () const`

*Returns a pointer to the parent widget.*

  - `void parent (Fl_Group *p)`

*Internal use only - "for hacks only".*

  - `void position (int X, int Y)`

*Repositions the window or widget.*

  - `void redraw ()`

*Schedules the drawing of the widget.*

  - `void redraw_label ()`

*Schedules the drawing of the label.*

  - `Fl_Color selection_color () const`

*Gets the selection color.*

  - `void selection_color (Fl_Color a)`

*Sets the selection color.*

  - `int send (int event)`

*Sends the specified event to the widget.*

  - `void set_active ()`

*Marks the widget as active without sending events or changing focus.*

  - `void set_changed ()`

*Marks the value of the widget as changed.*

  - `void set_output ()`

*Sets a widget to output only.*

  - `void set_visible ()`

*Makes the widget visible.*

  - `void set_visible_focus ()`

*Enables keyboard focus navigation with this widget.*

  - `int shortcut_label () const`

*Returns whether the widget's label uses '&' to indicate shortcuts.*

  - `void shortcut_label (int value)`

*Sets whether the widget's label uses '&' to indicate shortcuts.*

  - `virtual void show ()`

*Makes a widget visible.*

  - `void size (int W, int H)`

*Changes the size of the widget.*

  - `int take_focus ()`

*Gives the widget the keyboard focus.*

  - `unsigned int takeevents () const`

*Returns if the widget is able to take events.*

- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip () const`  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window () const`  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type () const`  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data () const`  
*Gets the user data for this widget.*
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`  
*Sets the user data for this widget.*
- `void user_data (void *v)`  
*Sets the user data for this widget.*
- `int vertical_label_margin ()`  
*Get the spacing between the label and the vertical edge of the widget.*
- `void vertical_label_margin (int px)`  
*Set the spacing between the label and the vertical edge of the widget.*
- `unsigned int visible () const`  
*Returns whether a widget is visible.*
- `unsigned int visible_focus () const`  
*Checks whether this widget has a visible focus.*
- `void visible_focus (int v)`  
*Modifies keyboard focus navigation.*
- `int visible_r () const`  
*Returns whether a widget and all its parents are visible.*
- `int w () const`  
*Gets the widget width.*
- `Fl_When when () const`  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~Fl_Widget ()`  
*Destroys the widget.*

## Public Attributes

- `Fl_Input input`

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

### Protected Member Functions inherited from FL\_Valuator

- **FL\_Valuator** (int X, int Y, int W, int H, const char \*L)  
*Creates a new FL\_Valuator widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*

### Protected Member Functions inherited from FL\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **FL\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*

- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from **FL\_Widget**

- static void **default\_callback** (**FL\_Widget** \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

*flags possible values enumeration.*

#### 13.150.1 Detailed Description

The **FL\_Value\_Input** widget displays a numeric value.

The user can click in the text field and edit it - there is in fact a hidden **FL\_Input** widget with type(**FL\_FLOAT\_INPUT**) or type(**FL\_INT\_INPUT**) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If **step()** is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden **FL\_Input** widget is of type(**FL\_FLOAT\_INPUT**).

If **step()** is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one **step()** per pixel, the middle by 10 **step()**, and the right button by 100 \* **step()**. It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If **step()** is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.

## 13.150.2 Constructor & Destructor Documentation

### 13.150.2.1 Fl\_Value\_Input()

```
Fl_Value_Input::Fl_Value_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Value\\_Input](#) widget using the given position, size, and label string. The default boxtype is FL\_DOWN\_BOX.

## 13.150.3 Member Function Documentation

### 13.150.3.1 cursor\_color() [1/2]

```
Fl_Color Fl_Value_Input::cursor_color () const [inline]
```

Gets the color of the text cursor.

The text cursor is black by default.

### 13.150.3.2 cursor\_color() [2/2]

```
void Fl_Value_Input::cursor_color (
 Fl_Color n) [inline]
```

Sets the color of the text cursor.

The text cursor is black by default.

### 13.150.3.3 draw()

```
void Fl_Value_Input::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 13.150.3.4 handle()

```
int Fl_Value_Input::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

**13.150.3.5** `resize()`

```
void Fl_Value_Input::resize (
 int x,
 int y,
 int w,
 int h) [override], [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for `resize(X, Y, w(), h())`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

## Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

## See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Widget](#).

**13.150.3.6** `shortcut()` [1/2]

```
int Fl_Value_Input::shortcut () const [inline]
```

Returns the current shortcut key for the Input.

## See also

[Fl\\_Value\\_Input::shortcut\(int\)](#)

**13.150.3.7** `shortcut()` [2/2]

```
void Fl_Value_Input::shortcut (
 int s) [inline]
```

Sets the shortcut key to *s*.

Setting this overrides the use of '&' in the [label\(\)](#). The value is a bitwise OR of a key and a set of shift flags, for example `FL_ALT | 'a'`, `FL_ALT | (FL_F + 10)`, or just 'a'. A value of 0 disables the shortcut.

The key can be any value returned by [Fl::event\\_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event\\_state\(\)](#). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

#### 13.150.3.8 soft()

```
char Fl_Value_Input::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. The default is true.

#### 13.150.3.9 textcolor()

```
Fl_Color Fl_Value_Input::textcolor () const [inline]
```

Gets the color of the text in the value box.

#### 13.150.3.10 textfont() [1/2]

```
Fl_Font Fl_Value_Input::textfont () const [inline]
```

Gets the typeface of the text in the value box.

#### 13.150.3.11 textfont() [2/2]

```
void Fl_Value_Input::textfont (
 Fl_Font s) [inline]
```

Sets the typeface of the text in the value box.

#### 13.150.3.12 textsize() [1/2]

```
Fl_Fontsize Fl_Value_Input::textsize () const [inline]
```

Gets the size of the text in the value box.

#### 13.150.3.13 textsize() [2/2]

```
void Fl_Value_Input::textsize (
 Fl_Fontsize s) [inline]
```

Sets the size of the text in the value box.

The documentation for this class was generated from the following files:

- Fl\_Value\_Input.H
- Fl\_Value\_Input.cxx

## 13.151 Fl\_Value\_Output Class Reference

The [Fl\\_Value\\_Output](#) widget displays a floating point value.

```
#include <Fl_Value_Output.H>
```

Inheritance diagram for Fl\_Value\_Output:

### Public Member Functions

- `Fl_Value_Output` (int `x`, int `y`, int `w`, int `h`, const char \*`l`=0)  
*Creates a new `Fl_Value_Output` widget using the given position, size, and label string.*
- int `handle` (int) override  
*Handles the specified event.*
- `uchar` `soft` () const  
*If "soft" is turned on, the user is allowed to drag the value outside the range.*
- void `soft` (`uchar` `s`)  
*If "soft" is turned on, the user is allowed to drag the value outside the range.*
- `Fl_Color` `textcolor` () const  
*Sets the color of the text in the value box.*
- void `textcolor` (`Fl_Color` `s`)  
*Gets the color of the text in the value box.*
- `Fl_Font` `textfont` () const  
*Gets the typeface of the text in the value box.*
- void `textfont` (`Fl_Font` `s`)  
*Sets the typeface of the text in the value box.*
- `Fl_Fontsize` `textsize` () const  
*Gets the size of the text in the value box.*
- void `textsize` (`Fl_Fontsize` `s`)

### Public Member Functions inherited from `Fl_Valuator`

- void `bounds` (double `a`, double `b`)  
*Sets the minimum (`a`) and maximum (`b`) values for the valuator widget.*
- double `clamp` (double)  
*Clamps the passed value to the valuator range.*
- virtual int `format` (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string `format_str` ()  
*C++11 API for `Fl_Valuator::format(char* buffer)`.*
- double `increment` (double, int)  
*Adds `n` times the step value to the passed value.*
- double `maximum` () const  
*Gets the maximum value for the valuator.*
- void `maximum` (double `a`)  
*Sets the maximum value for the valuator.*
- double `minimum` () const  
*Gets the minimum value for the valuator.*
- void `minimum` (double `a`)  
*Sets the minimum value for the valuator.*
- void `precision` (int `digits`)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*

- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [FI\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [FI\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [FI\\_Valuator::step\(\)](#) const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- **~FI\_Valuator** () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) **align** () const  
*Gets the label alignment.*
- void **align** ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* **as\_gl\_window** ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FI\\_Group](#) \* **as\_group** ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* **as\_group** () const
- virtual [FI\\_Window](#) \* **as\_window** ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

- Sets the damage bits for an area inside the widget.*

  - int **damage\_resize** (int, int, int, int)

*Internal use only.*
- void **deactivate** ()

*Deactivates the widget.*
- **Fl\_Image** \* **deimage** ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const **Fl\_Image** \* **deimage** () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void **deimage** (**Fl\_Image** &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void **deimage** (**Fl\_Image** \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int **deimage\_bound** () const

*Returns whether the inactive image is managed by the widget.*
- void **do\_callback** (**Fl\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)

*Calls the widget callback function with default arguments.*
- void **do\_callback** (**Fl\_Widget** \*widget, long arg, **Fl\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)

*Calls the widget callback function with arbitrary arguments.*
- void **do\_callback** (**Fl\_Widget** \*widget, void \*arg=0, **Fl\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)

*Calls the widget callback function with arbitrary arguments.*
- void **draw\_label** (int, int, int, int, **Fl\_Align**) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int **h** () const

*Gets the widget height.*
- virtual void **hide** ()

*Makes a widget invisible.*
- int **horizontal\_label\_margin** ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void **horizontal\_label\_margin** (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- **Fl\_Image** \* **image** ()

*Gets the image that is used as part of the widget label when in the active state.*
- const **Fl\_Image** \* **image** () const

*Gets the image that is used as part of the widget label when in the active state.*
- void **image** (**Fl\_Image** &img)

*Sets the image to use as part of the widget label when in the active state.*
- void **image** (**Fl\_Image** \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int **image\_bound** () const

*Returns whether the image is managed by the widget.*
- int **inside** (const **Fl\_Widget** \*wgt) const

*Checks if this widget is a child of wgt.*
- int **is\_label\_copied** () const

*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* **label** () const

*Gets the current label text.*
- void **label** (const char \*text)

*Sets the current label pointer.*
- void **label** (**Fl\_Labeltype** a, const char \*b)

*Shortcut to set the label text and type in one call.*

- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [FL\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [Fl\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*

  - unsigned int [visible](#) () const
- Returns whether a widget is visible.*

  - unsigned int [visible\\_focus](#) () const
- Checks whether this widget has a visible focus.*

  - void [visible\\_focus](#) (int v)
- Modifies keyboard focus navigation.*

  - int [visible\\_r](#) () const
- Returns whether a widget and all its parents are visible.*

- `int w () const`  
*Gets the widget width.*
- `FL_When when () const`  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `FL_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FL_Widget ()`  
*Destroys the widget.*

### Protected Member Functions

- `void draw () override`  
*Draws the widget.*

### Protected Member Functions inherited from `FL_Valuator`

- `FL_Valuator (int X, int Y, int W, int H, const char *L)`  
*Creates a new `FL_Valuator` widget using the given position, size, and label string.*
- `void handle_drag (double newvalue)`  
*Called during a drag operation, after an `FL_WHEN_CHANGED` event is received and before the callback.*
- `void handle_push ()`  
*Stores the current value in the previous value.*
- `void handle_release ()`  
*Called after an `FL_WHEN_RELEASE` event is received and before the callback.*
- `int horizontal () const`  
*Tells if the valuator is an `FL_HORIZONTAL` one.*
- `double previous_value () const`  
*Gets the previous floating point value before an event changed it.*
- `void set_value (double v)`  
*Sets the current floating point value.*
- `double softclamp (double)`  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- `virtual void value_damage ()`  
*Asks for partial redraw.*

### Protected Member Functions inherited from `FL_Widget`

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FL_Boxtype t, FL_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`

- Draws a box of type t, of color c at the position X,Y and size W,H.*
- void `draw_focus` () const
- Draws a focus rectangle around the widget.*
- void `draw_focus` (FI\_Boxtype t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void `draw_focus` (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const
- Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const
- Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int x, int y, int w, int h, const char \*label=0L)
- Creates a widget at the given position and size.*
- unsigned int `flags` () const
- Gets the widget flags mask.*
- void `h` (int v)
- Internal use only.*
- void `set_flag` (unsigned int c)
- Sets a flag in the flags mask.*
- void `w` (int v)
- Internal use only.*
- void `x` (int v)
- Internal use only.*
- void `y` (int v)
- Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void `default_callback` (FI\_Widget \*widget, void \*data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from FI\_Widget

- enum {  
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,  
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7

`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,  
`USERFLAG1` = 1<<31 }  
*flags possible values enumeration.*

### 13.151.1 Detailed Description

The `Fl_Value_Output` widget displays a floating point value.

If `step()` is not zero, the user can adjust the value by dragging the mouse left and right. The left button moves one `step()` per pixel, the middle by  $10 * \text{step}()$ , and the right button by  $100 * \text{step}()$ .

This is much lighter-weight than `Fl_Value_Input` because it contains no text editing code or character buffer.

Figure 13.68 `Fl_Value_Output`

### 13.151.2 Constructor & Destructor Documentation

#### 13.151.2.1 `Fl_Value_Output()`

```
Fl_Value_Output::Fl_Value_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Value_Output` widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`.

Inherited destructor destroys the Valuator.

### 13.151.3 Member Function Documentation

#### 13.151.3.1 `draw()`

```
void Fl_Value_Output::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

#### 13.151.3.2 `handle()`

```
int Fl_Value_Output::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

## Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

**13.151.3.3 soft()** [1/2]

```
uchar Fl_Value_Output::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

**13.151.3.4 soft()** [2/2]

```
void Fl_Value_Output::soft (
 uchar s) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

**13.151.3.5 textcolor()** [1/2]

```
Fl_Color Fl_Value_Output::textcolor () const [inline]
```

Sets the color of the text in the value box.

**13.151.3.6 textcolor()** [2/2]

```
void Fl_Value_Output::textcolor (
 Fl_Color s) [inline]
```

Gets the color of the text in the value box.

**13.151.3.7 textfont()** [1/2]

```
Fl_Font Fl_Value_Output::textfont () const [inline]
```

Gets the typeface of the text in the value box.

**13.151.3.8 textfont()** [2/2]

```
void Fl_Value_Output::textfont (
 Fl_Font s) [inline]
```

Sets the typeface of the text in the value box.

### 13.151.3.9 `textsize()`

```
Fl_Fontsize Fl_Value_Output::textsize () const [inline]
```

Gets the size of the text in the value box.

The documentation for this class was generated from the following files:

- `Fl_Value_Output.H`
- `Fl_Value_Output.cxx`

## 13.152 `Fl_Value_Slider` Class Reference

The `Fl_Value_Slider` widget is a `Fl_Slider` widget with a box displaying the current value.

```
#include <Fl_Value_Slider.H>
```

Inheritance diagram for `Fl_Value_Slider`:

### Public Member Functions

- `Fl_Value_Slider` (int *x*, int *y*, int *w*, int *h*, const char \**l*=0)  
*Creates a new Fl\_Value\_Slider widget using the given position, size, and label string.*
- int `handle` (int) override  
*Handles the specified event.*
- `Fl_Color` `textcolor` () const  
*Gets the color of the text in the value box.*
- void `textcolor` (`Fl_Color` *s*)  
*Sets the color of the text in the value box.*
- `Fl_Font` `textfont` () const  
*Gets the typeface of the text in the value box.*
- void `textfont` (`Fl_Font` *s*)  
*Sets the typeface of the text in the value box.*
- `Fl_Fontsize` `textsize` () const  
*Gets the size of the text in the value box.*
- void `textsize` (`Fl_Fontsize` *s*)  
*Sets the size of the text in the value box.*
- int `value_height` () const  
*Gets the height of the value box in pixels (vertical mode only).*
- void `value_height` (int *s*)  
*Sets the height of the value box in pixels (vertical mode only).*
- int `value_width` () const  
*Gets the width of the value box in pixels (horizontal mode only).*
- void `value_width` (int *s*)  
*Sets the width of the value box in pixels (horizontal mode only).*

## Public Member Functions inherited from FI\_Slider

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- **FI\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new FI\_Slider widget using the given position, size, and label string.*
- **FI\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Slider widget using the given type, position, size, and label string.*
- uchar **num\_ticks** () const  
*Gets the number of tick marks.*
- **Scale\_Type** **scale** () const  
*Gets the scale type.*
- void **scale** (**Scale\_Type** s)  
*Sets the scale type.*
- int **scrollvalue** (int pos, int size, int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- **FI\_Boxtype** **slider** () const  
*Gets the slider box type.*
- void **slider** (**FI\_Boxtype** c)  
*Sets the slider box type.*
- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void **slider\_size** (double v)  
*Set the dimensions of the moving piece of slider.*
- uchar **ticks** () const  
*Gets the tick mark position.*
- void **ticks** (uchar t, uchar num\_ticks=11)  
*Sets the tick mark position for FI\_Nice\_Slider.*

## Public Member Functions inherited from FI\_Valuator

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for FI\_Valuator::format(char\* buffer).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)

- Sets the minimum and maximum values for the valuator.*

  - double **round** (double)
  - Round the passed value to the nearest step increment.*
  - double **step** () const
  - Gets or sets the step value.*
  - void **step** (double a, int b)
  - See double [FI\\_Valuator::step\(\)](#) const*
  - void **step** (double s)
  - See double [FI\\_Valuator::step\(\)](#) const.*
  - void **step** (int a)
  - See double [FI\\_Valuator::step\(\)](#) const*
  - double **value** () const
  - Gets the floating point(double) value.*
  - int **value** (double)
  - Sets the current value.*
  - ~**FI\_Valuator** () override
  - Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()
- Activates the widget.*
- unsigned int **active** () const
- Returns whether the widget is active.*
- int **active\_r** () const
- Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) **align** () const
- Gets the label alignment.*
- void **align** ([FI\\_Align](#) alignment)
- Sets the label alignment.*
- long **argument** () const
- Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
- Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* **as\_gl\_window** ()
- Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FI\\_Group](#) \* **as\_group** ()
- Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* **as\_group** () const
- virtual [FI\\_Window](#) \* **as\_window** ()
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([FI\\_Image](#) \*img)

- Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype](#) [box](#) () const

*Gets the box type of the widget.*
- void [box](#) ([Fl\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- [Fl\\_Callback\\_p](#) [callback](#) () const

*Gets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void [callback](#) ([Fl\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

*Sets a widget to accept input.*
- void [clear\\_visible](#) ()

*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*
- [Fl\\_Color](#) [color](#) () const

*Gets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg)

*Sets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg, [Fl\\_Color](#) sel)

*Sets the background and selection color of the widget.*
- int [contains](#) (const [Fl\\_Widget](#) \*w) const

*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- uchar [damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*

- int **damage\_resize** (int, int, int, int)  
*Internal use only.*
- void **deactivate** ()  
*Deactivates the widget.*
- **FL\_Image** \* **deimage** ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const **FL\_Image** \* **deimage** () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int **deimage\_bound** () const  
*Returns whether the inactive image is managed by the widget.*
- void **do\_callback** (**FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with default arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, long arg, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with arbitrary arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, void \*arg=0, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with arbitrary arguments.*
- void **draw\_label** (int, int, int, int, **FL\_Align**) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int **h** () const  
*Gets the widget height.*
- virtual void **hide** ()  
*Makes a widget invisible.*
- int **horizontal\_label\_margin** ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void **horizontal\_label\_margin** (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- **FL\_Image** \* **image** ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const **FL\_Image** \* **image** () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void **image** (**FL\_Image** &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **image** (**FL\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int **image\_bound** () const  
*Returns whether the image is managed by the widget.*
- int **inside** (const **FL\_Widget** \*wgt) const  
*Checks if this widget is a child of wgt.*
- int **is\_label\_copied** () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* **label** () const  
*Gets the current label text.*
- void **label** (const char \*text)  
*Sets the current label pointer.*
- void **label** (**FL\_Labeltype** a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int **label\_image\_spacing** ()

- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*
- [Fl\\_Color labelcolor](#) () const

*Gets the label color.*
- void [labelcolor](#) ([Fl\\_Color](#) c)

*Sets the label color.*
- [Fl\\_Font labelfont](#) () const

*Gets the font to use.*
- void [labelfont](#) ([Fl\\_Font](#) f)

*Sets the font to use.*
- [Fl\\_Fontsize labelsize](#) () const

*Gets the font size in pixels.*
- void [labelsizes](#) ([Fl\\_Fontsize](#) pix)

*Sets the font size in pixels.*
- [Fl\\_Labeltype labeltype](#) () const

*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)

*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const

*Returns if a widget is used for output only.*
- [Fl\\_Group \\* parent](#) () const

*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [Fl\\_Color selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*

- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

- Gets the widget width.*
- [FI\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [FI\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~FI\\_Widget](#) ()  
*Destroys the widget.*

### Protected Member Functions

- void [draw](#) () override  
*Draws the widget.*

### Protected Member Functions inherited from [FI\\_Slider](#)

- void [draw](#) (int, int, int, int)
- void [draw\\_ticks](#) (const [FI\\_Rect](#) &r, int S)  
*Draw tick marks.*
- int [handle](#) (int, int, int, int, int)
- double [increment\\_lin\\_log](#) (double v, int n, int [range](#))  
*Adds a sensible step value to the passed value.*
- double [position\\_to\\_value](#) (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double [value\\_to\\_position](#) (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

### Protected Member Functions inherited from [FI\\_Valuator](#)

- [FI\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FI\\_Valuator](#) widget using the given position, size, and label string.*
- void [handle\\_drag](#) (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void [handle\\_push](#) ()  
*Stores the current value in the previous value.*
- void [handle\\_release](#) ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int [horizontal](#) () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double [previous\\_value](#) () const  
*Gets the previous floating point value before an event changed it.*
- void [set\\_value](#) (double v)  
*Sets the current floating point value.*
- double [softclamp](#) (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

## Additional Inherited Members

## Public Types inherited from [FI\\_Slider](#)

- enum [Scale\\_Type](#) : uchar { [LINEAR\\_SCALE](#) = 0 , [LOG\\_SCALE](#) }  
*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*
- enum [Tick\\_Position](#) : uchar {  
[TICKS\\_NONE](#) = 0x00 , [TICKS\\_BELOW](#) = 0x01 , [TICKS\\_ABOVE](#) = 0x02 , [TICKS\\_LEFT](#) = 0x01 ,  
[TICKS\\_RIGHT](#) = 0x02 }  
*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*

## Static Public Member Functions inherited from Fl\_Widget

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from Fl\_Widget

*flags possible values enumeration.*

### 13.152.1 Detailed Description

The [Fl\\_Value\\_Slider](#) widget is a [Fl\\_Slider](#) widget with a box displaying the current value.

Figure 13.69 [Fl\\_Value\\_Slider](#)

### 13.152.2 Constructor & Destructor Documentation

#### 13.152.2.1 Fl\_Value\_Slider()

```
Fl_Value_Slider::Fl_Value_Slider (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Value\\_Slider](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

### 13.152.3 Member Function Documentation

#### 13.152.3.1 draw()

```
void Fl_Value_Slider::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Slider](#).

### 13.152.3.2 [handle\(\)](#)

```
int Fl_Value_Slider::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Slider](#).

### 13.152.3.3 [value\\_height\(\)](#) [1/2]

```
int Fl_Value_Slider::value_height () const [inline]
```

Gets the height of the value box in pixels (vertical mode only).

#### Since

1.4.0

### 13.152.3.4 [value\\_height\(\)](#) [2/2]

```
void Fl_Value_Slider::value_height (
 int s) [inline]
```

Sets the height of the value box in pixels (vertical mode only).

Limited range checking is applied but drawing errors may occur if the size `s` is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 25.

## Parameters

in	s	new height of the value box
----	---	-----------------------------

## Since

1.4.0

**13.152.3.5 value\_width()** [1/2]

```
int Fl_Value_Slider::value_width () const [inline]
```

Gets the width of the value box in pixels (horizontal mode only).

## Since

1.4.0

**13.152.3.6 value\_width()** [2/2]

```
void Fl_Value_Slider::value_width (
 int s) [inline]
```

Sets the width of the value box in pixels (horizontal mode only).

Limited range checking is applied but drawing errors may occur if the size *s* is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 35.

## Parameters

in	s	new width of the value box
----	---	----------------------------

## Since

1.4.0

The documentation for this class was generated from the following files:

- `Fl_Value_Slider.H`
- `Fl_Value_Slider.cxx`

**13.153 FI\_Widget Class Reference**

[FI\\_Widget](#) is the base class for all widgets in FLTK.

```
#include <Fl_Widget.H>
```

Inheritance diagram for FI\_Widget:

### Public Member Functions

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **Fl\_Align align** () const  
*Gets the label alignment.*
- void **align** (**Fl\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **Fl\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an **Fl\_Gl\_Window** pointer if this widget is an **Fl\_Gl\_Window**.*
- virtual class **Fl\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **Fl\_Group** \* **as\_group** ()  
*Returns an **Fl\_Group** pointer if this widget is an **Fl\_Group**.*
- virtual **Fl\_Group** const \* **as\_group** () const
- virtual **Fl\_Window** \* **as\_window** ()

- Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* **as\_window** () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) **box** () const
  - Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)
  - Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) **callback** () const
  - Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)
  - Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
  - Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)
  - Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)
  - Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)
  - Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
  - Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()
  - Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()
  - Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)
  - Clears or sets the damage flags.*
- void [clear\\_output](#) ()
  - Sets a widget to accept input.*
- void [clear\\_visible](#) ()
  - Hides the widget.*
- void [clear\\_visible\\_focus](#) ()
  - Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) **color** () const
  - Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)
  - Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)
  - Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const
  - Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)
  - Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

- Sets the current tooltip text.*
- `uchar damage () const`
  - Returns non-zero if `draw()` needs to be called.*
- `void damage (uchar c)`
  - Sets the damage bits for the widget.*
- `void damage (uchar c, int x, int y, int w, int h)`
  - Sets the damage bits for an area inside the widget.*
- `int damage_resize (int, int, int, int)`
  - Internal use only.*
- `void deactivate ()`
  - Deactivates the widget.*
- `Fl_Image * deimage ()`
  - Gets the image that is used as part of the widget label when in the inactive state.*
- `const Fl_Image * deimage () const`
  - Gets the image that is used as part of the widget label when in the inactive state.*
- `void deimage (Fl_Image &img)`
  - Sets the image to use as part of the widget label when in the inactive state.*
- `void deimage (Fl_Image *img)`
  - Sets the image to use as part of the widget label when in the inactive state.*
- `int deimage_bound () const`
  - Returns whether the inactive image is managed by the widget.*
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with default arguments.*
- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with arbitrary arguments.*
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with arbitrary arguments.*
- `virtual void draw ()=0`
  - Draws the widget.*
- `void draw_label (int, int, int, int, Fl_Align) const`
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- `int h () const`
  - Gets the widget height.*
- `virtual int handle (int event)`
  - Handles the specified event.*
- `virtual void hide ()`
  - Makes a widget invisible.*
- `int horizontal_label_margin ()`
  - Get the spacing between the label and the horizontal edge of the widget.*
- `void horizontal_label_margin (int px)`
  - Set the spacing between the label and the horizontal edge of the widget.*
- `Fl_Image * image ()`
  - Gets the image that is used as part of the widget label when in the active state.*
- `const Fl_Image * image () const`
  - Gets the image that is used as part of the widget label when in the active state.*
- `void image (Fl_Image &img)`
  - Sets the image to use as part of the widget label when in the active state.*
- `void image (Fl_Image *img)`
  - Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`
  - Returns whether the image is managed by the widget.*

- int `inside` (const `FL_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FL_Color` c)  
*Sets the label color.*
- `FL_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FL_Font` f)  
*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)  
*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const  
*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)  
*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const  
*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const  
*Returns if a widget is used for output only.*
- `FL_Group` \* `parent` () const  
*Returns a pointer to the parent widget.*
- void `parent` (`FL_Group` \*p)  
*Internal use only - "for hacks only".*
- void `position` (int X, int Y)  
*Repositions the window or widget.*
- void `redraw` ()  
*Schedules the drawing of the widget.*
- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- `FL_Color` `selection_color` () const

- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [Fl\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

- void `vertical_label_margin` (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const  
*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const  
*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `FL_When` when () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `FL_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~FL_Widget` ()  
*Destroys the widget.*

### Static Public Member Functions

- static void `default_callback` (`FL_Widget` \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types

- enum {  
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,  
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7  
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11  
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15  
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`  
= 1<<19 ,  
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,  
`AUTO_DELETE_USER_DATA` = 1<<23 ,  
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,  
`USERFLAG1` = 1<<31 }  
*flags possible values enumeration.*

### Protected Member Functions

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (Fl\_Boxtype t, Fl\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (Fl\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **Fl\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Friends

- class **Fl\_Group**

### 13.153.1 Detailed Description

**Fl\_Widget** is the base class for all widgets in FLTK.

You can't create one of these because the constructor is not public. However you can subclass it.

All "property" accessing methods, such as **color()**, **parent()**, or **argument()** are implemented as trivial inline functions and thus are as fast and small as accessing fields in a structure. Unless otherwise noted, the property setting methods such as **color(n)** or **label(s)** are also trivial inline functions, even if they change the widget's appearance. It is up to the user code to call **redraw()** after these.

## 13.153.2 Member Enumeration Documentation

### 13.153.2.1 anonymous enum

anonymous enum [protected]

flags possible values enumeration.

See [activate\(\)](#), [output\(\)](#), [visible\(\)](#), [changed\(\)](#), [set\\_visible\\_focus\(\)](#)

## Enumerator

INACTIVE	the widget can't receive focus, and is disabled but potentially visible
INVISIBLE	the widget is not drawn, but can receive a few special events
OUTPUT	for output only
NOBORDER	don't draw a decoration ( <a href="#">Fl_Window</a> )
FORCE_POSITION	don't let the window manager position the window ( <a href="#">Fl_Window</a> )
NON_MODAL	this is a hovering toolbar window ( <a href="#">Fl_Window</a> )
SHORTCUT_LABEL	the label contains a shortcut we need to draw
CHANGED	the widget value changed
OVERRIDE	position window on top ( <a href="#">Fl_Window</a> )
VISIBLE_FOCUS	accepts keyboard focus navigation if the widget can have the focus
COPIED_LABEL	the widget label is internally copied, its destruction is handled by the widget
CLIP_CHILDREN	all drawing within this widget will be clipped ( <a href="#">Fl_Group</a> )
MENU_WINDOW	a temporary popup window, dismissed by clicking outside ( <a href="#">Fl_Window</a> )
TOOLTIP_WINDOW	a temporary popup, transparent to events, and dismissed easily ( <a href="#">Fl_Window</a> )
MODAL	a window blocking input to all other windows ( <a href="#">Fl_Window</a> )
NO_OVERLAY	window not using a hardware overlay plane ( <a href="#">Fl_Menu_Window</a> )
GROUP_RELATIVE	Reserved, not implemented. DO NOT USE.
COPIED_TOOLTIP	the widget tooltip is internally copied, its destruction is handled by the widget
FULLSCREEN	a fullscreen window ( <a href="#">Fl_Window</a> )
MAC_USE_ACCENTS_MENU	On the macOS platform, pressing and holding a key on the keyboard opens an accented-character menu window ( <a href="#">Fl_Input</a> , <a href="#">Fl_Text_Editor</a> )
NEEDS_KEYBOARD	set on touch screen devices if a widget needs a keyboard when it gets the focus. Reserved, not yet used in 1.4.0.  See also  <a href="#">Fl_Widget::needs_keyboard()</a>
IMAGE_BOUND	binding the image to the widget will transfer ownership, so that the widget will delete the image when it is no longer needed
DEIMAGE_BOUND	bind the inactive image to the widget, so the widget deletes the image when it is no longer needed
AUTO_DELETE_USER_DATA	automatically call <code>delete</code> on the <code>user_data</code> pointer when destroying this widget; if set, <code>user_data</code> must point to a class derived from the class <a href="#">Fl_Callback_User_Data</a>
MAXIMIZED	a maximized <a href="#">Fl_Window</a>
POPUP	popup window (i.e., positioned relatively to another mapped window)
USERFLAG3	reserved for 3rd party extensions
USERFLAG2	reserved for 3rd party extensions
USERFLAG1	reserved for 3rd party extensions

## 13.153.3 Constructor &amp; Destructor Documentation

## 13.153.3.1 Fl\_Widget()

```
Fl_Widget::Fl_Widget (
 int x,
 int y,
 int w,
 int h,
 const char * label = 0L) [protected]
```

Creates a widget at the given position and size.

The `Fl_Widget` is a protected constructor, but all derived widgets have a matching public constructor. It takes a value for `x()`, `y()`, `w()`, `h()`, and an optional value for `label()`.

#### Parameters

in	<i>x,y</i>	the position of the widget relative to the enclosing window
in	<i>w,h</i>	size of the widget in pixels
in	<i>label</i>	optional text for the widget label

### 13.153.3.2 ~Fl\_Widget()

```
Fl_Widget::~~Fl_Widget () [virtual]
```

Destroys the widget.

Destroys the widget, taking care of throwing focus before if any.

Destroying single widgets is not very common. You almost always want to destroy the parent group instead, which will destroy all of the child widgets and groups in that group.

#### Since

FLTK 1.3, the widget's destructor removes the widget from its parent group, if it is member of a group.

Destruction removes the widget from any parent group! And groups when destroyed destroy all their children. This is convenient and fast. Also removes the widget from the Pen API list.

## 13.153.4 Member Function Documentation

### 13.153.4.1 activate()

```
void Fl_Widget::activate ()
```

Activates the widget.

Changing this value will send `FL_ACTIVATE` to the widget if `active_r()` is true.

#### See also

[active\(\)](#), [active\\_r\(\)](#), [deactivate\(\)](#)

### 13.153.4.2 active()

```
unsigned int Fl_Widget::active () const [inline]
```

Returns whether the widget is active.

#### Return values

0	if the widget is inactive
---	---------------------------

#### See also

[active\\_r\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

### 13.153.4.3 active\_r()

```
int Fl_Widget::active_r () const
```

Returns whether the widget and all of its parents are active.

#### Return values

0	if this or any of the parent widgets are inactive
---	---------------------------------------------------

See also

[active\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

#### 13.153.4.4 align() [1/2]

```
Fl_Align Fl_Widget::align () const [inline]
```

Gets the label alignment.

Returns

label alignment

See also

[label\(\)](#), [align\(Fl\\_Align\)](#), [Fl\\_Align](#)

#### 13.153.4.5 align() [2/2]

```
void Fl_Widget::align (
 Fl_Align alignment) [inline]
```

Sets the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is FL\_ALIGN\_CENTER, which centers the label inside the widget.

Parameters

in	<i>alignment</i>	new label alignment
----	------------------	---------------------

See also

[align\(\)](#), [Fl\\_Align](#)

#### 13.153.4.6 argument() [1/2]

```
long Fl_Widget::argument () const [inline]
```

Gets the current user data (long) argument that is passed to the callback function.

Note

On platforms with `sizeof(long) < sizeof(void*)`, particularly on Windows 64-bit platforms, this method can truncate stored addresses (`void*`) to the size of a `long` value. Use with care and only if you are sure that the stored `user_data` value fits in a `long` value because it was stored with [argument\(long\)](#) or another method using only `long` values. You may want to use [user\\_data\(\)](#) instead.

See also

[user\\_data\(\)](#)

#### 13.153.4.7 argument() [2/2]

```
void Fl_Widget::argument (
 long v) [inline]
```

Sets the current user data (long) argument that is passed to the callback function.

See also

[argument\(\)](#)

**13.153.4.8 as\_gl\_window()**

```
virtual class Fl_Gl_Window * Fl_Widget::as_gl_window () [inline], [virtual]
```

Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Gl\\_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Gl\\_Window](#).

**Return values**

<b>NULL</b>	if this widget is not derived from <a href="#">Fl_Gl_Window</a> .
-------------	-------------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_window\(\)](#)

Reimplemented in [Fl\\_Gl\\_Window](#).

**13.153.4.9 as\_group()**

```
virtual Fl_Group * Fl_Widget::as_group () [inline], [virtual]
```

Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Group](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Group](#), and you can use the returned pointer to access its children or other [Fl\\_Group](#)-specific methods.

**Example:**

```
void my_callback (Fl_Widget *w, void *) {
 Fl_Group *g = w->as_group();
 if (g)
 printf ("This group has %d children\n", g->children());
 else
 printf ("This widget is not a group!\n");
}
```

**Return values**

<b>NULL</b>	if this widget is not derived from <a href="#">Fl_Group</a> .
-------------	---------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[Fl\\_Widget::as\\_window\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented in [Fl\\_Group](#).

**13.153.4.10 as\_window()**

```
virtual Fl_Window * Fl_Widget::as_window () [inline], [virtual]
```

Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Window](#), and you can use the returned pointer to access its children or other [Fl\\_Window](#)-specific methods.

**Return values**

<b>NULL</b>	if this widget is not derived from <a href="#">Fl_Window</a> .
-------------	----------------------------------------------------------------

**Note**

This method is provided to avoid `dynamic_cast`.

**See also**

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented in [Fl\\_Window](#).

**13.153.4.11 bind\_deimage() [1/2]**

```
void Fl_Widget::bind_deimage (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the inactive state.

**Parameters**

<i>in</i>	<i>img</i>	the new image for the deactivated widget
-----------	------------	------------------------------------------

**Note**

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

**See also**

`void deimage\(Fl\_Image\* img\)`

**13.153.4.12 bind\_deimage() [2/2]**

```
void Fl_Widget::bind_deimage (
 int f) [inline]
```

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

**Parameters**

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user
----------	----------------------------------------------------------------------

**See also**

[deimage\\_bound\(\)](#), [bind\\_image\(\)](#)

**13.153.4.13 bind\_image() [1/2]**

```
void Fl_Widget::bind_image (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the active state.

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

Calling [bind\\_image\(\)](#) with a new image will delete the old image if it was bound, and then set the new image, and bind that. If old and new image are the same, nothing happens.

Calling [bind\\_image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

**Parameters**

<i>in</i>	<i>img</i>	the new image for the label
-----------	------------	-----------------------------

See also

[void image\(Fl\\_Image\\* img\)](#)

#### 13.153.4.14 [bind\\_image\(\)](#) [2/2]

```
void Fl_Widget::bind_image (
 int f) [inline]
```

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

Parameters

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user
----------	----------------------------------------------------------------------

See also

[image\\_bound\(\)](#), [bind\\_deimage\(\)](#)

#### 13.153.4.15 [box\(\)](#) [1/2]

```
Fl_Boxtype Fl_Widget::box (
 void) const [inline]
```

Gets the box type of the widget.

Returns

the current box type

See also

[box\(Fl\\_Boxtype\)](#), [Fl\\_Boxtype](#)

#### 13.153.4.16 [box\(\)](#) [2/2]

```
void Fl_Widget::box (
 Fl_Boxtype new_box) [inline]
```

Sets the box type for the widget.

This identifies a routine that draws the background of the widget. See [Fl\\_Boxtype](#) for the available types. The default depends on the widget, but is usually [FL\\_NO\\_BOX](#) or [FL\\_UP\\_BOX](#).

Parameters

<i>in</i>	<i>new_box</i>	the new box type
-----------	----------------	------------------

See also

[box\(\)](#), [Fl\\_Boxtype](#)

#### 13.153.4.17 [callback\(\)](#) [1/6]

```
Fl_Callback_p Fl_Widget::callback () const [inline]
```

Gets the current callback function for the widget.

Each widget has a single callback.

Returns

current callback

**13.153.4.18 callback()** [2/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb) [inline]
```

Sets the current callback function for the widget.  
Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
----	-----------	--------------

**13.153.4.19 callback()** [3/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb,
 Fl_Callback_User_Data * p,
 bool auto_free) [inline]
```

Sets the current callback function and managed user data for the widget.  
Setting `auto_free` will transfer ownership of the callback user data to the widget. Deleting the widget will then also delete the user data.

**Parameters**

in	<i>cb</i>	new callback
in	<i>p</i>	user data
in	<i>auto_free</i>	if set, the widget will free user data when destroyed

**13.153.4.20 callback()** [4/6]

```
void Fl_Widget::callback (
 Fl_Callback * cb,
 void * p) [inline]
```

Sets the current callback function and data for the widget.  
Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
in	<i>p</i>	user data

**13.153.4.21 callback()** [5/6]

```
void Fl_Widget::callback (
 Fl_Callback0 * cb) [inline]
```

Sets the current callback function for the widget.  
Each widget has a single callback.

**Parameters**

in	<i>cb</i>	new callback
----	-----------	--------------

**13.153.4.22 callback()** [6/6]

```
void Fl_Widget::callback (
```

```

 Fl_Callback1 * cb,
 long p = 0) [inline]

```

Sets the current callback function for the widget.  
Each widget has a single callback.

#### Parameters

in	<i>cb</i>	new callback
in	<i>p</i>	user data

#### 13.153.4.23 changed()

```

unsigned int Fl_Widget::changed () const [inline]

```

Checks if the widget value changed since the last callback.

"Changed" is a flag that is turned on when the user changes the value stored in the widget. This is only used by subclasses of [Fl\\_Widget](#) that store values, but is in the base class so it is easier to scan all the widgets in a panel and [do\\_callback\(\)](#) on the changed ones in response to an "OK" button.

Most widgets turn this flag off when they do the callback, and when the program sets the stored value.

#### Note

[do\\_callback\(\)](#) turns this flag off after the callback.

#### Return values

0	if the value did not change
---	-----------------------------

#### See also

[set\\_changed\(\)](#), [clear\\_changed\(\)](#)

[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\)](#)

#### 13.153.4.24 clear\_active()

```

void Fl_Widget::clear_active () [inline]

```

Marks the widget as inactive without sending events or changing focus.

This is mainly for specialized use, for normal cases you want [deactivate\(\)](#).

#### See also

[deactivate\(\)](#)

#### 13.153.4.25 clear\_changed()

```

void Fl_Widget::clear_changed () [inline]

```

Marks the value of the widget as unchanged.

#### See also

[changed\(\)](#), [set\\_changed\(\)](#)

#### 13.153.4.26 clear\_damage()

```

void Fl_Widget::clear_damage (
 uchar c = 0) [inline]

```

Clears or sets the damage flags.

Damage flags are cleared when parts of the widget drawing is repaired.

The optional argument *c* specifies the bits that **are set** after the call (default: 0) and **not** the bits that are cleared!

**Note**

Therefore it is possible to set damage bits with this method, but this should be avoided. Use [damage\(uchar\)](#) instead.

**Parameters**

<code>in</code>	<code>c</code>	new bitmask of damage flags (default: 0)
-----------------	----------------	------------------------------------------

**See also**

[damage\(uchar\)](#), [damage\(\)](#)

**13.153.4.27 clear\_output()**

```
void Fl_Widget::clear_output () [inline]
```

Sets a widget to accept input.

**See also**

[set\\_output\(\)](#), [output\(\)](#)

**13.153.4.28 clear\_visible()**

```
void Fl_Widget::clear_visible () [inline]
```

Hides the widget.

You must still redraw the parent to see a change in the window. Normally you want to use the [hide\(\)](#) method instead.

**13.153.4.29 clear\_visible\_focus()**

```
void Fl_Widget::clear_visible_focus () [inline]
```

Disables keyboard focus navigation with this widget.

Normally, all widgets participate in keyboard focus navigation.

**See also**

[set\\_visible\\_focus\(\)](#), [visible\\_focus\(\)](#), [visible\\_focus\(int\)](#)

**13.153.4.30 color() [1/3]**

```
Fl_Color Fl_Widget::color (
 void) const [inline]
```

Gets the background color of the widget.

**Returns**

current background color

**See also**

[color\(Fl\\_Color\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

**13.153.4.31 color() [2/3]**

```
void Fl_Widget::color (
 Fl_Color bg) [inline]
```

Sets the background color of the widget.

The color is passed to the box routine. The color is either an index into an internal table of RGB colors or an RGB color value generated using [fl\\_rgb\\_color\(\)](#).

The default for most widgets is FL\_BACKGROUND\_COLOR. Use [Fl::set\\_color\(\)](#) to redefine colors in the color map.

## Parameters

<i>in</i>	<i>bg</i>	background color
-----------	-----------	------------------

## See also

[color\(\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#), [selection\\_color\(Fl\\_Color\)](#)

**13.153.4.32 color()** [3/3]

```
void Fl_Widget::color (
 Fl_Color bg,
 Fl_Color sel) [inline]
```

Sets the background and selection color of the widget.  
The two color form sets both the background and selection colors.

## Parameters

<i>in</i>	<i>bg</i>	background color
<i>in</i>	<i>sel</i>	selection color

## See also

[color\(unsigned\)](#), [selection\\_color\(unsigned\)](#)

**13.153.4.33 contains()**

```
int Fl_Widget::contains (
 const Fl_Widget * w) const
```

Checks if *w* is a child of this widget.

## Parameters

<i>in</i>	<i>w</i>	potential child widget
-----------	----------	------------------------

## Returns

Returns 1 if *w* is a child of this widget, or is equal to this widget. Returns 0 if *w* is NULL.

**13.153.4.34 copy\_label()**

```
void Fl_Widget::copy_label (
 const char * new_label)
```

Sets the current label.

Unlike [label\(\)](#), this method allocates a copy of the label string instead of using the original string pointer.  
The internal copy will automatically be freed whenever you assign a new label or when the widget is destroyed.

## Parameters

<i>in</i>	<i>new_label</i>	the new label text
-----------	------------------	--------------------

## See also

[label\(\)](#)

**13.153.4.35 copy\_tooltip()**

```
void Fl_Widget::copy_tooltip (
 const char * text)
```

Sets the current tooltip text.

Unlike [tooltip\(\)](#), this method allocates a copy of the tooltip string instead of using the original string pointer.

The internal copy will automatically be freed whenever you assign a new tooltip or when the widget is destroyed.

If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

**Parameters**

in	<i>text</i>	New tooltip text (an internal copy is made and managed)
----	-------------	---------------------------------------------------------

**See also**

[tooltip\(const char\\*\)](#), [tooltip\(\)](#)

**13.153.4.36 damage() [1/3]**

```
uchar Fl_Widget::damage () const [inline]
```

Returns non-zero if [draw\(\)](#) needs to be called.

The damage value is actually a bit field that the widget subclass can use to figure out what parts to draw.

**Returns**

a bitmap of flags describing the kind of damage to the widget

**See also**

[damage\(uchar\)](#), [clear\\_damage\(uchar\)](#)

**13.153.4.37 damage() [2/3]**

```
void Fl_Widget::damage (
 uchar c)
```

Sets the damage bits for the widget.

Setting damage bits will schedule the widget for the next redraw.

**Parameters**

in	<i>c</i>	bitmask of flags to set
----	----------	-------------------------

**See also**

[damage\(\)](#), [clear\\_damage\(uchar\)](#)

**13.153.4.38 damage() [3/3]**

```
void Fl_Widget::damage (
 uchar c,
 int x,
 int y,
 int w,
 int h)
```

Sets the damage bits for an area inside the widget.

Setting damage bits will schedule the widget for the next redraw.

## Parameters

in	<i>c</i>	bitmask of flags to set
in	<i>x,y,w,h</i>	size of damaged area

## See also

[damage\(\)](#), [clear\\_damage\(uchar\)](#)

**13.153.4.39 deactivate()**

```
void Fl_Widget::deactivate ()
```

Deactivates the widget.

Inactive widgets will be drawn "grayed out", e.g. with less contrast than the active widget. Inactive widgets will not receive any keyboard or mouse button events. Other events (including `FL_ENTER`, `FL_MOVE`, `FL_LEAVE`, `FL_SHORTCUT`, and others) will still be sent. A widget is only active if [active\(\)](#) is true on it *and all of its parents*. Changing this value will send `FL_DEACTIVATE` to the widget if [active\\_r\(\)](#) is true.

Currently you cannot deactivate [Fl\\_Window](#) widgets.

## See also

[activate\(\)](#), [active\(\)](#), [active\\_r\(\)](#)

**13.153.4.40 default\_callback()**

```
void Fl_Widget::default_callback (
 Fl_Widget * widget,
 void * data) [static]
```

The default callback for all widgets that don't set a callback.

This callback function puts a pointer to the widget on the queue returned by [Fl::readqueue\(\)](#). This is the default for all widgets if you don't set a callback.

You can avoid the overhead of this default handling if you set the callback to `NULL` explicitly.

Relying on the default callback and reading the callback queue with [Fl::readqueue\(\)](#) is not recommended. If you need a callback, you should set one with [Fl\\_Widget::callback\(Fl\\_Callback \\*cb, void \\*data\)](#) or one of its variants.

## Parameters

in	<i>widget</i>	the <a href="#">Fl_Widget</a> given to the callback
in	<i>data</i>	user data associated with that callback

## See also

[callback\(\)](#), [Fl::readqueue\(\)](#)  
[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\)](#)

**13.153.4.41 deimage() [1/4]**

```
Fl_Image * Fl_Widget::deimage () [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

## Returns

the current image for the deactivated widget

**13.153.4.42 deimage() [2/4]**

```
const Fl_Image * Fl_Widget::deimage () const [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

**Returns**

the current image for the deactivated widget

**13.153.4.43 deimage() [3/4]**

```
void Fl_Widget::deimage (
 Fl_Image & img)
```

Sets the image to use as part of the widget label when in the inactive state.

**Parameters**

in	<i>img</i>	the new image for the deactivated widget
----	------------	------------------------------------------

**See also**

void [deimage\(Fl\\_Image\\* img\)](#)

**13.153.4.44 deimage() [4/4]**

```
void Fl_Widget::deimage (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the inactive state.

