Reimplemented from [Fl\\_Window](#).

**13.49.3.12 handle()**

```
int Fl_Gl_Window::handle (
 int event) [override], [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Glut\\_Window](#).

**13.49.3.13 hide()**

```
void Fl_Gl_Window::hide () [override], [virtual]
```

Hides the window and destroys the OpenGL context.

Reimplemented from [Fl\\_Widget](#).

**13.49.3.14 make\_current()**

```
void Fl_Gl_Window::make_current ()
```

The [make\\_current\(\)](#) method selects the OpenGL context for the widget.

It is called automatically prior to the [draw\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

**13.49.3.15 make\_overlay\_current()**

```
void Fl_Gl_Window::make_overlay_current ()
```

Selects the OpenGL context for the widget's overlay.

This method is called automatically prior to the [draw\\_overlay\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

**13.49.3.16 mode() [1/3]**

```
Fl_Mode Fl_Gl_Window::mode () const [inline]
```

Returns the current OpenGL capabilities of the window.

Don't use this if capabilities were set through [Fl\\_Gl\\_Window::mode\(const int \\*a\)](#).

**13.49.3.17 mode() [2/3]**

```
int Fl_Gl_Window::mode (
 const int * a) [inline]
```

Set the OpenGL capabilities of the window using platform-specific data.

**Parameters**

<i>a</i>	zero-ending array of platform-specific attributes and attribute values
----------	------------------------------------------------------------------------

**Unix/Linux platform:** attributes are GLX attributes adequate for the 3rd argument of the [glXChooseVisual\(\)](#) function (e.g., [GLX\\_DOUBLEBUFFER](#), defined by including [<GL/glx.h>](#)).

**Note**

What attributes are adequate here is subject to change. The preferred, stable public API is [Fl\\_Gl\\_Window::mode\(int a\)](#).

**Windows platform:** this member function is of no use.

**Mac OS X platform:** attributes belong to the [CGLPixelFormatAttribute](#) enumeration (defined by including [<OpenGL/OpenGL.h>](#), e.g., [kCGLPFADoubleBuffer](#)) and may be followed by adequate attribute values.

**13.49.3.18 mode() [3/3]**

```
int Fl_Gl_Window::mode (
 int a) [inline]
```

Set or change the OpenGL capabilities of the window.

The value can be any of the following OR'd together:

- `FL_RGB` - RGB color (not indexed)
- `FL_RGB8` - RGB color with at least 8 bits of each color
- `FL_INDEX` - Indexed mode
- `FL_SINGLE` - not double buffered
- `FL_DOUBLE` - double buffered
- `FL_ACCUM` - accumulation buffer
- `FL_ALPHA` - alpha channel in color
- `FL_DEPTH` - any depth buffer (or set `FL_DEPTH32` for at least 32 bits)
- `FL_DEPTH32` - depth buffer with at least 32 bits
- `FL_STENCIL` - stencil buffer
- `FL_MULTISAMPLE` - multisample antialiasing
- `FL_OPENGL3` - use OpenGL version 3.0 or more.

`FL_RGB` and `FL_SINGLE` have a value of zero, so they are "on" unless you give `FL_INDEX` or `FL_DOUBLE`.

If the desired combination cannot be done, FLTK will try turning off `FL_MULTISAMPLE`. If this also fails the [show\(\)](#) will call [Fl::error\(\)](#) and not show the window.

You can change the mode while the window is displayed. This is most useful for turning double-buffering on and off. Under X this will cause the old X window to be destroyed and a new one to be created. If this is a top-level window this will unfortunately also cause the window to blink, raise to the top, and be de-iconized, and the `xid()` will change, possibly breaking other code. It is best to make the GL window a child of another window if you wish to do this! `mode()` must not be called within [draw\(\)](#) since it changes the current context.

The `FL_OPENGL3` flag is recommended to use OpenGL version 3 or more. This flag is required (not just recommended) if GL 3.0 is in use and at least one of these conditions applies:

- the program runs on the macOS platform;
- the [Fl\\_Gl\\_Window](#) has child widgets.

See more details in [Using OpenGL 3.0 \(or higher versions\)](#).

**Version**

the `FL_OPENGL3` flag appeared in version 1.3.4

**13.49.3.19 ortho()**