**Parameters**

in	<i>img</i>	the new image for the deactivated widget
----	------------	------------------------------------------

**Note**

The caller is responsible for making sure *img* is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

**See also**

void [bind\\_deimage\(Fl\\_Image\\* img\)](#)

**13.153.4.45 deimage\_bound()**

```
int Fl_Widget::deimage_bound () const [inline]
```

Returns whether the inactive image is managed by the widget.

**Return values**

0	if the image is not bound to the widget
1	if the image will be deleted when the widget is deleted

**See also**

[image\\_bound\(\)](#), [bind\\_deimage\(\)](#)

**13.153.4.46 do\_callback() [1/3]**

```
void Fl_Widget::do_callback (
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) [inline]
```

Calls the widget callback function with default arguments.

This is the same as calling

```
do_callback(this, user_data(), reason);
```

#### Parameters

in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>
----	---------------	----------------------------------------------------------------------------------------------

#### See also

[callback\(\)](#)

[do\\_callback\(Fl\\_Widget \\*widget, void \\*data, Fl\\_Callback\\_Reason reason\), Fl\\_Callback\\_Reason](#)

### 13.153.4.47 do\_callback() [2/3]

```
void Fl_Widget::do_callback (
 Fl_Widget * widget,
 long arg,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) [inline]
```

Calls the widget callback function with arbitrary arguments.

#### Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	call the callback with <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>

#### See also

[callback\(\)](#)

[do\\_callback\(Fl\\_Widget \\*widget, void \\*data\), Fl\\_Callback\\_Reason](#)

### 13.153.4.48 do\_callback() [3/3]

```
void Fl_Widget::do_callback (
 Fl_Widget * widget,
 void * arg = 0,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN)
```

Calls the widget callback function with arbitrary arguments.

All overloads of [do\\_callback\(\)](#) call this method. It does nothing if the widget's [callback\(\)](#) is NULL. It clears the widget's *changed* flag **after** the callback was called unless the callback is the default callback. Hence it is not necessary to call [clear\\_changed\(\)](#) after calling [do\\_callback\(\)](#) in your own widget's [handle\(\)](#) method.

A *reason* must be set for widgets if different actions can trigger the same callback.

#### Note

It is legal to delete the widget in the callback (i.e. in user code), but you must not access the widget in the [handle\(\)](#) method after calling [do\\_callback\(\)](#) if the widget was deleted in the callback. We recommend to use [Fl\\_Widget\\_Tracker](#) to check whether the widget was deleted in the callback.

#### Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	use <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to <a href="#">FL_REASON_UNKNOWN</a>

See also

[default\\_callback\(\)](#)  
[callback\(\)](#)  
class [Fl\\_Widget\\_Tracker](#)  
[Fl::callback\\_reason\(\)](#)

#### 13.153.4.49 draw()

```
virtual void Fl_Widget::draw () [pure virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implemented in [Fl\\_Adjuster](#), [Fl\\_Box](#), [Fl\\_Browser](#), [Fl\\_Button](#), [Fl\\_Cairo\\_Window](#), [Fl\\_Chart](#), [Fl\\_Choice](#), [Fl\\_Clock\\_Output](#), [Fl\\_Counter](#), [Fl\\_Dial](#), [Fl\\_File\\_Input](#), [Fl\\_Flex](#), [Fl\\_FormsBitmap](#), [Fl\\_FormsPixmap](#), [Fl\\_Free](#), [Fl\\_Gl\\_Window](#), [Fl\\_Grid](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input](#), [Fl\\_Input\\_Choice](#), [Fl\\_Light\\_Button](#), [Fl\\_Menu\\_Bar](#), [Fl\\_Menu\\_Button](#), [Fl\\_Pack](#), [Fl\\_Positioner](#), [Fl\\_Progress](#), [Fl\\_Return\\_Button](#), [Fl\\_Roller](#), [Fl\\_Scroll](#), [Fl\\_Scrollbar](#), [Fl\\_Shortcut\\_Button](#), [Fl\\_Slider](#), [Fl\\_Spinner](#), [Fl\\_Sys\\_Menu\\_Bar](#), [Fl\\_Table](#), [Fl\\_Tabs](#), [Fl\\_Text\\_Display](#), [Fl\\_Timer](#), [Fl\\_Tree](#), [Fl\\_Value\\_Input](#), [Fl\\_Value\\_Output](#), [Fl\\_Value\\_Slider](#), [Fl\\_Window](#), [Fl\\_Wizard](#), [Fl\\_FormsText](#), [Fl\\_Glut\\_Window](#), and [Fl\\_Terminal](#).

#### 13.153.4.50 draw\_focus() [1/3]

```
void Fl_Widget::draw_focus () const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the widget's boxtype and coordinates and its background color [color\(\)](#).

See also

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int, Fl\\_Color\) const](#)

#### 13.153.4.51 draw\_focus() [2/3]

```
void Fl_Widget::draw_focus (
 Fl_Boxtype t,
 int X,
 int Y,
 int W,
 int H) const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the given boxtype and coordinates and the widget's background color [color\(\)](#).

See also

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int, Fl\\_Color\) const](#)

#### 13.153.4.52 draw\_focus() [3/3]

```
void Fl_Widget::draw_focus (
 Fl_Boxtype bt,
 int X,
 int Y,
 int W,
```

```
int H,
 Fl_Color bg) const [protected]
```

Draws a focus box for the widget at the given position and size.

This method does nothing if

- the global option [Fl::visible\\_focus\(\)](#) or
- the per-widget option [visible\\_focus\(\)](#) is false (off).

This means that [Fl\\_Widget::draw\\_focus\(\)](#) or one of the more specialized methods can be called without checking these visible focus options.

#### Note

This method must only be called if the widget has the focus. This is not tested internally.

The boxtype `bt` is used to calculate the inset so the focus box is drawn inside the box borders.

The default focus box drawing color is black. The background color `bg` is used to determine a better visible color if necessary by using [fl\\_contrast\(\)](#) with the given background color.

#### Parameters

in	<i>bt</i>	Boxtype that needs to be considered (frame width)
in	<i>X,Y,W,H</i>	Bounding box
in	<i>bg</i>	Background color

#### See also

[Fl\\_Widget::draw\\_focus\(\)](#)

[Fl\\_Widget::draw\\_focus\(Fl\\_Boxtype, int, int, int, int\) const](#)

#### 13.153.4.53 draw\_label() [1/3]

```
void Fl_Widget::draw_label () const [protected]
```

Draws the widget's label at the defined label position.

This is the normal call for a widget's [draw\(\)](#) method.

#### 13.153.4.54 draw\_label() [2/3]

```
void Fl_Widget::draw_label (
 int X,
 int Y,
 int W,
 int H) const [protected]
```

Draws the label in an arbitrary bounding box.

[draw\(\)](#) can use this instead of [draw\\_label\(void\)](#) to change the bounding box

#### 13.153.4.55 draw\_label() [3/3]

```
void Fl_Widget::draw_label (
 int X,
 int Y,
 int W,
 int H,
 Fl_Align a) const
```

Draws the label in an arbitrary bounding box with an arbitrary alignment.

Anybody can call this to force the label to draw anywhere.

**13.153.4.56 h() [1/2]**

```
int Fl_Widget::h () const [inline]
```

Gets the widget height.

**Returns**

the height of the widget in pixels.

**13.153.4.57 h() [2/2]**

```
void Fl_Widget::h (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

**13.153.4.58 handle()**

```
int Fl_Widget::handle (
 int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

**Parameters**

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

**Return values**

0	if the event was not used or understood
1	if the event was used and can be deleted

**See also**

[Fl\\_Event](#)

Reimplemented in [Fl\\_Color\\_Chooser](#), [Fl\\_Free](#), [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Text\\_Editor](#), [Fl\\_Tree](#), [Fl\\_Browser\\_](#), [Fl\\_File\\_Input](#), [Fl\\_Scheme\\_Choice](#), [Fl\\_Spinner::Fl\\_Spinner\\_Input](#), [Fl\\_Spinner](#), [Fl\\_Table\\_Row](#), [Fl\\_Tile](#), [Fl\\_Adjuster](#), [Fl\\_Box](#), [Fl\\_Button](#), [Fl\\_Check\\_Browser](#), [Fl\\_Choice](#), [Fl\\_Clock](#), [Fl\\_Counter](#), [Fl\\_Dial](#), [Fl\\_Gl\\_Window](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input](#), [Fl\\_Light\\_Button](#), [Fl\\_Menu\\_Bar](#), [Fl\\_Menu\\_Button](#), [Fl\\_Positioner](#), [Fl\\_Repeat\\_Button](#), [Fl\\_Return\\_Button](#), [Fl\\_Roller](#), [Fl\\_Scroll](#), [Fl\\_Scrollbar](#), [Fl\\_Secret\\_Input](#), [Fl\\_Shortcut\\_Button](#), [Fl\\_Slider](#), [Fl\\_Tabs](#), [Fl\\_Timer](#), [Fl\\_Value\\_Input](#), [Fl\\_Value\\_Output](#), [Fl\\_Value\\_Slider](#), [Fl\\_Window](#), and [Fl\\_Glut\\_Window](#).

**13.153.4.59 hide()**

```
void Fl_Widget::hide () [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented in [Fl\\_Browser](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Overlay\\_Window](#), and [Fl\\_Window](#).

#### 13.153.4.60 `horizontal_label_margin()` [1/2]

```
int Fl_Widget::horizontal_label_margin () [inline]
```

Get the spacing between the label and the horizontal edge of the widget.

Returns

px gap in pixels

#### 13.153.4.61 `horizontal_label_margin()` [2/2]

```
void Fl_Widget::horizontal_label_margin (
 int px) [inline]
```

Set the spacing between the label and the horizontal edge of the widget.

Parameters

in	<i>px</i>	gap in pixels
----	-----------	---------------

#### 13.153.4.62 `image()` [1/4]

```
Fl_Image * Fl_Widget::image () [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

#### 13.153.4.63 `image()` [2/4]

```
const Fl_Image * Fl_Widget::image () const [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

#### 13.153.4.64 `image()` [3/4]

```
void Fl_Widget::image (
 Fl_Image & img)
```

Sets the image to use as part of the widget label when in the active state.

Parameters

in	<i>img</i>	the new image for the label
----	------------	-----------------------------

See also

[void image\(Fl\\_Image\\* img\)](#)

#### 13.153.4.65 image() [4/4]

```
void Fl_Widget::image (
 Fl_Image * img)
```

Sets the image to use as part of the widget label when in the active state.

The caller is responsible for making sure `img` is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

Calling [image\(\)](#) with a new image will delete the old image if it was bound, and set the new image without binding it. If old and new are the same, the image will not be deleted, but it will be unbound.

Calling [image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

Parameters

in	<i>img</i>	the new image for the label
----	------------	-----------------------------

See also

[bind\\_image\(Fl\\_Image\\* img\)](#)

#### 13.153.4.66 image\_bound()

```
int Fl_Widget::image_bound () const [inline]
```

Returns whether the image is managed by the widget.

Return values

0	if the image is not bound to the widget
1	if the image will be deleted when the widget is deleted

See also

[deimage\\_bound\(\)](#), [bind\\_image\(\)](#)

#### 13.153.4.67 inside()

```
int Fl_Widget::inside (
 const Fl_Widget * wgt) const [inline]
```

Checks if this widget is a child of `wgt`.

Returns 1 if this widget is a child of `wgt`, or is equal to `wgt`. Returns 0 if `wgt` is NULL.

Parameters

in	<i>wgt</i>	the possible parent widget.
----	------------	-----------------------------

See also

[contains\(\)](#)

#### 13.153.4.68 is\_label\_copied()

```
int Fl_Widget::is_label_copied () const [inline]
```

Returns whether the current label was assigned with [copy\\_label\(\)](#).  
This can be useful for temporarily overwriting the widget's label and restoring it later.

#### Return values

0	current label was assigned with <a href="#">label()</a> .
1	current label was assigned with <a href="#">copy_label()</a> .

#### 13.153.4.69 [label\(\)](#) [1/3]

```
const char * Fl_Widget::label () const [inline]
```

Gets the current label text.

#### Returns

a pointer to the current label text

#### See also

[label\(const char \\*\)](#), [copy\\_label\(const char \\*\)](#)

#### 13.153.4.70 [label\(\)](#) [2/3]

```
void Fl_Widget::label (
 const char * text)
```

Sets the current label pointer.

The label is shown somewhere on or next to the widget. See [Labels and Label Types](#) for details about what can be put in a label. The passed pointer is stored unchanged in the widget (the string is *not* copied), so if you need to set the label to a formatted value, make sure the buffer is static, global, or allocated. The [copy\\_label\(\)](#) method can be used to make a copy of the label string automatically.

#### Parameters

in	<i>text</i>	pointer to new label text
----	-------------	---------------------------

#### See also

[copy\\_label\(\)](#)

#### 13.153.4.71 [label\(\)](#) [3/3]

```
void Fl_Widget::label (
 Fl_Labeltype a,
 const char * b) [inline]
```

Shortcut to set the label text and type in one call.

#### See also

[label\(const char \\*\)](#), [labeltype\(Fl\\_Labeltype\)](#)

#### 13.153.4.72 [label\\_image\\_spacing\(\)](#) [1/2]

```
int Fl_Widget::label_image_spacing () [inline]
```

Return the gap size between the label and the image.

#### Returns

spacing in pixels

**13.153.4.73 label\_image\_spacing()** [2/2]

```
void Fl_Widget::label_image_spacing (
 int gap) [inline]
```

Set the gap between the label and the image in pixels.  
This value is limited to 0..255.

**Parameters**

in	<i>gap</i>	spacing in pixels
----	------------	-------------------

**13.153.4.74 labelShortcut()**

```
unsigned int Fl_Widget::labelShortcut (
 const char * t) [static]
```

Returns the Unicode value of the '&x' shortcut in a given text.

The given text *t* (usually a widget's label or a menu text) is searched for a '&x' shortcut label, and if found, the Unicode value (code point) of the '&x' shortcut is returned.

**Parameters**

<i>t</i>	text or label to search for '&x' shortcut.
----------	--------------------------------------------

**Returns**

Unicode (UCS-4) value of shortcut in *t* or 0.

**Note**

Internal use only.

**13.153.4.75 labelcolor()** [1/2]

```
Fl_Color Fl_Widget::labelcolor () const [inline]
```

Gets the label color.

The default color is FL\_FOREGROUND\_COLOR.

**Returns**

the current label color

**13.153.4.76 labelcolor()** [2/2]

```
void Fl_Widget::labelcolor (
 Fl_Color c) [inline]
```

Sets the label color.

The default color is FL\_FOREGROUND\_COLOR.

**Parameters**

in	<i>c</i>	the new label color
----	----------	---------------------

**13.153.4.77 labelfont()** [1/2]

```
Fl_Font Fl_Widget::labelfont () const [inline]
```

Gets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set\\_font\(\)](#) can define new typefaces.

#### Returns

current font used by the label

#### See also

[Fl\\_Font](#)

### 13.153.4.78 labelfont() [2/2]

```
void Fl_Widget::labelfont (
 Fl_Font f) [inline]
```

Sets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set\\_font\(\)](#) can define new typefaces.

#### Parameters

<i>in</i>	<i>f</i>	the new font for the label
-----------	----------	----------------------------

#### See also

[Fl\\_Font](#)

### 13.153.4.79 labelsize() [1/2]

```
Fl_Fontsize Fl_Widget::labelsize () const [inline]
```

Gets the font size in pixels.

The default size is 14 pixels.

#### Returns

the current font size

### 13.153.4.80 labelsize() [2/2]

```
void Fl_Widget::labelsize (
 Fl_Fontsize pix) [inline]
```

Sets the font size in pixels.

#### Parameters

<i>in</i>	<i>pix</i>	the new font size
-----------	------------	-------------------

#### See also

[Fl\\_Fontsize labelsize\(\)](#)

### 13.153.4.81 labeltype() [1/2]

```
Fl_Labeltype Fl_Widget::labeltype () const [inline]
```

Gets the label type.

**Returns**

the current label type.

**See also**

[Fl\\_Labeltype](#)

**13.153.4.82 labeltype() [2/2]**

```
void Fl_Widget::labeltype (
 Fl_Labeltype a) [inline]
```

Sets the label type.

The label type identifies the function that draws the label of the widget. This is generally used for special effects such as embossing or for using the [label\(\)](#) pointer as another form of data such as an icon. The value FL\_NORMAL\_LABEL prints the label as plain text.

**Parameters**

<code>in</code>	<code>a</code>	new label type
-----------------	----------------	----------------

**See also**

[Fl\\_Labeltype](#)

**13.153.4.83 measure\_label()**

```
void Fl_Widget::measure_label (
 int & ww,
 int & hh) const [inline]
```

Sets width `ww` and height `hh` accordingly with the label size.

Labels with images will return `w()` and `h()` of the image.

This calls [fl\\_measure\(\)](#) internally. For more information about the arguments `ww` and `hh` and word wrapping

**See also**

[fl\\_measure\(const char\\*, int&, int&, int\)](#)

**13.153.4.84 needs\_keyboard() [1/2]**

```
bool Fl_Widget::needs_keyboard () const [inline]
```

Returns whether this widget needs a keyboard.

**Returns**

true or false

**See also**

[needs\\_keyboard\(bool\)](#)

**13.153.4.85 needs\_keyboard() [2/2]**

```
void Fl_Widget::needs_keyboard (
 bool needs) [inline]
```

Sets whether this widget needs a keyboard.

Set this on touch screen devices if a widget needs a keyboard when it gets the focus.

**Note**

This flag can be set but is not yet **used** in FLTK 1.4.0. It is intended to be used in the future on real touch devices.

## Parameters

in	needs	Set this to true or false
----	-------	---------------------------

**13.153.4.86 output()**

```
unsigned int Fl_Widget::output () const [inline]
```

Returns if a widget is used for output only.

[output\(\)](#) means the same as [lactive\(\)](#) except it does not change how the widget is drawn. The widget will not receive any events. This is useful for making scrollbars or buttons that work as displays rather than input devices.

## Return values

0	if the widget is used for input and output
---	--------------------------------------------

## See also

[set\\_output\(\)](#), [clear\\_output\(\)](#)

**13.153.4.87 parent()** [1/2]

```
Fl_Group * Fl_Widget::parent () const [inline]
```

Returns a pointer to the parent widget.

Usually this is a [Fl\\_Group](#) or [Fl\\_Window](#).

## Return values

NULL	if the widget has no parent
------	-----------------------------

## See also

[Fl\\_Group::add\(Fl\\_Widget\\*\)](#)

**13.153.4.88 parent()** [2/2]

```
void Fl_Widget::parent (
 Fl_Group * p) [inline]
```

Internal use only - "for hacks only".

It is ***STRONGLY recommended*** not to use this method, because it short-circuits [Fl\\_Group](#)'s normal widget adding and removing methods, if the widget is already a child widget of another [Fl\\_Group](#).

Use [Fl\\_Group::add\(Fl\\_Widget\\*\)](#) and/or [Fl\\_Group::remove\(Fl\\_Widget\\*\)](#) instead.

**13.153.4.89 position()**

```
void Fl_Widget::position (
 int X,
 int Y) [inline]
```

Repositions the window or widget.

[position\(X, Y\)](#) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#).

## Parameters

in	X,Y	new position relative to the parent window
----	-----	--------------------------------------------

See also

[resize\(int,int,int,int\)](#), [size\(int,int\)](#)

#### 13.153.4.90 redraw()

```
void Fl_Widget::redraw ()
```

Schedules the drawing of the widget.

Marks the widget as needing its [draw\(\)](#) routine called.

#### 13.153.4.91 redraw\_label()

```
void Fl_Widget::redraw_label ()
```

Schedules the drawing of the label.

Marks the widget or the parent as needing a redraw for the label area of a widget.

#### 13.153.4.92 resize()

```
void Fl_Widget::resize (
 int x,
 int y,
 int w,
 int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and [size\(W, H\)](#) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

##### Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented in [Fl\\_Browser\\_](#), [Fl\\_Flex](#), [Fl\\_Grid](#), [Fl\\_Input\\_Choice](#), [Fl\\_Pack](#), [Fl\\_Scroll](#), [Fl\\_Spinner](#), [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Tile](#), [Fl\\_Window](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Group](#), [Fl\\_Help\\_View](#), [Fl\\_Input\\_](#), [Fl\\_Overlay\\_Window](#), [Fl\\_Tabs](#), [Fl\\_Tree](#), and [Fl\\_Value\\_Input](#).

#### 13.153.4.93 selection\_color() [1/2]

```
Fl_Color Fl_Widget::selection_color () const [inline]
```

Gets the selection color.

##### Returns

the current selection color

See also

[selection\\_color\(Fl\\_Color\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

**13.153.4.94 selection\_color()** [2/2]

```
void Fl_Widget::selection_color (
 Fl_Color a) [inline]
```

Sets the selection color.

The selection color is defined for Forms compatibility and is usually used to color the widget when it is selected, although some widgets use this color for other purposes. You can set both colors at once with [color\(Fl\\_Color bg, Fl\\_Color sel\)](#).

**Parameters**

in	<i>a</i>	the new selection color
----	----------	-------------------------

**See also**

[selection\\_color\(\)](#), [color\(Fl\\_Color, Fl\\_Color\)](#)

**13.153.4.95 send()**

```
int Fl_Widget::send (
 int event)
```

Sends the specified event to the widget.

This is a wrapper for [handle\(\)](#), used by groups to send events to child widgets. If the target is a subwindow, [send](#) updates mouse coordinates and does some additional event processing before calling [handle\(\)](#).

**Parameters**

in	<i>event</i>	the kind of event to send
----	--------------	---------------------------

**Returns**

the return value of [handle\(event\)](#)

**13.153.4.96 set\_active()**

```
void Fl_Widget::set_active () [inline]
```

Marks the widget as active without sending events or changing focus.

This is mainly for specialized use, for normal cases you want [activate\(\)](#).

**See also**

[activate\(\)](#)

**13.153.4.97 set\_changed()**

```
void Fl_Widget::set_changed () [inline]
```

Marks the value of the widget as changed.

**See also**

[changed\(\)](#), [clear\\_changed\(\)](#)

**13.153.4.98 set\_output()**

```
void Fl_Widget::set_output () [inline]
```

Sets a widget to output only.

**See also**

[output\(\)](#), [clear\\_output\(\)](#)

#### 13.153.4.99 set\_visible()

```
void Fl_Widget::set_visible () [inline]
```

Makes the widget visible.

You must still redraw the parent widget to see a change in the window. Normally you want to use the [show\(\)](#) method instead.

#### 13.153.4.100 set\_visible\_focus()

```
void Fl_Widget::set_visible_focus () [inline]
```

Enables keyboard focus navigation with this widget.

Note, however, that this will not necessarily mean that the widget will accept focus, but for widgets that can accept focus, this method enables it if it has been disabled.

See also

[visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#), [visible\\_focus\(int\)](#)

#### 13.153.4.101 shortcut\_label() [1/2]

```
int Fl_Widget::shortcut_label () const [inline]
```

Returns whether the widget's label uses '&' to indicate shortcuts.

See also

[void shortcut\\_label\(int value\)](#)

#### 13.153.4.102 shortcut\_label() [2/2]

```
void Fl_Widget::shortcut_label (
 int value) [inline]
```

Sets whether the widget's label uses '&' to indicate shortcuts.

By default, all objects of classes [Fl\\_Menu\\_](#) (and derivatives), [Fl\\_Button](#) (and derivatives), [Fl\\_Text\\_Display](#), [Fl\\_Value\\_Input](#), and [Fl\\_Input\\_](#) (and derivatives) use character '&' in their label, unless '&' is repeated, to indicate shortcuts: '&' does not appear in the drawn label, the next character after '&' in the label is drawn underlined, and typing this character triggers the corresponding menu window, button, or other widget. If the label contains 2 consecutive '&', only one is drawn and the next character is not underlined and not used as a shortcut. If `value` is set to 0, all these labels don't process character '&' as indicating a shortcut: '&' is drawn in the label, the next character is not underlined and does not define a shortcut.

#### 13.153.4.103 show()

```
void Fl_Widget::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented in [Fl\\_Browser](#), [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Overlay\\_Window](#), [Fl\\_Single\\_Window](#), [Fl\\_Tabs](#), and [Fl\\_Window](#).

**13.153.4.104 size()**

```
void Fl_Widget::size (
 int W,
 int H) [inline]
```

Changes the size of the widget.

size(W, H) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

**Parameters**

in	<i>W,H</i>	new size
----	------------	----------

**See also**

[position\(int,int\)](#), [resize\(int,int,int,int\)](#)

**13.153.4.105 take\_focus()**

```
int Fl_Widget::take_focus ()
```

Gives the widget the keyboard focus.

Tries to make this widget be the [Fl::focus\(\)](#) widget, by first sending it an FL\_FOCUS event, and if it returns non-zero, setting [Fl::focus\(\)](#) to this widget. You should use this method to assign the focus to a widget.

**Returns**

true if the widget accepted the focus.

**13.153.4.106 takesevents()**

```
unsigned int Fl_Widget::takesevents () const [inline]
```

Returns if the widget is able to take events.

This is the same as ([active\(\)](#) && ![output\(\)](#) && [visible\(\)](#)) but is faster.

**Return values**

0	if the widget takes no events
---	-------------------------------

**13.153.4.107 test\_shortcut() [1/2]**

```
int Fl_Widget::test_shortcut ()
```

Returns true if the widget's label contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually FL\_KEYDOWN or FL\_SHORTCUT). The widget's label is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event\\_text\(\)](#) is used to get the entered key value.

**Returns**

true, if the entered text matches the widget's '&x' shortcut, false (0) otherwise.

**Note**

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of FL\_SHORTCUT.

**13.153.4.108 test\_shortcut() [2/2]**

```
int Fl_Widget::test_shortcut (
 const char * t,
 const bool require_alt = false) [static]
```

Returns true if the given text `t` contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually `FL_KEYDOWN` or `FL_SHORTCUT`). The given text `t` (usually a widget's label or menu text) is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event\\_text\(\)](#) is used to get the entered key value. [Fl::event\\_state\(\)](#) is used to get the Alt modifier, if `require_alt` is true.

#### Parameters

<code>t</code>	text or label to search for '&x' shortcut.
<code>require_alt</code>	if true: match only if Alt key is pressed.

#### Returns

true, if the entered text matches the '&x' shortcut in `t` false (0) otherwise.

#### Note

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of `FL_SHORTCUT`.

#### 13.153.4.109 tooltip() [1/2]

```
const char * Fl_Widget::tooltip () const [inline]
```

Gets the current tooltip text.

#### Returns

a pointer to the tooltip text or NULL

#### See also

[tooltip\(const char\\*\)](#), [copy\\_tooltip\(const char\\*\)](#)

#### 13.153.4.110 tooltip() [2/2]

```
void Fl_Widget::tooltip (
 const char * text)
```

Sets the Tooltip Text for a Widget.

Assigns a tooltip string that appears in a popup when the user hovers over the widget. The provided string is not copied. The caller must ensure it remains valid by storing it in a static, global, or dynamically allocated buffer. If you need the tooltip string to be copied and managed automatically, use [copy\\_tooltip\(\)](#).

By default, a widget inherits the tooltip of its parent if none is explicitly set. If you assign a tooltip to a group but not to its child widgets, the child widgets will display the group's tooltip. To prevent inheritance, set the child's tooltip to an empty string ("").

Tooltips can be updated dynamically before they are displayed. When a tooltip is about to be shown, FLTK sends an `FL_BEFORE_TOOLTIP` event to the widget's [handle\(\)](#) method. Developers can override the tooltip text temporarily using [Fl\\_Tooltip::override\\_text\(const char\\* new\\_text\)](#) and returning 1 from [handle\(\)](#) to apply the change.

#### Parameters

<code>in</code>	<code>text</code>	New tooltip text (no copy is made)
-----------------	-------------------	------------------------------------

#### See also

[copy\\_tooltip\(const char\\*\)](#), [tooltip\(\)](#)

**13.153.4.111 top\_window()**

```
Fl_Window * Fl_Widget::top_window () const
```

Returns a pointer to the top-level window for the widget.

In other words, the 'window manager window' that contains this widget. This method differs from `window()` in that it won't return sub-windows (if there are any).

**Returns**

the top-level window, or NULL if no top-level window is associated with this widget.

**See also**

`window()`

**13.153.4.112 top\_window\_offset()**

```
Fl_Window * Fl_Widget::top_window_offset (
 int & xoff,
 int & yoff) const
```

Finds the x/y offset of the current widget relative to the top-level window.

**Parameters**

out	<i>xoff,yoff</i>	Returns the x/y offset
-----	------------------	------------------------

**Returns**

the top-level window (or NULL for a widget that's not in any window)

**13.153.4.113 type() [1/2]**

```
uchar Fl_Widget::type () const [inline]
```

Gets the widget type.

Returns the widget type value, which gives some information about the derived widget class to which the object belongs. Noticeably, the condition `type() >= FL_WINDOW` indicates a widget is an `Fl_Window` or derived object.

**Note**

Known values for `type_` are listed at the top of `src/Fl_Widget.cxx`.

**13.153.4.114 type() [2/2]**

```
void Fl_Widget::type (
 uchar t) [inline]
```

Sets the widget type.

**See also**

`type()`

**13.153.4.115 user\_data()**

```
void * Fl_Widget::user_data () const [inline]
```

Gets the user data for this widget.

Gets the current user data (void \*) argument that is passed to the callback function.

**Returns**

user data as a pointer

**13.153.4.116 vertical\_label\_margin()** [1/2]

```
int Fl_Widget::vertical_label_margin () [inline]
```

Get the spacing between the label and the vertical edge of the widget.

**Returns**

px gap in pixels

**13.153.4.117 vertical\_label\_margin()** [2/2]

```
void Fl_Widget::vertical_label_margin (
 int px) [inline]
```

Set the spacing between the label and the vertical edge of the widget.

**Parameters**

in	px	gap in pixels
----	----	---------------

**13.153.4.118 visible()**

```
unsigned int Fl_Widget::visible () const [inline]
```

Returns whether a widget is visible.

**Return values**

0	if the widget is not drawn and hence invisible.
---	-------------------------------------------------

**See also**

[show\(\)](#), [hide\(\)](#), [visible\\_r\(\)](#)

**13.153.4.119 visible\_focus()** [1/2]

```
unsigned int Fl_Widget::visible_focus () const [inline]
```

Checks whether this widget has a visible focus.

**Return values**

0	if this widget has no visible focus.
---	--------------------------------------

**See also**

[visible\\_focus\(int\)](#), [set\\_visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#)

**13.153.4.120 visible\_focus()** [2/2]

```
void Fl_Widget::visible_focus (
 int v) [inline]
```

Modifies keyboard focus navigation.

**Parameters**

in	v	set or clear visible focus
----	---	----------------------------

See also

[set\\_visible\\_focus\(\)](#), [clear\\_visible\\_focus\(\)](#), [visible\\_focus\(\)](#)

#### 13.153.4.121 `visible_r()`

```
int Fl_Widget::visible_r () const
```

Returns whether a widget and all its parents are visible.

Return values

0	if the widget or any of its parents are invisible.
---	----------------------------------------------------

See also

[show\(\)](#), [hide\(\)](#), [visible\(\)](#)

#### 13.153.4.122 `w()` [1/2]

```
int Fl_Widget::w () const [inline]
```

Gets the widget width.

Returns

the width of the widget in pixels.

#### 13.153.4.123 `w()` [2/2]

```
void Fl_Widget::w (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

#### 13.153.4.124 `when()` [1/2]

```
Fl_When Fl_Widget::when () const [inline]
```

Returns the conditions under which the callback is called.

You can set the flags with [when\(uchar\)](#), the default value is `FL_WHEN_RELEASE`.

Returns

set of flags

See also

[when\(uchar\)](#), [Fl\\_When](#), [do\\_callback\(\)](#), [Fl::callback\\_reason\(\)](#)

#### 13.153.4.125 `when()` [2/2]

```
void Fl_Widget::when (
 uchar i) [inline]
```

Sets the flags used to decide when a callback is called.

This controls when callbacks are done. The following values are useful, the default value is `FL_WHEN_RELEASE`:

- 0: The callback is not done, but [changed\(\)](#) is turned on.
- `FL_WHEN_CHANGED`: The callback is done each time the text is changed by the user.

- `FL_WHEN_RELEASE`: The callback will be done when this widget loses the focus, including when the window is unmapped. This is a useful value for text fields in a panel where doing the callback on every change is wasteful. However the callback will also happen if the mouse is moved out of the window, which means it should not do anything visible (like pop up an error message). You might do better setting this to zero, and scanning all the items for `changed()` when the OK button on a panel is pressed.
- `FL_WHEN_ENTER_KEY`: If the user types the Enter key, the entire text is selected, and the callback is done if the text has changed. Normally the Enter key will navigate to the next field (or insert a newline for a `Fl_Multiline_Input`) - this changes the behavior.
- `FL_WHEN_ENTER_KEY|FL_WHEN_NOT_CHANGED`: The Enter key will do the callback even if the text has not changed. Useful for command fields.
- `FL_WHEN_CLOSED` : If the user requests that the widget is closed, the callback is called with `FL_REASON_CLOSED`. The `Fl_Tabs` widget checks this flag on its children to determine whether to display a close button on the tab of that widget.

`Fl_Widget::when()` is a set of bitflags used by subclasses of `Fl_Widget` to decide when to do the callback. If the value is zero then the callback is never done. Other values are described in the individual widgets. This field is in the base class so that you can scan a panel and `do_callback()` on all the ones that don't do their own callbacks in response to an "OK" button.

#### Parameters

<code>in</code>	<code>i</code>	set of flags
-----------------	----------------	--------------

#### See also

`Fl_When`, `do_callback()`, `Fl::callback_reason()`

#### 13.153.4.126 window()

```
Fl_Window * Fl_Widget::window () const
```

Returns a pointer to the nearest parent window up the widget hierarchy.

This will return sub-windows if there are any, or the parent window if there's no sub-windows. If this widget IS the top-level window, NULL is returned.

#### Return values

<code>NULL</code>	if no window is associated with this widget.
-------------------	----------------------------------------------

#### Note

for an `Fl_Window` widget, this returns its *parent* window (if any), not *this* window.

#### See also

`top_window()`

#### 13.153.4.127 x() [1/2]

```
int Fl_Widget::x () const [inline]
```

Gets the widget position in its window.

#### Returns

the x position relative to the window

**13.153.4.128 x() [2/2]**

```
void Fl_Widget::x (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

**13.153.4.129 y() [1/2]**

```
int Fl_Widget::y () const [inline]
```

Gets the widget position in its window.

**Returns**

the y position relative to the window

**13.153.4.130 y() [2/2]**

```
void Fl_Widget::y (
 int v) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

**13.154 Fl\_Widget\_Surface Class Reference**

A surface on which any FLTK widget can be drawn.

```
#include <Fl_Widget_Surface.H>
```

Inheritance diagram for Fl\_Widget\_Surface:

**Public Member Functions**

- void [draw](#) ([Fl\\_Widget](#) \*widget, int delta\_x=0, int delta\_y=0)  
*Draws the widget on the drawing surface.*
- void [draw\\_decorated\\_window](#) ([Fl\\_Window](#) \*win, int x\_offset=0, int y\_offset=0)  
*Draws a window with its title bar and frame if any.*
- virtual void [origin](#) (int \*x, int \*y)  
*Computes the coordinates of the current origin of graphics functions.*
- virtual void [origin](#) (int x, int y)

- Sets the position of the origin of graphics in the drawable part of the drawing surface.*
- void [print\\_window\\_part](#) ([FI\\_Window](#) \*win, int x, int y, int w, int h, int delta\_x=0, int delta\_y=0)  
*Draws a rectangular part of an on-screen window.*
- virtual int [printable\\_rect](#) (int \*w, int \*h)  
*Computes the width and height of the drawable area of the drawing surface.*
- virtual void [translate](#) (int x, int y)  
*Translates the current graphics origin accounting for the current rotation.*
- virtual void [untranslate](#) ()  
*Undoes the effect of a previous [translate\(\)](#) call.*

### Public Member Functions inherited from [FI\\_Surface\\_Device](#)

- [FI\\_Graphics\\_Driver](#) \* **driver** ()  
*Returns the graphics driver of this drawing surface.*
- virtual bool [is\\_current](#) ()  
*Is this surface the current drawing surface?*
- virtual void [set\\_current](#) (void)  
*Make this surface the current drawing surface.*
- virtual ~[FI\\_Surface\\_Device](#) ()  
*The destructor.*

### Protected Member Functions

- [FI\\_Widget\\_Surface](#) ([FI\\_Graphics\\_Driver](#) \*d)  
*The constructor.*

### Protected Member Functions inherited from [FI\\_Surface\\_Device](#)

- void **driver** ([FI\\_Graphics\\_Driver](#) \*graphics\_driver)  
*Sets the graphics driver of this drawing surface.*
- virtual void [end\\_current](#) ()  
*FLTK calls this each time a surface ceases to be the current drawing surface.*
- [FI\\_Surface\\_Device](#) ([FI\\_Graphics\\_Driver](#) \*graphics\_driver)  
*Constructor that sets the graphics driver to use for the created surface.*

### Protected Attributes

- int **x\_offset**  
*horizontal offset to the origin of graphics coordinates*
- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

### Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_Surface\\_Device](#)

- static [FI\\_Surface\\_Device](#) \* [pop\\_current](#) ()  
*Removes the top element from the current drawing surface stack, and makes the new top element current.*
- static void [push\\_current](#) ([FI\\_Surface\\_Device](#) \*new\_current)  
*Pushes `new_current` on top of the stack of current drawing surfaces, and makes it current.*
- static [FI\\_Surface\\_Device](#) \* [surface](#) ()  
*The current drawing surface.*

### 13.154.1 Detailed Description

A surface on which any FLTK widget can be drawn.

### 13.154.2 Constructor & Destructor Documentation

#### 13.154.2.1 Fl\_Widget\_Surface()

```
Fl_Widget_Surface::Fl_Widget_Surface (
 Fl_Graphics_Driver * d) [protected]
```

The constructor.

##### Parameters

<i>d</i>	can be nul.
----------	-------------

### 13.154.3 Member Function Documentation

#### 13.154.3.1 draw()

```
void Fl_Widget_Surface::draw (
 Fl_Widget * widget,
 int delta_x = 0,
 int delta_y = 0)
```

Draws the widget on the drawing surface.

The widget's position on the surface is determined by the last call to [origin\(\)](#) and by the optional delta\_x and delta\_y arguments. Its dimensions are in points unless there was a previous call to [scale\(\)](#).

##### Parameters

in	<i>widget</i>	Any FLTK widget (e.g., standard, custom, window).
in	<i>delta_x, delta_y</i>	Optional horizontal and vertical offsets for positioning the widget top left relatively to the current origin of graphics.

#### 13.154.3.2 draw\_decorated\_window()

```
void Fl_Widget_Surface::draw_decorated_window (
 Fl_Window * win,
 int win_offset_x = 0,
 int win_offset_y = 0)
```

Draws a window with its title bar and frame if any.

*win\_offset\_x* and *win\_offset\_y* are optional coordinates of where to position the window top left. Equivalent to [draw\(\)](#) if *win* is a subwindow or has no border. Use [Fl\\_Window::decorated\\_w\(\)](#) and [Fl\\_Window::decorated\\_h\(\)](#) to get the size of the framed window.

#### 13.154.3.3 origin() [1/2]

```
void Fl_Widget_Surface::origin (
 int * x,
 int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

##### Parameters

out	<i>x, y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-------------	---------------------------------------------------------------------------------------------------

Reimplemented in [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#),

[Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

#### 13.154.3.4 origin() [2/2]

```
void Fl_Widget_Surface::origin (
 int x,
 int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

##### Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_EPS\\_File\\_Surface](#), [Fl\\_Printer](#), and [Fl\\_SVG\\_File\\_Surface](#).

#### 13.154.3.5 print\_window\_part()

```
void Fl_Widget_Surface::print_window_part (
 Fl_Window * win,
 int x,
 int y,
 int w,
 int h,
 int delta_x = 0,
 int delta_y = 0)
```

Draws a rectangular part of an on-screen window.

##### Parameters

<i>win</i>	The window from where to capture. Can be an <a href="#">Fl_Gl_Window</a> . Sub-windows that intersect the rectangle are also captured.
<i>x</i>	The rectangle left
<i>y</i>	The rectangle top
<i>w</i>	The rectangle width
<i>h</i>	The rectangle height
<i>delta_x, delta_y</i>	Optional horizontal and vertical offsets from current graphics origin where to draw the top left of the captured rectangle.

#### 13.154.3.6 printable\_rect()

```
int Fl_Widget_Surface::printable_rect (
 int * w,
 int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented in [FI\\_Copy\\_Surface](#), [FI\\_Image\\_Surface](#), [FI\\_PDF\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), [FI\\_EPS\\_File\\_Surface](#), [FI\\_Printer](#), and [FI\\_SVG\\_File\\_Surface](#).

**13.154.3.7 translate()**

```
void FI_Widget_Surface::translate (
 int x,
 int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented in [FI\\_Copy\\_Surface](#), [FI\\_Image\\_Surface](#), [FI\\_PDF\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), [FI\\_EPS\\_File\\_Surface](#), [FI\\_Printer](#), and [FI\\_SVG\\_File\\_Surface](#).

**13.154.3.8 untranslate()**

```
void FI_Widget_Surface::untranslate (
 void) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented in [FI\\_Copy\\_Surface](#), [FI\\_Image\\_Surface](#), [FI\\_PDF\\_File\\_Surface](#), [FI\\_EPS\\_File\\_Surface](#), [FI\\_SVG\\_File\\_Surface](#), [FI\\_PostScript\\_File\\_Device](#), and [FI\\_Printer](#).

The documentation for this class was generated from the following files:

- [FI\\_Widget\\_Surface.H](#)

**13.155 FI\_Widget\_Tracker Class Reference**

This class should be used to control safe widget deletion.

```
#include <FI_Widget_Tracker.H>
```

**Public Member Functions**

- void **clear** ()  
*Clear the widget pointer.*
- int **deleted** ()  
*Check if the widget was deleted since the tracker was created.*
- int **exists** ()  
*Check if the widget exists and was not deleted since the tracker was created.*
- **FI\_Widget\_Tracker** (const [FI\\_Widget\\_Tracker](#) &)=delete
- **FI\_Widget\_Tracker** ([FI\\_Widget](#) \*wi)  
*The constructor adds a widget to the watch list.*
- **FI\_Widget\_Tracker** ([FI\\_Widget\\_Tracker](#) &&)=delete
- [FI\\_Widget\\_Tracker](#) & **operator=** (const [FI\\_Widget\\_Tracker](#) &)=delete
- [FI\\_Widget\\_Tracker](#) & **operator=** ([FI\\_Widget\\_Tracker](#) &&)=delete
- [FI\\_Widget](#) \* **widget** ()  
*Returns a pointer to the watched widget.*
- **~FI\_Widget\_Tracker** ()  
*The destructor removes a widget from the watch list.*

### 13.155.1 Detailed Description

This class should be used to control safe widget deletion.

You can use an [Fl\\_Widget\\_Tracker](#) object to watch another widget, if you need to know whether this widget has been deleted during a callback.

This simplifies the use of the "safe widget deletion" methods [Fl::watch\\_widget\\_pointer\(\)](#) and [Fl::release\\_widget\\_pointer\(\)](#) and makes their use more reliable, because the destructor automatically releases the widget pointer from the widget watch list.

[Fl\\_Widget\\_Tracker](#) is intended to be used as an automatic (local/stack) variable, such that its destructor is called when the object's scope is left. This ensures that no stale widget pointers are left in the widget watch list (see example below).

You can also create [Fl\\_Widget\\_Tracker](#) objects with `new`, but then it is your responsibility to delete the object (and thus remove the widget pointer from the watch list) when it is no longer needed.

Example:

```
int MyClass::handle (int event) {

 if (...) {
 Fl_Widget_Tracker wp(this); // watch myself
 do_callback(); // call the callback

 if (wp.deleted()) return 1; // exit, if deleted

 // Now we are sure that the widget has not been deleted,
 // and it is safe to access the widget:

 box(FL_FLAT_BOX);
 color(FL_WHITE);
 redraw();
 }
}
```

### 13.155.2 Member Function Documentation

#### 13.155.2.1 deleted()

```
int Fl_Widget_Tracker::deleted () [inline]
```

Check if the widget was deleted since the tracker was created.

Returns

1 if the watched widget has been deleted, otherwise 0

#### 13.155.2.2 exists()

```
int Fl_Widget_Tracker::exists () [inline]
```

Check if the widget exists and was not deleted since the tracker was created.

Returns

1 if the watched widget exists, otherwise 0

#### 13.155.2.3 widget()

```
Fl_Widget * Fl_Widget_Tracker::widget () [inline]
```

Returns a pointer to the watched widget.

Returns

nullptr if the widget was deleted.

The documentation for this class was generated from the following files:

- [Fl\\_Widget\\_Tracker.H](#)
- [Fl.cxx](#)

## 13.156 Fl\_Window Class Reference

This widget produces an actual window.

```
#include <Fl_Window.H>
```

Inheritance diagram for Fl\_Window:

### Public Types

- typedef struct HICON\_\_ \* **HICON**

### Public Member Functions

- void [allow\\_expand\\_outside\\_parent](#) ()  
*Allow this subwindow to expand outside the area of its parent window.*
- virtual class [Fl\\_Double\\_Window](#) \* [as\\_double\\_window](#) ()  
*Return non-null if this is an [Fl\\_Double\\_Window](#) object.*
- virtual class [Fl\\_Overlay\\_Window](#) \* [as\\_overlay\\_window](#) ()  
*Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.*
- [Fl\\_Window](#) const \* [as\\_window](#) () const **override**
- [Fl\\_Window](#) \* [as\\_window](#) () **override**  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- unsigned int **border** () const  
*Returns whether the window possesses a border.*
- void [border](#) (int b)  
*Sets whether or not the window manager border is around the window.*
- void [clear\\_border](#) ()  
*Fast inline function to turn the window manager border off.*
- void [clear\\_modal\\_states](#) ()  
*Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*
- void **copy\_label** (const char \*a)  
*Sets the window titlebar label to a copy of a character string.*
- void [cursor](#) (const [Fl\\_RGB\\_Image](#) \*, int, int)  
*Changes the cursor for this window using the provided image as cursor's shape.*
- void [cursor](#) ([Fl\\_Cursor](#) c, [Fl\\_Color](#), [Fl\\_Color](#)=FL\_WHITE)  
*For back compatibility only.*
- void [cursor](#) ([Fl\\_Cursor](#))  
*Changes the cursor for this window.*
- int [decorated\\_h](#) () const  
*Returns the window height including any window title bar and any frame added by the window manager.*
- int [decorated\\_w](#) () const

- Returns the window width including any frame added by the window manager.*
- void **default\_cursor** (FL\_Cursor c, FL\_Color, FL\_Color=FL\_WHITE)
  - For back compatibility only.*
- void **default\_cursor** (FL\_Cursor)
  - Sets the default window cursor.*
- void **draw\_backdrop** ()
  - Draw the background image if one is set and is aligned inside.*
- FL\_Window (int w, int h, const char \*title=0)
  - Creates a window from the given width w, height h, and title.*
- FL\_Window (int x, int y, int w, int h, const char \*title=0)
  - Creates a window from the given position (x, y), size (w, h) and title.*
- virtual void **flush** ()
  - Forces the window to be drawn, this window is also made current and calls **draw()**.*
- void **free\_position** ()
  - Undoes the effect of a previous **resize()** or **show()** so that the next time **show()** is called the window manager is free to position the window.*
- void **fullscreen** ()
  - Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int **fullscreen\_active** () const
  - Returns non zero if FULLSCREEN flag is set, 0 otherwise.*
- void **fullscreen\_off** ()
  - Turns off any side effects of **fullscreen()***
- void **fullscreen\_off** (int X, int Y, int W, int H)
  - Turns off any side effects of **fullscreen()** and does **resize(X,Y,W,H)**.*
- void **fullscreen\_screens** (int top, int bottom, int left, int right)
  - Sets which screens should be used when this window is in fullscreen mode.*
- uchar **get\_size\_range** (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL) const
  - Gets the allowable range to which the user can resize this window.*
- int **handle** (int) **override**
  - Handles the specified event.*
- void **hide** () **override**
  - Removes the window from the screen.*
- void **hotspot** (const FL\_Widget &p, int offscreen=0)
  - See void FL\_Window::hotspot(int x, int y, int offscreen = 0)*
- void **hotspot** (const FL\_Widget \*, int offscreen=0)
  - See void FL\_Window::hotspot(int x, int y, int offscreen = 0)*
- void **hotspot** (int x, int y, int offscreen=0)
  - Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*
- const void \* **icon** () const
  - Gets the current icon window target dependent data.*
- void **icon** (const FL\_RGB\_Image \*)
  - Sets or resets a single window icon.*
- void **icon** (const void \*ic)
  - Platform-specific method to set the window icon usable on Windows and X11 only.*
- void **iconize** ()
  - Iconifies the window.*
- const char \* **iconlabel** () const
  - See void FL\_Window::iconlabel(const char\*)*

- void **iconlabel** (const char \*)  
*Sets the icon label.*
- void **icons** (const [FI\\_RGB\\_Image](#) \*[], int)  
*Sets the window icons.*
- void **icons** (HICON big\_icon, HICON small\_icon)  
*Sets the window icons using HICON handles (Windows platform only).*
- const char \* **label** () const  
*See void [FL\\_Window::label\(const char\\*\)](#)*
- void **label** (const char \*)  
*Sets the window title bar label.*
- void **label** (const char \*label, const char \*[iconlabel](#))  
*Sets the icon label.*
- void [make\\_current](#) ()  
*Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.*
- void [maximize](#) ()  
*Maximizes a top-level window to its current screen.*
- unsigned int **maximize\_active** () const  
*Returns whether the window is currently maximized.*
- unsigned int **menu\_window** () const  
*Returns true if this window is a menu window.*
- unsigned int [modal](#) () const  
*Returns true if this window is modal.*
- unsigned int **non\_modal** () const  
*Returns true if this window is modal or non-modal.*
- [fl\\_uintptr\\_t](#) **os\_id** () const  
*Returns a platform-specific identification of a shown window, or 0 if not shown.*
- unsigned int **override** () const  
*Returns non zero if OVERRIDE flag is set, 0 otherwise.*
- void [resize](#) (int X, int Y, int W, int H) [override](#)  
*Changes the size and position of the window.*
- int [screen\\_num](#) () const  
*The number of the screen containing the mapped window.*
- void [screen\\_num](#) (int screen\_num)  
*Set the number of the screen where to map the window.*
- void [set\\_menu\\_window](#) ()  
*Marks the window as a menu window.*
- void [set\\_modal](#) ()  
*A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void [set\\_non\\_modal](#) ()  
*A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.*
- void **set\_override** ()  
*Activates the flags NOBORDER|OVERRIDE.*
- void [set\\_tooltip\\_window](#) ()  
*Marks the window as a tooltip window.*
- const [FI\\_Image](#) \* [shape](#) () const  
*Returns the image controlling the window shape or NULL.*
- void [shape](#) (const [FI\\_Image](#) &b)  
*Set the window's shape with an [FI\\_Image](#).*

- void [shape](#) (const [FL\\_Image](#) \*img)  
*Assigns a non-rectangular shape to the window.*
- void [show](#) () [override](#)  
*Puts the window on the screen.*
- void [show](#) (int argc, char \*\*argv)  
*Puts the window on the screen with [show\(\)](#) and parses command-line arguments.*
- int [shown](#) () const  
*Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).*
- void [size\\_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)  
*Sets the allowable range to which the user can resize this window.*
- unsigned int [tooltip\\_window](#) () const  
*Returns true if this window is a tooltip window.*
- void [un\\_maximize](#) ()  
*Returns a previously maximized top-level window to its previous size.*
- void [wait\\_for\\_expose](#) ()  
*Waits for the window to be displayed after calling [show\(\)](#).*
- int [x\\_root](#) () const  
*Gets the x position of the window on the screen.*
- const char \* [xclass](#) () const  
*Returns the xclass for this window, or a default.*
- void [xclass](#) (const char \*c)  
*Sets the xclass for this window.*
- int [y\\_root](#) () const  
*Gets the y position of the window on the screen.*
- virtual [~FL\\_Window](#) ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*& [\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void [add](#) ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void [add](#) ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void [add\\_resizable](#) ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* [array](#) () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* [as\\_group](#) () const [override](#)
- [FL\\_Group](#) \* [as\\_group](#) () [override](#)  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void [begin](#) ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* [child](#) (int n) const  
*Returns the n'th child.*
- int [children](#) () const  
*Returns how many child widgets the group has.*
- void [clear](#) ()  
*Deletes all child widgets from memory recursively.*
- unsigned int [clip\\_children](#) () const

- Returns the current clipping mode.*
- void `clip_children` (int c)
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int `delete_child` (int n)
  - Removes the widget at `index` from the group and deletes it.*
- void `end` ()
  - Exactly the same as `current(this->parent())`.*
- int `find` (const `FL_Widget` &o) const
  - See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` \*) const
  - Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \*s=0)
  - Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()
  - This is for forms compatibility only.*
- void `init_sizes` ()
  - Resets the internal array of widget sizes and positions.*
- void `insert` (`FL_Widget` &, int i)
  - The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)
  - This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)
  - Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)
  - Removes the widget o from the group.*
- void `remove` (int index)
  - Removes the widget at `index` from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const
  - Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)
  - Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual `~FL_Group` ()
  - The destructor also deletes all the children.*

## Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  - Activates the widget.*
- unsigned int `active` () const
  - Returns whether the widget is active.*
- int `active_r` () const
  - Returns whether the widget and all of its parents are active.*
- `FL_Align` `align` () const
  - Gets the label alignment.*
- void `align` (`FL_Align` alignment)
  - Sets the label alignment.*
- long `argument` () const

- Gets the current user data (long) argument that is passed to the callback function.*

  - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

  - virtual class [Fl\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()

*Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).*

  - virtual class [Fl\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- void [bind\\_deimage](#) ([Fl\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)

*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([Fl\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype](#) [box](#) () const

*Gets the box type of the widget.*
- void [box](#) ([Fl\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- [Fl\\_Callback\\_p](#) [callback](#) () const

*Gets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void [callback](#) ([Fl\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

*Sets a widget to accept input.*
- void [clear\\_visible](#) ()

*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*
- [Fl\\_Color](#) [color](#) () const

*Gets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg)

*Sets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg, [Fl\\_Color](#) sel)

*Sets the background and selection color of the widget.*
- int [contains](#) (const [Fl\\_Widget](#) \*w) const

- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- [uchar damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*
- void [deactivate](#) ()

*Deactivates the widget.*
- [FL\\_Image \\* deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image \\* deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const

*Gets the widget height.*
- int [horizontal\\_label\\_margin](#) ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image \\* image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image \\* image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const

*Checks if this widget is a child of wgt.*

- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) (Fl\_Labeltype a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- Fl\_Color [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) (Fl\_Color c)  
*Sets the label color.*
- Fl\_Font [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) (Fl\_Font f)  
*Sets the font to use.*
- Fl\_Fontsize [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) (Fl\_Fontsize pix)  
*Sets the font size in pixels.*
- Fl\_Labeltype [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) (Fl\_Labeltype a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- Fl\_Group \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) (Fl\_Group \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- Fl\_Color [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) (Fl\_Color a)  
*Sets the selection color.*
- int [send](#) (int event)

- Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*

- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `FL_When` `when` () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `FL_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~FL_Widget` ()  
*Destroys the widget.*

### Static Public Member Functions

- static `FL_Window` \* `current` ()  
*Returns the last window that was made current.*
- static void `default_callback` (`FL_Window` \*, void \*v)  
*Back compatibility: Sets the default callback v for win to call on close event.*
- static void `default_icon` (const `FL_RGB_Image` \*)  
*Sets a single default window icon.*
- static void `default_icons` (const `FL_RGB_Image` \*[], int)  
*Sets the default window icons.*
- static void `default_icons` (HICON big\_icon, HICON small\_icon)  
*Sets the default window icons (Windows platform only).*
- static const char \* `default_xclass` ()  
*Returns the default xclass.*
- static void `default_xclass` (const char \*)  
*Sets the default window xclass.*
- static bool `is_a_rescale` ()  
*Returns true when a window is being rescaled.*
- static char `show_next_window_iconic` ()  
*Returns the static flag whether the next window should be opened iconified.*
- static void `show_next_window_iconic` (char stat)  
*Sets a static flag whether the next window should be opened iconified.*

### Static Public Member Functions inherited from `FL_Group`

- static `FL_Group` \* `current` ()  
*Returns the currently active group.*
- static void `current` (`FL_Group` \*g)  
*Sets the current group.*

## Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Member Functions

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [override](#)  
*Draws the widget.*
- int [force\\_position](#) () const  
*Returns the internal state of the window's `FORCE_POSITION` flag.*
- void [force\\_position](#) (int force)  
*Sets an internal flag that tells FLTK and the window manager to honor position requests.*
- void [free\\_icons](#) ()  
*Deletes all icons previously attached to the window.*
- int [is\\_resizable](#) ()  
*Protected method to determine whether a window is resizable.*

## Protected Member Functions inherited from [Fl\\_Group](#)

- [Fl\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([Fl\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [Fl\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([Fl\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([Fl\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from [Fl\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*

- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.156.1 Detailed Description

This widget produces an actual window.

This can either be a main window, with a border and title and all the window management controls, or a "subwindow" inside a window. This is controlled by whether or not the window has a [parent\(\)](#).

Once you create a window, you usually add children [Fl\\_Widget](#)'s to it by using `window->add(child)` for each new widget. See [Fl\\_Group](#) for more information on how to add and remove children.

There are several subclasses of [Fl\\_Window](#) that provide double-buffering, overlay, menu, and OpenGL support.

The window's callback is done if the user tries to close a window using the window manager and [Fl::modal\(\)](#) is zero or equal to the window. [Fl\\_Window](#) has a default callback that calls [Fl\\_Window::hide\(\)](#). Callback reasons can be `FL_REASON_CANCELLED` if the Escape key was pressed, or `FL_REASON_CLOSED` when the close button is clicked. `FL_WHEN_...` flags are ignored.

### 13.156.2 Constructor & Destructor Documentation

#### 13.156.2.1 [Fl\\_Window\(\)](#) [1/2]

```
Fl_Window::Fl_Window (
 int w,
 int h,
 const char * title = 0)
```

Creates a window from the given width `w`, height `h`, and `title`.

If [Fl\\_Group::current\(\)](#) is not NULL, the window is created as a subwindow of the parent window.

The `(w, h)` form of the constructor creates a top-level window and asks the window manager to position the window. The `(x, y, w, h)` form of the constructor either creates a subwindow or a top-level window at the specified location `(x, y)`, subject to window manager configuration. If you do not specify the position of the window, the window manager will pick a place to show the window or allow the user to pick a location. Use `position(x, y)` or [hotspot\(\)](#) before calling [show\(\)](#) to request a position on the screen. See [Fl\\_Window::resize\(\)](#) for some more details on positioning windows. Top-level windows initially have [visible\(\)](#) set to 0 and [parent\(\)](#) set to NULL. Subwindows initially have [visible\(\)](#) set to 1 and [parent\(\)](#) set to the parent window pointer.

[Fl\\_Widget::box\(\)](#) defaults to `FL_FLAT_BOX`. If you plan to completely fill the window with children widgets you should change this to `FL_NO_BOX`. If you turn the window border off you may want to change this to `FL_UP_BOX`.

See also

[Fl\\_Window\(int x, int y, int w, int h, const char \\*title\)](#)

#### 13.156.2.2 [Fl\\_Window\(\)](#) [2/2]

```
Fl_Window::Fl_Window (
 int x,
 int y,
 int w,
 int h,
 const char * title = 0)
```

Creates a window from the given position `(x, y)`, size `(w, h)` and `title`.

On a multi-screen system, the values computed by [Fl::screen\\_xywh\(int &X, int &Y, int &W, int &H, int n\)](#) can be used to discover the coordinates of the area of screen `#n`. When these screens have various scale factor values, an `(x, y)` pair may not be enough to specify the targeted screen for the window, because the same `(x,y)` pair can belong to several screens. In that situation, a call to [Fl\\_Window::screen\\_num\(int\)](#) is to be used to identify unambiguously the targeted screen.

See also

[Fl\\_Window\(int w, int h, const char \\*title\)](#)  
[Fl::screen\\_xywh\(int &X, int &Y, int &W, int &H, int n\)](#)

Note

Under Wayland, it's generally not possible for the client app to control the position of a window in the system. It's possible to specify on what screen should the compositor place a fullscreen window. It's also possible to make an [Fl\\_Window](#) the child of another window or group and control with `x` and `y` its screen position relatively to the enclosing window. Apply member function [Fl\\_Window::allow\\_expand\\_outside\\_parent\(\)](#) to the child window to allow it to expand partially or totally outside its parent.

### 13.156.2.3 ~Fl\_Window()

```
Fl_Window::~~Fl_Window () [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl\\_Window](#) and all of its children can be automatic (local) variables, but you must declare the [Fl\\_Window](#) *first* so that it is destroyed last.

## 13.156.3 Member Function Documentation

### 13.156.3.1 allow\_expand\_outside\_parent()

```
void Fl_Window::allow_expand_outside_parent ()
```

Allow this subwindow to expand outside the area of its parent window.

This is presently implemented only for the Wayland platform to help support window docking.

Since

1.4.0

### 13.156.3.2 as\_double\_window()

```
virtual class Fl_Double_Window * Fl_Window::as_double_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Double\\_Window](#) object.

Reimplemented in [Fl\\_Double\\_Window](#).

### 13.156.3.3 as\_overlay\_window()

```
virtual class Fl_Overlay_Window * Fl_Window::as_overlay_window () [inline], [virtual]
```

Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.

Reimplemented in [Fl\\_Overlay\\_Window](#).

### 13.156.3.4 as\_window() [1/2]

```
Fl_Window const * Fl_Window::as_window () const [inline], [override], [virtual]
```

Reimplemented from [Fl\\_Widget](#).

### 13.156.3.5 as\_window() [2/2]

```
Fl_Window * Fl_Window::as_window () [inline], [override], [virtual]
```

Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl\\_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl\\_Window](#), and you can use the returned pointer to access its children or other [Fl\\_Window](#)-specific methods.

## Return values

<code>NULL</code>	if this widget is not derived from <a href="#">Fl_Window</a> .
-------------------	----------------------------------------------------------------

## Note

This method is provided to avoid `dynamic_cast`.

## See also

[Fl\\_Widget::as\\_group\(\)](#), [Fl\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented from [Fl\\_Widget](#).

**13.156.3.6 border()**

```
void Fl_Window::border (
 int b)
```

Sets whether or not the window manager border is around the window.

The default value is true. The macOS platform ignores requests to change the border state of a fullscreen or maximized window. *With some X window managers, this does not work after [show\(\)](#) has been called.*

**13.156.3.7 clear\_border()**

```
void Fl_Window::clear_border () [inline]
```

Fast inline function to turn the window manager border off.

It only works before [show\(\)](#) is called.

**13.156.3.8 clear\_modal\_states()**

```
void Fl_Window::clear_modal_states () [inline]
```

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

Note that there are *three* states for a window: modal, non-modal, and normal.

You can not change the "modality" of a window whilst it is shown, so it is necessary to first [hide\(\)](#) the window, change its "modality" as required, then re-show the window for the new state to take effect.

This method can also be used to change a "modal" window into a "non-modal" one. On several supported platforms, the "modal" state over-rides the "non-modal" state, so the "modal" state must be cleared before the window can be set into the "non-modal" state. In general, the following sequence should work:

```
win->hide();
win->clear_modal_states();
// Set win to new state as desired, or leave "normal", e.g...
win->set_non_modal();
win->show();
```

## Note

Under some window managers, the sequence of hiding the window and changing its modality will often cause it to be re-displayed at a different position when it is subsequently shown. This is an irritating feature but appears to be unavoidable at present. As a result we would advise to use this method only when absolutely necessary.

## See also

void [set\\_modal\(\)](#), void [set\\_non\\_modal\(\)](#)

**13.156.3.9 current()**

```
Fl_Window * Fl_Window::current () [static]
```

Returns the last window that was made current.

## See also

[Fl\\_Window::make\\_current\(\)](#)

**13.156.3.10 cursor()** [1/3]

```
void Fl_Window::cursor (
 const Fl_RGB_Image * image,
 int hotx,
 int hoty)
```

Changes the cursor for this window using the provided image as cursor's shape.

The window must be [show\(\)](#) for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The default cursor will be used if the provided image cannot be used as a cursor.

**Parameters**

<i>image</i>	Sets the cursor size and shape
<i>hotx,hoty</i>	Sets the cursor's active location relatively to top-left of <i>image</i> when clicking

**See also**

[cursor\(Fl\\_Cursor\)](#), [default\\_cursor\(\)](#)

**13.156.3.11 cursor()** [2/3]

```
void Fl_Window::cursor (
 Fl_Cursor c,
 Fl_Color ,
 Fl_Color = FL_WHITE)
```

For back compatibility only.

Same as [Fl\\_Window::cursor\(Fl\\_Cursor\)](#)

**13.156.3.12 cursor()** [3/3]

```
void Fl_Window::cursor (
 Fl_Cursor c)
```

Changes the cursor for this window.

The window must be [show\(\)](#) for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The type `Fl_Cursor` is an enumeration defined in [<FL/Enumerations.H>](#).

**See also**

[cursor\(const Fl\\_RGB\\_Image\\*, int, int\)](#), [default\\_cursor\(\)](#)

**13.156.3.13 decorated\_h()**

```
int Fl_Window::decorated_h () const
```

Returns the window height including any window title bar and any frame added by the window manager.

Same as [h\(\)](#) if applied to a subwindow, or if window is not yet mapped.

**Note**

Under X11, FLTK is able to compute the size of window titlebars and borders only if these decoration elements are strictly X11-based. When that's not the case, [decorated\\_h\(\)](#) returns the same value as [h\(\)](#) and [decorated\\_w\(\)](#) as [w\(\)](#), and FLTK cannot access window decorations.

Under X11 again, the values returned by [decorated\\_h\(\)](#) and [decorated\\_w\(\)](#) may not be reliable **during a resize operation**. The size of decoration elements of a window is best computed when the window is first mapped.

**13.156.3.14 decorated\_w()**

```
int Fl_Window::decorated_w () const
```

Returns the window width including any frame added by the window manager.  
Same as [w\(\)](#) if applied to a subwindow, or if window is not yet mapped.

See also

[decorated\\_h\(\)](#).

**13.156.3.15 default\_cursor() [1/2]**

```
void Fl_Window::default_cursor (
 Fl_Cursor c,
 Fl_Color ,
 Fl_Color = FL_WHITE)
```

For back compatibility only.  
same as [Fl\\_Window::default\\_cursor\(Fl\\_Cursor\)](#)

**13.156.3.16 default\_cursor() [2/2]**

```
void Fl_Window::default_cursor (
 Fl_Cursor c)
```

Sets the default window cursor.  
This is the cursor that will be used after the mouse pointer leaves a widget with a custom cursor set.

See also

[cursor\(const Fl\\_RGB\\_Image\\*, int, int\), default\\_cursor\(\)](#)

**13.156.3.17 default\_icon()**

```
void Fl_Window::default_icon (
 const Fl_RGB_Image * icon) [static]
```

Sets a single default window icon.  
If *icon* is NULL the current default icons are removed.

Parameters

<i>in</i>	<i>icon</i>	default icon for all windows subsequently created or NULL
-----------	-------------	-----------------------------------------------------------

See also

[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)  
[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)  
[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

**13.156.3.18 default\_icons() [1/2]**

```
void Fl_Window::default_icons (
 const Fl_RGB_Image * icons[],
 int count) [static]
```

Sets the default window icons.

The default icons are used for all windows that don't have their own icons set before [show\(\)](#) is called. You can change the default icons whenever you want, but this only affects windows that are created (and shown) after this call.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call.

#### Parameters

in	<i>icons</i>	default icons for all windows subsequently created
in	<i>count</i>	number of images in <i>icons</i> . Set to 0 to remove the current default icons

#### See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

#### Note

See [Window icons](#) for the Wayland platform.

### 13.156.3.19 default\_icons() [2/2]

```
static void Fl_Window::default_icons (
 HICON big_icon,
 HICON small_icon) [static]
```

Sets the default window icons (Windows platform only).

Convenience function to set the default icons using Windows' native HICON icon handles.

The given icons are copied. You can free the icons immediately after this call.

#### Parameters

in	<i>big_icon</i>	default large icon for all windows subsequently created
in	<i>small_icon</i>	default small icon for all windows subsequently created

#### See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

[Fl\\_Window::icons\(HICON, HICON\)](#)

### 13.156.3.20 default\_size\_range()

```
void Fl_Window::default_size_range () [protected]
```

Protected method to calculate the default size range of a window.

This method is called internally prior to showing a window to ensure that the window's size range values are calculated if a [resizable\(\)](#) widget has been set but [size\\_range\(\)](#) has not been called explicitly.

This method does nothing if [size\\_range\(\)](#) has been called before.

Otherwise FLTK tries to figure out the window's size range from the setting of the window's [resizable\(\)](#) widget as follows and roughly in the given order.

1. If [resizable\(\)](#) is NULL (this is the default) then the window cannot be resized and the resize border and max-size control will not be displayed for the window.

2. If either dimension of `resizable()` is zero, then the window cannot resize in that direction.
3. The `resizable()` widget is clipped to the window area.
4. The non-resizable portion of the window is calculated as the difference of the window's size and the clipped `resizable()` widget's size.
5. If either dimension of the clipped `resizable()` widget is greater than 100, then 100 is considered its minimum width/height. This allows the resizable widget to shrink below its original size.
6. Finally the minimum width/height of the window is set to the non-resizable portion plus the width/height of the `resizable()` widget as calculated above.

In simple words:

- It is assumed that the `resizable()` widget can be indefinitely enlarged and/or shrunk to a minimum width/height of 100 unless it is smaller than that, which is then considered the minimum.
- The window's `size_range()` minimum values are set to the sum of the non-resizable portion of the window and the previously calculated minimum size of the `resizable()` widget.

Examples:

```
Fl_Window win(400, 400);
win.resizable(win);
// win.size_range(100, 100, 0, 0);
```

The minimum size of the resizable is 100, hence the minimum size of the total window is also 100 in both directions.

```
Fl_Window win(400, 400);
Fl_Box box(20, 20, 360, 360);
win.resizable(box);
// win.size_range(140, 140, 0, 0);
```

The calculated minimum width and height would be 20 + 100 + 20 in both dimensions.

```
Fl_Window win(400, 400);
Fl_Box box(200, 0, 500, 300); // note: width 500 too large: clipped
win.resizable(box);
// win.size_range(300, 200, 0, 0);
```

The width of the resizable is clipped to 200, hence the minimum size of the total window is also 200 (fix) + 100 (min. resizable) in x direction. The minimum value in y direction is 100 (resizable) + 100 (fixed part).

The calculation is based on clipping the resizable widget to the window area to prevent programming errors and the assumption that the resizable widget can be shrunk to 100x100 or its original size, whichever is smaller.

If this is not what you want, please use `Fl_Window::size_range()` explicitly so you can set any appropriate range.

Since

1.4.0

### 13.156.3.21 default\_xclass() [1/2]

```
const char * Fl_Window::default_xclass () [static]
```

Returns the default xclass.

See also

[Fl\\_Window::default\\_xclass\(const char \\*\)](#)

### 13.156.3.22 default\_xclass() [2/2]

```
void Fl_Window::default_xclass (
 const char * xc) [static]
```

Sets the default window xclass.

The default xclass is used for all windows that don't have their own xclass set before `show()` is called. You can change the default xclass whenever you want, but this only affects windows that are created (and shown) after this call.

The given string `xc` is copied. You can use a local variable or free the string immediately after this call.

If you don't call this, the default xclass for all windows will be "FLTK". You can reset the default xclass by specifying NULL for `xc`.

If you call `Fl_Window::xclass(const char *)` for any window, then this also sets the default xclass, unless it has been set before.

## Parameters

in	xc	default xclass for all windows subsequently created
----	----	-----------------------------------------------------

## See also

[Fl\\_Window::xclass\(const char \\*\)](#)

**13.156.3.23 draw()**

```
void Fl_Window::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

**13.156.3.24 flush()**

```
void Fl_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented in [Fl\\_Double\\_Window](#), [Fl\\_Gl\\_Window](#), [Fl\\_Overlay\\_Window](#), and [Fl\\_Single\\_Window](#).

**13.156.3.25 force\_position() [1/2]**

```
int Fl_Window::force_position () const [inline], [protected]
```

Returns the internal state of the window's FORCE\_POSITION flag.

## Return values

1	if flag is set
0	otherwise

## See also

[force\\_position\(int\)](#)

**13.156.3.26 force\_position() [2/2]**

```
void Fl_Window::force_position (
 int force) [inline], [protected]
```

Sets an internal flag that tells FLTK and the window manager to honor position requests.

This is used internally and should not be needed by user code.

## Parameters

in	force	1 to set the FORCE_POSITION flag, 0 to clear it
----	-------	-------------------------------------------------

**13.156.3.27 free\_icons()**

```
void Fl_Window::free_icons () [protected]
```

Deletes all icons previously attached to the window.

See also

[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*icons\[\], int count\)](#)

### 13.156.3.28 free\_position()

```
void Fl_Window::free_position () [inline]
```

Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.

This is the same as the *protected* method `Fl_Window::force_position(0)`.

### 13.156.3.29 fullscreen()

```
void Fl_Window::fullscreen ()
```

Makes the window completely fill one or more screens, without any window manager border visible.

You must use [fullscreen\\_off\(\)](#) to undo this.

Note

On some platforms, this can result in the keyboard being grabbed. The window may also be recreated, meaning [hide\(\)](#) and [show\(\)](#) will be called.

See also

[void Fl\\_Window::fullscreen\\_screens\(\)](#)

### 13.156.3.30 fullscreen\_screens()

```
void Fl_Window::fullscreen_screens (
 int top,
 int bottom,
 int left,
 int right)
```

Sets which screens should be used when this window is in fullscreen mode.

The window will be resized to the top of the screen with index `top`, the bottom of the screen with index `bottom`, etc.

If this method is never called, or if any argument is  $< 0$ , then the window will be resized to fill the screen it is currently on.

Wayland compositors may support only partially or not at all multi-screen fullscreen windows.

See also

[void Fl\\_Window::fullscreen\(\)](#)

### 13.156.3.31 get\_size\_range()

```
uchar Fl_Window::get_size_range (
 int * minWidth,
 int * minHeight,
 int * maxWidth = NULL,
 int * maxHeight = NULL,
 int * deltaX = NULL,
 int * deltaY = NULL,
 int * aspectRatio = NULL) const
```

Gets the allowable range to which the user can resize this window.

## Parameters

out	<i>minWidth,minHeight,maxWidth,maxHeight,deltaX,deltaY,aspectRatio</i>	are all pointers to integers that will receive the current respective value during the call. Every pointer can be NULL if that value is not needed.
-----	------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------

## Return values

0	if size range not set
1	if the size range was explicitly set by a call to <a href="#">Fl_Window::size_range()</a> or has been calculated

## See also

[Fl\\_Window::size\\_range\(int minWidth, int minHeight, int maxWidth, int maxHeight, int deltaX, int deltaY, int aspectRatio\)](#)

## Since

1.4.0

**13.156.3.32 handle()**

```
int Fl_Window::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

**13.156.3.33 hide()**

```
void Fl_Window::hide () [override], [virtual]
```

Removes the window from the screen.

If the window is already hidden or has not been shown then this does nothing and is harmless.  
Reimplemented from [Fl\\_Widget](#).

### 13.156.3.34 hotspot()

```
void Fl_Window::hotspot (
 int x,
 int y,
 int offscreen = 0)
```

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

If the optional offscreen parameter is non-zero, then the window is allowed to extend off the screen (this does not work with some X window managers).

See also

[position\(\)](#)

### 13.156.3.35 icon() [1/3]

```
const void * Fl_Window::icon () const
```

Gets the current icon window target dependent data.

**Deprecated** in 1.3.3

### 13.156.3.36 icon() [2/3]

```
void Fl_Window::icon (
 const Fl_RGB_Image * icon)
```

Sets or resets a single window icon.

A window icon *can* be changed while the window is shown, but this *may* be platform and/or window manager dependent. To be sure that the window displays the correct window icon you should always set the icon before the window is shown.

If a window icon has not been set for a particular window, then the default window icon (see links below) or the system default icon will be used.

This method makes an internal copy of the `icon` pixel buffer, so once set, the [Fl\\_RGB\\_Image](#) instance can be freed by the caller.

#### Parameters

<code>in</code>	<code>icon</code>	icon for this window, NULL to reset window icon.
-----------------	-------------------	--------------------------------------------------

See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)  
[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)  
[Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)

#### Note

See [Window icons](#) for the Wayland platform.

### 13.156.3.37 icon() [3/3]

```
void Fl_Window::icon (
 const void * ic)
```

Platform-specific method to set the window icon usable on Windows and X11 only.

See [Setting the Icon of a Window](#) for its use under X11, and [Setting the Icon of a Window](#) under Windows.

**Deprecated** in 1.3.3 in favor of platform-independent methods [Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*icon\)](#) and [Fl\\_Window::icons\(const Fl\\_RGB\\_Image \\*icons\[\], int count\)](#).

### 13.156.3.38 iconize()

```
void Fl_Window::iconize ()
```

Iconifies the window.

If you call this when [shown\(\)](#) is false it will [show\(\)](#) it as an icon. If the window is already iconified this does nothing. Call [show\(\)](#) to restore the window.

When a window is iconified/restored (either by these calls or by the user) the [handle\(\)](#) method is called with FL\_HIDE and FL\_SHOW events and [visible\(\)](#) is turned on and off.

There is no way to control what is drawn in the icon except with the string passed to [Fl\\_Window::xclass\(\)](#). You should not rely on window managers displaying the icons.

### 13.156.3.39 icons() [1/2]

```
void Fl_Window::icons (
 const Fl_RGB_Image * icons[],
 int count)
```

Sets the window icons.

You may set multiple window icons with different sizes. Dependent on the platform and system settings the best (or the first) icon will be chosen.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call. If `count` is zero, current icons are removed. If `count` is greater than zero (must not be negative), then `icons[]` must contain at least `count` valid image pointers (not NULL). Otherwise the behavior is undefined.

#### Parameters

in	<i>icons</i>	icons for this window
in	<i>count</i>	number of images in <i>icons</i> . Set to 0 to remove the current icons

#### See also

[Fl\\_Window::default\\_icon\(const Fl\\_RGB\\_Image \\*\)](#)  
[Fl\\_Window::default\\_icons\(const Fl\\_RGB\\_Image \\*\[\], int\)](#)  
[Fl\\_Window::icon\(const Fl\\_RGB\\_Image \\*\)](#)

#### Note

See [Window icons](#) for the Wayland platform.

### 13.156.3.40 icons() [2/2]

```
void Fl_Window::icons (
 HICON big_icon,
 HICON small_icon)
```

Sets the window icons using HICON handles (Windows platform only).

The given icons are copied. You can free the icons immediately after this call.

#### Parameters

in	<i>big_icon</i>	large window icon
in	<i>small_icon</i>	small window icon

### 13.156.3.41 is\_a\_rescale()

```
bool Fl_Window::is_a_rescale () [static]
```

Returns true when a window is being rescaled.

Since

1.4.0

### 13.156.3.42 is\_resizable()

```
int Fl_Window::is_resizable () [protected]
```

Protected method to determine whether a window is resizable.

If [size\\_range\(\)](#) has not yet been called this method calculates the default size range values by calling [default\\_size\\_range\(\)](#).

This method is for internal use only. The returned value is a bit mask and non-zero if the window is resizable in at least one direction.

Returns

non-zero if the window is resizable

Return values

0	the window is not resizable
1	the window is resizable in horizontal direction (w)
2	the window is resizable in vertical direction (h)
3	the window is resizable in both directions (w and h)

See also

[default\\_size\\_range\(\)](#)

Since

1.4.0

### 13.156.3.43 make\_current()

```
void Fl_Window::make_current ()
```

Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.

This is useful for incremental update of windows, such as in an idle callback, which will make your program behave much better if it draws a slow graphic. **Danger: incremental update is very hard to debug and maintain!**

This method only works for the [Fl\\_Window](#) and [Fl\\_Gl\\_Window](#) derived classes.

### 13.156.3.44 maximize()

```
void Fl_Window::maximize ()
```

Maximizes a top-level window to its current screen.

This function is effective only with a [show\(\)](#)'n, resizable, top-level window. Bordered and borderless windows can be used. Fullscreen windows can't be used.

See also

[Fl\\_Window::un\\_maximize\(\)](#), [Fl\\_Window::maximize\\_active\(\)](#)

Since

1.4.0

### 13.156.3.45 modal()

```
unsigned int Fl_Window::modal () const [inline]
```

Returns true if this window is modal.

### 13.156.3.46 os\_id()

```
fl_uintptr_t Fl_Window::os_id () const
```

Returns a platform-specific identification of a shown window, or 0 if not shown.

#### Note

This identification may differ from the platform-specific reference of an [Fl\\_Window](#) object used by functions [fl\\_x11\\_xid\(\)](#), [fl\\_mac\\_xid\(\)](#), [fl\\_x11\\_find\(\)](#), and [fl\\_mac\\_find\(\)](#).

- X11 platform: the window's XID.
- macOS platform: The window number of the window's window device.
- other platforms: 0.

#### Since

1.4.0

### 13.156.3.47 resize()

```
void Fl_Window::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Changes the size and position of the window.

If [shown\(\)](#) is true, these changes are communicated to the window server (which may refuse that size and cause a further resize). If [shown\(\)](#) is false, the size and position are used when [show\(\)](#) is called. See [Fl\\_Group](#) for the effect of resizing on the child widgets.

You can also call the [Fl\\_Widget](#) methods [position\(x, y\)](#) and [size\(w, h\)](#) which are inline wrappers for this virtual function.

A top-level window can not force, but merely suggest a position and size to the operating system. The window manager may not be willing or able to display a window at the desired position or with the given dimensions. It is up to the application developer to verify window parameters after the resize request.

Reimplemented from [Fl\\_Group](#).

### 13.156.3.48 screen\_num() [1/2]

```
int Fl_Window::screen_num () const
```

The number of the screen containing the mapped window.

This method returns the screen number (0 .. n) of the window if it is shown, otherwise the result value is undefined.

#### Note

The return value is undefined before the window is shown and if the window has been hidden after it was previously shown.

To position a window on a particular screen, use [Fl\\_Window::screen\\_num\(int\)](#) **before** you [show\(\)](#) it.

#### Returns

screen number of the window if it is shown

See also

[Fl\\_Window::screen\\_num\(int\)](#)

Since

1.4.0

### 13.156.3.49 screen\_num() [2/2]

```
void Fl_Window::screen_num (
 int screen_num)
```

Set the number of the screen where to map the window.

Call this and set also the window's desired x/y position before [show\(\)](#)ing the window. This can be necessary if a system has several screens with distinct scaling factors because the window's [x\(\)](#) and [y\(\)](#) may not suffice to uniquely identify one screen.

Consider a system with two screens where the left screen is A pixels wide and has a scaling factor of 1 whereas the right screen has a scaling factor of 2. For the sake of simplicity, consider only the X coordinate of the window. FLTK coordinates translate directly to pixel coordinates on the left screen, whereas FLTK coordinates multiplied by 2 correspond to pixel coordinates on the right screen. Consequently, FLTK coordinates between A/2 + 1 and A-1 can map to both screens. Therefore both the window coordinates and the screen number are necessary to uniquely identify where a window is to be mapped.

The valid range of `screen_num` is 0 .. [Fl::screen\\_count\(\)](#) - 1.

This method does nothing if

- the window is already [shown\(\)](#) or
- the given screen number is out of range.

Parameters

in	<i>screen_num</i>	screen number where the window is to be mapped
----	-------------------	------------------------------------------------

See also

[Fl\\_Window::screen\\_num\(\)](#)

[Fl::screen\\_count\(\)](#)

Since

1.4.0

### 13.156.3.50 set\_menu\_window()

```
void Fl_Window::set_menu_window () [inline]
```

Marks the window as a menu window.

This is intended for internal use, but it can also be used if you write your own menu handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

### 13.156.3.51 set\_modal()

```
void Fl_Window::set_modal () [inline]
```

A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

Several modal windows may be shown at once, in which case only the last one shown gets events. You can see which window (if any) is modal by calling [Fl::modal\(\)](#).

### 13.156.3.52 set\_non\_modal()

```
void Fl_Window::set_non_modal () [inline]
```

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.

There are *three* states for a window: modal, non-modal, and normal.

### 13.156.3.53 set\_tooltip\_window()

```
void Fl_Window::set_tooltip_window () [inline]
```

Marks the window as a tooltip window.

This is intended for internal use, but it can also be used if you write your own tooltip handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

#### Note

Since [Fl\\_Tooltip\\_Window](#) is derived from [Fl\\_Menu\\_Window](#), this also **clears** the [menu\\_window\(\)](#) state.

### 13.156.3.54 shape() [1/3]

```
const Fl_Image * Fl_Window::shape () const
```

Returns the image controlling the window shape or NULL.

#### Since

1.4.0

### 13.156.3.55 shape() [2/3]

```
void Fl_Window::shape (
 const Fl_Image & img)
```

Set the window's shape with an [Fl\\_Image](#).

#### See also

void [shape\(const Fl\\_Image\\* img\)](#)

### 13.156.3.56 shape() [3/3]

```
void Fl_Window::shape (
 const Fl_Image * img)
```

Assigns a non-rectangular shape to the window.

This function gives an arbitrary shape (not just a rectangular region) to an [Fl\\_Window](#). An [Fl\\_Image](#) of any dimension can be used as mask; it is rescaled to the window's dimension as needed.

The layout and widgets inside are unaware of the mask shape, and most will act as though the window's rectangular bounding box is available to them. It is up to you to make sure they adhere to the bounds of their masking shape.

The `img` argument can be an [Fl\\_Bitmap](#), [Fl\\_Pixmap](#), [Fl\\_RGB\\_Image](#) or [Fl\\_Shared\\_Image](#):

- With [Fl\\_Bitmap](#) or [Fl\\_Pixmap](#), the shaped window covers the image part where bitmap bits equal one, or where the pixmap is not fully transparent.
- With an [Fl\\_RGB\\_Image](#) with an alpha channel (depths 2 or 4), the shaped window covers the image part that is not fully transparent.

- With an [Fl\\_RGB\\_Image](#) of depth 1 (gray-scale) or 3 (RGB), the shaped window covers the non-black image part.
- With an [Fl\\_Shared\\_Image](#), the shape is determined by rules above applied to the underlying image. The shared image should not have been scaled through [Fl\\_Image::scale\(\)](#).

Platform details:

- On the unix/linux platform, the SHAPE extension of the X server is required. This function does control the shape of [Fl\\_Gl\\_Window](#) instances.
- On the Windows platform, this function does nothing with class [Fl\\_Gl\\_Window](#).
- On the Mac platform, OS version 10.4 or above is required. An 8-bit shape-mask is used when `img` is an [Fl\\_RGB\\_Image](#): with depths 2 or 4, the image alpha channel becomes the shape mask such that areas with alpha = 0 are out of the shaped window; with depths 1 or 3, white and black are in and out of the shaped window, respectively, and other colors give intermediate masking scores. This function does nothing with class [Fl\\_Gl\\_Window](#).

The window borders and caption created by the window system are turned off by default. They can be re-enabled by calling [Fl\\_Window::border\(1\)](#).

A usage example is found at `example/shapedwindow.cxx`.

Version

1.3.3

### 13.156.3.57 [show\(\)](#) [1/2]

```
void Fl_Window::show () [override], [virtual]
```

Puts the window on the screen.

This has the side effect of opening the display, if not done before.

If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call [show\(\)](#) at any time, even if the window is already up. It also means that [show\(\)](#) serves the purpose of [raise\(\)](#) in other toolkits.

[Fl\\_Window::show\(int argc, char \\*\\*argv\)](#) is used for top-level windows and allows standard arguments to be parsed from the command-line.

Note

For some obscure reasons [Fl\\_Window::show\(\)](#) resets the current group by calling [Fl\\_Group::current\(0\)](#). The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you [show\(\)](#) an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

**Todo** Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

See also

[Fl\\_Window::show\(int argc, char \\*\\*argv\)](#)

Reimplemented from [Fl\\_Widget](#).