```
void Fl_Gl_Window::ortho ()
```

Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.

If you are drawing 2D images, your [draw\(\)](#) method may want to call this if [valid\(\)](#) is false.

**13.49.3.20 pixel\_h()**

```
int Fl_Gl_Window::pixel_h () [inline]
```

Gives the window height in OpenGL pixels.

When an [Fl\\_Gl\\_Window](#) is mapped to a HighDPI display, the value given by [Fl\\_Gl\\_Window::h\(\)](#) which is expressed in FLTK units, may differ from the window height in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use [pixel\\_h\(\)](#) rather than [h\(\)](#). Method [pixel\\_h\(\)](#) detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version

1.3.4

**13.49.3.21 pixel\_w()**

```
int Fl_Gl_Window::pixel_w () [inline]
```

Gives the window width in OpenGL pixels.

When an [Fl\\_Gl\\_Window](#) is mapped to a HighDPI display, the value given by [Fl\\_Gl\\_Window::w\(\)](#) which is expressed in FLTK units, may differ from the window width in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use [pixel\\_w\(\)](#) rather than [w\(\)](#). Method [pixel\\_w\(\)](#) detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version

1.3.4

**13.49.3.22 pixels\_per\_unit()**

```
float Fl_Gl_Window::pixels_per_unit ()
```

The number of pixels per FLTK unit of length for the window.

This method dynamically adjusts its value when the GUI is rescaled or when the window is moved to/from displays of distinct resolutions. This method is useful, e.g., to convert, in a window's [handle\(\)](#) method, the FLTK units returned by [Fl::event\\_x\(\)](#) and [Fl::event\\_y\(\)](#) to the pixel units used by the OpenGL source code.

Version

1.3.4

**13.49.3.23 redraw\_overlay()**

```
void Fl_Gl_Window::redraw_overlay ()
```

Causes [draw\\_overlay\(\)](#) to be called at a later time.

Initially the overlay is clear. If you want the window to display something in the overlay when it first appears, you must call this immediately after you [show\(\)](#) your window.

**13.49.3.24 resize()**

```
void Fl_Gl_Window::resize (
 int x,
 int y,
 int w,
 int h) [override], [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and size(W, H) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

## Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

## See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Widget](#).

**13.49.3.25 show()**

```
void Fl_Gl_Window::show () [override], [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL\_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL\_SHOW or FL\_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL\_SHOW or FL\_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

## See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

**13.49.3.26 swap\_buffers()**

```
void Fl_Gl_Window::swap_buffers ()
```

The [swap\\_buffers\(\)](#) method swaps the back and front buffers.

It is called automatically after the [draw\(\)](#) method is called.

**13.49.3.27 swap\_interval()** [1/2]

```
int Fl_Gl_Window::swap_interval () const
```

Gets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden [Fl\\_Gl\\_Window::draw\(\)](#) method that will be overridden by the user.

## Note

This method depends highly on the underlying OpenGL contexts and driver implementation. Some drivers return no information, most drivers don't support intervals with multiple frames and return only 0 or 1.

Some drivers have the ability to set the swap interval but no way to query it, hence this method may return -1 even though the interval was set correctly. Conversely a return value greater zero does not guarantee that the driver actually honors the setting.

## Returns

an integer greater zero if vertical blanking is taken into account when swapping OpenGL buffers

0 if the vertical blanking is ignored

-1 if the information can not be retrieved

**13.49.3.28 swap\_interval() [2/2]**

```
void Fl_Gl_Window::swap_interval (
 int frames)
```

Sets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden `Fl_Gl_Window::draw()` method that will be overridden by the user.

**Note**

This method depends highly on the underlying OpenGL contexts and driver implementation. Most driver seem to accept only 0 and 1 to swap buffer asynchronously or in sync with the vertical blank.

**Parameters**

in	<i>frames</i>	set the number of vertical frame blanks between OpenGL buffer swaps
----	---------------	---------------------------------------------------------------------

**13.49.3.29 valid()**

```
char Fl_Gl_Window::valid () const [inline]
```

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on *after* `draw()` is called.

You can use this inside your `draw()` method to avoid unnecessarily initializing the OpenGL context. Just do this:

```
void mywindow::draw() {
 if (!valid()) {
 glViewport(0,0,pixel_w(),pixel_h());
 glFrustum(...);
 ...other initialization...
 }
 if (!context_valid()) {
 ...load textures, etc. ...
 }
 ... draw your geometry here ...
}
```

You can turn `valid()` on by calling `valid(1)`. You should only do this after fixing the transformation inside a `draw()` or after `make_current()`. This is done automatically after `draw()` returns.

The documentation for this class was generated from the following files:

- Fl\_Gl\_Window.H
- Fl\_Gl\_Overlay.cxx
- Fl\_Gl\_Window.cxx

**13.50 Fl\_Glut\_Bitmap\_Font Struct Reference**

fltk glut font/size attributes used in the glutXXX functions

```
#include <glut.H>
```

**Public Attributes**

- [Fl\\_Font](#) font
- [Fl\\_Fontsize](#) size

**13.50.1 Detailed Description**

fltk glut font/size attributes used in the glutXXX functions

The documentation for this struct was generated from the following file:

- glut.H

## 13.55 FI\_Glut\_Window Class Reference

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in `glut_compatibility.cxx`):

```
#include <glut.H>
```

Inheritance diagram for FI\_Glut\_Window:

### Public Member Functions

- **Fl\_Glut\_Window** (int w, int h, const char \*t=0)  
*Creates a glut window, registers to the glut windows list.*
- **Fl\_Glut\_Window** (int x, int y, int w, int h, const char \*t=0)  
*Creates a glut window, registers to the glut windows list.*
- void **make\_current** ()
- ~**Fl\_Glut\_Window** ()  
*Destroys the glut window, first unregister it from the glut windows list.*

### Public Member Functions inherited from **Fl\_Gl\_Window**

- **Fl\_Gl\_Window** const \* **as\_gl\_window** () const *override*
- **Fl\_Gl\_Window** \* **as\_gl\_window** () *override*  
*Returns an **Fl\_Gl\_Window** pointer if this widget is an **Fl\_Gl\_Window**.*
- int **can\_do** () const  
*Returns non-zero if the hardware supports the current OpenGL mode.*
- int **can\_do\_overlay** ()  
*Returns true if the hardware overlay is possible.*
- **GLContext** **context** () const  
*Returns a pointer to the window's OpenGL rendering context.*
- void **context** (**GLContext**, int destroy\_flag=0)  
*Sets a pointer to the GLContext that this window is using.*
- char **context\_valid** () const  
*Will only be set if the OpenGL context is created or recreated.*
- void **context\_valid** (char v)  
*See char **Fl\_Gl\_Window::context\_valid()** const.*
- **Fl\_Gl\_Window** (int W, int H, const char \*l=0)  
*Creates a new **Fl\_Gl\_Window** widget using the given size, and label string.*
- **Fl\_Gl\_Window** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new **Fl\_Gl\_Window** widget using the given position, size, and label string.*
- void **flush** () *override*  
*Forces the window to be drawn, this window is also made current and calls **draw()**.*
- void **hide** () *override*  
*Hides the window and destroys the OpenGL context.*
- void **hide\_overlay** ()  
*Hides the window if it is not this window, does nothing in Windows.*
- void **invalidate** ()  
*The **invalidate()** method turns off **valid()** and is equivalent to calling **value(0)**.*
- void **make\_current** ()

- The `make_current()` method selects the OpenGL context for the widget.

  - void `make_overlay_current` ()
 

Selects the OpenGL context for the widget's overlay.
  - `Fl_Mode mode` () const
 

Returns the current OpenGL capabilities of the window.
  - int `mode` (const int \*a)
 

Set the OpenGL capabilities of the window using platform-specific data.
  - int `mode` (int a)
 

Set or change the OpenGL capabilities of the window.
  - void `ortho` ()
 

Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.
  - int `pixel_h` ()
 

Gives the window height in OpenGL pixels.
  - int `pixel_w` ()
 

Gives the window width in OpenGL pixels.
  - float `pixels_per_unit` ()
 

The number of pixels per FLTK unit of length for the window.
  - void `redraw_overlay` ()
 

Causes `draw_overlay()` to be called at a later time.
  - void `resize` (int, int, int, int) **override**

Changes the size or position of the widget.
  - void `show` () **override**

Makes a widget visible.
  - void `show` (int a, char \*\*b)
 

Same as `Fl_Window::show(int a, char **b)`
  - void `swap_buffers` ()
 

The `swap_buffers()` method swaps the back and front buffers.
  - int `swap_interval` () const
 

Gets the rate at which the GL windows swaps buffers.
  - void `swap_interval` (int)
 

Sets the rate at which the GL windows swaps buffers.
  - char `valid` () const
 

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after `draw()` is called.
  - void `valid` (char v)
 