### 13.156.3.58 [show\(\)](#) [2/2]

```
void Fl_Window::show (
 int argc,
 char ** argv)
```

Puts the window on the screen with [show\(\)](#) and parses command-line arguments.

This call should be used for top-level windows, at least for the first (main) window. It allows standard arguments to be parsed, as done by [Fl::args\(int, char \\*\\*\)](#), from the command-line. You can use `argc` and `argv` from `main(int argc, char **argv)` for this call.

This call also sets up some system-specific internal variables, that is, it sets `FL_SELECTION_COLOR` and calls `Fl::background()`, `Fl::background2()`, `Fl::foreground()` with default or X resources-given values, and calls `Fl::scheme(const char *)` for the current scheme. On X11, it also calls `Fl::dnd_text_ops(int)`, `Fl_Tooltip::enable(int)`, `Fl::visible_focus(int)` with X resources-given values.

## Parameters

<i>argc</i>	command-line argument count, usually from <code>main()</code>
<i>argv</i>	command-line argument vector, usually from <code>main()</code>

## See also

virtual void [Fl\\_Window::show\(\)](#)  
[Fl::args\(int, char \\*\\*\)](#)

**13.156.3.59 show\_next\_window\_iconic()** [1/2]

```
static char Fl_Window::show_next_window_iconic () [inline], [static]
```

Returns the static flag whether the next window should be opened iconified.

## Note

This is an **internal function**, you should not use this in user code.

Please use [Fl\\_Window::iconize\(\)](#) to iconify a window.

**13.156.3.60 show\_next\_window\_iconic()** [2/2]

```
static void Fl_Window::show_next_window_iconic (
 char stat) [inline], [static]
```

Sets a static flag whether the next window should be opened iconified.

## Note

This is an **internal function**, you should not use this in user code.

Please use [Fl\\_Window::iconize\(\)](#) instead.

**13.156.3.61 shown()**

```
int Fl_Window::shown () const [inline]
```

Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).

You can tell if a window is iconified with `(w->shown() && !w->visible())`.

**13.156.3.62 size\_range()**

```
void Fl_Window::size_range (
 int minWidth,
 int minHeight,
 int maxWidth = 0,
 int maxHeight = 0,
 int deltaX = 0,
 int deltaY = 0,
 int aspectRatio = 0)
```

Sets the allowable range to which the user can resize this window.

We recommend to call [size\\_range\(\)](#) if you have a [resizable\(\)](#) widget in a main window, and to call it after setting the [resizable\(\)](#) and before [show\(\)](#)'ing the window for best cross platform compatibility.

If this function is **not** called, FLTK tries to figure out the range when the window is shown. Please see the protected method [default\\_size\\_range\(\)](#) for details.

It is undefined what happens if the current window size does not fit in the constraints passed to [size\\_range\(\)](#).

**Note**

This only works for top-level windows and the exact behavior can be platform specific. To work correctly across all platforms `size_range()` must be called after setting the `resizable()` widget of the window and before the window is `show()`'n.

Calling `size_range()` after the window has been shown may work on some but not all platforms. If you need to change the `size_range()` after the window has been shown, then you should consider to `hide()` and `show()` the window again, i.e. call `hide()`, `size_range()`, and `show()` in this order.

Typical usage: call

```
size_range(minWidth, minHeight);
```

after setting the resizable widget and before calling `show()`. This ensures that the window cannot be resized smaller than the given values by user interaction.

`maxWidth` and `maxHeight` might be useful in some special cases but less frequently used.

The other optional parameters `deltaX`, `deltaY`, and `aspectRatio` are not recommended because they may not work on all platforms and may even under X11 not be supported by all Window Managers.

**Parameters**

in	<i>minWidth,minHeight</i>	The smallest the window can be. Either value must be greater than 0.
in	<i>maxWidth,maxHeight</i>	The largest the window can be. If either is equal to the minimum then you cannot resize in that direction. If either is zero then FLTK picks a maximum size in that direction such that the window will fill the screen.
in	<i>deltaX,deltaY</i>	These are size increments. The window will be constrained to widths of $\text{minWidth} + N * \text{deltaX}$ , where N is any non-negative integer. If these are less or equal to 1 they are ignored (this is always ignored on Windows).
in	<i>aspectRatio</i>	A flag that indicates that the window should preserve its aspect ratio. This only works if both the maximum and minimum have the same aspect ratio (ignored on Windows and by many X window managers).

**13.156.3.63 un\_maximize()**

```
void Fl_Window::un_maximize ()
```

Returns a previously maximized top-level window to its previous size.

See also

[Fl\\_Window::maximize\(\)](#)

Since

1.4.0

**13.156.3.64 wait\_for\_expose()**

```
void Fl_Window::wait_for_expose ()
```

Waits for the window to be displayed after calling `show()`.

`Fl_Window::show()` is not guaranteed to show and draw the window on all platforms immediately. Instead this is done in the background; particularly on X11 it will take a few messages (client server roundtrips) to display the window. Usually this small delay doesn't matter, but in some cases you may want to have the window instantiated and displayed synchronously.

Currently (as of FLTK 1.3.4) this method has an effect on X11 and Mac OS. On Windows, `show()` is always synchronous. The effect of `show()` varies with versions of Mac OS X: early versions have the window appear on the screen when `show()` returns, later versions don't. If you want to write portable code and need this synchronous `show()` feature, add `win->wait_for_expose()` on all platforms, and FLTK will just do the right thing.

This method can be used for displaying splash screens before calling `Fl::run()` or for having exact control over which window has the focus after calling `show()`.

If the window is not `shown()`, this method does nothing.

**Note**

Depending on the platform and window manager `wait_for_expose()` may not guarantee that the window is fully drawn when it is called. Under X11 it may only make sure that the window is **mapped**, i.e. the internal (OS dependent) window object was created (and maybe shown on the desktop as an empty frame or something like that). You may need to call `Fl::flush()` after `wait_for_expose()` to make sure the window and all its widgets are drawn and thus visible.

FLTK does the best it can do to make sure that all widgets get drawn if you call `wait_for_expose()` and `Fl::flush()`. However, dependent on the window manager it can not be guaranteed that this does always happen synchronously. The only guaranteed behavior that all widgets are eventually drawn is if the FLTK event loop is run continuously, for instance with `Fl::run()`.

**See also**

virtual void `Fl_Window::show()`

Example code for displaying a window before calling `Fl::run()`

```
Fl_Double_Window win = new Fl_Double_Window(...);

// do more window initialization here ...

win->show(); // show window
win->wait_for_expose(); // wait, until displayed
Fl::flush(); // make sure everything gets drawn

// do more initialization work that needs some time here ...

Fl::run(); // start FLTK event loop
```

Note that the window will not be responsive until the event loop is started with `Fl::run()`.

**13.156.3.65 xclass() [1/2]**

```
const char * Fl_Window::xclass () const
```

Returns the xclass for this window, or a default.

**See also**

`Fl_Window::default_xclass(const char *)`

`Fl_Window::xclass(const char *)`

**13.156.3.66 xclass() [2/2]**

```
void Fl_Window::xclass (
 const char * xc)
```

Sets the xclass for this window.

A string used to tell the system what type of window this is. Mostly this identifies the picture to draw in the icon. This only works if called *before* calling `show()`.

*Under X*, this is turned into a XA\_WM\_CLASS pair by truncating at the first non-alphanumeric character and capitalizing the first character, and the second one if the first is 'x'. Thus "foo" turns into "foo, Foo", and "xprog.1" turns into "xprog, XProg".

*Under Wayland*, this is used to set the "application identifier" of toplevel windows. If not set, the executable name is used.

*Under Microsoft Windows*, this string is used as the name of the WNDCLASS structure. The user should avoid names that may collide with system-reserved window class names (e.g., anything beginning with "edit").

**Since**

FLTK 1.3 the passed string is copied. You can use a local variable or free the string immediately after this call. Note that FLTK 1.1 stores the *pointer* without copying the string.

If the default xclass has not yet been set, this also sets the default xclass for all windows created subsequently.

## 13.157 Fl\_Wizard Class Reference

This widget is based off the [Fl\\_Tabs](#) widget, but instead of displaying tabs it only changes "tabs" under program control.

```
#include <Fl_Wizard.H>
```

Inheritance diagram for `Fl_Wizard`:

### Public Member Functions

- [Fl\\_Wizard](#) (int, int, int, int, const char \* = 0)  
*The constructor creates the [Fl\\_Wizard](#) widget at the specified position and size.*
- void [next](#) ()  
*This method shows the next child of the wizard.*
- void [prev](#) ()  
*Shows the previous child.*
- [Fl\\_Widget \\*](#) [value](#) ()  
*Gets the current visible child widget.*
- void [value](#) ([Fl\\_Widget \\*](#))  
*Sets the child widget that is visible.*
- void [value](#) (int)  
*Sets the child widget that is visible.*

### Public Member Functions inherited from [Fl\\_Group](#)

- [Fl\\_Widget \\*](#) & [\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void [add](#) ([Fl\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void [add](#) ([Fl\\_Widget](#) \*o)  
*See void [Fl\\_Group::add\(Fl\\_Widget &w\)](#)*

- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See *int FL\_Group::find(const FL\_Widget \*w) const*.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \*=0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- int **handle** (int) override  
*Handles the specified event.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*
- [FL\\_Widget](#) \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) &o)  
*Sets the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*

- void **resize** (int, int, int, int) override  
*Resizes the [FL\\_Group](#) widget and all of its children.*
- virtual **~FL\_Group** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align](#) **align** () const  
*Gets the label alignment.*
- void **align** ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* **as\_gl\_window** ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FL\\_Window](#) \* **as\_window** ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) **box** () const  
*Gets the box type of the widget.*
- void **box** ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) **callback** () const  
*Gets the current callback function for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void **callback** ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*

- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) color () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- uchar [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)  
*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FI\\_Widget](#) \*widget, long arg, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

- Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const `FL_Image` \* `image` () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const  
*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FL_Color` c)  
*Sets the label color.*
- `FL_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FL_Font` f)  
*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)  
*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const  
*Gets the label type.*

- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

- Gets the current tooltip text.*
- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window** \* **top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window** \* **top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const  
*Gets the widget type.*
- void **type** (uchar t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (**Fl\_Callback\_User\_Data** \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual **~Fl\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the wizard border and visible child.*

## Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([FI\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int [flags](#) () const  
*Gets the widget flags mask.*
- void [h](#) (int v)  
*Internal use only.*
- void [set\\_flag](#) (unsigned int c)  
*Sets a flag in the flags mask.*
- void [w](#) (int v)

*Internal use only.*

- void `x` (int v)

*Internal use only.*

- void `y` (int v)

*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Group`

- static `Fl_Group * current` ()  
*Returns the currently active group.*
- static void `current` (`Fl_Group *g`)  
*Sets the current group.*

### Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget *widget`, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## 13.157.1 Detailed Description

This widget is based off the `Fl_Tabs` widget, but instead of displaying tabs it only changes "tabs" under program control.

Its primary purpose is to support "wizards" that step a user through configuration or troubleshooting tasks.

As with `Fl_Tabs`, wizard panes are composed of child (usually `Fl_Group`) widgets. Navigation buttons must be added separately.

## 13.157.2 Constructor & Destructor Documentation

### 13.157.2.1 `Fl_Wizard()`

```
Fl_Wizard::Fl_Wizard (
 int xx,
 int yy,
```

```
int ww,
int hh,
const char * l = 0)
```

The constructor creates the [Fl\\_Wizard](#) widget at the specified position and size.  
The inherited destructor destroys the widget and its children.

### 13.157.3 Member Function Documentation

#### 13.157.3.1 draw()

```
void Fl_Wizard::draw (
 void) [override], [protected], [virtual]
```

Draws the wizard border and visible child.

Reimplemented from [Fl\\_Group](#).

#### 13.157.3.2 next()

```
void Fl_Wizard::next ()
```

This method shows the next child of the wizard.

If the last child is already visible, this function does nothing.

#### 13.157.3.3 value()

```
void Fl_Wizard::value (
 int ix)
```

Sets the child widget that is visible.

#### Parameters

in	ix	index of the child widget to show. If the index is out of range, this function does nothing.
----	----	----------------------------------------------------------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Wizard.H](#)
- [Fl\\_Wizard.cxx](#)

## 13.158 Fl\_XBM\_Image Class Reference

The [Fl\\_XBM\\_Image](#) class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

```
#include <Fl_XBM_Image.H>
```

Inheritance diagram for [Fl\\_XBM\\_Image](#):

#### Public Member Functions

- [Fl\\_XBM\\_Image](#) (const char \*filename)  
*The constructor loads the named XBM file from the given name filename.*

#### Public Member Functions inherited from [Fl\\_Bitmap](#)

- int **cache\_h** () const

- int **cache\_w** () const
- **FI\_Image** \* **copy** () const
- **FI\_Image** \* **copy** (int W, int H) const override  
*Creates a resized copy of the image.*
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draws the image to the current drawing surface with a bounding box.*
- **FI\_Bitmap** (const char \*bits, int bits\_length, int W, int H)  
*The constructors create a new bitmap from the specified bitmap data.*
- **FI\_Bitmap** (const char \*bits, int W, int H)  
*The constructors create a new bitmap from the specified bitmap data.*
- **FI\_Bitmap** (const uchar \*bits, int bits\_length, int W, int H)  
*The constructors create a new bitmap from the specified bitmap data.*
- **FI\_Bitmap** (const uchar \*bits, int W, int H)  
*The constructors create a new bitmap from the specified bitmap data.*
- void **label** (**FI\_Menu\_Item** \*m) override  
*This method is an obsolete way to set the image attribute of a menu item.*
- void **label** (**FI\_Widget** \*w) override  
*This method is an obsolete way to set the image attribute of a widget or menu item.*
- void **uncache** () override  
*If the image has been cached for display, delete the cache data.*
- virtual ~**FI\_Bitmap** ()  
*The destructor frees all memory and server resources that are used by the bitmap.*

## Public Member Functions inherited from **FI\_Image**

- virtual class **FI\_Shared\_Image** \* **as\_shared\_image** ()  
*Returns whether an image is an **FI\_Shared\_Image** or not.*
- virtual void **color\_average** (**FI\_Color** c, float i)  
*The **color\_average()** method averages the colors in the image with the provided FLTK color value.*
- **FI\_Image** \* **copy** () const  
*Creates a copy of the image in the same size.*
- int **count** () const  
*Returns the number of data values associated with the image.*
- int **d** () const  
*Returns the image depth.*
- const char \*const \* **data** () const  
*Returns a pointer to the current image data array.*
- int **data\_h** () const  
*Returns the height of the image data.*
- int **data\_w** () const  
*Returns the width of the image data.*
- virtual void **desaturate** ()  
*The **desaturate()** method converts an image to grayscale.*
- void **draw** (int X, int Y)  
*Draws the image to the current drawing surface.*
- int **fail** () const  
*Returns a value that is not 0 if there is currently no image available.*
- **FI\_Image** (int W, int H, int D)  
*The constructor creates an empty image with the specified width, height, and depth.*
- int **h** () const

- Returns the current image drawing height in FLTK units.*

  - void `inactive` ()
 

*The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.*
  - int `ld` () const
 

*Returns the current line data size in bytes.*
  - virtual void `release` ()
 

*Releases an `Fl_Image` - the same as 'delete this'.*
  - virtual void `scale` (int width, int height, int proportional=1, int can\_expand=0)
 

*Sets the drawing size of the image.*
  - int `w` () const
 

*Returns the current image drawing width in FLTK units.*
  - virtual `~Fl_Image` ()
 

*The destructor is a virtual method that frees all memory used by the image.*

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Image`

- static `Fl_Labeltype` `define_FL_IMAGE_LABEL` ()
- static `Fl_RGB_Scaling` `RGB_scaling` ()
 

*Returns the currently used RGB image scaling method.*
- static void `RGB_scaling` (`Fl_RGB_Scaling`)
 

*Sets the RGB image scaling method used for copy(int, int).*
- static `Fl_RGB_Scaling` `scaling_algorithm` ()
 

*Gets what algorithm is used when resizing a source image to draw it.*
- static void `scaling_algorithm` (`Fl_RGB_Scaling` algorithm)
 

*Sets what algorithm is used when resizing a source image to draw it.*

### Public Attributes inherited from `Fl_Bitmap`

- int `alloc_array`

*Non-zero if array points to bitmap data allocated internally.*
- const `uchar` \* `array`

*pointer to raw bitmap data*

### Static Public Attributes inherited from `Fl_Image`

- static const int `ERR_FILE_ACCESS` = -2
- static const int `ERR_FORMAT` = -3
- static const int `ERR_MEMORY_ACCESS` = -4
- static const int `ERR_NO_IMAGE` = -1
- static bool `register_images_done` = false
 

*True after `fl_register_images()` was called, false before.*

### Protected Member Functions inherited from `Fl_Image`

- void `d` (int D)
 

*Sets the current image depth.*
- void `data` (const char \*const \*p, int c)
 

*Sets the current data pointer and count of pointers in the array.*
- void `draw_empty` (int X, int Y)
 

*The protected method `draw_empty()` draws a box with an X in it.*
- int `draw_scaled` (int X, int Y, int W, int H)

*Draw the image to the current drawing surface rescaled to a given width and height.*

- void **h** (int H)

*Sets the height of the image data.*

- void **ld** (int LD)

*Sets the current line data size in bytes.*

- void **w** (int W)

*Sets the width of the image data.*

### Static Protected Member Functions inherited from FI\_Image

- static void **labeltype** (const FI\_Label \*lo, int lx, int ly, int lw, int lh, FI\_Align la)
- static void **measure** (const FI\_Label \*lo, int &lw, int &lh)

### 13.158.1 Detailed Description

The FI\_XBM\_Image class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

### 13.158.2 Constructor & Destructor Documentation

#### 13.158.2.1 FI\_XBM\_Image()

```
FI_XBM_Image::FI_XBM_Image (
 const char * name)
```

The constructor loads the named XBM file from the given name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- FI\_XBM\_Image.H
- FI\_XBM\_Image.cxx

## 13.159 FI\_XPM\_Image Class Reference

The FI\_XPM\_Image class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

```
#include <FI_XPM_Image.H>
```

Inheritance diagram for FI\_XPM\_Image:

### Public Member Functions

- FI\_XPM\_Image (const char \*filename)

*The constructor loads the XPM image from the name filename.*

### Public Member Functions inherited from FI\_Pixmap

- int **cache\_h** () const
- int **cache\_w** () const
- void **color\_average** (FI\_Color c, float i) override

*The color\_average() method averages the colors in the image with the provided FLTK color value.*

- [FL\\_Image](#) \* **copy** () const
- [FL\\_Image](#) \* **copy** (int W, int H) const override  
*Creates a resized copy of the image.*
- void **desaturate** () override  
*The [desaturate\(\)](#) method converts an image to grayscale.*
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draws the image to the current drawing surface with a bounding box.*
- [FL\\_Pixmap](#) (char \*const \*D)  
*The constructors create a new pixmap from the specified XPM data.*
- [FL\\_Pixmap](#) (const char \*const \*D)  
*The constructors create a new pixmap from the specified XPM data.*
- [FL\\_Pixmap](#) (const [uchar](#) \*const \*D)  
*The constructors create a new pixmap from the specified XPM data.*
- [FL\\_Pixmap](#) ([uchar](#) \*const \*D)  
*The constructors create a new pixmap from the specified XPM data.*
- void **label** ([FL\\_Menu\\_Item](#) \*m) override  
*This method is an obsolete way to set the image attribute of a menu item.*
- void **label** ([FL\\_Widget](#) \*w) override  
*This method is an obsolete way to set the image attribute of a widget or menu item.*
- void **uncache** () override  
*If the image has been cached for display, delete the cache data.*
- virtual ~[FL\\_Pixmap](#) ()  
*The destructor frees all memory and server resources that are used by the pixmap.*

## Public Member Functions inherited from [FL\\_Image](#)

- virtual class [FL\\_Shared\\_Image](#) \* **as\_shared\_image** ()  
*Returns whether an image is an [FL\\_Shared\\_Image](#) or not.*
- [FL\\_Image](#) \* **copy** () const  
*Creates a copy of the image in the same size.*
- int **count** () const  
*Returns the number of data values associated with the image.*
- int **d** () const  
*Returns the image depth.*
- const char \*const \* **data** () const  
*Returns a pointer to the current image data array.*
- int **data\_h** () const  
*Returns the height of the image data.*
- int **data\_w** () const  
*Returns the width of the image data.*
- void **draw** (int X, int Y)  
*Draws the image to the current drawing surface.*
- int **fail** () const  
*Returns a value that is not 0 if there is currently no image available.*
- [FL\\_Image](#) (int W, int H, int D)  
*The constructor creates an empty image with the specified width, height, and depth.*
- int **h** () const  
*Returns the current image drawing height in FLTK units.*
- void **inactive** ()

The *inactive()* method calls *color\_average(FL\_BACKGROUND\_COLOR, 0.33f)* to produce an image that appears grayed out.

- int **ld** () const  
Returns the current line data size in bytes.
- virtual void **release** ()  
Releases an *FI\_Image* - the same as 'delete this'.
- virtual void **scale** (int width, int height, int proportional=1, int can\_expand=0)  
Sets the drawing size of the image.
- int **w** () const  
Returns the current image drawing width in FLTK units.
- virtual ~**FI\_Image** ()  
The destructor is a virtual method that frees all memory used by the image.

### Additional Inherited Members

### Static Public Member Functions inherited from *FI\_Image*

- static *FI\_Labeltype* **define\_FL\_IMAGE\_LABEL** ()
- static *FI\_RGB\_Scaling* **RGB\_scaling** ()  
Returns the currently used RGB image scaling method.
- static void **RGB\_scaling** (*FI\_RGB\_Scaling*)  
Sets the RGB image scaling method used for copy(int, int).
- static *FI\_RGB\_Scaling* **scaling\_algorithm** ()  
Gets what algorithm is used when resizing a source image to draw it.
- static void **scaling\_algorithm** (*FI\_RGB\_Scaling* algorithm)  
Sets what algorithm is used when resizing a source image to draw it.

### Public Attributes inherited from *FI\_Pixmap*

- int **alloc\_data**

### Static Public Attributes inherited from *FI\_Image*

- static const int **ERR\_FILE\_ACCESS** = -2
- static const int **ERR\_FORMAT** = -3
- static const int **ERR\_MEMORY\_ACCESS** = -4
- static const int **ERR\_NO\_IMAGE** = -1
- static bool **register\_images\_done** = false  
True after *fl\_register\_images()* was called, false before.

### Protected Member Functions inherited from *FI\_Pixmap*

- void **measure** ()

### Protected Member Functions inherited from *FI\_Image*

- void **d** (int D)  
Sets the current image depth.
- void **data** (const char \*const \*p, int c)  
Sets the current data pointer and count of pointers in the array.
- void **draw\_empty** (int X, int Y)  
The protected method *draw\_empty()* draws a box with an X in it.
- int **draw\_scaled** (int X, int Y, int W, int H)  
Draw the image to the current drawing surface rescaled to a given width and height.

- void **h** (int H)  
*Sets the height of the image data.*
- void **ld** (int LD)  
*Sets the current line data size in bytes.*
- void **w** (int W)  
*Sets the width of the image data.*

### Static Protected Member Functions inherited from **FI\_Image**

- static void **labeltype** (const **FI\_Label** \*lo, int lx, int ly, int lw, int lh, **FI\_Align** la)
- static void **measure** (const **FI\_Label** \*lo, int &lw, int &lh)

### 13.159.1 Detailed Description

The **FI\_XPM\_Image** class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

### 13.159.2 Constructor & Destructor Documentation

#### 13.159.2.1 **FI\_XPM\_Image**()

```
FI_XPM_Image::FI_XPM_Image (
 const char * name)
```

The constructor loads the XPM image from the name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- FI\_XPM\_Image.H
- FI\_XPM\_Image.cxx

## 13.160 **FI\_GIF\_Image::GIF\_FRAME** Struct Reference

### Classes

- struct **CPAL**

### Public Member Functions

- void **colors** (int nclrs, int bg, int tp)
- void **disposal** (int mode, int time)
- **GIF\_FRAME** (int frame, const **uchar** \*data)
- **GIF\_FRAME** (int frame, int W, int H, int fx, int fy, int fw, int fh, const **uchar** \*data)

### Public Attributes

- int **bkgd**
- const **uchar** \* **bptr**
- int **clrs**
- const struct **FI\_GIF\_Image::GIF\_FRAME::CPAL** \* **cpal**
- int **delay**
- int **dispose**
- int **h**
- int **height**
- int **ifrm**
- int **trans**
- int **w**
- int **width**

- int **x**
- int **y**

The documentation for this struct was generated from the following file:

- FI\_GIF\_Image.H

## 13.161 FI\_ICO\_Image::IconDirEntry Struct Reference

Windows ICONDIRENTRY structure

```
#include <FI_ICO_Image.H>
```

### Public Attributes

- int **bColorCount**  
*Number of colors (0 if 8bpp)*
- int **bHeight**  
*Image height.*
- int **bReserved**  
*Reserved.*
- int **bWidth**  
*Image width.*
- int **dwBytesInRes**  
*Resource size in bytes.*
- int **dwImageOffset**  
*Offset to the image.*
- int **wBitCount**  
*Bits per pixel.*
- int **wPlanes**  
*Color Planes.*

### 13.161.1 Detailed Description

Windows ICONDIRENTRY structure

The documentation for this struct was generated from the following file:

- FI\_ICO\_Image.H

## 13.162 FI\_Text\_Editor::Key\_Binding Struct Reference

Simple linked list item associating a key/state to a function.

```
#include <FI_Text_Editor.H>
```

### Public Attributes

- [Key\\_Func](#) **function**  
*associated function*
- int **key**  
*the key pressed*
- [Key\\_Binding](#) \* **next**  
*next key binding in the list*
- int **state**  
*the state of key modifiers*

### 13.162.1 Detailed Description

Simple linked list item associating a key/state to a function.

The documentation for this struct was generated from the following file:

- [Fl\\_Text\\_Editor.H](#)

## 13.163 [Fl\\_Terminal::Margin](#) Class Reference

### Public Member Functions

- void **bottom** (int val)
- int **bottom** (void) const
- void **left** (int val)
- int **left** (void) const
- void **right** (int val)
- int **right** (void) const
- void **top** (int val)
- int **top** (void) const

The documentation for this class was generated from the following file:

- [Fl\\_Terminal.H](#)

## 13.164 [Fl\\_Preferences::Name](#) Class Reference

'[Name](#)' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

```
#include <Fl_Preferences.H>
```

### Public Member Functions

- [Name](#) (const char \*format,...)  
*Creates a group name or entry name on the fly.*
- [Name](#) (unsigned int n)  
*Creates a group name or entry name on the fly.*
- **operator const char \* ()** const  
*Return the [Name](#) as a "C" string.*

### 13.164.1 Detailed Description

'[Name](#)' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

Example: `prefs.set(Fl\_Preferences::Name("File%d",i),file[i]);`

See `test/preferences.cxx` as a sample for writing arrays into preferences.

'[Name](#)' is actually implemented as a class inside [Fl\\_Preferences](#). It casts into `const char*` and gets automatically destroyed after the enclosing call ends.

## 13.164.2 Constructor & Destructor Documentation

### 13.164.2.1 [Name\(\)](#) [1/2]

```
Fl_Preferences::Name::Name (
 unsigned int n)
```

Creates a group name or entry name on the fly.

This version creates a simple unsigned integer as an entry name.

```
int n, i;
Fl_Preferences prev(appPrefs, "PreviousFiles");
prev.get("n", 0);
for (i=0; i<n; i++)
 prev.get(Fl_Preferences::Name(i), prevFile[i], "");
```

### 13.164.2.2 Name() [2/2]

```
Fl_Preferences::Name::Name (
 const char * format,
 ...)
```

Creates a group name or entry name on the fly.

This version creates entry names as in 'printf'.

```
int n, i;
Fl_Preferences prefs(USER, "matthiasm.com", "test");
prev.get("nFiles", 0);
for (i=0; i<n; i++)
 prev.get(Fl_Preferences::Name("File%d", i), prevFile[i], "");
```

The documentation for this class was generated from the following files:

- Fl\_Preferences.H
- Fl\_Preferences.cxx

## 13.165 Fl\_Preferences::Node Class Reference

### Public Member Functions

- void **add** (const char \*line)
- [Node](#) \* **addChild** (const char \*path)
- const char \* **child** (int ix)
- [Node](#) \* **childNode** (int ix)

- **RootNode** ([FI\\_Preferences](#) \*, [Root](#) root, const char \*vendor, const char \*application)
- int **write** ()

The documentation for this class was generated from the following files:

- FI\_Preferences.H
- FI\_Preferences.cxx

## 13.170 FI\_Scroll::Scrollbar\_Data Struct Reference

A local struct to manage a scrollbar's xywh region and tab values.

```
#include <FI_Scroll.H>
```

## Public Attributes

- int **first**  
*scrollbar tab's "number of first line"*
- int **h**  
*scrollbar's position and size*
- int **pos**  
*scrollbar tab's "position of first line displayed"*
- int **size**  
*scrollbar tab's "size of window in lines"*
- int **total**  
*scrollbar tab's "total number of lines"*
- int **w**
- int **x**
- int **y**

### 13.170.1 Detailed Description

A local struct to manage a scrollbar's xywh region and tab values.

The documentation for this struct was generated from the following file:

- `Fl_Scroll.H`

## 13.171 `Fl_Scroll::ScrollInfo` Struct Reference

Structure to manage scrollbar and widget interior sizes.

```
#include <Fl_Scroll.H>
```

## Public Attributes

- `Fl_Rect` **child**  
*child bounding box or (x(), y(), 0, 0) if empty*
- int **hneeded**  
*horizontal scrollbar visibility*
- `Scrollbar_Data` **hscroll**  
*horizontal scrollbar region + values*
- `Fl_Rect` **innerbox**  
*widget's inner box, excluding scrollbars*
- `Fl_Rect` **innerchild**  
*widget's inner box, including scrollbars*
- int **scrollsize**  
*the effective scrollbar thickness (local or global)*
- int **vneeded**  
*vertical scrollbar visibility*
- `Scrollbar_Data` **vscroll**  
*vertical scrollbar region + values*

### 13.171.1 Detailed Description

Structure to manage scrollbar and widget interior sizes.

This is filled out by `recalc_scrollbars()` for use in calculations that need to know the visible scroll area size, etc.

Version

1.3.3

The documentation for this struct was generated from the following file:

- `Fl_Scroll.H`

## 13.172 Fl\_Terminal::Selection Class Reference

### Public Member Functions

- bool **clear** (void)

- bool **start** (int row, int col, bool char\_right)
- void **start\_push** ()
- int **state** (void) const

### 13.172.1 Member Function Documentation

#### 13.172.1.1 get\_selection()

```
bool Fl_Terminal::Selection::get_selection (
 int & srow,
 int & scol,
 int & erow,
 int & ecol) const
```

Return selection start/end.

Ensures (start <= end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom.

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

The documentation for this class was generated from the following files:

- [Fl\\_Terminal.H](#)
- [Fl\\_Terminal.cxx](#)

## 13.173 Fl\_Tile::Size\_Range Struct Reference

### Public Attributes

- int **maxh**
- int **maxw**
- int **minh**
- int **minw**

The documentation for this struct was generated from the following file:

- [Fl\\_Tile.H](#)

## 13.174 FI\_Text\_Display::Style\_Table\_Entry Struct Reference

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

```
#include <FI_Text_Display.H>
```

### Public Attributes

- unsigned **attr**  
*further attributes for the text style (see ATTR\_BGCOLOR, etc.)*
- [FI\\_Color](#) **bgcolor**  
*text background color if ATTR\_BGCOLOR or ATTR\_BGCOLOR\_EXT is set*
- [FI\\_Color](#) **color**  
*text color*
- [FI\\_Font](#) **font**  
*text font*
- [FI\\_Fontsize](#) **size**  
*text font size*

### 13.174.1 Detailed Description

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

There must be one entry for each style that can be used in an [FI\\_Text\\_Display](#) for displaying text. The style table is an array of struct [Style\\_Table\\_Entry](#).

The style table is associated with an [FI\\_Text\\_Display](#) by using [FI\\_Text\\_Display::highlight\\_data\(\)](#).

See also

[FI\\_Text\\_Display::highlight\\_data\(\)](#)

The documentation for this struct was generated from the following file:

- FI\_Text\_Display.H

## 13.175 FI::TimeoutData Struct Reference

### Public Attributes

- [FI\\_Timeout\\_Handler](#) **cb**
- void \* **data**
- double **t**

The documentation for this struct was generated from the following file:

- FI.H

## 13.176 FI\_Terminal::Utf8Char Class Reference

## 14.2 events.H File Reference

Global event handling variables and functions.

```

#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
#include <FL/core/function_types.H>

```

### Namespaces

- namespace [Fl](#)

*[Fl](#) is the FLTK global namespace containing state information and global methods for the current application.*

### Functions

- void [Fl::add\\_handler](#) ([Fl\\_Event\\_Handler](#) ha)  
*Install a function to parse unrecognized events.*
- void [Fl::add\\_handler](#) ([Fl\\_Event\\_Handler](#) ha, [Fl\\_Event\\_Handler](#) before)  
*Install a function to parse unrecognized events with less priority than another function.*
- void [Fl::add\\_system\\_handler](#) ([Fl\\_System\\_Handler](#) h, void \*data)

- Install a function to intercept system events.*
- `FL_Widget * FL::belowmouse ()`  
*Gets the widget that is below the mouse.*
- `void FL::belowmouse (FL_Widget *)`  
*Sets the widget that is below the mouse.*
- `FL_Callback_Reason FL::callback_reason ()`  
*Give the reason for calling a callback.*
- `int FL::compose (int &del)`  
*Any text editing widget should call this for each FL\_KEYBOARD event.*
- `void FL::compose_reset ()`  
*If the user moves the cursor, be sure to call FL::compose\_reset().*
- `void FL::disable_im ()`  
*Disables the system input methods facilities.*
- `void FL::enable_im ()`  
*Enables the system input methods facilities.*
- `int FL::event ()`  
*Returns the last event that was processed.*
- `int FL::event_alt ()`  
*Returns non-zero if the Alt key is pressed.*
- `int FL::event_button ()`  
*Gets which particular mouse button caused the current event.*
- `int FL::event_button1 ()`  
*Returns non-zero if mouse button 1 is currently held down.*
- `int FL::event_button2 ()`  
*Returns non-zero if mouse button 2 is currently held down.*
- `int FL::event_button3 ()`  
*Returns non-zero if mouse button 3 is currently held down.*
- `int FL::event_button4 ()`  
*Returns non-zero if mouse button 4 is currently held down.*
- `int FL::event_button5 ()`  
*Returns non-zero if mouse button 5 is currently held down.*
- `int FL::event_buttons ()`  
*Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.*
- `int FL::event_clicks ()`  
*Returns non zero if we had a double click event.*
- `void FL::event_clicks (int i)`  
*Manually sets the number returned by FL::event\_clicks().*
- `void * FL::event_clipboard ()`  
*During an FL\_PASTE event of non-textual data, returns a pointer to the pasted data.*
- `const char * FL::event_clipboard_type ()`  
*Returns the type of the pasted data during an FL\_PASTE event.*
- `int FL::event_command ()`  
*Returns non-zero if the FL\_COMMAND key is pressed, either FL\_CTRL or on OSX FL\_META.*
- `int FL::event_ctrl ()`  
*Returns non-zero if the Control key is pressed.*
- `FL_Event_Dispatch FL::event_dispatch ()`  
*Return the current event dispatch function.*
- `void FL::event_dispatch (FL_Event_Dispatch d)`  
*Set a new event dispatch function.*
- `int FL::event_dx ()`  
*Returns the current horizontal mouse scrolling associated with the FL\_MOUSEWHEEL event.*

- float [Fl::event\\_dx\\_f](#) ()  
*Returns the current horizontal mouse scrolling associated with the FL\_MOUSEWHEEL event.*
- int [Fl::event\\_dy](#) ()  
*Returns the current vertical mouse scrolling associated with the FL\_MOUSEWHEEL event.*
- float [Fl::event\\_dy\\_f](#) ()  
*Returns the current vertical mouse scrolling associated with the FL\_MOUSEWHEEL event.*
- int [Fl::event\\_inside](#) (const [Fl\\_Widget](#) \*)  
*Returns whether or not the mouse event is inside a given child widget.*
- int [Fl::event\\_inside](#) (int, int, int, int)  
*Returns whether or not the mouse event is inside the given rectangle.*
- int [Fl::event\\_is\\_click](#) ()  
*Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last FL\_PUSH or FL\_KEYBOARD event for it to be considered a "drag" rather than a "click".*
- void [Fl::event\\_is\\_click](#) (int i)  
*Clears the value returned by [Fl::event\\_is\\_click](#)().*
- int [Fl::event\\_key](#) ()  
*Gets which key on the keyboard was last pushed.*
- int [Fl::event\\_key](#) (int key)  
*Returns true if the given `key` was held down (or pressed) during the last event.*
- int [Fl::event\\_length](#) ()  
*Returns the length of the text in [Fl::event\\_text](#)().*
- int [Fl::event\\_original\\_key](#) ()  
*Returns the keycode of the last key event, regardless of the NumLock state.*
- int [Fl::event\\_shift](#) ()  
*Returns non-zero if the Shift key is pressed.*
- int [Fl::event\\_state](#) ()  
*Returns the keyboard and mouse button states of the last event.*
- int [Fl::event\\_state](#) (int mask)  
*Returns non-zero if any of the passed event state bits are turned on.*
- const char \* [Fl::event\\_text](#) ()  
*Returns the text associated with the current event, including FL\_PASTE or FL\_DND\_RELEASE events.*
- int [Fl::event\\_x](#) ()  
*Returns the mouse position of the event relative to the [Fl\\_Window](#) it was passed to.*
- int [Fl::event\\_x\\_root](#) ()  
*Returns the mouse position on the screen of the event.*
- int [Fl::event\\_y](#) ()  
*Returns the mouse position of the event relative to the [Fl\\_Window](#) it was passed to.*
- int [Fl::event\\_y\\_root](#) ()  
*Returns the mouse position on the screen of the event.*
- [Fl\\_Widget](#) \* [Fl::focus](#) ()  
*Gets the current [Fl::focus](#)() widget.*
- void [Fl::focus](#) ([Fl\\_Widget](#) \*)  
*Sets the widget that will receive FL\_KEYBOARD events.*
- int [Fl::get\\_key](#) (int key)  
*Returns true if the given `key` is held down now.*
- int [Fl::get\\_mouse](#) (int &X, int &Y)  
*Return the number of the mouse-containing screen and computes the mouse screen coordinates.*
- int [Fl::handle](#) (int, [Fl\\_Window](#) \*)  
*Handle events from the window system.*
- int [Fl::handle\\_](#) (int, [Fl\\_Window](#) \*)  
*Handle events from the window system.*

- `Fl_Event_Handler Fl::last_handler ()`  
*Returns the last function installed by a call to `Fl::add_handler()`.*
- `Fl_Widget * Fl::pushed ()`  
*Gets the widget that is being pushed.*
- `void Fl::pushed (Fl_Widget *)`  
*Sets the widget that is being pushed.*
- `void Fl::remove_handler (Fl_Event_Handler h)`  
*Removes a previously added event handler.*
- `void Fl::remove_system_handler (Fl_System_Handler h)`  
*Removes a previously added system event handler.*
- `int Fl::test_shortcut (Fl_Shortcut)`  
*Tests the current event, which must be an `FL_KEYBOARD` or `FL_SHORTCUT`, against a shortcut value (described in `Fl_Button`).*

### Variables

- `char const *const Fl::clipboard_image = "image"`  
*Denotes image data.*
- `char const *const Fl::clipboard_plain_text = "text/plain"`  
*Denotes plain textual data.*

### 14.2.1 Detailed Description

Global event handling variables and functions.

[Fl::Pen::Trait::PROXIMITY](#) = 0x0400 }  
*Bitfield of traits.*

### Functions

- [Trait Fl::Pen::driver\\_traits\(\)](#)

- Query the traits supported by the pen/tablet driver.*
- bool [Fl::Pen::driver\\_traits](#) (Trait bits)
  - Return true if the corresponding bit is set in the driver traits.*
- constexpr [State Fl::Pen::operator&](#) (State lhs, State rhs)
  - Bitwise AND operator for State enum.*
- constexpr [Trait Fl::Pen::operator&](#) (Trait lhs, Trait rhs)
  - Bitwise AND operator for Trait enum.*
- constexpr [State Fl::Pen::operator|](#) (State lhs, State rhs)
  - Bitwise OR operator for State enum.*
- constexpr [Trait Fl::Pen::operator|](#) (Trait lhs, Trait rhs)
  - Bitwise OR operator for Trait enum.*
- [State & Fl::Pen::operator|=](#) (State &lhs, State rhs)
  - Bitwise OR assignment operator for State enum.*
- [Trait & Fl::Pen::operator|=](#) (Trait &lhs, Trait rhs)
  - Bitwise OR assignment operator for Trait enum.*
- [Trait Fl::Pen::pen\\_traits](#) (int pen\_id=0)
  - Query traits of the current pen or stylus.*
- bool [Fl::Pen::pen\\_traits](#) (Trait bits, int pen\_id=0)
  - Return true if the corresponding bit is set in the pen traits.*
- void [Fl::Pen::release](#) ()
  - Clear the "pushed" state and forward pen events as mouse events.*
- void [Fl::Pen::subscribe](#) (Fl\_Widget \*widget)
  - Receives a [Pen::ENTER](#) event when the pen enters this widget.*
- void [Fl::Pen::unsubscribe](#) (Fl\_Widget \*widget)
  - Stop receiving [Pen::ENTER](#) for this widget.*

#### Query values during event handling

- double [Fl::Pen::event\\_barrel\\_pressure](#) ()
  - Returns barrel pressure or tangential pressure.*
- int [Fl::Pen::event\\_pen\\_id](#) ()
  - Returns the ID of the pen used in the last event.*
- double [Fl::Pen::event\\_pressure](#) ()
  - Returns the pressure between the tip or eraser and the surface.*
- double [Fl::Pen::event\\_proximity](#) ()
  - Returns the proximity of the pen to the surface between 0 and 1.*
- [State Fl::Pen::event\\_state](#) ()
  - Returns the state of the various buttons and tips.*
- bool [Fl::Pen::event\\_state](#) (State bits)
  - Return true if any of the bits are set in the event state.*
- double [Fl::Pen::event\\_tilt\\_x](#) ()
  - Returns the tilt of the pen in the x and y directions between -1 and 1.*
- double [Fl::Pen::event\\_tilt\\_y](#) ()
  - Returns pen Y-axis tilt, see [event\\_tilt\\_x\(\)](#)*
- [State Fl::Pen::event\\_trigger](#) ()
  - Returns the state change that triggered the event.*
- double [Fl::Pen::event\\_twist](#) ()
  - Returns the pen's axial rotation in degrees.*
- double [Fl::Pen::event\\_x](#) ()
  - Returns the pen x and y position inside the handling widget as doubles.*
- double [Fl::Pen::event\\_x\\_root](#) ()
  - Returns the pen x and y position in global coordinates as doubles.*
- double [Fl::Pen::event\\_y](#) ()
  - Returns pen Y coordinate in widget space, see [event\\_x\(\)](#).*
- double [Fl::Pen::event\\_y\\_root](#) ()
  - Returns pen Y coordinate in screen space, see [event\\_x\\_root\(\)](#).*

### 14.8.1 Detailed Description

```

### Macros

- `#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)`  
*The FLTK API version number as an int.*
- `#define FL_IMAGE_WITH_ALPHA 0x40000000`
- `#define FL_VERSION`  
*The FLTK version number as a double.*

### Names of Non-ASCII keys and mouse buttons

The following constants define the names of non-ASCII keys on the keyboard and of mouse buttons for `FL_KEYBOARD` and `FL_SHORTCUT` events.

See also

[`Fl::event\_key\(\)`](#) and [`Fl::get\_key\(int\)`](#) (use ASCII letters for all other keys):

- `#define FL_Alt_Gr 0xfe03`  
*The AltGr key on some international keyboards.*
- `#define FL_Alt_L 0xffe9`  
*The left alt key.*
- `#define FL_Alt_R 0xffea`  
*The right alt key.*
- `#define FL_Back 0xEF26`  
*Like back on a browser.*
- `#define FL_BackSpace 0xff08`  
*The backspace key.*
- `#define FL_Button 0xfee8`  
*A mouse button; use `FL_Button + n` for mouse button `n`.*
- `#define FL_Caps_Lock 0xffe5`  
*The caps lock key.*
- `#define FL_Control_L 0xffe3`  
*The lefthand control key.*
- `#define FL_Control_R 0xffe4`  
*The righthand control key.*
- `#define FL_Delete 0xffff`  
*The delete key.*
- `#define FL_Down 0xff54`  
*The down arrow key.*
- `#define FL_Eisu 0xff2f`  
*The Eisu key of JIS keyboards.*
- `#define FL_End 0xff57`  
*The end key.*
- `#define FL_Enter 0xff0d`  
*The enter key.*
- `#define FL_Escape 0xff1b`  
*The escape key.*

- **#define FL\_F** 0xffbd  
*One of the function keys; use FL\_F + n for function key n.*
- **#define FL\_F\_Last** 0xffe0  
*The last function key; use to range-check function keys.*
- **#define FL\_Favorites** 0xEF30  
*Show favorite locations.*
- **#define FL\_Forward** 0xEF27  
*Like forward on a browser.*
- **#define FL\_Help** 0xff68  
*The 'help' key on Mac keyboards.*
- **#define FL\_Home** 0xff50  
*The home key.*
- **#define FL\_Home\_Page** 0xEF18  
*Display user's home page.*
- **#define FL\_Insert** 0xff63  
*The insert key.*
- **#define FL\_Iso\_Key** 0xff0c  
*The additional key of ISO keyboards.*
- **#define FL\_JIS\_Underscore** 0xff31  
*The underscore key of JIS keyboards.*
- **#define FL\_Kana** 0xff2e  
*The Kana key of JIS keyboards.*
- **#define FL\_KP** 0xff80  
*One of the keypad numbers; use FL\_KP + 'n' for digit n.*
- **#define FL\_KP\_Enter** 0xff8d  
*The enter key on the keypad, same as FL\_KP+'r'.*
- **#define FL\_KP\_Last** 0xffbd  
*The last keypad key; use to range-check keypad.*
- **#define FL\_Left** 0xff51  
*The left arrow key.*
- **#define FL\_Mail** 0xEF19  
*Invoke user's mail program.*
- **#define FL\_Media\_Next** 0xEF17  
*Next track.*
- **#define FL\_Media\_Play** 0xEF14  
*Start playing of audio.*
- **#define FL\_Media\_Prev** 0xEF16  
*Previous track.*
- **#define FL\_Media\_Stop** 0xEF15  
*Stop playing audio.*
- **#define FL\_Menu** 0xff67  
*The menu key.*
- **#define FL\_Meta\_L** 0xffe7  
*The left meta/Windows key.*
- **#define FL\_Meta\_R** 0xffe8  
*The right meta/Windows key.*
- **#define FL\_Num\_Lock** 0xff7f  
*The num lock key.*
- **#define FL\_Page\_Down** 0xff56  
*The page-down key.*
- **#define FL\_Page\_Up** 0xff55  
*The page-up key.*
- **#define FL\_Pause** 0xff13  
*The pause key.*
- **#define FL\_Print** 0xff61  
*The print (or print-screen) key.*
- **#define FL\_Refresh** 0xEF29  
*Refresh the page.*
- **#define FL\_Right** 0xff53

- *The right arrow key.*
- #define **FL\_Scroll\_Lock** 0xff14
- *The scroll lock key.*
- #define **FL\_Search** 0xEF1B
- *Search.*
- #define **FL\_Shift\_L** 0xffe1
- *The lefthand shift key.*
- #define **FL\_Shift\_R** 0xffe2
- *The righthand shift key.*
- #define **FL\_Sleep** 0xEF2F
- *Put system to sleep.*
- #define **FL\_Stop** 0xEF28
- *Stop current operation.*
- #define **FL\_Tab** 0xff09
- *The tab key.*
- #define **FL\_Up** 0xff52
- *The up arrow key.*
- #define **FL\_Volume\_Down** 0xEF11
- *Volume control down.*
- #define **FL\_Volume\_Mute** 0xEF12
- *Mute sound from the system.*
- #define **FL\_Volume\_Up** 0xEF13
- *Volume control up.*
- #define **FL\_Yen** 0xff30
- *The Yen key of JIS keyboards.*

## Mouse Buttons

These constants define the button numbers for `FL_PUSH` and `FL_RELEASE` events.

See also

[`Fl::event\_button\(\)`](#)

- #define **FL\_BACK\_MOUSE** 4
- *The back mouse button (side button 1)*
- #define **FL\_FORWARD\_MOUSE** 5
- *The forward mouse button (side button 2)*
- #define **FL\_LEFT\_MOUSE** 1
- *The left mouse button.*
- #define **FL\_MIDDLE\_MOUSE** 2
- *The middle mouse button.*
- #define **FL\_RIGHT\_MOUSE** 3
- *The right mouse button.*

## Event States

The following constants define bits in the `Fl::event_state()` value.

- #define **FL\_ALT** 0x00080000
- *One of the alt keys is down.*
- #define **FL\_BUTTON**(n) (0x00800000<<(n))
- *Mouse button n (n = 1..5) is pushed, undefined if n outside 1..5.*
- #define **FL\_BUTTON1** 0x01000000
- *Mouse button 1 is pushed (L)*
- #define **FL\_BUTTON2** 0x02000000
- *Mouse button 2 is pushed (M)*
- #define **FL\_BUTTON3** 0x04000000
- *Mouse button 3 is pushed (R)*
- #define **FL\_BUTTON4** 0x08000000
- *Mouse button 4 is pushed (BACK)*
- #define **FL\_BUTTON5** 0x10000000

- *Mouse button 5 is pushed (FORWARD)*
- #define **FL\_BUTTONS** 0x1f000000
- *Bitmask: any mouse button (1-5) is pushed.*
- #define **FL\_CAPS\_LOCK** 0x00020000
- *The caps lock is on.*
- #define **FL\_CTRL** 0x00040000
- *One of the ctrl keys is down.*
- #define **FL\_KEY\_MASK** 0x0000ffff
- *All keys are 16 bit for now.*
- #define **FL\_META** 0x00400000
- *One of the meta/Windows keys is down.*
- #define **FL\_NUM\_LOCK** 0x00100000
- *The num lock is on.*
- #define **FL\_SCROLL\_LOCK** 0x00800000
- *The scroll lock is on.*
- #define **FL\_SHIFT** 0x00010000
- *One of the shift keys is down.*

### Typedefs

- typedef int [Fl\\_Fontsize](#)
- *Size of a font in pixels.*

### Enumerations

`FL_CURSOR_NS` = 78 , `FL_CURSOR_WE` = 79 , `FL_CURSOR_NWSE` = 80 , `FL_CURSOR_NESW` = 81 ,  
`FL_CURSOR_N` = 70 , `FL_CURSOR_NE` = 69 , `FL_CURSOR_E` = 49 , `FL_CURSOR_SE` = 8 ,  
`FL_CURSOR_S` = 9 , `FL_CURSOR_SW` = 7 , `FL_CURSOR_W` = 36 , `FL_CURSOR_NW` = 68 ,  
`FL_CURSOR_NONE` = 255 }

*The following constants define the mouse cursors that are available in FLTK.*

### Variables

- `Fl_Fontsize FL_NORMAL_SIZE`  
*normal font size*

### Box Types

FLTK standard box types

This enum defines the standard box types included with FLTK.

**Note**

For backward compatibility, the `FL_Boxtype` enum includes some additional symbols that start with underscores. These underscore-prefixed symbols have identical values to their regular counterparts.

`FL_NO_BOX` means nothing is drawn at all, so whatever is already on the screen remains. The `FL_..._FRAME` types only draw their edges, leaving the interior unchanged. The blue color in the image below is the area that is not drawn by the frame types.

**Figure 14.1 FLTK Standard Box Types**

**Note**

Not all box types are depicted in the figure above. See enum [FL\\_Boxtype](#) below for the complete list of box types.

**See also**

[Fl::get\\_system\\_colors\(\)](#)

- [FL\\_Boxtype fl\\_box](#) ([FL\\_Boxtype](#) b)

*Get the filled version of a frame.*

```

*FLTK standard box types.*

- **#define FL\_CIRCLE\_BOX FL\_ROUND\_DOWN\_BOX**
- **#define FL\_DIAMOND\_BOX FL\_DIAMOND\_DOWN\_BOX**
- **Fl\_Boxtype fl\_down (Fl\_Boxtype b)**  
*Get the "pressed" or "down" version of a box.*
- **Fl\_Boxtype fl\_frame (Fl\_Boxtype b)**  
*Get the unfilled, frame only version of a box.*
- **#define FL\_FRAME FL\_ENGRAVED\_FRAME**
- **#define FL\_FRAME\_BOX FL\_ENGRAVED\_BOX**
- **Fl\_Labeltype fl\_define\_FL\_EMBOSSED\_LABEL ()**  
*Initializes the internal table entry for FL\_EMBOSSED\_LABEL and returns its internal value.*
- **Fl\_Labeltype fl\_define\_FL\_ENGRAVED\_LABEL ()**  
*Initializes the internal table entry for FL\_ENGRAVED\_LABEL and returns its internal value.*
- **Fl\_Labeltype fl\_define\_FL\_ICON\_LABEL ()**  
*Initializes the internal table entry for FL\_ICON\_LABEL and returns its internal value.*
- **Fl\_Labeltype fl\_define\_FL\_IMAGE\_LABEL ()**  
*Initializes the internal table entry for FL\_IMAGE\_LABEL and returns its internal value.*
- **Fl\_Labeltype fl\_define\_FL\_MULTI\_LABEL ()**  
*Initializes the internal table entry for FL\_MULTI\_LABEL and returns its internal value.*
- **Fl\_Labeltype fl\_define\_FL\_SHADOW\_LABEL ()**  
*Initializes the internal table entry for FL\_SHADOW\_LABEL and returns its internal value.*
- **#define FL\_EMBOSSED\_LABEL fl\_define\_FL\_EMBOSSED\_LABEL()**  
*Draws a label with embossed text.*
- **#define FL\_ENGRAVED\_LABEL fl\_define\_FL\_ENGRAVED\_LABEL()**  
*Draws a label with engraved text.*
- **#define FL\_ICON\_LABEL fl\_define\_FL\_ICON\_LABEL()**  
*Draws an icon as the label.*
- **#define FL\_IMAGE\_LABEL fl\_define\_FL\_IMAGE\_LABEL()**  
*Draws an image (Fl\_Image) as the label.*
- **#define FL\_MULTI\_LABEL fl\_define\_FL\_MULTI\_LABEL()**  
*Draws a label that can comprise several parts like text and images.*
- **#define FL\_SHADOW\_LABEL fl\_define\_FL\_SHADOW\_LABEL()**  
*Draws a label with shadows behind the text.*
- **#define FL\_SYMBOL\_LABEL FL\_NORMAL\_LABEL**  
*Sets the current label type and returns its corresponding Fl\_Labeltype value.*

## Colors

The `Fl_Color` type holds an FLTK color value.

Colors are either 8-bit indexes into a [virtual colormap](#) or 24-bit RGB color values. (See [Colors](#) for the default FLTK colormap)

Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

```
Fl_Color => 0xrrgbbii
 | | | |
 | | | +--- index between 0 and 255
 | | +----- blue color component (8 bit)
 | +----- green component (8 bit)
 +----- red component (8 bit)
```

A color can have either an index or an rgb value. Colors with rgb set and an index >0 are reserved for special use.

- `const Fl_Color FL_BACKGROUND2_COLOR = 7`  
*the default background color for text, list, and valuator widgets*
- `const Fl_Color FL_BACKGROUND_COLOR = 49`  
*Default background color.*
- `const Fl_Color FL_BLACK = 56`
- `const Fl_Color FL_BLUE = 216`
- `typedef unsigned int Fl_Color`  
*An FLTK color value; see also [Colors](#)*
- `Fl_Color fl_color_average (Fl_Color c1, Fl_Color c2, float weight)`  
*Returns the weighted average color between the two given colors.*
- `#define FL_COLOR_CUBE (Fl_Color)56`
- `Fl_Color fl_color_cube (int r, int g, int b)`  
*Returns a color out of the color cube.*
- `Fl_Color fl_contrast (Fl_Color fg, Fl_Color bg, int context=0, int size=0)`  
*Returns a color that contrasts with the background color.*
- `typedef Fl_Color() Fl_Contrast_Function(Fl_Color, Fl_Color, int, int)`  
*Type of a custom `fl_contrast()` function.*
- `void fl_contrast_function (Fl_Contrast_Function *f)`  
*Register a custom contrast function.*
- `int fl_contrast_level ()`  
*Get the contrast level (sensitivity) of the `fl_contrast()` method.*
- `void fl_contrast_level (int level)`  
*Set the contrast level (sensitivity) of the `fl_contrast()` method.*
- `enum Fl_Contrast_Mode {`  
    `FL_CONTRAST_NONE = 0, FL_CONTRAST_LEGACY, FL_CONTRAST_CIELAB, FL_CONTRAST_CUSTOM`  
    `,`  
    `FL_CONTRAST_LAST }`  
*Define the possible modes to calculate `fl_contrast()`.*
- `int fl_contrast_mode ()`  
*Return the current contrast algorithm (mode).*
- `void fl_contrast_mode (int mode)`  
*Set the contrast algorithm (mode).*
- `const Fl_Color FL_CYAN = 223`
- `const Fl_Color FL_DARK1 = 47`
- `const Fl_Color FL_DARK2 = 45`
- `const Fl_Color FL_DARK3 = 39`
- `const Fl_Color FL_DARK_BLUE = 136`

- `const FI_Color FL_DARK_CYAN = 140`
- `const FI_Color FL_DARK_GREEN = 60`
- `const FI_Color FL_DARK_MAGENTA = 152`
- `const FI_Color FL_DARK_RED = 72`
- `const FI_Color FL_DARK_YELLOW = 76`
- `FI_Color fl_darker (FI_Color c)`  
*Returns a darker version of the specified color.*
- `const FI_Color FL_FOREGROUND_COLOR = 0`  
*the default foreground color (0) used for labels and text*
- `#define FL_FREE_COLOR (FI_Color)16`  
*Colors numbered between FL\_FREE\_COLOR and FL\_FREE\_COLOR + FL\_NUM\_FREE\_COLOR - 1 are free for the user to be given any value using FI::set\_color().*
- `#define FL_GRAY FL_BACKGROUND_COLOR`
- `const FI_Color FL_GRAY0 = 32`
- `#define FL_GRAY_RAMP (FI_Color)32`
- `FI_Color fl_gray_ramp (int i)`  
*Returns a gray color value from black (i == 0) to white (i == FL\_NUM\_GRAY - 1).*
- `const FI_Color FL_GREEN = 63`
- `FI_Color fl_inactive (FI_Color c)`  
*Returns the inactive, dimmed version of the given color.*
- `const FI_Color FL_INACTIVE_COLOR = 8`  
*the inactive foreground color*
- `const FI_Color FL_LIGHT1 = 50`
- `const FI_Color FL_LIGHT2 = 52`
- `const FI_Color FL_LIGHT3 = 54`
- `FI_Color fl_lighter (FI_Color c)`  
*Returns a lighter version of the specified color.*
- `double fl_lightness (FI_Color color)`  
*Return the perceived lightness of a color.*
- `double fl_luminance (FI_Color color)`  
*Return the raw / physical luminance of a color.*
- `const FI_Color FL_MAGENTA = 248`
- `#define FL_NUM_BLUE 5`
- `#define FL_NUM_FREE_COLOR 16`
- `#define FL_NUM_GRAY 24`
- `#define FL_NUM_GREEN 8`
- `#define FL_NUM_RED 5`
- `const FI_Color FL_RED = 88`
- `FI_Color fl_rgb_color (uchar g)`  
*Returns the 24-bit color value closest to g (grayscale).*
- `FI_Color fl_rgb_color (uchar r, uchar g, uchar b)`  
*Returns the 24-bit color value closest to r, g, b.*
- `const FI_Color FL_SELECTION_COLOR = 15`  
*the default selection/highlight color*
- `const FI_Color FL_WHITE = 255`
- `const FI_Color FL_YELLOW = 95`

## Alignment Flags

Flags to control the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is `FL_ALIGN_CENTER` (0) for most widgets, which centers the label inside the widget.

All alignment flags use the common prefix "`FL_ALIGN_`". In the following descriptions this prefix is sometimes omitted for brevity.

Flags can be or'd to achieve a combination of alignments, but there are some "*magic values*" (e.g. combinations of TOP and BOTTOM and of LEFT and RIGHT) that have special meanings (see below). For instance:

`FL_ALIGN_TOP_LEFT == (FL_ALIGN_TOP | FL_ALIGN_LEFT) != FL_ALIGN_LEFT_TOP.`

Outside alignments (`FL_ALIGN_INSIDE` is not set):

```

 TOP_LEFT TOP TOP_RIGHT
+-----+
LEFT_TOP | | RIGHT_TOP
| | |
LEFT | CENTER | RIGHT
| | |
LEFT_BOTTOM | | RIGHT_BOTTOM
+-----+
 BOTTOM_LEFT BOTTOM BOTTOM_RIGHT

```

Inside alignments (`FL_ALIGN_INSIDE` is set):

```

+-----+
|TOP_LEFT TOP TOP_RIGHT|
| | |
|LEFT CENTER RIGHT|
| | |
|BOTTOM_LEFT BOTTOM BOTTOM_RIGHT|
+-----+

```

See also

[Fl\\_Align](#), [FL\\_ALIGN\\_CENTER](#), etc.

### Note

1. Bit positions not defined in the following constants of type `Fl_Align` are reserved for future extensions. Do not use.
2. The "*magic values*" (`FL_ALIGN_`)`LEFT_TOP`, `RIGHT_TOP`, `LEFT_BOTTOM`, and `RIGHT_BOTTOM` must not be used together with `FL_ALIGN_INSIDE`. Use `TOP_LEFT`, `TOP_RIGHT`, `BOTTOM_LEFT`, or `BOTTOM_RIGHT` instead.
3. Although bits can be or'd together there are some unused/illegal combinations, for instance:
  - setting both `FL_ALIGN_TOP` and `FL_ALIGN_BOTTOM` in combinations other than those given in the `Fl_Align` constants below (magic values)
  - setting both `FL_ALIGN_LEFT` and `FL_ALIGN_RIGHT` in combinations other than those given in the `Fl_Align` constants below (magic values)
  - using one of the "magic values" (2) together with `FL_ALIGN_INSIDE`

Using illegal bit combinations or undefined bits may yield unexpected behavior, and this behavior may be changed without notice in future FLTK versions.

### • typedef unsigned **Fl\_Align**

*FLTK type for alignment control.*

- const `Fl_Align FL_ALIGN_BOTTOM` = 0x0002

*Align the label at the bottom of the widget.*

- const `Fl_Align FL_ALIGN_BOTTOM_LEFT` = `FL_ALIGN_BOTTOM` | `FL_ALIGN_LEFT`
- const `Fl_Align FL_ALIGN_BOTTOM_RIGHT` = `FL_ALIGN_BOTTOM` | `FL_ALIGN_RIGHT`
- const `Fl_Align FL_ALIGN_CENTER` = 0x0000

*Align the label horizontally in the middle.*

- const `Fl_Align FL_ALIGN_CLIP` = 0x0040

*All parts of the label that are larger than the widget will not be drawn.*

- const `Fl_Align FL_ALIGN_IMAGE_BACKDROP` = 0x0200

*If the label contains an image, draw the image or deimage in the background.*

- const [Fl\\_Align](#) **FL\_ALIGN\_IMAGE\_MASK** = 0x0320  
*Mask value to test for image alignment flags.*
- const [Fl\\_Align](#) **FL\_ALIGN\_IMAGE\_NEXT\_TO\_TEXT** = 0x0100  
*If the label contains an image, draw the text to the right of the image.*
- const [Fl\\_Align](#) **FL\_ALIGN\_IMAGE\_OVER\_TEXT** = 0x0000  
*If the label contains an image, draw the text below the image.*
- const [Fl\\_Align](#) **FL\_ALIGN\_INSIDE** = 0x0010  
*Draw the label inside of the widget.*
- const [Fl\\_Align](#) **FL\_ALIGN\_LEFT** = 0x0004  
*Align the label at the left of the widget.*
- const [Fl\\_Align](#) **FL\_ALIGN\_LEFT\_BOTTOM** = 0x000d  
*Outside only, left of widget, bottom position, magic value: TOP | LEFT | RIGHT.*
- const [Fl\\_Align](#) **FL\_ALIGN\_LEFT\_TOP** = 0x0007  
*Outside only, left of widget, top position, magic value: TOP | BOTTOM | LEFT.*
- const [Fl\\_Align](#) **FL\_ALIGN\_NOWRAP** = 0x0000  
*Nothing, same as FL\_ALIGN\_CENTER, for back compatibility.*
- const [Fl\\_Align](#) **FL\_ALIGN\_POSITION\_MASK** = 0x000f  
*Mask value to test for TOP, BOTTOM, LEFT, and RIGHT flags.*
- const [Fl\\_Align](#) **FL\_ALIGN\_RIGHT** = 0x0008  
*Align the label to the right of the widget.*
- const [Fl\\_Align](#) **FL\_ALIGN\_RIGHT\_BOTTOM** = 0x000e  
*Outside only, right of widget, bottom position, magic value: BOTTOM | LEFT | RIGHT.*
- const [Fl\\_Align](#) **FL\_ALIGN\_RIGHT\_TOP** = 0x000b  
*Outside only, right of widget, top position, magic value: TOP | BOTTOM | RIGHT.*
- const [Fl\\_Align](#) **FL\_ALIGN\_TEXT\_NEXT\_TO\_IMAGE** = 0x0120  
*If the label contains an image, draw the text to the left of the image.*
- const [Fl\\_Align](#) **FL\_ALIGN\_TEXT\_OVER\_IMAGE** = 0x0020  
*If the label contains an image, draw the text on top of the image.*
- const [Fl\\_Align](#) **FL\_ALIGN\_TOP** = 0x0001  
*Align the label at the top of the widget.*
- const [Fl\\_Align](#) **FL\_ALIGN\_TOP\_LEFT** = [FL\\_ALIGN\\_TOP](#) | [FL\\_ALIGN\\_LEFT](#)
- const [Fl\\_Align](#) **FL\_ALIGN\_TOP\_RIGHT** = [FL\\_ALIGN\\_TOP](#) | [FL\\_ALIGN\\_RIGHT](#)
- const [Fl\\_Align](#) **FL\_ALIGN\_WRAP** = 0x0080  
*Wrap text that does not fit the width of the widget.*

## Font Numbers

The following constants define the standard FLTK fonts:

- const [Fl\\_Font](#) **FL\_BOLD** = 1  
*add this to Helvetica, Courier, or Times*
- const [Fl\\_Font](#) **FL\_BOLD\_ITALIC** = 3  
*add this to Helvetica, Courier, or Times*
- const [Fl\\_Font](#) **FL\_COURIER** = 4  
*Courier normal.*
- const [Fl\\_Font](#) **FL\_COURIER\_BOLD** = 5  
*Courier bold.*
- const [Fl\\_Font](#) **FL\_COURIER\_BOLD\_ITALIC** = 7  
*Courier bold-italic.*
- const [Fl\\_Font](#) **FL\_COURIER\_ITALIC** = 6  
*Courier italic.*
- typedef int **Fl\_Font**

- A font number is an index into the internal font table.*
- const [Fl\\_Font](#) **FL\_FREE\_FONT** = 16  
*first one to allocate*
  - const [Fl\\_Font](#) **FL\_HELVETICA** = 0  
*Helvetica (or Arial) normal (0)*
  - const [Fl\\_Font](#) **FL\_HELVETICA\_BOLD** = 1  
*Helvetica (or Arial) bold.*
  - const [Fl\\_Font](#) **FL\_HELVETICA\_BOLD\_ITALIC** = 3  
*Helvetica (or Arial) bold-oblique.*
  - const [Fl\\_Font](#) **FL\_HELVETICA\_ITALIC** = 2  
*Helvetica (or Arial) oblique.*
  - const [Fl\\_Font](#) **FL\_ITALIC** = 2  
*add this to Helvetica, Courier, or Times*
  - const [Fl\\_Font](#) **FL\_SCREEN** = 13  
*Default monospaced screen font.*
  - const [Fl\\_Font](#) **FL\_SCREEN\_BOLD** = 14  
*Default monospaced bold screen font.*
  - const [Fl\\_Font](#) **FL\_SYMBOL** = 12  
*Standard symbol font.*
  - const [Fl\\_Font](#) **FL\_TIMES** = 8  
*Times roman.*
  - const [Fl\\_Font](#) **FL\_TIMES\_BOLD** = 9  
*Times roman bold.*
  - const [Fl\\_Font](#) **FL\_TIMES\_BOLD\_ITALIC** = 11  
*Times roman bold-italic.*
  - const [Fl\\_Font](#) **FL\_TIMES\_ITALIC** = 10  
*Times roman italic.*
  - const [Fl\\_Font](#) **FL\_ZAPF\_DINGBATS** = 15  
*Zapf-dingbats font.*

### 14.10.1 Detailed Description

This file contains type definitions and general enumerations.

### 14.10.2 Macro Definition Documentation

#### 14.10.2.1 FL\_IMAGE\_LABEL

```
#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()
```

Draws an image ([Fl\\_Image](#)) as the label.

This is useful for one particular part of an [Fl\\_Multi\\_Label](#). Use [Fl\\_Widget::image\(\)](#) and/or [Fl\\_Widget::deimage\(\)](#) for normal widgets with images as labels.

#### 14.10.2.2 FL\_MULTI\_LABEL

```
#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()
```

Draws a label that can comprise several parts like text and images.

See also

[Fl\\_Multi\\_Label](#)

### 14.10.2.3 FL\_SYMBOL\_LABEL

```
#define FL_SYMBOL_LABEL FL_NORMAL_LABEL
```

Sets the current label type and returns its corresponding FL\_Labeltype value.

FL\_SYMBOL\_LABEL is an alias for FL\_NORMAL\_LABEL.

'@' symbols can be drawn with normal labels as well.

This definition is for historical reasons only (forms compatibility). You should use FL\_NORMAL\_LABEL instead.

## 14.10.3 Typedef Documentation

### 14.10.3.1 Fl\_Contrast\_Function

```
typedef Fl_Color() Fl_Contrast_Function(Fl_Color, Fl_Color, int, int)
```

Type of a custom [fl\\_contrast\(\)](#) function.

Use this signature to define your own custom [fl\\_contrast\(\)](#) function together with [fl\\_contrast\\_mode\(FL\\_↵ CONTRAST\\_CUSTOM\)](#). Example:

```
Fl_Color my_contrast(Fl_Color fg, Fl_Color bg, int context, int size) {
 // calculate contrast and ...
 return color;
}
// call this early in your main() program:
fl_contrast_function(my_contrast);
fl_contrast_mode(FL_CONTRAST_CUSTOM);
fl_contrast_level(50); // optional, must be called after fl_contrast_mode()
```

For parameters and types see [fl\\_contrast\(Fl\\_Color, Fl\\_Color, int, int\)](#).

See also

[fl\\_contrast\(Fl\\_Color, Fl\\_Color, int, int\)](#)

[fl\\_contrast\\_mode\(int\)](#)

### 14.10.3.2 Fl\_Fontsize

```
typedef int Fl_Fontsize
```

Size of a font in pixels.

This is the approximate height of a font in pixels.

## 14.10.4 Enumeration Type Documentation

### 14.10.4.1 anonymous enum

```
anonymous enum
```

FD "when" conditions.

Enumerator

FL_READ	Call the callback when there is data to be read.
FL_WRITE	Call the callback when data can be written without blocking.
FL_EXCEPT	Call the callback if an exception occurs on the file.

### 14.10.4.2 Fl\_Arrow\_Type

```
enum Fl_Arrow_Type
```

Arrow types define the type of arrow drawing function.

FLTK schemes can draw several graphical elements in their particular way. One of these elements is an arrow type that can be in different GUI elements like scrollbars, choice buttons, and FLTK's [Fl\\_Return\\_Button](#).

Note

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

Since

1.4.0

Enumerator

FL_ARROW_SINGLE	Single arrow, e.g. in <a href="#">Fl_Scrollbar</a> .
FL_ARROW_DOUBLE	Double arrow, e.g. in <a href="#">Fl_Counter</a> .
FL_ARROW_CHOICE	Dropdown box, e.g. in <a href="#">Fl_Choice</a> .
FL_ARROW_RETURN	Return arrow, e.g. in <a href="#">Fl_Return_Button</a> .

#### 14.10.4.3 Fl\_Boxtype

enum [Fl\\_Boxtype](#)

FLTK standard box types.

This enum defines the standard box types included with FLTK.

Enumerator

FL_NO_BOX	nothing is drawn at all, this box is invisible
FL_FLAT_BOX	a flat box
FL_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_UP_FRAME	see figure <a href="#">Standard Box Types</a>
FL_DOWN_FRAME	see figure <a href="#">Standard Box Types</a>
FL_THIN_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_THIN_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_THIN_UP_FRAME	see figure <a href="#">Standard Box Types</a>
FL_THIN_DOWN_FRAME	see figure <a href="#">Standard Box Types</a>
FL_ENGRAVED_BOX	see figure <a href="#">Standard Box Types</a>
FL_EMBOSSSED_BOX	see figure <a href="#">Standard Box Types</a>
FL_ENGRAVED_FRAME	see figure <a href="#">Standard Box Types</a>
FL_EMBOSSSED_FRAME	see figure <a href="#">Standard Box Types</a>
FL_BORDER_BOX	see figure <a href="#">Standard Box Types</a>
FL_SHADOW_BOX	see figure <a href="#">Standard Box Types</a>
FL_BORDER_FRAME	see figure <a href="#">Standard Box Types</a>
FL_SHADOW_FRAME	see figure <a href="#">Standard Box Types</a>
FL_ROUNDED_BOX	see figure <a href="#">Standard Box Types</a>
FL_RSHADOW_BOX	see figure <a href="#">Standard Box Types</a>
FL_ROUNDED_FRAME	see figure <a href="#">Standard Box Types</a>
FL_RFLAT_BOX	see figure <a href="#">Standard Box Types</a>
FL_ROUND_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_ROUND_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_DIAMOND_UP_BOX	see figure <a href="#">Standard Box Types</a>
FL_DIAMOND_DOWN_BOX	see figure <a href="#">Standard Box Types</a>
FL_OVAL_BOX	see figure <a href="#">Standard Box Types</a>
FL_OSHADOW_BOX	see figure <a href="#">Standard Box Types</a>
FL_OVAL_FRAME	see figure <a href="#">Standard Box Types</a>
FL_OFLAT_BOX	see figure <a href="#">Standard Box Types</a>
FL_PLASTIC_UP_BOX	plastic version of FL_UP_BOX

## Enumerator

FL_PLASTIC_DOWN_BOX	plastic version of FL_DOWN_BOX
FL_PLASTIC_UP_FRAME	plastic version of FL_UP_FRAME
FL_PLASTIC_DOWN_FRAME	plastic version of FL_DOWN_FRAME
FL_PLASTIC_THIN_UP_BOX	plastic version of FL_THIN_UP_BOX
FL_PLASTIC_THIN_DOWN_BOX	plastic version of FL_THIN_DOWN_BOX
FL_PLASTIC_ROUND_UP_BOX	plastic version of FL_ROUND_UP_BOX
FL_PLASTIC_ROUND_DOWN_BOX	plastic version of FL_ROUND_DOWN_BOX
FL_GTK_UP_BOX	gtk+ version of FL_UP_BOX
FL_GTK_DOWN_BOX	gtk+ version of FL_DOWN_BOX
FL_GTK_UP_FRAME	gtk+ version of FL_UP_FRAME
FL_GTK_DOWN_FRAME	gtk+ version of FL_DOWN_FRAME
FL_GTK_THIN_UP_BOX	gtk+ version of FL_THIN_UP_BOX
FL_GTK_THIN_DOWN_BOX	gtk+ version of FL_THIN_DOWN_BOX
FL_GTK_THIN_UP_FRAME	gtk+ version of FL_THIN_UP_FRAME
FL_GTK_THIN_DOWN_FRAME	gtk+ version of FL_THIN_DOWN_FRAME
FL_GTK_ROUND_UP_BOX	gtk+ version of FL_ROUND_UP_BOX
FL_GTK_ROUND_DOWN_BOX	gtk+ version of FL_ROUND_DOWN_BOX
FL_GLEAM_UP_BOX	gleam version of FL_UP_BOX
FL_GLEAM_DOWN_BOX	gleam version of FL_DOWN_BOX
FL_GLEAM_UP_FRAME	gleam version of FL_UP_FRAME
FL_GLEAM_DOWN_FRAME	gleam version of FL_DOWN_FRAME
FL_GLEAM_THIN_UP_BOX	gleam version of FL_THIN_UP_BOX
FL_GLEAM_THIN_DOWN_BOX	gleam version of FL_THIN_DOWN_BOX
FL_GLEAM_ROUND_UP_BOX	gleam version of FL_ROUND_UP_BOX
FL_GLEAM_ROUND_DOWN_BOX	gleam version of FL_ROUND_DOWN_BOX
FL_OXY_UP_BOX	oxy version of FL_UP_BOX
FL_OXY_DOWN_BOX	oxy version of FL_DOWN_BOX
FL_OXY_UP_FRAME	oxy version of FL_UP_FRAME
FL_OXY_DOWN_FRAME	oxy version of FL_DOWN_FRAME
FL_OXY_THIN_UP_BOX	oxy version of FL_THIN_UP_BOX
FL_OXY_THIN_DOWN_BOX	oxy version of FL_THIN_DOWN_BOX
FL_OXY_THIN_UP_FRAME	oxy version of FL_THIN_UP_FRAME
FL_OXY_THIN_DOWN_FRAME	oxy version of FL_THIN_DOWN_FRAME
FL_OXY_ROUND_UP_BOX	oxy version of FL_ROUND_UP_BOX
FL_OXY_ROUND_DOWN_BOX	oxy version of FL_ROUND_DOWN_BOX
FL_OXY_BUTTON_UP_BOX	FL_OXY_BUTTON_UP_BOX.
FL_OXY_BUTTON_DOWN_BOX	FL_OXY_BUTTON_DOWN_BOX.
FL_FREE_BOXTYPE	the first free box type for creation of new box types
FL_MAX_BOXTYPE	highest legal index for a box type

## 14.10.4.4 FI\_Callback\_Reason

enum [Fl\\_Callback\\_Reason](#)

These constants describe why a callback is performed.

See also

[Fl::callback\\_reason\(\)](#), [Fl\\_Widget::when\(\)](#), [Fl\\_When](#)

#### Enumerator

FL_REASON_UNKNOWN	unknown or unset reason
FL_REASON_SELECTED	an item was selected
FL_REASON_DESELECTED	an item was de-selected
FL_REASON_RESELECTED	an item was re-selected (double-clicked).
FL_REASON_OPENED	an item was opened
FL_REASON_CLOSED	an item was closed
FL_REASON_DRAGGED	an item was dragged into a new place
FL_REASON_CANCELLED	a dialog was cancelled
FL_REASON_CHANGED	the value of the widget was modified
FL_REASON_GOT_FOCUS	a widget received focus
FL_REASON_LOST_FOCUS	a widget lost focus
FL_REASON_RELEASED	the mouse button was released
FL_REASON_ENTER_KEY	user finished input pressing Enter
FL_REASON_USER	user defined callback reasons

#### 14.10.4.5 Fl\_Contrast\_Mode

enum [Fl\\_Contrast\\_Mode](#)

Define the possible modes to calculate [fl\\_contrast\(\)](#).

#### Enumerator

FL_CONTRAST_NONE	always return foreground color
FL_CONTRAST_LEGACY	legacy (FLTK 1.3.x) contrast function
FL_CONTRAST_CIELAB	new (FLTK 1.4.0) default function
FL_CONTRAST_CUSTOM	optional custom contrast function
FL_CONTRAST_LAST	internal use only (invalid contrast mode)

#### 14.10.4.6 Fl\_Cursor

enum [Fl\\_Cursor](#)

The following constants define the mouse cursors that are available in FLTK.

Cursors are provided by the system when available, or bitmaps built into FLTK as a fallback.

#### Enumerator

FL_CURSOR_DEFAULT	the default cursor, usually an arrow:
FL_CURSOR_ARROW	an arrow pointer:
FL_CURSOR_CROSS	crosshair:
FL_CURSOR_WAIT	busy indicator (for instance hourglass): ,
FL_CURSOR_INSERT	I-beam:
FL_CURSOR_HAND	pointing hand:
FL_CURSOR_HELP	question mark pointer: ?
FL_CURSOR_MOVE	4-pointed arrow or hand: ,
FL_CURSOR_NS	up/down resize:

## Enumerator

FL_CURSOR_WE	left/right resize:
FL_CURSOR_NWSE	diagonal resize:
FL_CURSOR_NESW	diagonal resize:
FL_CURSOR_N	upwards resize:
FL_CURSOR_NE	upwards, right resize:
FL_CURSOR_E	rightwards resize:
FL_CURSOR_SE	downwards, right resize:
FL_CURSOR_S	downwards resize:
FL_CURSOR_SW	downwards, left resize:
FL_CURSOR_W	leftwards resize:
FL_CURSOR_NW	upwards, left resize:
FL_CURSOR_NONE	invisible.

**14.10.4.7 Fl\_Damage**

enum [Fl\\_Damage](#)

Damage masks.

## Enumerator

FL_DAMAGE_CHILD	A child needs to be redrawn.
FL_DAMAGE_EXPOSE	The window was exposed.
FL_DAMAGE_SCROLL	The <a href="#">Fl_Scroll</a> widget was scrolled. Used by other widgets for other widget specific damages.
FL_DAMAGE_OVERLAY	The overlay planes need to be redrawn.
FL_DAMAGE_USER1	First user-defined damage bit.
FL_DAMAGE_USER2	Second user-defined damage bit.
FL_DAMAGE_ALL	Everything needs to be redrawn.

**14.10.4.8 Fl\_Event**

enum [Fl\\_Event](#)

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to the [Fl\\_Widget::handle\(\)](#) virtual method. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_*`() methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the `handle()` method.

Event numbers can be converted to their actual names using the `fl_eventnames[]` array (`std::map` since FLTK 1.5) defined in `#include <FL/names.h>`

See also

[Fl::event\\_text\(\)](#), [Fl::event\\_key\(\)](#), class `Fl::`

## Enumerator

FL_NO_EVENT	No event.
-------------	-----------

## Enumerator

FL_PUSH	A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling <a href="#">Fl::event_button()</a>. You find out the mouse position by calling <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a>.   A widget indicates that it "wants" the mouse click by returning non-zero from its <a href="#">Fl_Widget::handle()</a> method. It will then become the <a href="#">Fl::pushed()</a> widget and will get FL_DRAG and the matching FL_RELEASE events. If <a href="#">Fl_Widget::handle()</a> returns zero then FLTK will try sending the FL_PUSH to another widget.
FL_RELEASE	A mouse button has been released. You can find out what button by calling <a href="#">Fl::event_button()</a>.   In order to receive the FL_RELEASE event, the widget must return non-zero when handling FL_PUSH.
FL_ENTER	The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its <a href="#">handle()</a> method. It then becomes the <a href="#">Fl::belowmouse()</a> widget and will receive FL_MOVE and FL_LEAVE events.
FL_LEAVE	The mouse has moved out of the widget. In order to receive the FL_LEAVE event, the widget must return non-zero when handling FL_ENTER.
FL_DRAG	The mouse has moved with a button held down. The current button state is in <a href="#">Fl::event_state()</a>. The mouse position is in <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a>.   In order to receive FL_DRAG events, the widget must return non-zero when handling FL_PUSH.
FL_FOCUS	This indicates an <i>attempt</i> to give a widget the keyboard focus. If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its <a href="#">handle()</a> method. It then becomes the <a href="#">Fl::focus()</a> widget and gets FL_KEYDOWN, FL_KEYUP, and FL_UNFOCUS events. The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check <a href="#">Fl::event_key()</a> to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.
FL_UNFOCUS	This event is sent to the previous <a href="#">Fl::focus()</a> widget when another widget gets the focus or the window loses focus.

## Enumerator

FL_KEYDOWN	A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN. The key can be found in <a href="#">Fl::event_key()</a>. The text that the key should insert can be found with <a href="#">Fl::event_text()</a> and its length is in <a href="#">Fl::event_length()</a>. If you use the key handle() should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event.   To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events.   If you are writing a text-editing widget you may also want to call the <a href="#">Fl::compose()</a> function to translate individual keystrokes into non-ASCII characters.   FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.
FL_KEYBOARD	Equivalent to FL_KEYDOWN.   See also   <a href="#">FL_KEYDOWN</a>
FL_KEYUP	Key release event.   See also   <a href="#">FL_KEYDOWN</a>
FL_CLOSE	The user clicked the close button of a window. This event is used internally only to trigger the callback of <a href="#">Fl_Window</a> derived classed. The default callback closes the window calling <a href="#">Fl_Window::hide()</a>.
FL_MOVE	The mouse has moved without any mouse buttons held down. This event is sent to the <a href="#">Fl::belowmouse()</a> widget. In order to receive FL_MOVE events, the widget must return non-zero when handling FL_ENTER.
FL_SHORTCUT	If the <a href="#">Fl::focus()</a> widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the <a href="#">Fl::belowmouse()</a> widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes!   You can also make "global" shortcuts by using <a href="#">Fl::add_handler()</a>. A global shortcut will work no matter what windows are displayed or which one has the focus.
FL_DEACTIVATE	This widget is no longer active, due to <a href="#">Fl_Widget::deactivate()</a> being called on it or one of its parents. <a href="#">Fl_Widget::active()</a> may still be true after this, the widget is only active if <a href="#">Fl_Widget::active()</a> is true on it and all its parents (use <a href="#">Fl_Widget::active_r()</a> to check this).
FL_ACTIVATE	This widget is now active, due to <a href="#">Fl_Widget::activate()</a> being called on it or one of its parents.

## Enumerator

FL_HIDE	This widget is no longer visible, due to <a href="#">Fl_Widget::hide()</a> being called on it or one of its parents, or due to a parent window being minimized (old Wayland versions may not send the FL_HIDE event to minimized toplevel windows). <a href="#">Fl_Widget::visible()</a> may still be true after this, but the widget is visible only if <a href="#">visible()</a> is true for it and all its parents (use <a href="#">Fl_Widget::visible_r()</a> to check this).
FL_SHOW	This widget is visible again, due to <a href="#">Fl_Widget::show()</a> being called on it or one of its parents, or due to a parent window being restored. Child Fl_Windows respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass FL_SHOW to the base class <a href="#">Fl_Widget::handle()</a> method!
FL_PASTE	You should get this event some time after you call <a href="#">Fl::paste()</a> . The contents of <a href="#">Fl::event_text()</a> is the text to insert and the number of characters is in <a href="#">Fl::event_length()</a> .
FL_SELECTIONCLEAR	The <a href="#">Fl::selection_owner()</a> will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.
FL_MOUSEWHEEL	The user has moved the mouse wheel. The <a href="#">Fl::event_dx()</a> and <a href="#">Fl::event_dy()</a> methods can be used to find the amount to scroll horizontally and vertically.
FL_DND_ENTER	The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive FL_DND_DRAG, FL_DND_LEAVE and FL_DND_RELEASE events.
FL_DND_DRAG	The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.
FL_DND_LEAVE	The mouse has moved out of the widget.
FL_DND_RELEASE	The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following FL_PASTE event.
FL_SCREEN_CONFIGURATION_CHANGED	The screen configuration (number, positions) was changed. Use <a href="#">Fl::add_handler()</a> to be notified of this event.
FL_FULLSCREEN	The fullscreen state of the window has changed. This event is sent to the window's handle method.
FL_ZOOM_GESTURE	The user has made a zoom/pinch/magnification gesture (Mac OS platform only). The <a href="#">Fl::event_dy()</a> method can be used to find magnification amount, <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> are set as well. This event is sent to the window's handle method.
FL_ZOOM_EVENT	A zoom event (ctrl/+/-/0/ or cmd/+/-/0/) was processed. Use <a href="#">Fl::add_handler()</a> to be notified of this event.
FL_BEFORE_TOOLTIP	A tooltip is about to pop up for this widget. The mouse coordinates are available in <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> . Change the widget tooltip as needed.
FL_BEFORE_MENU	Triggered just before a menu is displayed. Widgets derived from <a href="#">Fl_Menu_</a> receive this event right before the menu appears, providing an opportunity to update menu item states and activation.

## Enumerator

FL_APP_ACTIVATE	Sent when the application is activated and becomes topmost and focused. X11 requires support of EWMH to generate this event.  See also  <a href="#">Fl::add_handler()</a>
FL_APP_DEACTIVATE	Sent when the application is sent to the background and deactivated. X11 requires support of EWMH to generate this event.  See also  <a href="#">Fl::add_handler()</a>

## 14.10.4.9 Fl\_Labeltype

enum [Fl\\_Labeltype](#)

The `labeltype()` method sets the type of the label.

## Note

The documented enum `Fl_Labeltype` contains some values (names) with leading underscores, e.g. `↔` `_FL_IMAGE_LABEL`. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

The following standard label types are included:

## Enumerator

FL_NORMAL_LABEL	draws the text (0)
FL_NO_LABEL	does nothing
_FL_SHADOW_LABEL	draws a drop shadow under the text
_FL_ENGRAVED_LABEL	draws edges as though the text is engraved
_FL_EMBOSSED_LABEL	draws edges as though the text is raised
_FL_MULTI_LABEL	draws a composite label  See also  <a href="#">Fl_Multi_Label</a>
_FL_ICON_LABEL	draws the icon associated with the text
_FL_IMAGE_LABEL	the label displays an "icon" based on a <a href="#">Fl_Image</a>
FL_FREE_LABELTYPE	first free labeltype to use for creating own labeltypes

## 14.10.4.10 Fl\_Orientation

enum [Fl\\_Orientation](#)

`Fl_Orientation` describes the orientation of a GUI element.

FLTK schemes can draw several graphical elements, for instance arrows, pointing at different directions. This enum defines the direction to use for drawing a particular GUI element.

The definition of this enum was chosen such that the enum value can be multiplied by 45 to get a rotation angle in degrees starting at the horizontal axis (0 = right, 1 = NE, 2 = up, ...) that can be used with [fl\\_rotate\(\)](#). Note: angle is counter-clockwise in degrees.

The 'unspecified' value **FL\_ORIENT\_NONE** shall be used for elements that would usually not be rotated, like the return arrow of the [Fl\\_Return\\_Button](#). It can still be used as an angle though since it is the same value as `FL_↔` `ORIENT_RIGHT` (0 degrees).

#### Note

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

#### Since

1.4.0

#### Enumerator

FL_ORIENT_NONE	GUI element direction is unspecified.
FL_ORIENT_RIGHT	GUI element pointing right ( 0°)
FL_ORIENT_NE	GUI element pointing NE ( 45°)
FL_ORIENT_UP	GUI element pointing up ( 90°)
FL_ORIENT_NW	GUI element pointing NW (135°)
FL_ORIENT_LEFT	GUI element pointing left (180°)
FL_ORIENT_SW	GUI element pointing SW (225°)
FL_ORIENT_DOWN	GUI element pointing down (270°)
FL_ORIENT_SE	GUI element pointing SE (315°)

#### 14.10.4.11 Fl\_When

enum [Fl\\_When](#)

These constants determine when a callback is performed.

`Fl_When` is a bit field. Some values are merely shortcuts for common bit combinations. New flags may be added in the future, so it's important to mask the required bit when reading via `when()`.