See char `Fl_Gl_Window::valid()` const.
  - `~Fl_Gl_Window` ()
 

The destructor removes the widget and destroys the OpenGL context associated with it.

## Public Member Functions inherited from `Fl_Window`

- void `allow_expand_outside_parent` ()
 

Allow this subwindow to expand outside the area of its parent window.
- virtual class `Fl_Double_Window * as_double_window` ()
 

Return non-null if this is an `Fl_Double_Window` object.
- virtual class `Fl_Overlay_Window * as_overlay_window` ()
 

Return non-null if this is an `Fl_Overlay_Window` object.
- `Fl_Window` const \* `as_window` () const **override**
- `Fl_Window * as_window` () **override**

Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.
- unsigned int `border` () const

- Returns whether the window possesses a border.*

  - void **border** (int b)

*Sets whether or not the window manager border is around the window.*
- void **clear\_border** ()

*Fast inline function to turn the window manager border off.*
- void **clear\_modal\_states** ()

*Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*
- void **copy\_label** (const char \*a)

*Sets the window titlebar label to a copy of a character string.*
- void **cursor** (const **Fl\_RGB\_Image** \*, int, int)

*Changes the cursor for this window using the provided image as cursor's shape.*
- void **cursor** (**Fl\_Cursor** c, **Fl\_Color**, **Fl\_Color**=FL\_WHITE)

*For back compatibility only.*
- void **cursor** (**Fl\_Cursor**)

*Changes the cursor for this window.*
- int **decorated\_h** () const

*Returns the window height including any window title bar and any frame added by the window manager.*
- int **decorated\_w** () const

*Returns the window width including any frame added by the window manager.*
- void **default\_cursor** (**Fl\_Cursor** c, **Fl\_Color**, **Fl\_Color**=FL\_WHITE)

*For back compatibility only.*
- void **default\_cursor** (**Fl\_Cursor**)

*Sets the default window cursor.*
- void **draw\_backdrop** ()

*Draw the background image if one is set and is aligned inside.*
- **Fl\_Window** (int w, int h, const char \*title=0)

*Creates a window from the given width w, height h, and title.*
- **Fl\_Window** (int x, int y, int w, int h, const char \*title=0)

*Creates a window from the given position (x, y), size (w, h) and title.*
- void **free\_position** ()

*Undoes the effect of a previous **resize()** or **show()** so that the next time **show()** is called the window manager is free to position the window.*
- void **fullscreen** ()

*Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int **fullscreen\_active** () const

*Returns non zero if FULLSCREEN flag is set, 0 otherwise.*
- void **fullscreen\_off** ()

*Turns off any side effects of **fullscreen()***
- void **fullscreen\_off** (int X, int Y, int W, int H)

*Turns off any side effects of **fullscreen()** and does **resize(X,Y,W,H)**.*
- void **fullscreen\_screens** (int top, int bottom, int left, int right)

*Sets which screens should be used when this window is in fullscreen mode.*
- **uchar** **get\_size\_range** (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL) const

*Gets the allowable range to which the user can resize this window.*
- int **handle** (int) **override**

*Handles the specified event.*
- void **hide** () **override**

*Removes the window from the screen.*
- void **hotspot** (const **Fl\_Widget** &p, int offscreen=0)

*See void **Fl\_Window::hotspot**(int x, int y, int offscreen = 0)*

- void **hotspot** (const [FL\\_Widget](#) \*, int offscreen=0)  
*See void [FL\\_Window::hotspot](#)(int x, int y, int offscreen = 0)*
- void **hotspot** (int x, int y, int offscreen=0)  
*Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*
- const void \* **icon** () const  
*Gets the current icon window target dependent data.*
- void **icon** (const [FL\\_RGB\\_Image](#) \*)  
*Sets or resets a single window icon.*
- void **icon** (const void \*ic)  
*Platform-specific method to set the window icon usable on Windows and X11 only.*
- void **iconize** ()  
*Iconifies the window.*
- const char \* **iconlabel** () const  
*See void [FL\\_Window::iconlabel](#)(const char\*)*
- void **iconlabel** (const char \*)  
*Sets the icon label.*
- void **icons** (const [FL\\_RGB\\_Image](#) \*[], int)  
*Sets the window icons.*
- void **icons** (HICON big\_icon, HICON small\_icon)  
*Sets the window icons using HICON handles (Windows platform only).*
- const char \* **label** () const  
*See void [FL\\_Window::label](#)(const char\*)*
- void **label** (const char \*)  
*Sets the window title bar label.*
- void **label** (const char \*label, const char \*[iconlabel](#))  
*Sets the icon label.*