#### Note

Some widgets may not fully support `FL_WHEN_...` flags.

#### See also

[Fl\\_Widget::when\(\)](#), [Fl::callback\\_reason\(\)](#), [Fl\\_Callback\\_Reason](#), [Fl\\_Widget::do\\_callback\(\)](#)

#### Enumerator

FL_WHEN_NEVER	Never call the callback.
FL_WHEN_CHANGED	Do the callback only when the widget value changes.
FL_WHEN_NOT_CHANGED	Do the callback whenever the user interacts with the widget.
FL_WHEN_RELEASE	Do the callback when the button or key is released and the value changes.
FL_WHEN_RELEASE_ALWAYS	Do the callback when the button or key is released, even if the value doesn't change.
FL_WHEN_ENTER_KEY	Do the callback when the user presses the ENTER key and the value changes.
FL_WHEN_ENTER_KEY_ALWAYS	Do the callback when the user presses the ENTER key, even if the value doesn't change.
FL_WHEN_ENTER_KEY_CHANGED	Do callbacks whether the value changed or not, and when the ENTER key is pressed.
FL_WHEN_CLOSED	Do the callback when a child of <a href="#">Fl_Tabs</a> is closed.

## 14.10.5 Function Documentation

### 14.10.5.1 fl\_box()

```
Fl_Boxtype fl_box (
 Fl_Boxtype b) [inline]
```

Get the filled version of a frame.

If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned.

### 14.10.5.2 fl\_color\_cube()

```
Fl_Color fl_color_cube (
 int r,
 int g,
 int b) [inline]
```

Returns a color out of the color cube.

*r* must be in the range 0 to FL\_NUM\_RED (5) minus 1, *g* must be in the range 0 to FL\_NUM\_GREEN (8) minus 1, *b* must be in the range 0 to FL\_NUM\_BLUE (5) minus 1.

To get the closest color to a 8-bit set of R,G,B values use:

```
fl_color_cube(R * (FL_NUM_RED - 1) / 255,
 G * (FL_NUM_GREEN - 1) / 255,
 B * (FL_NUM_BLUE - 1) / 255);
```

### 14.10.5.3 fl\_define\_FL\_EMBOSSED\_LABEL()

```
Fl_Labeltype fl_define_FL_EMBOSSED_LABEL () [extern]
```

Initializes the internal table entry for FL\_EMBOSSED\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.4 fl\_define\_FL\_ENGRAVED\_LABEL()

```
Fl_Labeltype fl_define_FL_ENGRAVED_LABEL () [extern]
```

Initializes the internal table entry for FL\_ENGRAVED\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.5 fl\_define\_FL\_ICON\_LABEL()

```
Fl_Labeltype fl_define_FL_ICON_LABEL () [extern]
```

Initializes the internal table entry for FL\_ICON\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.6 fl\_define\_FL\_IMAGE\_LABEL()

```
Fl_Labeltype fl_define_FL_IMAGE_LABEL () [extern]
```

Initializes the internal table entry for FL\_IMAGE\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.7 fl\_define\_FL\_MULTI\_LABEL()

```
Fl_Labeltype fl_define_FL_MULTI_LABEL () [extern]
```

Initializes the internal table entry for FL\_MULTI\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.8 fl\_define\_FL\_SHADOW\_LABEL()

```
Fl_Labeltype fl_define_FL_SHADOW_LABEL () [extern]
```

Initializes the internal table entry for FL\_SHADOW\_LABEL and returns its internal value.

Internal use only.

### 14.10.5.9 fl\_down()

```
Fl_Boxtype fl_down (
 Fl_Boxtype b) [inline]
```

Get the "pressed" or "down" version of a box.

If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

### 14.10.5.10 fl\_frame()

```
Fl_Boxtype fl_frame (
 Fl_Boxtype b) [inline]
```

Get the unfilled, frame only version of a box.

If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

### 14.10.5.11 fl\_gray\_ramp()

```
Fl_Color fl_gray_ramp (
 int i) [inline]
```

Returns a gray color value from black (i == 0) to white (i == FL\_NUM\_GRAY - 1).

FL\_NUM\_GRAY is defined to be 24 in the current FLTK release. To get the closest FLTK gray value to an 8-bit grayscale color 'I' use:

```
fl_gray_ramp(I * (FL_NUM_GRAY - 1) / 255)
```

## 14.10.6 Variable Documentation

### 14.10.6.1 FL\_ALIGN\_LEFT

```
const Fl_Align FL_ALIGN_LEFT = 0x0004
```

Align the label at the left of the widget.

Inside labels appear left-justified starting at the left side of the widget, outside labels are right-justified and drawn to the left of the widget.

### 14.10.6.2 FL\_ALIGN\_TOP

```
const Fl_Align FL_ALIGN_TOP = 0x0001
```

Align the label at the top of the widget.

Inside labels appear below the top, outside labels are drawn on top of the widget.

### 14.10.6.3 FL\_NORMAL\_SIZE

```
Fl_Fontsize FL_NORMAL_SIZE [extern]
```

normal font size

normal font size

## 14.12 filename.H File Reference

File names and URI utility functions.

```

#include "Fl_Export.H"
#include <FL/platform_types.h>
#include <string>

```

### Macros

- `#define FL_PATH_MAX 2048`  
*all path buffers should use this length*

## Typedefs

- typedef int() `Fl_File_Sort_F`(struct dirent \*\*, struct dirent \*\*)  
*File sorting function.*

## Functions

- void `fl_decode_uri` (char \*uri)  
*Decodes a URL-encoded string.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from)  
*Makes a filename absolute from a relative filename to the current working directory.*
- int `fl_filename_absolute` (char \*to, int tolen, const char \*from, const char \*cwd)  
*Concatenate the absolute path *base* with *from* to form the new absolute path in *to*.*
- std::string `fl_filename_absolute_str` (const std::string &from)  
*Makes a filename absolute from a filename relative to the current working directory.*
- std::string `fl_filename_absolute_str` (const std::string &from, const std::string &base)  
*Append the relative filename *from* to the absolute filename *base* to form the new absolute path.*
- int `fl_filename_expand` (char \*to, int tolen, const char \*from)  
*Expands a filename containing shell variables and tilde (~).*
- std::string `fl_filename_expand_str` (const std::string &from)  
*Expands a filename containing shell variables and tilde (~).*
- const char \* `fl_filename_ext` (const char \*buf)  
*Gets the extension of a filename.*
- std::string `fl_filename_ext_str` (const std::string &filename)  
*Return a new string that contains the filename extension.*
- void `fl_filename_free_list` (struct dirent \*\*l, int n)  
*Free the list of filenames that is generated by `fl_filename_list()`.*
- int `fl_filename_isdir` (const char \*name)  
*Determines if a file exists and is a directory from its filename.*
- int `fl_filename_list` (const char \*d, struct dirent \*\*l, `Fl_File_Sort_F` \*s=`fl_numericsort`)  
*Portable and const-correct wrapper for the `scandir()` function.*
- int `fl_filename_match` (const char \*name, const char \*pattern)  
*Checks if a string *s* matches a pattern *p*.*
- const char \* `fl_filename_name` (const char \*filename)  
*Gets the file name from a path.*
- std::string `fl_filename_name_str` (const std::string &filename)  
*Return a new string that contains the name part of the filename.*
- std::string `fl_filename_path_str` (const std::string &filename)  
*Return a new string that contains the path part of the filename.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from)  
*Makes a filename relative to the current working directory.*
- int `fl_filename_relative` (char \*to, int tolen, const char \*from, const char \*cwd)  
*Makes a filename relative to any other directory.*
- std::string `fl_filename_relative_str` (const std::string &from)  
*Makes a filename relative to the current working directory.*
- std::string `fl_filename_relative_str` (const std::string &from, const std::string &base)  
*Makes a filename relative to any directory.*
- char \* `fl_filename_setext` (char \*to, int tolen, const char \*ext)  
*Replaces the extension in *buf* of *max*.*
- std::string `fl_filename_setext_str` (const std::string &filename, const std::string &new\_extension)  
*Return a copy of the old filename with the new extension.*
- std::string `fl_getcwd_str` ()  
*Cross-platform function to get the current working directory as a UTF-8 encoded value in an std::string.*
- int `fl_open_uri` (const char \*uri, char \*msg, int msglen)  
*Opens the specified Uniform Resource Identifier (URI).*

## 14.12.1 Detailed Description

File names and URI utility functions.

## 14.13 filename.H

#include <FL/Fl_Widget_Tracker.H>
#include <FL/Fl_Cairo.H>
#include "fl_utf8.h"
#include "Enumerations.H"
#include <string.h>
#include <vector>

```

### Classes

- struct [Fl::TimeoutData](#)

## Namespaces

- namespace `Fl`

*Fl is the FLTK global namespace containing state information and global methods for the current application.*

## Macros

- `#define FL_Object Fl_Widget`

*for back compatibility - use Fl\_Widget!*

## Functions

- `int Fl::abi_check (const int val=99999)`  
*Returns whether the runtime library ABI version is correct.*
- `int Fl::abi_version ()`  
*Returns the compiled-in value of the FL\_ABI\_VERSION constant.*
- `void Fl::add_check (Fl_Timeout_Handler, void *=0)`  
*FLTK will call this callback just before it flushes the display and waits for events.*
- `void Fl::add_clipboard_notify (Fl_Clipboard_Notify_Handler h, void *data=0)`  
*FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.*
- `void Fl::add_fd (int fd, Fl_FD_Handler cb, void *=0)`  
*Adds file descriptor fd to listen to.*
- `void Fl::add_fd (int fd, int when, Fl_FD_Handler cb, void *=0)`  
*Adds file descriptor fd to listen to.*
- `void Fl::add_idle (Fl_Idle_Handler cb, void *data=0)`  
*Adds a callback function that is called every time by Fl::wait() and also makes it act as though the timeout is zero (this makes Fl::wait() return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).*
- `void Fl::add_idle (Fl_Old_Idle_Handler cb)`
- `void Fl::add_timeout (double t, Fl_Timeout_Handler cb, void *data=0)`  
*Adds a one-shot timeout callback.*
- `int Fl::api_version ()`  
*Returns the compiled-in value of the FL\_API\_VERSION constant.*
- `int Fl::arg (int argc, char **argv, int &i)`  
*Parse a single switch from argv, starting at word i.*
- `void Fl::args (int argc, char **argv)`  
*Parse all command line switches matching standard FLTK options only.*
- `int Fl::args (int argc, char **argv, int &i, Fl_Args_Handler cb=0)`  
*Parse command line switches using the cb argument handler.*
- `int Fl::args_to_utf8 (int argc, char **&argv)`  
*Convert Windows commandline arguments to UTF-8.*
- `void Fl::awake ()`  
*Notifies the main GUI thread from a worker thread.*
- `int Fl::awake (Fl_Awake_Handler handler, void *user_data=nullptr)`  
*Schedules a callback to be executed by the main thread, then wakes up the main thread.*
- `void Fl::awake (void *message)`  
*Awake the main GUI thread and leave a message pointer.*
- `int Fl::awake_once (Fl_Awake_Handler handler, void *user_data=nullptr)`  
*Schedules a callback to be executed once by the main thread, then wakes up the main thread.*
- `void Fl::background (uchar, uchar, uchar)`  
*Changes fl\_color(FL\_BACKGROUND\_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.*
- `void Fl::background2 (uchar, uchar, uchar)`

- Changes the alternative background color.*

  - `bool Fl::box_bg (Fl_Boxtype)`  
*Returns whether the given boxtype draws its background.*
  - `int Fl::box_border_radius_max ()`  
*Get the maximum border radius of all "rounded" boxtypes in pixels.*
  - `void Fl::box_border_radius_max (int R)`  
*Set the maximum border radius of all "rounded" boxtypes in pixels.*
  - `Fl_Color Fl::box_color (Fl_Color)`  
*Gets the drawing color to be used for the background of a box.*
  - `int Fl::box_dh (Fl_Boxtype)`  
*Returns the height offset for the given boxtype.*
  - `int Fl::box_dw (Fl_Boxtype)`  
*Returns the width offset for the given boxtype.*
  - `int Fl::box_dx (Fl_Boxtype)`  
*Returns the X offset for the given boxtype.*
  - `int Fl::box_dy (Fl_Boxtype)`  
*Returns the Y offset for the given boxtype.*
  - `int Fl::box_shadow_width ()`  
*Get the box shadow width of all "shadow" boxtypes in pixels.*
  - `void Fl::box_shadow_width (int W)`  
*Set the box shadow width of all "shadow" boxtypes in pixels.*
  - `bool Fl::cairo_autolink_context ()`  
*Gets the current autolink mode for Cairo support.*
  - `void Fl::cairo_autolink_context (bool alink)`  
*When FLTK\_HAVE\_CAIRO is defined and `cairo_autolink_context()` is true, any current window dc is linked to a current Cairo context.*
  - `cairo_t * Fl::cairo_cc ()`  
*Gets the current Cairo context linked with a fltk window.*
  - `void Fl::cairo_cc (cairo_t *c, bool own=false)`  
*Sets the current Cairo context to c.*
  - `void Fl::cairo_flush (cairo_t *c)`  
*Flush Cairo drawings on Cairo context c.*
  - `cairo_t * Fl::cairo_make_current (Fl_Window *w)`  
*Provides a Cairo context for window wi.*
  - `int Fl::check ()`  
*Same as `Fl::wait(0)`.*
  - `int Fl::clipboard_contains (const char *type)`  
*Returns non 0 if the clipboard contains data matching type.*
  - `void Fl::copy (const char *stuff, int len, int destination=0, const char *type=Fl::clipboard_plain_text)`  
*Copies data to the selection buffer, the clipboard, or both.*
  - `int Fl::damage ()`  
*If true then `flush()` will do something.*
  - `void Fl::damage (int d)`  
*If true then `flush()` will do something.*
  - `void Fl::default_atclose (Fl_Window *, void *)`  
*Default callback for window widgets.*
  - `void Fl::display (const char *)`  
*Sets the X or Wayland display to use for all windows.*
  - `int Fl::dnd ()`  
*Initiate a Drag And Drop operation.*
  - `int Fl::draw_box_active ()`

- Determines if the currently drawn box is active or inactive.*

  - `int FL::draw_GL_text_with_textures ()`  
*returns whether whether OpenGL uses textures to draw all text.*
  - `void FL::draw_GL_text_with_textures (int val)`  
*sets whether OpenGL uses textures to draw all text.*
  - `FL_Window * FL::first_window ()`  
*Returns the first top-level window in the list of shown() windows.*
  - `void FL::first_window (FL_Window *)`  
*Sets the window that is returned by first\_window().*
  - `void FL::flush ()`  
*Causes all the windows that need it to be redrawn and graphics forced out through the pipes.*
  - `void FL::foreground (uchar, uchar, uchar)`  
*Changes fl\_color(FL\_FOREGROUND\_COLOR).*
  - `void FL::free_color (FL_Color i, int overlay=0)`  
*Frees the specified color from the colormap, if applicable.*
  - `FL_Box_Draw_F * FL::get_boxtype (FL_Boxtype)`  
*Gets the current box drawing function for the specified box type.*
  - `unsigned FL::get_color (FL_Color i)`  
*Returns the RGB value(s) for the given FLTK color index.*
  - `void FL::get_color (FL_Color i, uchar &red, uchar &green, uchar &blue)`  
*Returns the RGB value(s) for the given FLTK color index.*
  - `void FL::get_color (FL_Color i, uchar &red, uchar &green, uchar &blue, uchar &alpha)`  
*Returns the RGBA value(s) for the given FLTK color index.*
  - `const char * FL::get_font (FL_Font)`  
*Gets the string for this face.*
  - `const char * FL::get_font_name (FL_Font, int *attributes=0)`  
*Get a human-readable string describing the family of this face.*
  - `int FL::get_font_sizes (FL_Font, int *&sizep)`  
*Return an array of sizes in sizep.*
  - `void FL::get_system_colors ()`  
*Read the user preference colors from the system and use them to call FL::foreground(), FL::background(), and FL::background2().*
  - `int FL::gl_visual (int, int *alist=0)`  
*This does the same thing as FL::visual(int) but also requires OpenGL drawing to work.*
  - `FL_Window * FL::grab ()`  
*Returns the window that currently receives all events.*
  - `void FL::grab (FL_Window &win)`  
*See grab(FL\_Window\*)*
  - `void FL::grab (FL_Window *)`  
*Selects the window to grab.*
  - `int FL::h ()`  
*Returns the height in pixels of the main screen work area.*
  - `int FL::has_check (FL_Timeout_Handler, void *=0)`  
*Returns 1 if the check exists and has not been called yet, 0 otherwise.*
  - `int FL::has_idle (FL_Idle_Handler cb, void *data=0)`  
*Returns true if the specified idle callback is currently installed.*
  - `int FL::has_timeout (FL_Timeout_Handler cb, void *data=0)`  
*Returns true if the timeout exists and has not been called yet.*
  - `void FL::hide_all_windows ()`  
*Hide all visible windows to make FLTK leave FL::run().*
  - `bool FL::idle ()`

- Returns whether at least one idle callback is currently set.*

  - `int FL::is_scheme (const char *name)`

*Returns whether the current scheme is the given name.*
- `void FL::keyboard_screen_scaling (int value)`

*Controls the possibility to scale all windows by ctrl+/-/0/ or cmd+/-/0/.*
- `int FL::lock ()`

*Acquire the global UI lock for FLTK.*
- `int FL::menu_linespacing ()`

*Gets the default line spacing used by menus.*
- `void FL::menu_linespacing (int H)`

*Sets the default line spacing used by menus.*
- `FL_Window * FL::modal ()`

*Returns the top-most `modal()` window currently shown.*
- `FL_Window * FL::next_window (const FL_Window *)`

*Returns the next top-level window in the list of shown() windows.*
- `float FL::normalized_screen_scale (int n)`

*Gets the normalized GUI scaling factor of screen number *n*.*
- `void FL::normalized_screen_scale (int n, float factor)`

*Sets the normalized GUI scaling factor of screen number *n*.*
- `FL_Stamp FL::now (double offset=0)`

*Set a time stamp at this point in time with optional signed offset in seconds.*
- `void FL::own_colormap ()`

*Makes FLTK use its `own colormap`.*
- `void FL::paste (FL_Widget &receiver)`

*Backward compatibility only.*
- `void FL::paste (FL_Widget &receiver, int source, const char *type=FL::clipboard_plain_text)`

*Pastes the data from the selection buffer (*source* is 0) or the clipboard (*source* is 1) into *receiver*.*
- `int FL::program_should_quit ()`

*Returns non-zero when a request for program termination was received and accepted.*
- `void FL::program_should_quit (int should_i)`

*Indicate to the FLTK library whether a program termination request was received and accepted.*
- `FL_Widget * FL::readqueue ()`

*Reads the default callback queue and returns the first widget.*
- `int FL::ready ()`

*This is similar to `FL::check()` except this does not call `FL::flush()` or any callbacks, which is useful if your program is in a state where such callbacks are illegal.*
- `void FL::redraw ()`

*Redraws all widgets.*
- `int FL::reload_scheme ()`

*Called internally when setting a new scheme according to scheme name.*
- `void FL::remove_check (FL_Timeout_Handler, void *data=0)`

*Removes a check callback.*
- `void FL::remove_clipboard_notify (FL_Clipboard_Notify_Handler h)`

*Stop calling the specified callback when there are changes to the selection buffer or the clipboard.*
- `void FL::remove_fd (int)`

*Removes a file descriptor handler.*
- `void FL::remove_fd (int, int when)`

*Removes a file descriptor handler.*
- `void FL::remove_idle (FL_Idle_Handler cb, void *data=0)`

*Removes the specified idle callback, if it is installed.*
- `int FL::remove_next_timeout (FL_Timeout_Handler cb, void *data=0, void **data_return=0)`

- Remove the next matching timeout callback and return its `data` pointer.*

  - void `FL::remove_timeout` (`FL_Timeout_Handler` cb, void \*data=0)
- Remove one or more matching timeout callbacks from the timer queue.*

  - void `FL::repeat_timeout` (double t, `FL_Timeout_Handler` cb, void \*data=0)
- Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.*

  - int `FL::run` ()
- Calls `FL::wait()` repeatedly as long as any windows are displayed.*

  - const char \* `FL::scheme` ()
- See void `scheme(const char *name)`*

  - int `FL::scheme` (const char \*name)
- Sets the current widget scheme.*

  - int `FL::screen_count` ()
- Gets the total count of available screens.*

  - void `FL::screen_dpi` (float &h, float &v, int n=0)
- Gets the screen resolution in dots-per-inch for the given screen.*

  - `FL_Screen_Driver` \* `FL::screen_driver` ()
- Returns a pointer to the unique `FL_Screen_Driver` object of the platform.*

  - int `FL::screen_num` (int x, int y)
- Gets the screen number of a screen that contains the specified screen position x, y.*

  - int `FL::screen_num` (int x, int y, int w, int h)
- Gets the screen number of the screen which intersects the most with the rectangle defined by x, y, w, h.*

  - float `FL::screen_scale` (int n)
- Gets the GUI scaling factor of screen number n.*

  - void `FL::screen_scale` (int n, float factor)
- Sets the GUI scaling factor of screen number n.*

  - int `FL::screen_scaling_supported` ()
- Returns whether scaling factors are supported by this platform.*

  - void `FL::screen_work_area` (int &X, int &Y, int &W, int &H)
- Gets the bounding box of the work area of the screen that contains the mouse pointer.*

  - void `FL::screen_work_area` (int &X, int &Y, int &W, int &H, int mx, int my)
- Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.*

  - void `FL::screen_work_area` (int &X, int &Y, int &W, int &H, int n)
- Gets the bounding box of the work area of the given screen.*

  - void `FL::screen_xywh` (int &X, int &Y, int &W, int &H)
- Gets the bounding box of a screen that contains the mouse pointer.*

  - void `FL::screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my)
- Gets the bounding box of a screen that contains the specified screen position mx, my.*

  - void `FL::screen_xywh` (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)
- Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by mx, my, mw, mh.*

  - void `FL::screen_xywh` (int &X, int &Y, int &W, int &H, int n)
- Gets the screen bounding rect for the given screen.*

  - int `FL::scrollbar_size` ()
- Gets the default scrollbar size used by `FL_Browser_`, `FL_Help_View`, `FL_Scroll`, and `FL_Text_Display` widgets.*

  - void `FL::scrollbar_size` (int W)
- Sets the default scrollbar size that is used by the `FL_Browser_`, `FL_Help_View`, `FL_Scroll`, and `FL_Text_Display` widgets.*

  - double `FL::seconds_between` (`FL_Timestamp` &back, `FL_Timestamp` &further\_back)
- Return the time in seconds between two time stamps.*

  - double `FL::seconds_since` (`FL_Timestamp` &then)
- Return the time in seconds between now and a previously taken time stamp.*

  - void `FL::selection` (`FL_Widget` &owner, const char \*, int len)
- Changes the current selection.*

- `Fl_Widget * Fl::selection_owner ()`  
*back-compatibility only: Gets the widget owning the current selection*
- `void Fl::selection_owner (Fl_Widget *)`  
*Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.*
- `int Fl::selection_to_clipboard ()`  
*Returns the current selection\_to\_clipboard mode.*
- `void Fl::selection_to_clipboard (int mode)`  
*Copies selections on X11 directly to the clipboard if enabled.*
- `void Fl::set_abort (Fl_Abort_Handler f)`  
*For back compatibility, sets the void Fl::fatal handler callback.*
- `void Fl::set_atclose (Fl_Atclose_Handler f)`  
*For back compatibility, sets the Fl::atclose handler callback.*
- `void Fl::set_box_color (Fl_Color)`  
*Sets the drawing color for the box that is currently drawn.*
- `void Fl::set_boxtype (Fl_Boxtype, Fl_Box_Draw_F *, uchar, uchar, uchar, uchar, Fl_Box_Draw_Focus_F *=NULL)`  
*Sets the function to call to draw a specific box type.*
- `void Fl::set_boxtype (Fl_Boxtype, Fl_Boxtype from)`  
*Copies the from boxtype.*
- `void Fl::set_color (Fl_Color i, unsigned c)`  
*Sets an entry in the fl\_color index table.*
- `void Fl::set_color (Fl_Color, uchar, uchar, uchar)`  
*Sets an entry in the fl\_color index table.*
- `void Fl::set_color (Fl_Color, uchar, uchar, uchar, uchar)`  
*Sets an entry in the fl\_color index table.*
- `void Fl::set_font (Fl_Font, const char *)`  
*Changes a face.*
- `void Fl::set_font (Fl_Font, Fl_Font)`  
*Copies one face to another.*
- `Fl_Font Fl::set_fonts (const char **=0)`  
*FLTK will open the display, and add every fonts on the server to the face table.*
- `void Fl::set_labeltype (Fl_Labeltype, Fl_Label_Draw_F *, Fl_Label_Measure_F *)`  
*Sets the functions to call to draw and measure a specific labeltype.*
- `void Fl::set_labeltype (Fl_Labeltype, Fl_Labeltype from)`  
*Sets the functions to call to draw and measure a specific labeltype.*
- `int Fl::system (const char *command)`  
*Run a command line on the computer.*
- `Fl_System_Driver * Fl::system_driver ()`  
*Returns a pointer to the unique Fl\_System\_Driver object of the platform.*
- `void * Fl::thread_message ()`  
*Returns the last message sent by a child thread.*
- `long Fl::ticks_between (Fl_Timestamp &back, Fl_Timestamp &further_back)`  
*Return the time in ticks (60Hz) between two time stamps.*
- `long Fl::ticks_since (Fl_Timestamp &then)`  
*Return the time in ticks (60Hz) between now and a previously taken time stamp.*
- `std::vector< TimeoutData > Fl::timeout_list ()`  
*Return a list of all currently running timeouts.*
- `void Fl::unlock ()`  
*Release the global UI lock set by Fl::lock().*
- `int Fl::use_high_res_GL ()`

- Returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.*
- void `FL::use_high_res_GL` (int val)  
*Sets whether GL windows should be drawn at high resolution on Apple computers with retina displays.*
- double `FL::version` ()  
*Returns the compiled-in value of the `FL_VERSION` constant.*
- int `FL::visual` (int)  
*Selects a visual so that your graphics are drawn correctly.*
- int `FL::w` ()  
*Returns the width in pixels of the main screen work area.*
- int `FL::wait` ()  
*Waits until "something happens" and then returns.*
- double `FL::wait` (double time)  
*Waits a maximum of `time_to_wait` seconds or until "something happens".*
- int `FL::x` ()  
*Returns the leftmost x coordinate of the main screen work area.*
- int `FL::y` ()  
*Returns the topmost y coordinate of the main screen work area.*

### Variables

- void(\* `FL::atclose` )(FL\_Window \*, void \*) = `FL::default_atclose`  
*Back compatibility: default window callback handler.*
- void(\* `FL::error` )(const char \*,...) = `FL_System_Driver::error`  
*FLTK calls `FL::error()` to output a normal error message.*
- void(\* `FL::fatal` )(const char \*,...) = `FL_System_Driver::fatal`  
*FLTK calls `FL::fatal()` to output a fatal error message.*
- const char \* `fl_local_alt`  
*string pointer used in shortcuts, you can change it to another language*
- const char \* `fl_local_ctrl`  
*string pointer used in shortcuts, you can change it to another language*
- const char \* `fl_local_meta`  
*string pointer used in shortcuts, you can change it to another language*
- const char \* `fl_local_shift`  
*string pointer used in shortcuts, you can change it to another language*
- const char \*const `FL::help` = `helpmsg+13`  
*Usage string displayed if `FL::args()` detects an invalid argument.*
- void(\* `FL::warning` )(const char \*,...) = `FL_System_Driver::warning`  
*FLTK calls `FL::warning()` to output a warning message.*

### 14.14.1 Detailed Description

`FL` namespace.

## 14.15 FL.H

[Go to the documentation of this file.](#)

```
00001 //
00002 // Main header file for the Fast Light Tool Kit (FLTK).

## 14.18.1 Detailed Description

API for common dialogs.

## 14.18.2 Enumeration Type Documentation

### 14.18.2.1 Fl\_Beep

enum [Fl\\_Beep](#)

Defines the different system beeps available.

Some systems may play different sounds or use different sound volume depending on the [Fl\\_Beep](#) value. The implementation is platform dependent.

See also

[fl\\_beep\(int\)](#)

Enumerator

<a href="#">FL_BEEP_DEFAULT</a>	Default beep.
---------------------------------	---------------

## Enumerator

FL_BEEP_MESSAGE	Message beep.
FL_BEEP_ERROR	Error beep.
FL_BEEP_QUESTION	Question beep.
FL_BEEP_PASSWORD	Password beep.
FL_BEEP_NOTIFICATION	Notification beep.

## 14.18.3 Function Documentation

### 14.18.3.1 fl\_message\_position()

```
void fl_message_position (
 Fl_Widget & widget) [inline]
```

See also

[fl\\_message\\_position\(Fl\\_Widget \\*widget\).](#)

## 14.20 fl\_attr.h File Reference

This file defines compiler-specific macros.

### Macros

- `#define __fl_attr(x)`  
*This section lists macros for Doxygen documentation only.*
- `#define FL_DEPRECATED(msg, func)`  
*Enclosing a function or method in FL\_DEPRECATED marks it as no longer recommended.*
- `#define FL_OVERRIDE override`  
*This macro makes it safe to use the C++11 keyword `override` with older compilers.*

### 14.20.1 Detailed Description

This file defines compiler-specific macros.

### 14.20.2 Macro Definition Documentation

#### 14.20.2.1 \_\_fl\_attr

```
#define __fl_attr(
 x)
```

This section lists macros for Doxygen documentation only.

The next section will define the actual macros based on the compiler used and based on the capabilities of the version of that compiler. To be used in prototypes with a variable list of arguments. This macro helps detection of mismatches between format string and argument list at compilation time.

Usage example: [FL/fl\\_ask.H](#)

#### 14.20.2.2 FL\_DEPRECATED

```
#define FL_DEPRECATED(
 msg,
 func)
```

##### Value:

```
/*##### \deprecated msg */ \
func
```

Enclosing a function or method in FL\_DEPRECATED marks it as no longer recommended.

This macro syntax can not be used if the return type contains a comma, which is not the case in FLTK.

```
FL_DEPRECATED("Outdated, don't use", int position()) { return position; }
```

#### 14.20.2.3 FL\_OVERRIDE

```
#define FL_OVERRIDE override
```

This macro makes it safe to use the C++11 keyword `override` with older compilers.

Since FLTK 1.5.0 a C++11 capable compiler is required, hence we can safely define FL\_OVERRIDE unconditionally as 'override'.

This macro is kept for backwards compatibility with old (1.4.x) user code that uses the FL\_OVERRIDE macro.

We recommend to use 'override' explicitly if C++11 or higher is available.

## 14.29 Fl\_Cairo.H File Reference

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

```
#include <FL/Fl.H>
```

```
#include <cairo.h>
```

### Classes

- class [Fl\\_Cairo\\_State](#)

*Contains all the necessary info on the current cairo context.*

### 14.29.1 Detailed Description

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

#### Note

In FLTK 1.3.x this header file ([Fl\\_Cairo.H](#)) included the platform specific Cairo headers. This is no longer true since 1.4.0.

This header file is platform agnostic. If you need platform specific Cairo headers you need to `#include` them in your source file.

To use FLTK's builtin Cairo support you need to `#include <FL/Fl.H>` **before** you include any other FLTK header which is officially required anyway. Since FLTK 1.4.0 the preprocessor constants `FLTK_HAVE_CAIRO` and/or `FLTK_HAVE_CAIROEXT` are defined in `<FL/Fl.H>` by including `<FL/fl_config.h>`.

## 14.30 Fl\_Cairo.H

## 14.33 fl\_callback\_macros.H File Reference

This file provides macros for easy function and method callbacks with multiple type safe arguments.

```
#include <stdlib.h>
```

### Macros

- `#define FL_FUNCTION_CALLBACK_3(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2)`  
*Declare a C function callback with custom parameters.*
- `#define FL_INLINE_CALLBACK_2(WIDGET, TYPE0, NAME0, VALUE0, TYPE1, NAME1, VALUE1, LAMBDA)`  
*Creates code to declare a callback function in line with instantiating a widget.*
- `#define FL_METHOD_CALLBACK_1(WIDGET, CLASS, SELF, METH, TYPE0, VALUE0)`  
*Declare a non-static class method callback with custom parameters.*

### 14.33.1 Detailed Description

This file provides macros for easy function and method callbacks with multiple type safe arguments.

### 14.33.2 Macro Definition Documentation

#### 14.33.2.1 FL\_FUNCTION\_CALLBACK\_3

```

#define FL_FUNCTION_CALLBACK_3(
 WIDGET,
 FUNC,
 TYPE0,
 VALUE0,
 TYPE1,
 VALUE1,
 TYPE2,
 VALUE2)

```

Declare a C function callback with custom parameters.

You can declare a plain C function callback or a static method callback with custom parameters using this macro. It simplifies the process of calling arbitrary functions with up to five custom parameters. The macro generates code that ensures type safety and expands FLTK's standard callbacks, which are limited to a single `void*` or `long` argument.

To use the macro, you provide the widget that will handle the callback as the first argument. The second argument can be either a regular function or a static method in any class.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```

#include <FL/fl_callback_macros.H>
...
Fl_Button *btn1 = new Fl_Button(10, 10, 100, 20, "Beep");
FL_FUNCTION_CALLBACK_0(btn1, fl_beep);
...
Fl_Button *btn2 = new Fl_Button(10, 40, 100, 20, "Hello");
FL_FUNCTION_CALLBACK_5(btn2,
 fl_message,
 const char *, "Hello\n%d %d %d %d",
 int, 1, int, 2, int, 3, int, 4

```

```
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>FUNC</i>	a C/C++ function or a static class method
<i>TYPE0,VALUE0,TYPE1,VALUE1,TYPE2,VALUE2</i>	a list of zero to five type/value pairs, all separated by commas

#### See also

### 14.33.2.2 FL\_INLINE\_CALLBACK\_2

```
#define FL_INLINE_CALLBACK_2(
 WIDGET,
 TYPE0,
 NAME0,
 VALUE0,
 TYPE1,
 NAME1,
 VALUE1,
 LAMBDA)
```

Creates code to declare a callback function in line with instantiating a widget.

You can use this macro to create a function as a callback, allowing you to define the callback function right where the widget and callback are declared, similar to a Lambda function.

The first argument of the macro specifies the widget that will handle the callback. Next, you can include up to five triplets, where each triplet consists of a type, a parameter name, and a value. For example, `int, x, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two triplets, such as `int, x, 3, int, y, 4`. The last digit of the macro name must be the same as the number of triplets (0..5).

The last argument is the actual function body itself.

The function body is limited to a syntax that the macro preprocessor can handle. It should include the leading '{' and trailing '}' and may contain local variable declarations, use global variables and functions, and use also the variables listed and initialized in the argument triples of the macro. Very large function bodies should be avoided because they may exceed the admissible size of a macro argument.

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_INLINE_CALLBACK_1(btn,
 const char *, name, btn->label(),
 {
 fl_message("Greetings from the %s button", name);
 }
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>TYPE0</i>	the type of the first parameter in the function call
<i>NAME0</i>	an arbitrary variable name that can be used as a parameter in the function body
<i>VALUE0</i>	a constant value or a variable; the value of the variable is copied when the callback is created
<i>TYPE1,NAME1,VALUE1</i>	as above; there are six macros that support 0 to 5 parameters
<i>LAMBDA</i>	the function body within the limits of the C macro preprocessor

### 14.33.2.3 FL\_METHOD\_CALLBACK\_1

```
#define FL_METHOD_CALLBACK_1(
 WIDGET,
 CLASS,
 SELF,
 METH,
 TYPE0,
 VALUE0)
```

Declare a non-static class method callback with custom parameters.

You can declare a callback for a non-static class method with custom parameters using this macro. It provides a convenient way to call arbitrary methods in any class, overcoming FLTK's limitation of passing only a single `void*` or `long` argument. Furthermore, it ensures type safety.

The first argument of the macro specifies the widget that will handle the callback. The second argument indicates the class type to be called. The third argument must be a pointer to an instance of that class. The fourth argument is the name of the method within the class. That method must be public and should not be static.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
```

```
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_METHOD_CALLBACK_1(btn, Fl_Button, btn, color, Fl_Color, FL_GREEN);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

#### Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>CLASS</i>	the class type
<i>SELF</i>	a pointer to an instance of the class
<i>METH</i>	a C++ class method that must be public and not static
<i>TYPE0,VALUE0</i>	a list of zero to five type/value pairs, all separated by commas

## 14.36 Fl\_Chart.H File Reference

[Fl\\_Chart](#) widget.

```
#include "Fl_Widget.H"
```

### Classes

- class [Fl\\_Chart](#)  
*Fl\_Chart displays simple charts.*

- struct [FL\\_CHART\\_ENTRY](#)

*For internal use only.*

## Macros

- **#define FL\_BAR\_CHART 0**  
*type() for Bar Chart variant*
- **#define FL\_CHART\_LABEL\_MAX 18**  
*max label length for entry*
- **#define FL\_CHART\_MAX 128**  
*max entries per chart*
- **#define FL\_FILL\_CHART 3**  
*type() for Fill Line Chart variant*
- **#define FL\_FILLED\_CHART [FL\\_FILL\\_CHART](#)**  
*for compatibility*
- **#define FL\_HORBAR\_CHART 1**  
*type() for Horizontal Bar Chart variant*
- **#define FL\_LINE\_CHART 2**  
*type() for Line Chart variant*
- **#define FL\_PIE\_CHART 5**  
*type() for Pie Chart variant*
- **#define FL\_SPECIALPIE\_CHART 6**  
*type() for Special Pie Chart variant*
- **#define FL\_SPIKE\_CHART 4**  
*type() for Spike Chart variant*

### 14.36.1 Detailed Description

[Fl\\_Chart](#) widget.

## 14.50 fl\_draw.H File Reference

utility header to pull drawing functions together

```
#include <FL/Enumerations.H>
#include <FL/Fl_Graphics_Driver.H>
#include <FL/Fl_Rect.H>
```

## Enumerations

- enum {  
[FL\\_SOLID](#) = 0 , [FL\\_DASH](#) = 1 , [FL\\_DOT](#) = 2 , [FL\\_DASHDOT](#) = 3 ,  
[FL\\_DASHDOTDOT](#) = 4 , [FL\\_CAP\\_FLAT](#) = 0x100 , [FL\\_CAP\\_ROUND](#) = 0x200 , [FL\\_CAP\\_SQUARE](#) = 0x300 ,  
[FL\\_JOIN\\_MITER](#) = 0x1000 , [FL\\_JOIN\\_ROUND](#) = 0x2000 , [FL\\_JOIN\\_BEVEL](#) = 0x3000 , [FL\\_UNIFORM\\_WIDTH](#)  
= 0x10000 }

## Functions

- int [fl\\_add\\_symbol](#) (const char \*name, void(\*draw\_in\_rect)(int x, int y, int w, int h, [FL\\_Color](#) c), int scalable)  
*Registers (or replaces) a named symbol drawn into an explicit pixel rectangle.*
- int [fl\\_add\\_symbol](#) (const char \*name, void(\*drawit)([FL\\_Color](#) c), int scalable)  
*Registers (or replaces) a named symbol drawn using complex vector drawing.*
- int [fl\\_antialias](#) ()  
*Return whether line drawings are currently antialiased.*
- void [fl\\_antialias](#) (int state)  
*Turn antialiased line drawings ON or OFF, if supported by platform.*
- void [fl\\_arc](#) (double x, double y, double r, double start, double end)  
*Add a series of points to the current path on the arc of a circle.*
- void [fl\\_arc](#) (int x, int y, int w, int h, double a1, double a2)  
*Draw ellipse sections using integer coordinates.*
- void [fl\\_begin\\_complex\\_polygon](#) ()  
*Start drawing a complex filled polygon.*
- void [fl\\_begin\\_line](#) ()  
*Start drawing a list of lines.*
- void [fl\\_begin\\_loop](#) ()  
*Start drawing a closed sequence of lines.*
- void [fl\\_begin\\_offscreen](#) ([FL\\_Offscreen](#) ctx)  
*Send all subsequent drawing commands to this offscreen buffer.*
- void [fl\\_begin\\_points](#) ()  
*Start drawing a list of points.*
- void [fl\\_begin\\_polygon](#) ()  
*Start drawing a convex filled polygon.*
- char [fl\\_can\\_do\\_alpha\\_blending](#) ()  
*Check whether platform supports true alpha blending for RGBA images.*
- [FL\\_RGB\\_Image](#) \* [fl\\_capture\\_window](#) ([FL\\_Window](#) \*win, int x, int y, int w, int h)  
*Captures the content of a rectangular zone of a mapped window.*
- void [fl\\_chord](#) (int x, int y, int w, int h, double a1, double a2)  
*fl\_chord declaration is a place holder - the function does not yet exist*
- void [fl\\_circle](#) (double x, double y, double r)  
*fl\_circle(x,y,r) is equivalent to fl\_arc(x,y,r,0,360), but may be faster.*
- int [fl\\_clip\\_box](#) (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)  
*Intersect a rectangle with the current clip region and return the bounding box of the result.*
- [FL\\_Region](#) [fl\\_clip\\_region](#) ()  
*Return the current clipping region.*
- void [fl\\_clip\\_region](#) ([FL\\_Region](#) r)

- Replace the top of the clipping stack with a clipping region of any shape.*

  - [FL\\_Color fl\\_color](#) ()

*Return the last [fl\\_color\(\)](#) that was set.*
- void [fl\\_color](#) ([FL\\_Color](#) c)

*Set the color for all subsequent drawing operations.*
- void [fl\\_color](#) (int c)

*for back compatibility - use [fl\\_color\(FL\\_Color c\)](#) instead*
- void [fl\\_color](#) ([uchar](#) r, [uchar](#) g, [uchar](#) b)

*Set the color for all subsequent drawing operations.*
- void [fl\\_copy\\_offscreen](#) (int x, int y, int w, int h, [FL\\_Offscreen](#) pixmap, int srcx, int srcy)

*Copy a rectangular area of the given offscreen buffer into the current drawing destination.*
- [FL\\_Offscreen fl\\_create\\_offscreen](#) (int w, int h)

*Creation of an offscreen graphics buffer.*
- void [fl\\_cursor](#) ([FL\\_Cursor](#))

*Sets the cursor for the current window to the specified shape and colors.*
- void [fl\\_cursor](#) ([FL\\_Cursor](#), [FL\\_Color](#) fg, [FL\\_Color](#) bg=[FL\\_WHITE](#))
- void [fl\\_curve](#) (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)

*Add a series of points on a Bézier curve to the path.*
- void [fl\\_delete\\_offscreen](#) ([FL\\_Offscreen](#) ctx)

*Deletion of an offscreen graphics buffer.*
- int [fl\\_descent](#) ()

*Return the recommended distance above the bottom of a [fl\\_height\(\)](#) tall box to draw the text at so it looks centered vertically in that box.*
- void [fl\\_draw](#) (const char \*str, int n, int x, int y)

*Draws starting at the given x, y location a UTF-8 string of length n bytes.*
- void [fl\\_draw](#) (const char \*str, int x, int y)

*Draw a nul-terminated UTF-8 string starting at the given x, y location.*
- void [fl\\_draw](#) (const char \*str, int x, int y, int w, int h, [FL\\_Align](#) align, [FL\\_Image](#) \*img=0, int draw\_symbols=1, int spacing=0)

*Fancy string drawing function which is used to draw all the labels.*
- void [fl\\_draw](#) (const char \*str, int x, int y, int w, int h, [FL\\_Align](#) align, void(\*callthis)(const char \*, int, int, int), [FL\\_Image](#) \*img=0, int draw\_symbols=1, int spacing=0)

*The same as [fl\\_draw\(const char\\*,int,int,int,int,FL\\_Align,FL\\_Image\\*,int\)](#) with the addition of the *callthis* parameter, which is a pointer to a text drawing function such as [fl\\_draw\(const char\\*, int, int, int\)](#) to do the real work.*
- void [fl\\_draw](#) (int angle, const char \*str, int n, int x, int y)

*Draw at the given x, y location a UTF-8 string of length n bytes rotating angle degrees counter-clockwise.*
- void [fl\\_draw](#) (int angle, const char \*str, int x, int y)

*Draw a nul-terminated UTF-8 string starting at the given x, y location and rotating angle degrees counter-clockwise.*
- void [fl\\_draw\\_arrow](#) ([FL\\_Rect](#) bb, [FL\\_Arrow\\_Type](#) t, [FL\\_Orientation](#) o, [FL\\_Color](#) color)

*Draw an "arrow like" GUI element for the selected scheme.*
- void [fl\\_draw\\_box](#) ([FL\\_Boxtype](#), int x, int y, int w, int h, [FL\\_Color](#))

*Draws a box using given type, position, size and color.*
- void [fl\\_draw\\_box\\_focus](#) ([FL\\_Boxtype](#), int x, int y, int w, int h, [FL\\_Color](#), [FL\\_Color](#))

*Draws the focus rectangle inside a box using given type, position, size and color.*
- void [fl\\_draw\\_check](#) ([FL\\_Rect](#) bb, [FL\\_Color](#) col)

*Draw a check mark inside the given bounding box.*
- void [fl\\_draw\\_circle](#) (int x, int y, int d, [FL\\_Color](#) color)

*Draw a potentially small, filled circle using a given color.*
- void [fl\\_draw\\_image](#) (const [uchar](#) \*buf, int X, int Y, int W, int H, int D=3, int L=0)

*Draw an 8-bit per color RGB or luminance image.*
- void [fl\\_draw\\_image](#) ([FL\\_Draw\\_Image\\_Cb](#) cb, void \*data, int X, int Y, int W, int H, int D=3)

- Draw an image using a callback function to generate image data.*

  - void **fl\_draw\_image\_mono** (const **uchar** \*buf, int X, int Y, int W, int H, int D=1, int L=0)

*Draw a gray-scale (1 channel) image.*

  - void **fl\_draw\_image\_mono** (FL\_Draw\_Image\_Cb cb, void \*data, int X, int Y, int W, int H, int D=1)

*Draw a gray-scale image using a callback function to generate image data.*

  - int **fl\_draw\_pixmap** (char \*const \*data, int x, int y, **FL\_Color** bg=FL\_GRAY)

*Draw XPM image data, with the top-left corner at the given position.*

  - int **fl\_draw\_pixmap** (const char \*const \*cdata, int x, int y, **FL\_Color** bg=FL\_GRAY)

*Draw XPM image data, with the top-left corner at the given position.*

  - void **fl\_draw\_radio** (int x, int y, int d, **FL\_Color** color)

*Draw a round check mark (circle) of a radio button.*

  - int **fl\_draw\_symbol** (const char \*label, int x, int y, int w, int h, **FL\_Color**)

*Draw the named symbol in the given rectangle using the given color.*

  - void **fl\_end\_complex\_polygon** ()

*End complex filled polygon, and draw.*

  - void **fl\_end\_line** ()

*End list of lines, and draw.*

  - void **fl\_end\_loop** ()

*End closed sequence of lines, and draw.*

  - void **fl\_end\_offscreen** ()

*Quit sending drawing commands to the current offscreen buffer.*

  - void **fl\_end\_points** ()

*End list of points, and draw.*

  - void **fl\_end\_polygon** ()

*End convex filled polygon, and draw.*

  - const char \* **fl\_expand\_text** (const char \*from, char \*buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw\_symbols=0)

*Copy from to buf, replacing control characters with ^X.*

  - void **fl\_focus\_rect** (int x, int y, int w, int h)

*Draw a dotted rectangle, used to indicate keyboard focus on a widget.*

  - **FL\_Font** **fl\_font** ()

*Return the face set by the most recent call to fl\_font().*

  - void **fl\_font** (**FL\_Font** face, **FL\_Fontsize** fsize)

*Sets the current font, which is then used in various drawing routines.*

  - void **fl\_frame** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*

  - void **fl\_frame2** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*

  - void **fl\_gap** ()

*Separate loops of the path.*

  - int **fl\_height** ()

*Return the recommended minimum line spacing for the current font.*

  - int **fl\_height** (int font, int size)

*This function returns the actual height of the specified font and size.*

  - const char \* **fl\_latin1\_to\_local** (const char \*t, int n=-1)

*Convert text from Windows/X11 latin1 character set to local encoding.*

  - void **fl\_line** (int x, int y, int x1, int y1)

*Draw a line from (x,y) to (x1,y1)*

  - void **fl\_line** (int x, int y, int x1, int y1, int x2, int y2)

*Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)*

  - void **fl\_line\_style** (int style, int width=0, char \*dashes=0)

- Set how to draw lines (the "pen").*

  - void **fl\_load\_identity** ()

*Set the transformation matrix to identity.*
- void **fl\_load\_matrix** (double a, double b, double c, double d, double x, double y)

*Set the current transformation matrix.*
- const char \* **fl\_local\_to\_latin1** (const char \*t, int n=-1)

*Convert text from local encoding to Windows/X11 latin1 character set.*
- const char \* **fl\_local\_to\_mac\_roman** (const char \*t, int n=-1)

*Convert text from local encoding to Mac Roman character set.*
- void **fl\_loop** (int x, int y, int x1, int y1, int x2, int y2)

*Outline a 3-sided polygon with lines.*
- void **fl\_loop** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)

*Outline a 4-sided polygon with lines.*
- const char \* **fl\_mac\_roman\_to\_local** (const char \*t, int n=-1)

*Convert text from Mac Roman character set to local encoding.*
- void **fl\_measure** (const char \*str, int &x, int &y, int draw\_symbols=1)

*Measure how wide and tall the string will be when printed by the fl\_draw() function with align parameter.*
- int **fl\_measure\_pixmap** (char \*const \*data, int &w, int &h)

*Get the dimensions of a pixmap.*
- int **fl\_measure\_pixmap** (const char \*const \*cdata, int &w, int &h)

*Get the dimensions of a pixmap.*
- void **fl\_mult\_matrix** (double a, double b, double c, double d, double x, double y)

*Concatenate another transformation onto the current one.*
- int **fl\_not\_clipped** (int x, int y, int w, int h)

*Does the rectangle intersect the current clip region?*
- unsigned int **fl\_old\_shortcut** (const char \*s)

*Emulation of XForms named shortcuts.*
- void **fl\_overlay\_clear** ()

*Erase a selection rectangle without drawing a new one.*
- void **fl\_overlay\_rect** (int x, int y, int w, int h)

*Draw a transient dotted selection rectangle.*
- float **fl\_override\_scale** ()

*Removes any GUI scaling factor in subsequent drawing operations.*
- void **fl\_pie** (int x, int y, int w, int h, double a1, double a2)

*Draw filled ellipse sections using integer coordinates.*
- void **fl\_point** (int x, int y)

*Draw a single pixel at the given coordinates.*
- void **fl\_polygon** (int x, int y, int x1, int y1, int x2, int y2)

*Fill a 3-sided polygon.*
- void **fl\_polygon** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)

*Fill a 4-sided polygon.*
- void **fl\_pop\_clip** ()

*Restore the previous clip region.*
- void **fl\_pop\_matrix** ()

*Restore the current transformation matrix from the stack.*
- void **fl\_push\_clip** (int x, int y, int w, int h)

*Intersect the current clip region with a rectangle and push this new region onto the stack.*
- void **fl\_push\_matrix** ()

*Save the current transformation matrix on the stack.*
- void **fl\_push\_no\_clip** ()

*Push an empty clip region onto the stack so nothing will be clipped.*

- `uchar * fl_read_image (uchar *p, int X, int Y, int W, int H, int alpha=0)`  
*Reads an RGB(A) image from the current window or off-screen buffer.*
- `void fl_rect (FI_Rect r)`  
*Draw a border inside the given bounding box.*
- `void fl_rect (int x, int y, int w, int h)`  
*Draw a border inside the given bounding box.*
- `void fl_rect (int x, int y, int w, int h, FI_Color c)`  
*Draw with passed color a border inside the given bounding box.*
- `void fl_rectf (FI_Rect bb, uchar r, uchar g, uchar b)`  
*Color a rectangle with "exactly" the passed  $r, g, b$  color.*
- `void fl_rectf (FI_Rect r)`  
*Color with current color a rectangle that exactly fills the given bounding box.*
- `void fl_rectf (FI_Rect r, FI_Color c)`  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- `void fl_rectf (int x, int y, int w, int h)`  
*Color with current color a rectangle that exactly fills the given bounding box.*
- `void fl_rectf (int x, int y, int w, int h, FI_Color c)`  
*Color with passed color a rectangle that exactly fills the given bounding box.*
- `void fl_rectf (int x, int y, int w, int h, uchar r, uchar g, uchar b)`  
*Color a rectangle with "exactly" the passed  $r, g, b$  color.*
- `int fl_remove_symbol (const char *name)`  
*Removes the symbol with name `name` from the system.*
- `void fl_rescale_offscreen (FI_Offscreen &ctx)`  
*Adapts an offscreen buffer to a changed value of the scale factor.*
- `void fl_reset_spot (void)`  
*Resets marked text.*
- `void fl_restore_clip ()`  
*Undo any clobbering of the clip region done by your program.*
- `void fl_restore_scale (float s)`  
*Restores the GUI scaling factor in subsequent drawing operations.*
- `void fl_rotate (double d)`  
*Concatenate rotation transformation onto the current one.*
- `void fl_rounded_rect (int x, int y, int w, int h, int r)`  
*Draw a rounded border inside the given bounding box.*
- `void fl_rounded_rectf (int x, int y, int w, int h, int r)`  
*Color with current color a rounded rectangle that exactly fills the given bounding box.*
- `void fl_rtl_draw (const char *str, int n, int x, int y)`  
*Draw a UTF-8 string of length `n` bytes right to left starting at the given  $x, y$  location.*
- `void fl_scale (double x)`  
*Concatenate scaling transformation onto the current one.*
- `void fl_scale (double x, double y)`  
*Concatenate scaling transformation onto the current one.*
- `void fl_scroll (int X, int Y, int W, int H, int dx, int dy, void(*draw_area)(void *, int, int, int, int), void *data)`  
*Scroll a rectangle and draw the newly exposed portions.*
- `void fl_set_spot (int font, int size, int X, int Y, int W, int H, FI_Window *win=0)`  
*Inform text input methods about the current text insertion cursor.*
- `void fl_set_status (int X, int Y, int W, int H)`  
*Related to text input methods under X11.*
- `const char * fl_shortcut_label (unsigned int shortcut)`  
*Get a human-readable string from a shortcut value.*
- `const char * fl_shortcut_label (unsigned int shortcut, const char **eom)`

- Get a human-readable string from a shortcut value.
- [Fl\\_Fontsize fl\\_size](#) ()
  - Return the *size* set by the most recent call to [fl\\_font\(\)](#).
- void [fl\\_text\\_extents](#) (const char \*t, int &dx, int &dy, int &w, int &h)
  - Determine the minimum pixel dimensions of a nul-terminated string using the current [fl\\_font\(\)](#).
- void [fl\\_text\\_extents](#) (const char \*t, int n, int &dx, int &dy, int &w, int &h)
  - Determine the minimum pixel dimensions of a sequence of *n* bytes of text using the current font face and size.
- double [fl\\_transform\\_dx](#) (double x, double y)
  - Transform distance using current transformation matrix.
- double [fl\\_transform\\_dy](#) (double x, double y)
  - Transform distance using current transformation matrix.
- double [fl\\_transform\\_x](#) (double x, double y)
  - Transform coordinate using the current transformation matrix.
- double [fl\\_transform\\_y](#) (double x, double y)
  - Transform coordinate using the current transformation matrix.
- void [fl\\_transformed\\_vertex](#) (double xf, double yf)
  - Add coordinate pair to the vertex list without further transformations.
- void [fl\\_translate](#) (double x, double y)
  - Concatenate translation transformation onto the current one.
- void [fl\\_vertex](#) (double x, double y)
  - Add a single vertex to the current path.
- double [fl\\_width](#) (const char \*txt)
  - Return the typographical width of a nul-terminated string using the current font face and size.
- double [fl\\_width](#) (const char \*txt, int n)
  - Return the typographical width of a sequence of *n* bytes of text in UTF-8 encoding, using the current font face and size.
- double [fl\\_width](#) (unsigned int c)
  - Return the typographical width of a single character using the current font face and size.
- void [fl\\_xylene](#) (int x, int y, int x1)
  - Draw a horizontal line from (x,y) to (x1,y).
- void [fl\\_xylene](#) (int x, int y, int x1, int y2)
  - Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).
- void [fl\\_xylene](#) (int x, int y, int x1, int y2, int x3)
  - Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).
- void [fl\\_yxline](#) (int x, int y, int y1)
  - Draw a vertical line from (x,y) to (x,y1)
- void [fl\\_yxline](#) (int x, int y, int y1, int x2)
  - Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).
- void [fl\\_yxline](#) (int x, int y, int y1, int x2, int y3)
  - Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).

00089 /* ===== Implementation note about image drawing =====
00090 A graphics driver can implement up to 6 virtual member functions to draw images:
00091 virtual void draw_pixmap(Fl_Pixmap *pixmap,int XP, int YP, int WP, int HP, int cx, int cy)
00092 virtual void draw_bitmap(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
00093 virtual void draw_rgb(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
00094 and
00095 virtual void draw_fixed(Fl_Pixmap *pixmap,int XP, int YP, int WP, int HP, int cx, int cy)
00096 virtual void draw_fixed(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
00097 virtual void draw_rgb(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
00098 - The 1st group of functions is used when the driver can directly map the image data,
00099 sized at data_w() x data_h(), to the image drawing area, sized at w()*scale x h()*scale
00100 where scale is the current GUI scale factor.
00101 - If the driver does not support such scale-and-draw operation for a given image type,
00102 it should implement the draw_fixed() function which is called by the library after the
00103 image has been internally resized to the drawing size and cached.
00104 - The platform-independent Fl_Graphics_Driver class implements the 1st group of functions.
00105 Each resizes the image, caches it, and calls the platform-specific implementation of
00106 draw_fixed(image-class *,...) with the cached image.
00107 - Consider an image object, say from class Fl_RGB_Image. Fl_RGB_Image::draw()
00108 calls the virtual member function draw_rgb(Fl_RGB_Image *,...). If Fl_XXX_Graphics_Driver
00109 re-implements this function, this code runs and is expected to draw the image
00110 adequately scaled to its drawing size. If Fl_XXX_Graphics_Driver does not re-implement
00111 this function, Fl_Graphics_Driver::draw_rgb(Fl_RGB_Image *,...) runs. It internally
00112 resizes the image, caches it, and calls Fl_XXX_Graphics_Driver::draw_fixed(Fl_RGB_Image *,...)
00113 that draws the image from its cached form which already has the adequate size.
00114 - Some drivers implement, for a given image class, only the function of the 1st group or
00115 only draw_fixed() as in these examples:
00116 - Fl_Quartz_Graphics_Driver implements only draw_rgb(Fl_RGB_Image *,...) because it
00117 can perform the scale-and-draw operation whatever the RGB image and the required scaling.
00118 - Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_Pixmap *,...). The library
00119 takes care of resizing and caching the Pixmap to the adequate drawing size.
00120 - Some drivers implement, for a given image class, the function of both groups, e.g. :
00121 Fl_GDI_Graphics_Driver implements both draw_rgb(Fl_RGB_Image *,...) and

```

```

00122 draw_fixed(Fl_RGB_Image *,...) because scale-and-draw may require function Alphablend()
00123 from MSIMG32.DLL. In the absence of that, the draw_rgb() implementation calls
00124 Fl_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image*,...).
00125
00126 Graphics drivers also implement cache(Fl_Pixmap*), cache(Fl_Bitmap*) and cache(Fl_RGB_Image*)
00127 to compute the cached form of all image types, and uncache(Fl_RGB_Image *,...),
00128 uncache_pixmap(fl_uintptr_t) and delete_bitmask(fl_uintptr_t) to destroy cached image forms.
00129 Graphics drivers that use the mask_ variable of class Fl_Pixmap to cache an Fl_Pixmap
00130 object also reimplement the uchar **Fl_Graphics_Driver::mask_bitmap() member function.
00131 */

#include <FL/Fl_Group.H>
```

```
#include <FL/Fl_Rect.H>
```

### Classes

- class [Fl\\_Grid::Cell](#)
- class [Fl\\_Grid](#)

*Fl\_Grid is a container (layout) widget with multiple columns and rows.*

### Typedefs

- typedef unsigned short [Fl\\_Grid\\_Align](#)  
*Fl\_Grid type for child widget alignment control.*

### Variables

- const [Fl\\_Grid\\_Align](#) [FL\\_GRID\\_BOTTOM](#) = 0x0002

*Align the widget at the bottom of the cell.*

- const `Fl_Grid_Align FL_GRID_BOTTOM_LEFT = FL_GRID_BOTTOM | FL_GRID_LEFT`
- const `Fl_Grid_Align FL_GRID_BOTTOM_RIGHT = FL_GRID_BOTTOM | FL_GRID_RIGHT`
- const `Fl_Grid_Align FL_GRID_CENTER = 0x0000`

*Align the widget in the middle of the cell (default).*

- const `Fl_Grid_Align FL_GRID_FILL = 0x0030`

*Stretch the widget in both directions to fill the cell.*

- const `Fl_Grid_Align FL_GRID_HORIZONTAL = 0x0010`

*Stretch the widget horizontally to fill the cell.*

- const `Fl_Grid_Align FL_GRID_LEFT = 0x0004`

*Align the widget at the left side of the cell.*

- const `Fl_Grid_Align FL_GRID_PROPORTIONAL = 0x0040`

*Stretch the widget proportionally.*

- const `Fl_Grid_Align FL_GRID_RIGHT = 0x0008`

*Align the widget at the right side of the cell.*

- const `Fl_Grid_Align FL_GRID_TOP = 0x0001`

*Align the widget at the top of the cell.*

- const `Fl_Grid_Align FL_GRID_TOP_LEFT = FL_GRID_TOP | FL_GRID_LEFT`
- const `Fl_Grid_Align FL_GRID_TOP_RIGHT = FL_GRID_TOP | FL_GRID_RIGHT`
- const `Fl_Grid_Align FL_GRID_VERTICAL = 0x0020`

*Stretch the widget vertically to fill the cell.*

## 14.67.1 Detailed Description

`Fl_Grid` container widget.

## 14.69 Fl\_Group.H File Reference

[Fl\\_Group](#) and [Fl\\_End](#) classes.

```

#include "Fl_Widget.H"
#include <vector>

```

### Classes

- class [Fl\\_End](#)  
*This is a dummy class that allows you to end a [Fl\\_Group](#) in a constructor list of a class:*
- class [Fl\\_Group](#)  
*The [Fl\\_Group](#) class is the main FLTK container widget.*

### 14.69.1 Detailed Description

[Fl\\_Group](#) and [Fl\\_End](#) classes.

## 14.70 Fl\_Group.H

## 14.79 Fl\_Image.H File Reference

[Fl\\_Image](#), [Fl\\_RGB\\_Image](#) classes.

```
#include "Enumerations.H"
```

```
#include "Fl_Widget.H"
```

### Classes

- class [Fl\\_Image](#)  
*Base class for image caching, scaling and drawing.*
- class [Fl\\_RGB\\_Image](#)  
*The [Fl\\_RGB\\_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.*

### Enumerations

- enum [Fl\\_RGB\\_Scaling](#) { [FL\\_RGB\\_SCALING\\_NEAREST](#) = 0 , [FL\\_RGB\\_SCALING\\_BILINEAR](#) }  
*The scaling algorithm to use for RGB images.*

### 14.79.1 Detailed Description

[Fl\\_Image](#), [Fl\\_RGB\\_Image](#) classes.

### 14.79.2 Enumeration Type Documentation

#### 14.79.2.1 Fl\_RGB\_Scaling

```
enum Fl_RGB_Scaling
```

The scaling algorithm to use for RGB images.

#### Enumerator

<a href="#">FL_RGB_SCALING_NEAREST</a>	default RGB image scaling algorithm
<a href="#">FL_RGB_SCALING_BILINEAR</a>	more accurate, but slower RGB image scaling algorithm

```

### Classes

- struct [Fl\\_Menu\\_Item](#)

The [Fl\\_Menu\\_Item](#) structure defines a single menu item that is used by the [Fl\\_Menu\\_](#) class.

### Typedefs

- typedef [Fl\\_Menu\\_Item](#) [Fl\\_Menu](#)

### Enumerations

- enum {  
[FL\\_MENU\\_INACTIVE](#) = 1 , [FL\\_MENU\\_TOGGLE](#) = 2 , [FL\\_MENU\\_VALUE](#) = 4 , [FL\\_MENU\\_RADIO](#) = 8 ,  
[FL\\_MENU\\_INVISIBLE](#) = 0x10 , [FL\\_SUBMENU\\_POINTER](#) = 0x20 , [FL\\_SUBMENU](#) = 0x40 , [FL\\_MENU\\_DIVIDER](#)  
= 0x80 ,  
[FL\\_MENU\\_HORIZONTAL](#) = 0x100 , [FL\\_MENU\\_CHATTY](#) = 0x200 , [FL\\_MENU\\_HEADLINE](#) = 0x400 }
- enum {  
[FL\\_PUP\\_NONE](#) = 0 , [FL\\_PUP\\_GREY](#) = [FL\\_MENU\\_INACTIVE](#) , [FL\\_PUP\\_GRAY](#) = [FL\\_MENU\\_INACTIVE](#) ,  
[FL\\_MENU\\_BOX](#) = [FL\\_MENU\\_TOGGLE](#) ,  
[FL\\_PUP\\_BOX](#) = [FL\\_MENU\\_TOGGLE](#) , [FL\\_MENU\\_CHECK](#) = [FL\\_MENU\\_VALUE](#) , [FL\\_PUP\\_CHECK](#) = [FL\\_MENU\\_VALUE](#) , [FL\\_PUP\\_RADIO](#) = [FL\\_MENU\\_RADIO](#) ,  
[FL\\_PUP\\_INVISIBLE](#) = [FL\\_MENU\\_INVISIBLE](#) , [FL\\_PUP\\_SUBMENU](#) = [FL\\_SUBMENU\\_POINTER](#) }

## 14.93.1 Enumeration Type Documentation

### 14.93.1.1 anonymous enum

anonymous enum

## Enumerator

FL_MENU_INACTIVE	Deactivate menu item (gray out)
FL_MENU_TOGGLE	Item is a checkbox toggle (shows checkbox for on/off state)
FL_MENU_VALUE	The on/off state for checkbox/radio buttons (if set, state is 'on')
FL_MENU_RADIO	Item is a radio button (one checkbox of many can be on)
FL_MENU_INVISIBLE	Item will not show up (shortcut will work)
FL_SUBMENU_POINTER	Indicates user_data() is a pointer to another menu array.
FL_SUBMENU	Item is a submenu to other items.
FL_MENU_DIVIDER	Creates divider line below this item. Also ends a group of radio buttons.
FL_MENU_HORIZONTAL	reserved, do not use
FL_MENU_CHATTY	Menu Item receives additional callbacks.
FL_MENU_HEADLINE	Mark menu item as a headline. Note: All other bits in flags are reserved: do not use them for your own purposes!

## 14.101 Fl\_Native\_File\_Chooser.H File Reference

[Fl\\_Native\\_File\\_Chooser](#) widget.

```
#include <FL/Fl_Export.H>
```

```
#include <FL/Fl_File_Chooser.H>
```

### Classes

- class [Fl\\_Native\\_File\\_Chooser](#)

*This class lets an FLTK application easily and consistently access the operating system's native file chooser.*

### 14.101.1 Detailed Description

[Fl\\_Native\\_File\\_Chooser](#) widget.

## 14.102 Fl\_Native\_File\_Chooser.H

[Go to the documentation of this file.](#)

```

00001 //
00002 // FLTK native OS file chooser widget
00003 //
00004 // Copyright 2004 Greg Ercolano.

00016 //
00017
00021 /* Implementation note:
00022
00023 class Fl_Native_File_Chooser <== public API used by applications
00024
00025 class Fl_Native_File_Chooser_Driver <== virtual API that a platform may implement
00026 this API has a do-nothing default implementation
00027
00028 class Fl_Native_File_Chooser_FLTK_Driver <== this API implementation is the default FLTK
file chooser

```

```

00029 class Fl_GTK_Native_File_Chooser_Driver <== this API implementation runs a GTK file
chooser
00030 class Fl_Kdialog_Native_File_Chooser_Driver <== this API implementation runs a KDE
file chooser
00031 it is determined at run-time if the GTK dynamic libraries are
available
00032 and the KDE file chooser runs under the KDE desktop
00033
00034 class Fl_Quartz_Native_File_Chooser_Driver <== this API implementation runs a Mac OS X file
chooser
00035
00036 class Fl_WinAPI_Native_File_Chooser_Driver <== this API implementation runs a Windows file
chooser
00037
00038
00039 Each platform must implement the constructor of the Fl_Native_File_Chooser class.
00040 This particular implementation:
00041
00042 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
00043 platform_fnfc = new Fl_Native_File_Chooser_FLTK_Driver(val);
00044 }
00045
00046 can be used by any platform.
00047 No more code is required. The cross-platform Fl_Native_File_Chooser_FLTK.cxx file must be compiled in
libfltk,
00048 and the default FLTK file chooser will be used.
00049
00050 This other implementation:
00051 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
00052 platform_fnfc = 0;
00053 }
00054 can be used by a platform that needs no file chooser.
00055 */

## 14.116 FI\_PostScript.H File Reference

declaration of classes [FI\\_PostScript\\_File\\_Device](#) and [FI\\_EPS\\_File\\_Surface](#).

```

#include <FL/Fl_Paged_Device.H>
#include <FL/fl_draw.H>
#include <stdarg.h>

```

### Classes

- class [FI\\_EPS\\_File\\_Surface](#)  
*Encapsulated PostScript drawing surface.*
- class [FI\\_PostScript\\_File\\_Device](#)  
*To send graphical output to a PostScript file.*

### Typedefs

- typedef int(\* [FI\\_PostScript\\_Close\\_Command](#)) (FILE \*)  
*Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.*

### 14.116.1 Detailed Description

declaration of classes [FI\\_PostScript\\_File\\_Device](#) and [FI\\_EPS\\_File\\_Surface](#).

### 14.116.2 Typedef Documentation

#### 14.116.2.1 FI\_PostScript\_Close\_Command

```
typedef int(* Fl_PostScript_Close_Command) (FILE *)
```

Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

A non-null return value indicates output error.

#### See also

## 14.138 Fl\_Shared\_Image.H File Reference

[Fl\\_Shared\\_Image](#) class.

```
#include "Fl_Image.H"
```

### Classes

- class [Fl\\_Shared\\_Image::Deleter](#)  
*Custom deleter for std::unique\_ptr<>.*
- class [Fl\\_Shared\\_Image](#)  
*This class supports caching, loading, and drawing of image files.*

### Typedefs

- typedef [Fl\\_Image](#) \*(\* [Fl\\_Shared\\_Handler](#)) (const char \*name, [uchar](#) \*header, int headerlen)  
*Test function (typedef) for adding new shared image formats.*

### Functions

- void [fl\\_register\\_images](#) ()  
*Register the known image formats.*

### 14.138.1 Detailed Description

[FI\\_Shared\\_Image](#) class.

### 14.138.2 Typedef Documentation

#### 14.138.2.1 FI\_Shared\_Handler

```
typedef FI_Image *(* FI_Shared_Handler) (const char *name, uchar *header, int headerlen)
```

Test function (typedef) for adding new shared image formats.

This defines the function type you can use to add a handler for unknown image formats that can be opened and loaded as an [FI\\_Shared\\_Image](#).

[fl\\_register\\_images\(\)](#) adds all image formats known to FLTK. Call [FI\\_Shared\\_Image::add\\_handler\(\)](#) to add your own check function to the list of known image formats.

Your function will be passed the filename (*name*), some *header* bytes already read from the image file and the size *headerlen* of the data read. The max value of size is implementation dependent. If your handler function needs to check more bytes you must open the image file yourself.

The provided buffer *header* must not be overwritten.

If your handler function can identify the file type you must open the file and return a valid [FI\\_Image](#) or derived type, otherwise you must return NULL. Example:

```
static FI_Image *check_my_image(const char *name,
 uchar *header,
 int headerlen) {
 // (test image type using header and headerlen)
 if (known) {
 // (load image data from file \p name)
 return new FI_RGB_Image(data, ...);
 } else
 return 0;
}
// add your handler:
FI_Shared_Image::add_handler(check_my_image);
```

#### Parameters

in	<i>name</i>	filename to be checked and opened if applicable
in	<i>header</i>	portion of the file that has already been read
in	<i>headerlen</i>	length of provided <i>header</i> data

#### Returns

valid [FI\\_Image](#) or NULL.

#### See also

[FI\\_Shared\\_Image::add\\_handler\(\)](#)

### 14.138.3 Function Documentation

#### 14.138.3.1 fl\_register\_images()

```
void fl_register_images () [extern]
```

Register the known image formats.

This function is provided in the `fltk_images` library and registers all of the "extra" image file formats known to FLTK that are not part of the core FLTK library.

You may add your own image formats with [FI\\_Shared\\_Image::add\\_handler\(\)](#).

## 14.139 FI\_Shared\_Image.H

00040
00041 /*
00042 "character size" is the size of a UTF-8 character in bytes
00043 "character width" is the width of a Unicode character in pixels
00044 "column" was originally defined as a character offset from the left margin.
00045 It was identical to the byte offset. In UTF-8, we have neither a byte offset
00046 nor truly fixed width fonts (*). Column could be a pixel value multiplied with
00047 an average character width (which is a bearable approximation).
00048
00049 * in Unicode, there are no fixed width fonts! Even if the ASCII characters may
00050 happen to be all the same width in pixels, Chinese characters surely are not.
00051 There are plenty of exceptions, like ligatures, that make special handling of
00052 "fixed" character widths a nightmare. I decided to remove all references to
00053 fixed fonts and see "columns" as a multiple of the average width of a
00054 character in the main font.

#include <FL/Fl_Scrollbar.H>
#include <FL/fl_draw.H>
#include <FL/Fl_Tree_Item.H>
#include <FL/Fl_Tree_Prefs.H>

```

### Classes

- class [Fl\\_Tree](#)  
*Tree widget.*

## Enumerations

- enum `Fl_Tree_Reason` {  
`FL_TREE_REASON_NONE` = `FL_REASON_UNKNOWN` , `FL_TREE_REASON_SELECTED` = `FL_REASON_SELECTED` , `FL_TREE_REASON_DESELECTED` = `FL_REASON_DESELECTED` , `FL_TREE_REASON_RESELECTED` = `FL_REASON_RESELECTED` ,  
`FL_TREE_REASON_OPENED` = `FL_REASON_OPENED` , `FL_TREE_REASON_CLOSED` = `FL_REASON_CLOSED` , `FL_TREE_REASON_DRAGGED` = `FL_REASON_DRAGGED` }

*The reason the callback was invoked.*

### 14.169.1 Detailed Description

This file contains the definitions of the `Fl_Tree` class.

### 14.169.2 Enumeration Type Documentation

#### 14.169.2.1 Fl\_Tree\_Reason

enum `Fl_Tree_Reason`

The reason the callback was invoked.

#### Enumerator

<code>FL_TREE_REASON_NONE</code>	unknown reason
<code>FL_TREE_REASON_SELECTED</code>	an item was selected
<code>FL_TREE_REASON_DESELECTED</code>	an item was de-selected
<code>FL_TREE_REASON_RESELECTED</code>	an item was re-selected (double-clicked). See <a href="#">Fl_Tree_Item_Reselect_Mode</a> to enable this.
<code>FL_TREE_REASON_OPENED</code>	an item was opened
<code>FL_TREE_REASON_CLOSED</code>	an item was closed
<code>FL_TREE_REASON_DRAGGED</code>	an item was dragged into a new place

Fl_Tree :
|_____ Fl_Tree_Item

```

### 14.175.2 Enumeration Type Documentation

#### 14.175.2.1 Fl\_Tree\_Connector

enum [Fl\\_Tree\\_Connector](#)

Defines the style of connection lines between items.

##### Enumerator

<a href="#">FL_TREE_CONNECTOR_NONE</a>	Use no lines connecting items.
<a href="#">FL_TREE_CONNECTOR_DOTTED</a>	Use dotted lines connecting items (default)
<a href="#">FL_TREE_CONNECTOR_SOLID</a>	Use solid lines connecting items.

#### 14.175.2.2 Fl\_Tree\_Item\_Draw\_Mode

enum [Fl\\_Tree\\_Item\\_Draw\\_Mode](#)

Bit flags that control how item's labels and widget(s) are drawn in the tree via item\_draw\_mode().

##### Enumerator

<a href="#">FL_TREE_ITEM_DRAW_DEFAULT</a>	If widget() defined, draw in place of label, and widget() tracks item height (default)
<a href="#">FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET</a>	If widget() defined, include label to the left of the widget.
<a href="#">FL_TREE_ITEM_HEIGHT_FROM_WIDGET</a>	If widget() defined, widget()'s height controls item's height.

**14.175.2.3 Fl\_Tree\_Item\_Reselect\_Mode**

enum [Fl\\_Tree\\_Item\\_Reselect\\_Mode](#)

Defines the ways an item can be (re) selected via `item_reselect_mode()`.

**Enumerator**

FL_TREE_SELECTABLE_ONCE	Item can only be selected once (default)
FL_TREE_SELECTABLE_ALWAYS	Enables FL_TREE_REASON_RESELECTED events for callbacks.

**14.175.2.4 Fl\_Tree\_Select**

enum [Fl\\_Tree\\_Select](#)

Tree selection style.

**Enumerator**

FL_TREE_SELECT_NONE	Nothing selected when items are clicked.
FL_TREE_SELECT_SINGLE	Single item selected when item is clicked (default)
FL_TREE_SELECT_MULTI	Multiple items can be selected by clicking with SHIFT, CTRL or mouse drags.
FL_TREE_SELECT_SINGLE_DRAGGABLE	Single items may be selected, and they may be reordered by mouse drag.

**14.175.2.5 Fl\_Tree\_Sort**

enum [Fl\\_Tree\\_Sort](#)

Sort order options for items added to the tree.

**Enumerator**

FL_TREE_SORT_NONE	No sorting; items are added in the order defined (default).
FL_TREE_SORT_ASCENDING	Add items in ascending sort order.
FL_TREE_SORT_DESCENDING	Add items in descending sort order.

**14.176 Fl\_Tree\_Prefs.H**

## 14.177 fl\_types.h File Reference

This file contains simple "C"-style type definitions.

```
#include "fl_attr.h"
```

### Typedefs

#### Miscellaneous

- typedef unsigned int [Fl\\_Shortcut](#)  
*16-bit Unicode character + 8-bit indicator for keyboard flags.*
- typedef unsigned char **uchar**  
*unsigned char*
- typedef unsigned long **ulong**  
*unsigned long*

### 14.177.1 Detailed Description

This file contains simple "C"-style type definitions.

### 14.177.2 Typedef Documentation

#### 14.177.2.1 Fl\_Shortcut

```
typedef unsigned int Fl_Shortcut
16-bit Unicode character + 8-bit indicator for keyboard flags.
```

#### Note

This **should** be 24-bit Unicode character + 8-bit indicator for keyboard flags. The upper 8 bits are currently unused but reserved.

Due to compatibility issues this type and all FLTK **shortcuts** can only be used with 16-bit Unicode characters (U+0000 .. U+FFFF) and not with the full range of unicode characters (U+0000 .. U+10FFFF).

This is caused by the bit flags FL\_SHIFT, FL\_CTRL, FL\_ALT, and FL\_META being all in the range 0x010000 .. 0x400000.

**Todo** Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 .. U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on **all** programs being coded with symbolic names and not hard coded bit values.

### Functions

- int [fl\\_access](#) (const char \*f, int mode)  
*Cross-platform function to test a files access() with a UTF-8 encoded name or value.*
- int [fl\\_chdir](#) (const char \*path)  
*Cross-platform function to change the current working directory, given as a UTF-8 encoded string.*
- int [fl\\_chmod](#) (const char \*f, int mode)  
*Cross-platform function to set a files mode() with a UTF-8 encoded name or value.*
- int [fl\\_close\\_fd](#) (int fd)  
*Cross-platform function to close a file descriptor.*
- int [fl\\_execvp](#) (const char \*file, char \*const \*argv)  
*Calls execvp on all platforms.*
- FILE \* [fl\\_fopen](#) (const char \*f, const char \*mode)  
*Cross-platform function to open files with a UTF-8 encoded name.*
- char \* [fl\\_getcwd](#) (char \*buf, int len)  
*Cross-platform function to get the current working directory as a UTF-8 encoded value.*
- char \* [fl\\_getenv](#) (const char \*v)  
*Cross-platform function to get environment variables with a UTF-8 encoded name or value.*
- char [fl\\_make\\_path](#) (const char \*path)  
*Cross-platform function to recursively create a path in the file system.*
- void [fl\\_make\\_path\\_for\\_file](#) (const char \*path)  
*Cross-platform function to create a path for the file in the file system.*
- int [fl\\_mkdir](#) (const char \*f, int mode)  
*Cross-platform function to create a directory with a UTF-8 encoded name.*
- unsigned int [fl\\_nonspacing](#) (unsigned int ucs)  
*Returns true if the Unicode character ucs is non-spacing.*
- int [fl\\_open](#) (const char \*fname, int oflags,...)  
*Cross-platform function to open files with a UTF-8 encoded name.*
- int [fl\\_open\\_ext](#) (const char \*fname, int binary, int oflags,...)  
*Cross-platform function to open files with a UTF-8 encoded name.*
- int [fl\\_putenv](#) (const char \*var)  
*Cross-platform function to write environment variables with a UTF-8 encoded name or value.*
- int [fl\\_rename](#) (const char \*f, const char \*n)

- Cross-platform function to rename a filesystem object using UTF-8 encoded names.*

  - `int fl_rmdir (const char *f)`
- Cross-platform function to remove a directory with a UTF-8 encoded name.*

  - `int fl_stat (const char *f, struct stat *b)`
- Cross-platform function to stat() a file using a UTF-8 encoded name or value.*

  - `int fl_system (const char *cmd)`
- Cross-platform function to run a system command with a UTF-8 encoded string.*

  - `int fl_tolower (unsigned int ucs)`

*Returns the Unicode lower case value of `ucs`.*
- `int fl_toupper (unsigned int ucs)`

*Returns the Unicode upper case value of `ucs`.*
- `unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)`

*Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.*
- `int fl_unlink (const char *fname)`

*Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.*
- `char * fl_utf2mbcs (const char *s)`

*Converts UTF-8 string `s` to a local multi-byte character string.*
- `const char * fl_utf8_clean (const char *str, int *len)`

*Test and optionally re-encode a UTF-8 string (character sequence).*
- `int fl_utf8_is_continuation (char byte)`

*Evaluates true if 'byte' is in the middle of a UTF-8 character (0x80..0xBF).*
- `const char * fl_utf8_next_composed_char (const char *from, const char *end)`

*Returns pointer to beginning of character after given location in UTF8 string accounting for emoji sequences.*
- `const char * fl_utf8_previous_composed_char (const char *from, const char *begin)`

*Returns pointer to beginning of character before given location in UTF8 string accounting for emoji sequences.*
- `const char * fl_utf8back (const char *p, const char *start, const char *end)`

*Move `p` backward until it points to the start of a UTF-8 character.*
- `int fl_utf8bytes (unsigned ucs)`

*Returns number of bytes that `utf8encode()` will use to encode the character `ucs`.*
- `unsigned fl_utf8decode (const char *p, const char *end, int *len)`

*Decode a single UTF-8 encoded character starting at `p`.*
- `int fl_utf8encode (unsigned ucs, char *buf)`

*Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.*
- `unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)`

*Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.*
- `unsigned fl_utf8froma (char *dst, unsigned dstlen, const char *src, unsigned srclen)`

*Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.*
- `unsigned fl_utf8fromwc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)`

*Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.*
- `const char * fl_utf8fwd (const char *p, const char *start, const char *end)`

*Move `p` forward until it points to the start of a UTF-8 character.*
- `int fl_utf8len (char c)`

*Returns the byte length of the UTF-8 sequence, or -1 if `c` is not a valid leading byte.*
- `int fl_utf8len1 (char c)`

*Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid.*
- `int fl_utf8locale ()`

*Return true if the "locale" seems to indicate that UTF-8 encoding is used.*
- `int fl_utf8strlen (const char *text, int len)`

*Return the length in bytes of a UTF-8 string.*
- `int fl_utf8test (const char *src, unsigned srclen)`

*Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.*

- unsigned [fl\\_utf8to\\_mb](#) (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)  
*Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).*
- unsigned [fl\\_utf8toa](#) (const char \*src, unsigned srclen, char \*dst, unsigned dstlen)  
*Convert a UTF-8 sequence into an array of 1-byte characters.*
- unsigned [fl\\_utf8toUtf16](#) (const char \*src, unsigned srclen, unsigned short \*dst, unsigned dstlen)  
*Convert a UTF-8 sequence into an array of 16-bit characters.*
- unsigned [fl\\_utf8towc](#) (const char \*src, unsigned srclen, wchar\_t \*dst, unsigned dstlen)  
*Converts a UTF-8 string into a wide character string.*
- int [fl\\_utf\\_nb\\_char](#) (const unsigned char \*buf, int len)  
*Returns the number of Unicode chars in the UTF-8 string.*
- int [fl\\_utf\\_strcasecmp](#) (const char \*s1, const char \*s2)  
*UTF-8 aware strcasecmp - converts to Unicode and tests.*
- int [fl\\_utf\\_strncasecmp](#) (const char \*s1, const char \*s2, int n)  
*UTF-8 aware strncasecmp - converts to lower case Unicode and tests.*
- int [fl\\_utf\\_tolower](#) (const unsigned char \*str, int len, char \*buf)  
*Converts the string str to its lower case equivalent into buf.*
- int [fl\\_utf\\_toupper](#) (const unsigned char \*str, int len, char \*buf)  
*Converts the string str to its upper case equivalent into buf.*
- int [fl\\_wcwidth](#) (const char \*src)  
*extended wrapper around [fl\\_wcwidth\\_\(unsigned int ucs\)](#) function.*
- int [fl\\_wcwidth\\_](#) (unsigned int ucs)  
*Wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK.*

## 14.185 FL\_Widget.H File Reference

[FL\\_Widget](#) and [FL\\_Label](#) classes.

```
#include "Fl.H"
```

### Classes

- class [FL\\_Callback\\_User\\_Data](#)  
*A class prototype that allows for additional data in callbacks.*
- struct [FL\\_Label](#)  
*This struct stores all information for a text or mixed graphics label.*
- class [FL\\_Widget](#)  
*FL\_Widget is the base class for all widgets in FLTK.*

### Macros

- #define [FL\\_RESERVED\\_TYPE](#) 100  
*Reserved type numbers (necessary for my cheapo RTTI) start here.*

### Typedefs

- typedef void() [FL\\_Callback](#)([FL\\_Widget](#) \*, void \*)  
*Default callback type definition for all fltk widgets (by far the most used)*
- typedef void() [FL\\_Callback0](#)([FL\\_Widget](#) \*)  
*One parameter callback type definition passing only the widget.*
- typedef void() [FL\\_Callback1](#)([FL\\_Widget](#) \*, long)  
*Callback type definition passing the widget and a long data value.*
- typedef [FL\\_Callback](#) \* [FL\\_Callback\\_p](#)  
*Default callback type pointer definition for all fltk widgets.*

### 14.185.1 Detailed Description

[FL\\_Widget](#) and [FL\\_Label](#) classes.

## 14.185.2 Macro Definition Documentation

### 14.185.2.1 FL\_RESERVED\_TYPE

```
#define FL_RESERVED_TYPE 100
```

Reserved type numbers (necessary for my cheapo RTTI) start here.

Grep the header files for "RESERVED\_TYPE" to find the next available number.

## 14.188 Fl\_Widget\_Tracker.H File Reference

Track widget deletion.

```

#include <FL/fl_config.h>
#include <FL/Fl_Export.H>

```

### Classes

- class [Fl\\_Widget\\_Tracker](#)  
*This class should be used to control safe widget deletion.*

### Namespaces

- namespace [Fl](#)  
*Fl is the FLTK global namespace containing state information and global methods for the current application.*

## Functions

- void `Fl::clear_widget_pointer` (`Fl_Widget` const \*w)  
*Clears a widget pointer in the watch list.*
- void `Fl::delete_widget` (`Fl_Widget` \*w)  
*Schedules a widget for deletion at the next call to the event loop.*
- void `Fl::do_widget_deletion` ()  
*Deletes widgets previously scheduled for deletion.*
- void `Fl::release_widget_pointer` (`Fl_Widget` \*&w)  
*Releases a widget pointer from the watch list.*
- void `Fl::watch_widget_pointer` (`Fl_Widget` \*&w)  
*Adds a widget pointer to the widget watch list.*

### 14.188.1 Detailed Description

Track widget deletion.

## 14.196 gl.h File Reference

This file defines wrapper functions for OpenGL in FLTK.

```

#include "Enumerations.H"
#include <GL/gl.h>

```

### Functions

- void **gl\_color** (Fl\_Color i)  
*Sets the current OpenGL color to an FLTK color.*
- void **gl\_color** (int c)  
*back compatibility*
- int **gl\_descent** ()  
*Returns the current font's descent.*
- void **gl\_draw** (const char \*)  
*Draws a nul-terminated string in the current font at the current position.*
- void **gl\_draw** (const char \*, float x, float y)  
*Draws a nul-terminated string in the current font at the given position.*
- void **gl\_draw** (const char \*, int n)  
*Draws an array of n characters of the string in the current font at the current position.*
- void **gl\_draw** (const char \*, int n, float x, float y)  
*Draws n characters of the string in the current font at the given position.*
- void **gl\_draw** (const char \*, int n, int x, int y)  
*Draws n characters of the string in the current font at the given position.*

- void `gl_draw` (const char \*, int x, int y)  
*Draws a nul-terminated string in the current font at the given position.*
- void `gl_draw` (const char \*, int x, int y, int w, int h, `FL_Align`)  
*Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X.*
- void `gl_draw_image` (const `uchar` \*, int x, int y, int w, int h, int d=3, int ld=0)
- void `gl_finish` ()  
*Releases an OpenGL context.*
- void `gl_font` (int fontid, int size)  
*Sets the current OpenGL font to the same font as calling `fl_font()`.*
- int `gl_height` ()  
*Returns the current font's height.*
- void `gl_measure` (const char \*, int &x, int &y)  
*Measure how wide and tall the string will be when drawn by the `gl_draw()` function.*
- void `gl_rect` (int x, int y, int w, int h)  
*Outlines the given rectangle with the current color.*
- void `gl_rectf` (int x, int y, int w, int h)  
*Fills the given rectangle with the current color.*
- void `gl_start` ()  
*Creates an OpenGL context.*
- int `gl_texture_pile_height` ()  
*Returns the current maximum height of the pile of pre-computed string textures.*
- void `gl_texture_pile_height` (int max)  
*Changes the maximum height of the pile of pre-computed string textures.*
- void `gl_texture_reset` ()  
*To call after GL operations that may invalidate textures used to draw text in GL scenes (e.g., switch between `FL_↔DOUBLE` / `FL_SINGLE` modes).*
- double `gl_width` (const char \*)  
*Returns the width of the string in the current font.*
- double `gl_width` (const char \*, int n)  
*Returns the width of n characters of the string in the current font.*
- double `gl_width` (`uchar`)  
*Returns the width of the character in the current font.*

### 14.196.1 Detailed Description

This file defines wrapper functions for OpenGL in FLTK.

To use OpenGL from within an FLTK application you MUST use `gl_visual()` to select the default visual before doing `show()` on any windows. Mesa will crash if you try to use a visual not returned by `glxChooseVisual`.

Historically, this did not always work well with `FL_Double_Window`'s! It can try to draw into the front buffer. Depending on the system this might either crash or do nothing (when pixmaps are being used as back buffer and GL is being done by hardware), work correctly (when GL is done with software, such as Mesa), or draw into the front buffer and be erased when the buffers are swapped (when double buffer hardware is being used)

### 14.196.2 Function Documentation

#### 14.196.2.1 `gl_color()`

```
void gl_color (
 Fl_Color i)
```

Sets the current OpenGL color to an FLTK color.

For color-index modes it will use `fl_xpixel(c)`, which is only right if the window uses the default colormap!

**14.196.2.2 gl\_draw()** [1/7]

```
void gl_draw (
 const char * str)
```

Draws a nul-terminated string in the current font at the current position.

See also

`gl_texture_pile_height(int)`

**14.196.2.3 gl\_draw()** [2/7]

```
void gl_draw (
 const char * str,
 float x,
 float y)
```

Draws a nul-terminated string in the current font at the given position.

See also

`gl_texture_pile_height(int)`

**14.196.2.4 gl\_draw()** [3/7]

```
void gl_draw (
 const char * str,
 int n)
```

Draws an array of n characters of the string in the current font at the current position.

See also

`gl_texture_pile_height(int)`

**14.196.2.5 gl\_draw()** [4/7]

```
void gl_draw (
 const char * str,
 int n,
 float x,
 float y)
```

Draws n characters of the string in the current font at the given position.

See also

`gl_texture_pile_height(int)`

**14.196.2.6 gl\_draw()** [5/7]

```
void gl_draw (
 const char * str,
 int n,
 int x,
 int y)
```

Draws n characters of the string in the current font at the given position.

See also

`gl_texture_pile_height(int)`

**14.196.2.7 gl\_draw()** [6/7]

```
void gl_draw (
 const char * str,
 int x,
 int y)
```

Draws a nul-terminated string in the current font at the given position.

See also

[gl\\_texture\\_pile\\_height\(int\)](#)

**14.196.2.8 gl\_draw()** [7/7]

```
void gl_draw (
 const char * str,
 int x,
 int y,
 int w,
 int h,
 Fl_Align align)
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X. and aligned with the edges or center. Exactly the same output as [fl\\_draw\(\)](#).