- void **make\_current** ()  
*Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.*
- void **maximize** ()  
*Maximizes a top-level window to its current screen.*
- unsigned int **maximize\_active** () const  
*Returns whether the window is currently maximized.*
- unsigned int **menu\_window** () const  
*Returns true if this window is a menu window.*
- unsigned int **modal** () const  
*Returns true if this window is modal.*
- unsigned int **non\_modal** () const  
*Returns true if this window is modal or non-modal.*
- [fl\\_uintptr\\_t](#) **os\_id** () const  
*Returns a platform-specific identification of a shown window, or 0 if not shown.*
- unsigned int **override** () const  
*Returns non zero if OVERRIDE flag is set, 0 otherwise.*
- void **resize** (int X, int Y, int W, int H) **override**  
*Changes the size and position of the window.*
- int **screen\_num** () const  
*The number of the screen containing the mapped window.*
- void **screen\_num** (int screen\_num)  
*Set the number of the screen where to map the window.*

- void [set\\_menu\\_window](#) ()  
*Marks the window as a menu window.*
- void [set\\_modal](#) ()  
*A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void [set\\_non\\_modal](#) ()  
*A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.*
- void **set\_override** ()  
*Activates the flags NOBORDER|OVERRIDE.*
- void [set\\_tooltip\\_window](#) ()  
*Marks the window as a tooltip window.*
- const [Fl\\_Image](#) \* [shape](#) () const  
*Returns the image controlling the window shape or NULL.*
- void [shape](#) (const [Fl\\_Image](#) &b)  
*Set the window's shape with an [Fl\\_Image](#).*
- void [shape](#) (const [Fl\\_Image](#) \*img)  
*Assigns a non-rectangular shape to the window.*
- void [show](#) () [override](#)  
*Puts the window on the screen.*
- void [show](#) (int argc, char \*\*argv)  
*Puts the window on the screen with [show\(\)](#) and parses command-line arguments.*
- int [shown](#) () const  
*Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).*
- void [size\\_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)  
*Sets the allowable range to which the user can resize this window.*
- unsigned int **tooltip\_window** () const  
*Returns true if this window is a tooltip window.*
- void [un\\_maximize](#) ()  
*Returns a previously maximized top-level window to its previous size.*
- void [wait\\_for\\_expose](#) ()  
*Waits for the window to be displayed after calling [show\(\)](#).*
- int **x\_root** () const  
*Gets the x position of the window on the screen.*
- const char \* [xclass](#) () const  
*Returns the xclass for this window, or a default.*
- void [xclass](#) (const char \*c)  
*Sets the xclass for this window.*
- int **y\_root** () const  
*Gets the y position of the window on the screen.*
- virtual [~Fl\\_Window](#) ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from [Fl\\_Group](#)

- [Fl\\_Widget](#) \*& **\_ddfdesign\_kludge** ()  
*This is for forms compatibility only.*
- void **add** ([Fl\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([Fl\\_Widget](#) \*o)  
*See void [Fl\\_Group::add\(Fl\\_Widget &w\)](#)*

- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See *int [FL\\_Group::find\(const \[FL\\\_Widget\]\(#\) \\*w\) const](#)*.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \*=0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*
- [FL\\_Widget](#) \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) &o)  
*Sets the group's resizable widget.*
- void **resizable** ([FL\\_Widget](#) \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual **~FL\_Group** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align align** () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI\_Boxtype box** () const  
*Gets the box type of the widget.*
- void **box** (**FI\_Boxtype** new\_box)  
*Sets the box type for the widget.*
- **FI\_Callback\_p callback** () const  
*Gets the current callback function for the widget.*
- void **callback** (**FI\_Callback** \*cb)  
*Sets the current callback function for the widget.*
- void **callback** (**FI\_Callback** \*cb, **FI\_Callback\_User\_Data** \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void **callback** (**FI\_Callback** \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void **callback** (**FI\_Callback0** \*cb)  
*Sets the current callback function for the widget.*
- void **callback** (**FI\_Callback1** \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int **changed** () const  
*Checks if the widget value changed since the last callback.*
- void **clear\_active** ()  
*Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()  