**14.196.2.9 gl\_font()**

```
void gl_font (
 int fontid,
 int size)
```

Sets the current OpenGL font to the same font as calling [fl\\_font\(\)](#).

See also

[Fl::draw\\_GL\\_text\\_with\\_textures\(int val\)](#)

**14.196.2.10 gl\_rect()**

```
void gl_rect (
 int x,
 int y,
 int w,
 int h)
```

Outlines the given rectangle with the current color.

If [Fl\\_Gl\\_Window::ortho\(\)](#) has been called, then the rectangle will exactly fill the given pixel rectangle.

**14.196.2.11 gl\_rectf()**

```
void gl_rectf (
 int x,
 int y,
 int w,
 int h)
```

Fills the given rectangle with the current color.

See also

[gl\\_rect\(int x, int y, int w, int h\)](#)

**14.196.2.12 gl\_texture\_pile\_height() [1/2]**

```
int gl_texture_pile_height (
 void)
```

Returns the current maximum height of the pile of pre-computed string textures.  
The default value is 100

See also

[Fl::draw\\_GL\\_text\\_with\\_textures\(int\)](#)

**14.196.2.13 gl\_texture\_pile\_height() [2/2]**

```
void gl_texture_pile_height (
 int max)
```

Changes the maximum height of the pile of pre-computed string textures.  
Strings that are often re-displayed can be processed much faster if this pile is set high enough to hold all of them.

Parameters

<i>max</i>	Maximum height of the texture pile
------------	------------------------------------

See also

[Fl::draw\\_GL\\_text\\_with\\_textures\(int\)](#)

**14.197 gl.h**

## 14.202 mac.H File Reference

Mac OS X-specific symbols.

### Classes

- class [Fl\\_Mac\\_App\\_Menu](#)

### Functions

- [Fl\\_Window](#) \* [fl\\_mac\\_find](#) (FLWindow \*)  
*Returns the [Fl\\_Window](#) corresponding to the given macOS-specific window reference.*
- CGContextRef [fl\\_mac\\_gc](#) ()  
*Returns the macOS-specific graphics context for the current window.*
- void [fl\\_mac\\_set\\_about](#) ([Fl\\_Callback](#) \*cb, void \*user\_data, int shortcut=0)  
*Attaches a callback to the "About myprog" item of the system application menu.*
- FLWindow \* [fl\\_mac\\_xid](#) (const [Fl\\_Window](#) \*win)  
*Returns the macOS-specific window reference corresponding to the given [Fl\\_Window](#) object.*

### Variables

- int [fl\\_mac\\_os\\_version](#)  
*The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).*

### 14.202.1 Detailed Description

Mac OS X-specific symbols.

## 14.205 names.h File Reference

This file defines arrays of human readable names for FLTK symbolic constants.

```

#include <FL/Fl.H>
#include <string>
#include <map>

```

### Functions

- `std::string fl_callback_reason_str` (int reason)  
*Return the C++ symbol of an Fl\_Callback\_Reason as a string.*
- `std::string fl_eventname_str` (int event)  
*Return the C++ symbol of an Fl\_Event as a string.*
- `std::string fl_fontname_str` (int font)  
*Return the C++ symbol of an Fl\_Font as a string.*

### Variables

- `const char *const fl_callback_reason_names` []  
*This is an array of callback reason names you can use to convert callback reasons into names.*
- `const char *const fl_fontnames` []  
*This is an array of font names you can use to convert font numbers into names.*

### 14.205.1 Detailed Description

This file defines arrays of human readable names for FLTK symbolic constants.

## 14.208 platform\_types.h File Reference

Definitions of platform-dependent types.

### Macros

- **#define FL\_COMMAND** opaque  
*An alias for FL\_CTRL on Windows and X11, or FL\_META on MacOS X.*
- **#define FL\_CONTROL** opaque  
*An alias for FL\_META on Windows and X11, or FL\_CTRL on MacOS X.*

### Typedefs

- typedef opaque [fl\\_intptr\\_t](#)  
*An integral type large enough to store a pointer or a long value.*
- typedef opaque [Fl\\_Offscreen](#)  
*Platform-specific value representing an offscreen drawing buffer.*
- typedef struct opaque \* [Fl\\_Region](#)  
*Pointer to a platform-specific structure representing a collection of rectangles.*
- typedef opaque **FL\_SOCKET**  
*socket or file descriptor*
- typedef opaque [Fl\\_Timestamp](#)  
*Platform-specific point in time, used for delta time calculation.*
- typedef opaque [fl\\_uintptr\\_t](#)  
*An unsigned integral type large enough to store a pointer or an unsigned long value.*
- typedef struct opaque \* [GLContext](#)  
*Pointer to a platform-specific structure representing the window's OpenGL rendering context.*

### 14.208.1 Detailed Description

Definitions of platform-dependent types.

The exact nature of these types varies with the platform. Therefore, portable FLTK applications should not assume these types have a specific size, or that they are pointers.

### 14.208.2 Typedef Documentation

#### 14.208.2.1 fl\_intptr\_t

```
typedef opaque fl_intptr_t
```

An integral type large enough to store a pointer or a long value.

A pointer value can be safely cast to fl\_intptr\_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl\_intptr\_t can also store a long int value.

#### 14.208.2.2 Fl\_Offscreen

```
typedef opaque Fl_Offscreen
```

Platform-specific value representing an offscreen drawing buffer.

##### Note

This value can be safely cast to these types on each platform:

- X11: Pixmap
- Wayland: cairo\_t \*
- Windows: HBITMAP
- macOS: CGContextRef

#### 14.208.2.3 Fl\_Region

```
typedef struct opaque* Fl_Region
```

Pointer to a platform-specific structure representing a collection of rectangles.

##### Note

This pointer can be safely cast to these types on each platform:

- X11: Region as defined by X11
- Wayland: cairo\_region\_t \*
- Windows: HRGN
- macOS: struct flCocoaRegion \*

#### 14.208.2.4 Fl\_Timestamp

```
typedef opaque Fl_Timestamp
```

Platform-specific point in time, used for delta time calculation.

##### Note

This type may be a struct. sizeof(Fl\_Timestamp) may be different on different platforms. Fl\_Timestamp may change with future ABI changes.

#### 14.208.2.5 fl\_uintptr\_t

```
typedef opaque fl_uintptr_t
```

An unsigned integral type large enough to store a pointer or an unsigned long value.

A pointer value can be safely cast to fl\_uintptr\_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl\_uintptr\_t can also store an unsigned long int value.

### 14.208.2.6 GLContext

```
typedef struct opaque* GLContext
```

Pointer to a platform-specific structure representing the window's OpenGL rendering context.

#### Note

This pointer can be safely cast to these types on each platform:

- X11: GLXContext
- Wayland: EGLContext
- Windows: HGLRC
- macOS: NSOpenGLContext \*

## 14.211 wayland.H File Reference

Definitions of functions specific to the Wayland platform.

### Typedefs

- typedef struct \_cairo **cairo\_t**
- typedef void \* **EGLContext**

### Functions

- int **fl\_wl\_buffer\_scale** ([Fl\\_Window](#) \*window)  
*Returns the current buffer scaling factor for window.*
- struct wl\_compositor \* **fl\_wl\_compositor** ()  
*Returns the wl\_compositor of the current Wayland session.*
- struct wl\_display \* **fl\_wl\_display** ()  
*Returns the Wayland display in use.*
- [Fl\\_Window](#) \* **fl\_wl\_find** (struct wld\_window \*)  
*Returns the [Fl\\_Window](#) corresponding to a given the platform-specific window reference.*
- cairo\_t \* **fl\_wl\_gc** ()  
*Returns the cairo context associated to the current window or [Fl\\_Image\\_Surface](#).*
- EGLContext **fl\_wl\_glcontext** ([GLContext](#) rc)  
*Returns the EGLContext corresponding to the given GLContext.*
- struct wl\_surface \* **fl\_wl\_surface** (struct wld\_window \*xid)  
*Returns the wl\_surface associated to a shown window.*
- struct wld\_window \* **fl\_wl\_xid** (const [Fl\\_Window](#) \*win)  
*Returns a platform-specific reference associated to a shown window.*

### 14.211.1 Detailed Description

Definitions of functions specific to the Wayland platform.

## 14.211.2 Function Documentation

### 14.211.2.1 fl\_wl\_compositor()

struct wl\_compositor \* fl\_wl\_compositor ( ) [extern]

Returns the wl\_compositor of the current Wayland session.

This allows, for example, to create a wl\_surface with

```
struct wl_surface *my_wl_surface = wl_compositor_create_surface(fl_wl_compositor());
```

### 14.211.2.2 fl\_wl\_gc()

cairo\_t \* fl\_wl\_gc ( ) [extern]

Returns the cairo context associated to the current window or [Fl\\_Image\\_Surface](#).

Usable both when the Wayland/X11 hybrid FLTK library runs as a Wayland client and when it runs as an X11 client.

## 14.212 wayland.H

## 14.217 x11.H File Reference

Definitions of functions specific to the X11 platform.

### Functions

- `cairo_t * fl_cairo_gc ()`  
Returns the Cairo-specific currently active graphics context (*FLTK\_GRAPHICS\_CAIRO=On*)
- `Display * fl_x11_display ()`  
Returns the X11 Display in use.
- `Fl_Window * fl_x11_find (Window xid)`  
Returns the *Fl\_Window* corresponding to the given Window reference.
- `GC fl_x11_gc ()`  
Returns the X11-specific currently active graphics context.
- `void fl_x11_use_display (Display *d)`  
Have FLTK use a pre-established X11 connection.
- `Window fl_x11_xid (const Fl_Window *win)`  
Returns the Window reference for the given *Fl\_Window*, or zero if not shown().

### 14.217.1 Detailed Description

Definitions of functions specific to the X11 platform.

### 14.217.2 Function Documentation

#### 14.217.2.1 fl\_x11\_find()

```

Fl_Window * fl_x11_find (
 Window xid) [extern]

```

Returns the *Fl\_Window* corresponding to the given Window reference.

#### 14.217.2.2 fl\_x11\_gc()

```

GC fl_x11_gc () [extern]

```

Returns the X11-specific currently active graphics context.

**14.217.2.3 fl\_x11\_use\_display()**

```
void fl_x11_use_display (
 Display * d) [extern]
```

Have FLTK use a pre-established X11 connection.

This function must be called before FLTK attempts to open its own X11 connection, that is, as long as [fl\\_x11\\_display\(\)](#) returns NULL.

**Parameters**

<i>d</i>	the X11 Display* value representing a valid, pre-established X11 connection
----------	-----------------------------------------------------------------------------

**14.217.2.4 fl\_x11\_xid()**

```
Window fl_x11_xid (
 const Fl_Window * win) [extern]
```

Returns the Window reference for the given [Fl\\_Window](#), or zero if not shown().

**14.218 x11.H**

[Go to the documentation of this file.](#)

## 14.221 Fl.cxx File Reference

Implementation of the member functions of class [Fl](#).

```
#include "Fl_Private.H"
#include <FL/platform.H>
#include "Fl_Screen_Driver.H"
#include "Fl_Window_Driver.H"
#include "Fl_System_Driver.H"
#include "Fl_Timeout.h"
#include <FL/Fl_Window.H>
#include <FL/Fl_Tooltip.H>
#include <FL/fl_draw.H>
#include <stdlib.h>
#include "flstring.h"
```

### Macros

- `#define FOREVER 1e20`

### Functions

- `bool fl_clipboard_notify_empty` (void)
- `void fl_close_display` ()  
*Closes the connection to the windowing system when that's possible.*
- `const char * fl_filename_name` (const char \*name)  
*Gets the file name from a path.*
- `Fl_Window * fl_find` (Window xid)  
*Returns the [Fl\\_Window](#) that corresponds to the given window reference, or `NULL` if not found.*
- `void fl_fix_focus` ()
- `void fl_open_callback` (void(\*cb)(const char \*))  
*Register a function called for each file dropped onto an application icon.*
- `void fl_open_display` ()  
*Opens the display.*
- `int fl_send_system_handlers` (void \*e)
- `void fl_throw_focus` ([Fl\\_Widget](#) \*o)
- `void fl_trigger_clipboard_notify` (int source)
- `Window fl_xid_` (const [Fl\\_Window](#) \*w)

### Variables

- `bool fl_disable_wayland` = true  
*Prevent the FLTK library from using its Wayland backend and force it to use its X11 backend.*
- `const char * fl_local_alt` = `Fl::system_driver()->alt_name()`

- string pointer used in shortcuts, you can change it to another language*
- `const char * fl_local_ctrl = Fl::system_driver()->control_name()`  
*string pointer used in shortcuts, you can change it to another language*
- `int(* fl_local_grab )(int)`
- `const char * fl_local_meta = Fl::system_driver()->meta_name()`  
*string pointer used in shortcuts, you can change it to another language*
- `const char * fl_local_shift = Fl::system_driver()->shift_name()`  
*string pointer used in shortcuts, you can change it to another language*
- `Fl_Widget * fl_oldfocus`
- `Fl_Widget * fl_selection_requestor`

### 14.221.1 Detailed Description

Implementation of the member functions of class `Fl`.

### 14.221.2 Function Documentation

#### 14.221.2.1 fl\_close\_display()

```
void fl_close_display ()
```

Closes the connection to the windowing system when that's possible.

You do *not* need to call this to exit, and in fact it is faster to not do so. It may be useful to call this if you want your program to continue without a GUI. You cannot open the display again, and cannot call any FLTK functions.

Note

Requires `#include <FL/platform.H>`

#### 14.221.2.2 fl\_find()

```
Fl_Window * fl_find (
 Window xid)
```

Returns the `Fl_Window` that corresponds to the given window reference, or `NULL` if not found.

**Deprecated** Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use `fl_x11_find(Window)`, `fl_wl_find(struct wld_window*)`, `fl_win32_find(HWND)` or `fl_mac_find(FLWindow*)` with FLTK 1.4.0 and above.

#### 14.221.2.3 fl\_open\_display()

```
void fl_open_display ()
```

Opens the display.

Automatically called by the library when the first window is `show()`'n. Does nothing if the display is already open.

Note

Requires `#include <FL/platform.H>`

### 14.221.3 Variable Documentation

#### 14.221.3.1 fl\_disable\_wayland

```
bool fl_disable_wayland = true
```

Prevent the FLTK library from using its Wayland backend and force it to use its X11 backend.

Put this declaration somewhere in your source code outside the body of any function:

```
FL_EXPORT bool fl_disable_wayland = true;
```

This declaration makes sure that source code developed for FLTK 1.3, including X11-specific code, will build and run with FLTK 1.4 and its Wayland platform with a single line source code level change. This declaration has no effect on non-Wayland platforms. Don't add this declaration if you want the Wayland backend to be used when it's available.

**Note**

Please see also chapter 2.1 of README.Wayland.txt for further information on how to build your application to ensure that this declaration is effective.

**Since**

1.4.0

## 14.222 fl\_arc.cxx File Reference

Utility functions for drawing arcs and circles.

```
#include <FL/fl_draw.H>
```

```
#include <FL/math.h>
```

### 14.222.1 Detailed Description

Utility functions for drawing arcs and circles.

## 14.223 fl\_ask.cxx File Reference

Utility functions for common dialogs.

```
#include <FL/Fl.H>
```

```
#include <FL/Fl_Box.H>
```

```
#include <FL/Fl_Input_.H>
```

```
#include "flstring.h"
```

```
#include "Fl_Screen_Driver.H"
```

```
#include <FL/fl_ask.H>
```

```
#include "Fl_Message.h"
```

```
#include <stdio.h>
```

```
#include <stdarg.h>
```

**Functions**

- void [fl\\_alert](#) (const char \*fmt,...)  
*Shows an alert message dialog box.*
- void [fl\\_beep](#) (int type)  
*Emits a system beep.*
- int [fl\\_choice](#) (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)  
*Shows a dialog displaying the printf style *fmt* message.*
- int [fl\\_choice\\_n](#) (const char \*fmt, const char \*b0, const char \*b1, const char \*b2,...)  
*Shows a dialog displaying the printf style *fmt* message.*
- const char \* [fl\\_input](#) (const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- const char \* [fl\\_input](#) (int maxchar, const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl\\_input\\_str](#) (int &ret, int maxchar, const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl\\_input\\_str](#) (int maxchar, const char \*fmt, const char \*defstr,...)  
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- void [fl\\_message](#) (const char \*fmt,...)  
*Shows an information message dialog box.*
- int [fl\\_message\\_hotspot](#) ()

- Gets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.*
- void `fl_message_hotspot` (int enable)

*Sets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.*
- `Fl_Widget * fl_message_icon` ()

*Gets the `Fl_Box` icon container of the current default dialog used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_icon_label` (const char \*str)

*Sets the icon label of the dialog window used in many common dialogs.*
- void `fl_message_position` (const int x, const int y, const int center)

*Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_position` (`Fl_Widget *widget`)

*Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- int `fl_message_position` (int \*x, int \*y)

*Gets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.*
- void `fl_message_title` (const char \*title)

*Sets the title of the dialog window used in many common dialogs.*
- void `fl_message_title_default` (const char \*title)

*Sets the default title of the dialog window used in many common dialogs.*
- const char \* `fl_password` (const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- const char \* `fl_password` (int maxchar, const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- std::string `fl_password_str` (int &ret, int maxchar, const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*
- std::string `fl_password_str` (int maxchar, const char \*fmt, const char \*defstr,...)

*Shows an input dialog displaying the `fmt` message with variable arguments.*

## Variables

- const char \* `fl_cancel` = "Cancel"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_close` = "Close"

*string pointer used in common dialogs, you can change it to another language*
- `Fl_Font fl_message_font_` = `FL_HELVETICA`
- `Fl_Fontsize fl_message_size_` = -1
- const char \* `fl_no` = "No"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_ok` = "OK"

*string pointer used in common dialogs, you can change it to another language*
- const char \* `fl_yes` = "Yes"

*string pointer used in common dialogs, you can change it to another language*

### 14.223.1 Detailed Description

Utility functions for common dialogs.

This file defines the functions

- [fl\\_alert\(\)](#)
- [fl\\_beep\(\)](#)
- [fl\\_message\(\)](#)
- [fl\\_ask\(\)](#) // deprecated since 1.1.7 (2006), see comment in [FL/fl\\_ask.H](#)
- [fl\\_choice\(\)](#)
- [fl\\_input\(\)](#)
- [fl\\_input\\_str\(\)](#)
- [fl\\_password\(\)](#)
- [fl\\_password\\_str\(\)](#)

and some more functions to change their behavior (positioning, window title, and more).

Since FLTK 1.4.0 a big part of these functions is implemented in class `Fl_Message`.

## 14.224 fl\_boxtype.cxx File Reference

Drawing code for common box types.

```
#include "src/Fl_Private.H"
#include <FL/Fl_Widget.H>
#include <FL/fl_draw.H>
#include <config.h>
```

### Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`
- `#define fl_border_box fl_rectbound`

*allow consistent naming*

### Typedefs

- `typedef struct BOXTABLE boxtable_t`

### Functions

- `void fl_border_frame (int x, int y, int w, int h, Fl\_Color c)`  
*Draws a frame of type FL\_BORDER\_FRAME.*
- `void fl_diamond_down_box (int x, int y, int w, int h, Fl\_Color bgcolor)`
- `void fl_diamond_focus (Fl\_Boxtype, int, int, int, int, Fl\_Color, Fl\_Color)`
- `void fl_diamond_up_box (int x, int y, int w, int h, Fl\_Color bgcolor)`
- `void fl_down_box (int x, int y, int w, int h, Fl\_Color c)`  
*Draws a box of type FL\_DOWN\_BOX.*
- `void fl_down_frame (int x, int y, int w, int h, Fl\_Color)`  
*Draws a frame of type FL\_DOWN\_FRAME.*
- `void fl_draw_box (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c)`  
*Draws a box using given type, position, size and color.*
- `void fl_draw_box_focus (Fl\_Boxtype bt, int x, int y, int w, int h, Fl\_Color fg, Fl\_Color bg)`

*Draws the focus rectangle inside a box using given type, position, size and color.*

- void **fl\_embossed\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_EMBOSSED\_BOX.*

- void **fl\_embossed\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_EMBOSSED\_FRAME.*

- void **fl\_engraved\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_ENGRAVED\_BOX.*

- void **fl\_engraved\_frame** (int x, int y, int w, int h, [FI\\_Color](#))

*Draws a frame of type FL\_ENGRAVED\_FRAME.*

- void **fl\_flat\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

*Draws a box of type FL\_FLAT\_BOX.*

- void **fl\_frame** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*

- void **fl\_frame2** (const char \*s, int x, int y, int w, int h)

*Draws a series of line segments around the given box.*

- void **fl\_gleam\_down\_box** (int x, int y, int w, int h, [FI\\_Color](#) c)

  - Draws a frame of type FL\_UP\_FRAME.*

### 14.224.1 Detailed Description

Drawing code for common box types.

### 14.224.2 Function Documentation

#### 14.224.2.1 fl\_rectbound()

```
void fl_rectbound (
 int x,
 int y,
 int w,
 int h,
 FL_Color bgcolor)
```

Draws a bounded rectangle with a given position, size and color.  
Equivalent to drawing a box of type FL\_BORDER\_BOX.

## 14.226 fl\_color.cxx File Reference

Color handling.

```

#include <FL/Fl.H>
#include <FL/Fl_Device.H>
#include <FL/Fl_Graphics_Driver.H>
#include "fl_cmap.h"

```

### Functions

- [FL\\_Color fl\\_color\\_average](#) ([FL\\_Color](#) color1, [FL\\_Color](#) color2, float weight)  
*Returns the weighted average color between the two given colors.*
- [FL\\_Color fl\\_inactive](#) ([FL\\_Color](#) c)  
*Returns the inactive, dimmed version of the given color.*

### Variables

- unsigned [fl\\_cmap](#) [256]

### 14.226.1 Detailed Description

Color handling.

### 14.226.2 Variable Documentation

#### 14.226.2.1 fl\_cmap

```
unsigned fl_cmap[256]
```

**Initial value:**

```

= {
}

```

## 14.227 Fl\_compose.cxx File Reference

Utility functions to support text input.

```

#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"

```

### 14.227.1 Detailed Description

Utility functions to support text input.

## 14.228 fl\_contrast.cxx File Reference

Color contrast handling.

```

#include <FL/Fl.H>
#include <math.h>

```

## Macros

- `#define DEBUG_CONTRAST_LEGACY 0`

## Functions

- `FL_Color fl_contrast (FL_Color fg, FL_Color bg, int context, int size)`  
*Returns a color that contrasts with the background color.*
- `void fl_contrast_function (FL_Contrast_Function *f)`  
*Register a custom contrast function.*
- `int fl_contrast_level ()`  
*Get the contrast level (sensitivity) of the **fl\_contrast()** method.*
- `void fl_contrast_level (int level)`  
*Set the contrast level (sensitivity) of the **fl\_contrast()** method.*
- `int fl_contrast_mode ()`  
*Return the current contrast algorithm (mode).*
- `void fl_contrast_mode (int mode)`  
*Set the contrast algorithm (mode).*
- `double fl_lightness (FL_Color color)`  
*Return the perceived lightness of a color.*
- `double fl_luminance (FL_Color color)`  
*Return the raw / physical luminance of a color.*
- `unsigned get_color (FL_Color i)`

## Variables

- `unsigned fl_cmap [256]`

### 14.228.1 Detailed Description

Color contrast handling.

Implementation of `fl_contrast()` and its variants.

## 14.229 fl\_curve.cxx File Reference

Utility for drawing Bézier curves, adding the points to the current `fl_begin/fl_vertex/fl_end` path.

```
#include <FL/fl_draw.H>
#include <math.h>
```

### 14.229.1 Detailed Description

Utility for drawing Bézier curves, adding the points to the current `fl_begin/fl_vertex/fl_end` path.

Incremental math implementation: I very much doubt this is optimal! From Foley/vanDam page 511. If anybody has a better algorithm, please send it!

## 14.230 FL\_Double\_Window.cxx File Reference

`FL_Double_Window` implementation.

```
#include <FL/Fl.H>
#include <FL/platform.H>
#include <FL/Fl_Double_Window.H>
#include <FL/fl_draw.H>
#include "Fl_Window_Driver.H"
```

### 14.230.1 Detailed Description

[Fl\\_Double\\_Window](#) implementation.

## 14.231 Fl\_get\_system\_colors.cxx File Reference

System color support.

```
#include <FL/Fl.H>
#include "Fl_Screen_Driver.H"
#include "Fl_System_Driver.H"
#include <FL/fl_draw.H>
#include <FL/platform.H>
#include <FL/math.h>
#include <FL/fl_utf8.h>
#include <FL/fl_string_functions.h>
#include "flstring.h"
#include <stdio.h>
#include <stdlib.h>
#include <FL/Fl_Pixmap.H>
#include <FL/Fl_Tiled_Image.H>
#include "tile.xpm"
```

### Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`

### Functions

- void **fl\_down\_box** (int, int, int, int, [Fl\\_Color](#))  
*Draws a box of type FL\_DOWN\_BOX.*
- void **fl\_down\_frame** (int, int, int, int, [Fl\\_Color](#))  
*Draws a frame of type FL\_DOWN\_FRAME.*
- int **fl\_parse\_color** (const char \*p, [uchar](#) &r, [uchar](#) &g, [uchar](#) &b)  
*Parse a string containing a description of a color and write r, g, and b.*
- void **fl\_round\_down\_box** (int, int, int, int, [Fl\\_Color](#))
- void **fl\_round\_focus** ([Fl\\_Boxtype](#), int, int, int, int, [Fl\\_Color](#), [Fl\\_Color](#))
- void **fl\_round\_up\_box** (int, int, int, int, [Fl\\_Color](#))
- void **fl\_thin\_down\_box** (int, int, int, int, [Fl\\_Color](#))  
*Draws a box of type FL\_THIN\_DOWN\_BOX.*
- void **fl\_thin\_down\_frame** (int, int, int, int, [Fl\\_Color](#))  
*Draws a frame of type FL\_THIN\_DOWN\_FRAME.*
- void **fl\_thin\_up\_box** (int, int, int, int, [Fl\\_Color](#))  
*Draws a box of type FL\_THIN\_UP\_BOX.*
- void **fl\_thin\_up\_frame** (int, int, int, int, [Fl\\_Color](#))  
*Draws a frame of type FL\_THIN\_UP\_FRAME.*
- void **fl\_up\_box** (int, int, int, int, [Fl\\_Color](#))  
*Draws a box of type FL\_UP\_BOX.*
- void **fl\_up\_frame** (int, int, int, int, [Fl\\_Color](#))  
*Draws a frame of type FL\_UP\_FRAME.*

### Variables

- const char \* **fl\_bg** = NULL
- const char \* **fl\_bg2** = NULL
- const char \* **fl\_fg** = NULL

### 14.231.1 Detailed Description

System color support.

### 14.231.2 Function Documentation

#### 14.231.2.1 fl\_parse\_color()

```
int fl_parse_color (
 const char * p,
 uchar & r,
 uchar & g,
 uchar & b)
```

Parse a string containing a description of a color and write r, g, and b.

This call is used by the Pixmap file format interpreter and by the command line arguments parser to set UI colors. RGB color triplets usually start with a '#' character, but it can be omitted if it does not conflict with the later rules. Color components are defined in hexadecimal notation with 1, 2, 3, or four hex digits per component, making color triplets 3, 6, 9, or 12 characters long. The interpreter is case insensitive. Valid code examples include "FF0000" for red, "#0F0" for green, and "000000004444" for a dark blue.

On the X11 platform, color values can also be given a color name like "red". The list of accepted color names is provided by the X11 server.

If none of the color interpretations work, `fl_parse_color` returns 0. The Pixmap reader interprets those as transparent, and are usually written as "None", "#transparent", or "bg".

#### Parameters

in	<i>p</i>	a C-string describing the color
out	<i>r,g,b</i>	the color components in the 0...255 range

#### Returns

0 if the color cannot be interpreted, 1 otherwise

## 14.232 Fl\_Gl\_Choice.H

```
00001 //
00002 // OpenGL definitions for the Fast Light Tool Kit (FLTK).

00014 // https://www.fltk.org/bugs.php
00015 //
00016 //
00017 // Internal interface to set up OpenGL.
00018 //
00019 // A "Fl_Gl_Choice" is created from an OpenGL mode and holds information
00020 // necessary to create a window (on X) and to create an OpenGL "context"
00021 // (on both X and Win32).
00022 //
00023 // create_gl_context takes a window (necessary only on Win32) and an
00024 // Fl_Gl_Choice and returns a new OpenGL context. All contexts share
00025 // display lists with each other.
00026 //
00027 // On X another create_gl_context is provided to create it for any
00028 // X visual.
00029 //
00030 // set_gl_context makes the given OpenGL context current and makes
00031 // it draw into the passed window. It tracks the current one context
00032 // to avoid calling the context switching code when the same context
00033 // is used, though it is a mystery to me why the GLX/WGL libraries
00034 // don't do this themselves...
00035 //
```

```

00036 // delete_gl_context destroys the context.
00037 //
00038 // This code is used by Fl_Gl_Window, gl_start(), and gl_visual()
00039
00040 #ifndef Fl_Gl_Choice_H
00041 #define Fl_Gl_Choice_H
00042

## 14.234 FL\_Graphics\_Driver.cxx File Reference

Implementation of class FL\_Graphics\_Driver.

```

#include <config.h>
#include <FL/FL_Graphics_Driver.H>
#include "FL_Scalable_Graphics_Driver.H"

```

### Variables

- FL\_Graphics\_Driver \* **fl\_graphics\_driver**

*Points to the driver that currently receives all graphics requests.*

### 14.234.1 Detailed Description

Implementation of class FL\_Graphics\_Driver.

## 14.235 FL\_Grid.cxx File Reference

Implements the [FL\\_Grid](#) container widget.

```

#include <FL/FL_Grid.H>
#include <FL/fl_draw.H>

```

### 14.235.1 Detailed Description

Implements the [Fl\\_Grid](#) container widget.

Since

1.4.0

- void [fl\\_plastic\\_up\\_round](#) (int x, int y, int w, int h, [Fl\\_Color](#) c)
- [Fl\\_Color](#) [shade\\_color](#) ([uchar](#) gc, [Fl\\_Color](#) bc)

### 14.242.1 Detailed Description

Implementation of the 'plastic' scheme.

## 14.243 Fl\_Private.H File Reference

Fl::Private namespace.

```
#include <FL/fl_config.h>
#include <FL/Fl.H>
```

### Namespaces

- namespace [Fl](#)  
*[Fl](#) is the FLTK global namespace containing state information and global methods for the current application.*

### Functions

- [cairo\\_t](#) \* [Fl::Private::cairo\\_make\\_current](#) (void \*gc, int W, int H)  
*Creates a Cairo context from a gc and the given size.*
- void [Fl::Private::run\\_checks](#) ()
- void [Fl::Private::run\\_idle](#) ()
- void [Fl::Private::set\\_idle](#)\_ ([Fl\\_Old\\_Idle\\_Handler](#) cb)  
*Sets an idle callback (internal use only).*

### Variables

- int [Fl::Private::box\\_border\\_radius\\_max](#)\_ = 15
  - int [Fl::Private::box\\_shadow\\_width](#)\_ = 3
  - [Fl\\_Cairo\\_State](#) [Fl::Private::cairo\\_state](#)\_
- current Cairo context information*

- int **Fl::Private::draw\_GL\_text\_with\_textures\_** = 1
- int **Fl::Private::e\_x\_down**
- int **Fl::Private::e\_y\_down**
- void(\* **Fl::Private::idle\_** )()
 

*The currently executing idle callback function: DO NOT USE THIS DIRECTLY!*
- unsigned char **Fl::Private::options\_** [**OPTION\_LAST**]
- unsigned char **Fl::Private::options\_read\_**
- int **Fl::Private::program\_should\_quit\_** = 0
- int **Fl::Private::selection\_to\_clipboard\_**
- int **Fl::Private::use\_high\_res\_GL\_** = 1

### 14.243.1 Detailed Description

Fl::Private namespace.

### 14.243.2 Function Documentation

#### 14.243.2.1 cairo\_make\_current()

```
cairo_t * Fl::Private::cairo_make_current (
 void * gc,
 int W,
 int H) [extern]
```

Creates a Cairo context from a gc and the given size.

#### Note

Only available if CMake FLTK\_OPTION\_CAIRO\_WINDOW is enabled.

#### 14.243.2.2 set\_idle\_()

```
void Fl::Private::set_idle_ (
 Fl_Old_Idle_Handler cb) [inline]
```

Sets an idle callback (internal use only).

This method is now private and is used to store the idle callback. The old, public set\_idle() method was deprecated since 1.3.x and is no longer available in FLTK 1.5.

See documentation: use [Fl::add\\_idle\(\)](#) instead.

### 14.243.3 Variable Documentation

#### 14.243.3.1 idle\_

```
void(* Fl::Private::idle_)() () [extern]
```

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!

This is now used as part of a higher level system allowing multiple idle callback functions to be called.

#### See also

[add\\_idle\(\)](#), [remove\\_idle\(\)](#)

00180 /* Member function read_win_rectangle() supports public functions
00181 fl_read_image() and fl_capture_window() which capture pixel data from
00182 a window (or also from an offscreen buffer with fl_read_image).
00183
00184 If 'may_capture_subwins' is true, an implementation may or may not capture
00185 also the content of subwindows embedded in 'win'. If subwindows were captured,
00186 *'did_capture_subwins' is returned set to true. If read_win_rectangle()
00187 is called with 'may_capture_subwins' set to true, 'did_capture_subwins' should
00188 be set before the call to the address of a boolean set to false.
00189 The implementation of this virtual function for the macOS platform has the
00190 capability of capturing subwindows when asked for.
00191
00192 A platform may also use its read_win_rectangle() implementation to capture
00193 window decorations (e.g., title bar). In that case, it is called by
00194 Fl_XXX_Window_Driver::capture_titlebar_and_borders().

[Fl\\_Timeout](#) handling.

```
#include <FL/Fl.H>
```

### Classes

- class [Fl\\_Timeout](#)

The internal class [Fl\\_Timeout](#) handles all timeout related functions.

### Macros

- #define FL\_TIMEOUT\_DEBUG 0

### 14.252.1 Detailed Description

[Fl\\_Timeout](#) handling.

This file contains implementations of:

- [Fl::add\\_timeout\(\)](#)

- [Fl::repeat\\_timeout\(\)](#)
- [Fl::has\\_timeout\(\)](#)
- [Fl::remove\\_timeout\(\)](#)
- [Fl::remove\\_next\\_timeout\(\)](#)

and related methods of class [Fl\\_Timeout](#).

## 14.253 Fl\_Timeout.h

*Write an RGB image to a JPEG image file.*

## 14.256.1 Detailed Description

JPEG image support functions.

## 14.256.2 Function Documentation

### 14.256.2.1 fl\_write\_jpeg() [1/3]

```
int fl_write_jpeg (
 const char * filename,
 const char * pixels,
 int w,
 int h,
 int d,
 int ld)
```

Write raw image data to a JPEG image file.

For further restrictions and return values please see [fl\\_write\\_jpeg\(const char \\*filename, FI\\_RGB\\_Image \\*img\)](#).

#### Parameters

in	<i>filename</i>	Output filename, extension should be '.jpg' or '.jpeg'
in	<i>pixels</i>	Image data
in	<i>w</i>	Image data width
in	<i>h</i>	Image data height
in	<i>d</i>	Image depth: 1 = GRAY, 2 = GRAY+alpha, 3 = RGB, 4 = RGBA
in	<i>ld</i>	Line delta: default (0) = w * d

#### Returns

success (0) or error code: negative values are errors

#### See also

[fl\\_write\\_jpeg\(const char \\*filename, FI\\_RGB\\_Image \\*img\)](#)

### 14.256.2.2 fl\_write\_jpeg() [2/3]

```
int fl_write_jpeg (
 const char * filename,
 const unsigned char * pixels,
 int w,
 int h,
```

```
int d,
int ld)
```

Write raw image data to a JPEG image file.

See also

[fl\\_write\\_jpeg\(const char \\*filename, const char \\*pixels, int w, int h, int d, int ld\)](#)

### 14.256.2.3 fl\_write\_jpeg() [3/3]

```
int fl_write_jpeg (
 const char * filename,
 Fl_RGB_Image * img)
```

Write an RGB image to a JPEG image file.

Create a JPEG image file from an RGB image ([Fl\\_RGB\\_Image](#)).

The image file is always written with the original image size `data_w()` and `data_h()`, even if the image has been scaled.

Image depth 1 (gray), 2 (gray + alpha), 3 (RGB), and 4 (RGBA) are supported. For images with alpha channel (depth 2 or 4), the alpha component is ignored and only the color data is written since JPEG does not support transparency.

Note

Error handling is limited to basic error detection: library availability and file opening errors.

#### Parameters

in	<i>filename</i>	Output filename, extension should be '.jpg' or '.jpeg'
in	<i>img</i>	RGB image to be written

#### Returns

success (0) or error code: negative values are errors

#### Return values

0	success, file has been written
-1	jpeg library not available
-2	file open error
-3	invalid image depth (must be 1, 2, 3, or 4)
-4	memory allocation error

- [fl\\_write\\_png](#) (const char \*filename, [FL\\_RGB\\_Image](#) \*img)  
*Write an RGB(A) image to a PNG image file.*

### 14.257.1 Detailed Description

PNG image support functions.

### 14.257.2 Function Documentation

#### 14.257.2.1 [fl\\_write\\_png\(\)](#) [1/3]

```
int fl_write_png (
 const char * filename,
 const char * pixels,
 int w,
 int h,
 int d,
 int ld)
```

Write raw image data to a PNG image file.

This is a very basic and restricted function to create a PNG image file from raw image data, e.g. a screenshot.

The image data must be aligned w/o gaps after each row (ld = 0 or ld = w \* d) or ld must be the total length of each row, i.e. w \* d + gapsize. If ld == 0 then ld = w \* d is assumed.

The total data size must be (w \* d + gapsize) \* h = ld' \* h where ld' = w \* d if ld == 0.

For further restrictions and return values please see [fl\\_write\\_png\(const char \\*filename, \[FL\\\_RGB\\\_Image\]\(#\) \\*img\)](#).

#### Parameters

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>pixels</i>	Image data
in	<i>w</i>	Image data width
in	<i>h</i>	Image data height
in	<i>d</i>	Image depth: 1 = GRAY, 2 = GRAY + alpha, 3 = RGB, 4 = RGBA
in	<i>ld</i>	Line delta: default (0) = w * d

#### Returns

success (0) or error code, see ...

#### See also

[fl\\_write\\_png\(const char \\*filename, \[FL\\\_RGB\\\_Image\]\(#\) \\*img\)](#)

#### 14.257.2.2 [fl\\_write\\_png\(\)](#) [2/3]

int fl_write_png (
 const char * filename,
 const unsigned char * pixels,
```

```

 int w,
 int h,
 int d,
 int ld)

```

Write raw image data to a PNG image file.

See also

[fl\\_write\\_png\(const char \\*filename, const char \\*pixels, int w, int h, int d, int ld\)](#)

### 14.257.2.3 fl\_write\_png() [3/3]

```

int fl_write_png (
 const char * filename,
 Fl_RGB_Image * img)

```

Write an RGB(A) image to a PNG image file.

This is a very basic and restricted function to create a PNG image file from an RGB image ([Fl\\_RGB\\_Image](#)).

The image data must be aligned w/o gaps, i.e. `ld()` **MUST** be zero or equal to `data_w() * data_h()`.

The image file is always written with the original image size `data_w()` and `data_h()`, even if the image has been scaled.

Image depth 1 (gray), 2 (gray + alpha channel), 3 (RGB) and 4 (RGBA) are supported.

Note

Currently there is no error handling except for errors when opening the file. This may be changed in the future.

#### Parameters

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>img</i>	RGB image to be written

#### Returns

success (0) or error code: negative values are errors

#### Return values

0	success, file has been written
-1	png or zlib library not available
-2	file open error

```

00001 #define mediamarrow_width 16
00002 #define mediamarrow_height 16
00003 static const unsigned char mediamarrow_bits[] = {
00004 0x40, 0x00, 0x60, 0x00, 0x70, 0x00, 0x78, 0x00, 0xfc, 0x3f, 0x78, 0x00,
00005 0x70, 0x00, 0x60, 0x02, 0x40, 0x06, 0x00, 0x0e, 0x00, 0x1e, 0xfc, 0x3f,
00006 0x00, 0x1e, 0x00, 0x0e, 0x00, 0x06, 0x00, 0x02};

```

## 14.262 numericssort.c File Reference

```

#include "flstring.h"
#include <stdlib.h>
#include <string.h>
#include <FL/platform_types.h>
#include <FL/filename.H>
#include <FL/fl_utf8.h>

```

## Functions

- `int fl_casumericsort` (struct dirent \*\*A, struct dirent \*\*B)  
*Compares directory entries alphanumerically (case-insensitive).*
- `int fl_numericsort` (struct dirent \*\*A, struct dirent \*\*B)  
*Compares directory entries alphanumerically (case-sensitive).*

## 14.262.1 Function Documentation

### 14.262.1.1 fl\_casumericsort()

```
int fl_casumericsort (
 struct dirent ** A,
 struct dirent ** B)
```

Compares directory entries alphanumerically (case-insensitive).

#### Note

This comparison is UTF-8 aware.

#### See also

[fl\\_numericsort\(\)](#)

### 14.262.1.2 fl\_numericsort()

```
int fl_numericsort (
 struct dirent ** A,
 struct dirent ** B)
```

Compares directory entries alphanumerically (case-sensitive).

Numbers are compared without sign, i.e. "-" is not taken as a sign of following numerical values. The following list of files would be in ascending order (examples are ASCII and numbers only for simplicity):

1. 1zzz.txt
2. 2xxx.txt
3. 19uuu.txt
4. 100aaa.txt
5. file1z.txt
6. file5a.txt
7. file5z.txt
8. file30z.txt
9. file200a.txt
10. temp+5.txt ('+' is lexically lower than '-')
11. temp-5.txt ('-' is not a sign)
12. temp-100.txt (100 is bigger than 5, no sign)

#### Parameters

in	<i>A</i>	first directory entry
in	<i>B</i>	second directory entry

**Returns**

comparison result (-1, 0, or +1)

**Return values**

-1	A < B
0	A == B
+1	A > B

**Note**

This comparison is UTF-8 aware.

**See also**

[fl\\_casenumercialsort\(\)](#)

## 14.267 vsnprintf.c File Reference

Portable vsnprintf() implementation.

```
#include <stdio.h>
```

```
#include "flstring.h"
```

### Functions

- `int fl_vsnprintf (char *str, size_t size, const char *fmt,...)`
- `int fl_vsnprintf (char *buffer, size_t bufsz, const char *format, va_list ap)`

*FLTK's platform independent wrapper for the vsnprintf() C library function.*

### 14.267.1 Detailed Description

Portable vsnprintf() implementation.

### 14.267.2 Function Documentation

#### 14.267.2.1 fl\_vsnprintf()

```

int fl_vsnprintf (
 char * buffer,
 size_t bufsz,
 const char * format,
 va_list ap)

```

FLTK's platform independent wrapper for the vsnprintf() C library function.

This function guarantees:

- access to vsnprintf(), even on systems that don't have it (FLTK's own built-in code is used)
- Guarantees NUL termination. Even if string expands larger than the buffer, a terminating NUL is included, unlike some implementations of vsnprintf(), notably Microsoft Visual Studio (pre-2015), which can leave the string unterminated when truncated.

If the build environment for FLTK has vsnprintf(), [fl\\_vsnprintf\(\)](#) is just a wrapper around the compiler's provided function. Otherwise, if the function is NOT available, FLTK's own built-in version is provided.

The FLTK built in provides these style options:

- `%[ -+#]`
- `*` – padding width
- `.*` – precision width
- Data types: `h`, `l`, `ll`, `L`
- Floating point formats: `E`, `G`, `e`, `f`, `g`
- Integer formats: `B`, `X`, `b`, `d`, `i`, `o`, `u`, `x`
- Pointer format: `p`
- String/char: `c`, `s`, `n`