*Marks the value of the widget as unchanged.*
- void **clear\_damage** (uchar c=0)  
*Clears or sets the damage flags.*
- void **clear\_output** ()

- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

  - void `horizontal_label_margin` (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

- `Fl_Image * image ()`  
*Gets the image that is used as part of the widget label when in the active state.*
- `const Fl_Image * image () const`  
*Gets the image that is used as part of the widget label when in the active state.*
- `void image (Fl_Image &img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void image (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`  
*Returns whether the image is managed by the widget.*
- `int inside (const Fl_Widget *wgt) const`  
*Checks if this widget is a child of wgt.*
- `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`  
*Gets the current label text.*
- `void label (const char *text)`  
*Sets the current label pointer.*
- `void label (Fl_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*
- `Fl_Color labelcolor () const`  
*Gets the label color.*
- `void labelcolor (Fl_Color c)`  
*Sets the label color.*
- `Fl_Font labelfont () const`  
*Gets the font to use.*
- `void labelfont (Fl_Font f)`  
*Sets the font to use.*
- `Fl_Fontsize labelsize () const`  
*Gets the font size in pixels.*
- `void labelsize (Fl_Fontsize pix)`  
*Sets the font size in pixels.*
- `Fl_Labeltype labeltype () const`  
*Gets the label type.*
- `void labeltype (Fl_Labeltype a)`  
*Sets the label type.*
- `void measure_label (int &ww, int &hh) const`  
*Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`  
*Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`  
*Sets whether this widget needs a keyboard.*
- `unsigned int output () const`  
*Returns if a widget is used for output only.*
- `Fl_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (Fl_Group *p)`

- Internal use only - "for hacks only".*

  - void **position** (int X, int Y)  
*Repositions the window or widget.*
  - void **redraw** ()  
*Schedules the drawing of the widget.*
  - void **redraw\_label** ()  
*Schedules the drawing of the label.*
  - **Fl\_Color selection\_color** () const  
*Gets the selection color.*
  - void **selection\_color** (**Fl\_Color** a)  
*Sets the selection color.*
  - int **send** (int event)  
*Sends the specified event to the widget.*
  - void **set\_active** ()  
*Marks the widget as active without sending events or changing focus.*
  - void **set\_changed** ()  
*Marks the value of the widget as changed.*
  - void **set\_output** ()  
*Sets a widget to output only.*
  - void **set\_visible** ()  
*Makes the widget visible.*
  - void **set\_visible\_focus** ()  
*Enables keyboard focus navigation with this widget.*
  - int **shortcut\_label** () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
  - void **shortcut\_label** (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
  - void **size** (int W, int H)  
*Changes the size of the widget.*
  - int **take\_focus** ()  
*Gives the widget the keyboard focus.*
  - unsigned int **takeevents** () const  
*Returns if the widget is able to take events.*
  - int **test\_shortcut** ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
  - const char \* **tooltip** () const  
*Gets the current tooltip text.*
  - void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
  - **Fl\_Window \* top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
  - **Fl\_Window \* top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
  - **uchar type** () const  
*Gets the widget type.*
  - void **type** (**uchar** t)  
*Sets the widget type.*
  - int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
  - void \* **user\_data** () const  
*Gets the user data for this widget.*

- void **user\_data** ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()  
*Destroys the widget.*

### Public Attributes

### Protected Member Functions

- void [draw](#) () [override](#)  
*Draws the [Fl\\_Gl\\_Window](#).*
- void [draw\\_overlay](#) () [override](#)  
*You must implement this virtual function if you want to draw into the overlay.*
- int [handle](#) (int) [override](#)  
*Handle some FLTK events as needed.*

### Protected Member Functions inherited from [FI\\_Gl\\_Window](#)

- void [draw\\_begin](#) ()  
*Supports drawing to an [FI\\_Gl\\_Window](#) with the FLTK 2D drawing API.*
- void [draw\\_end](#) ()  
*To be used as a match for a previous call to [FI\\_Gl\\_Window::draw\\_begin\(\)](#).*

### Protected Member Functions inherited from [FI\\_Window](#)

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [override](#)  
*Draws the widget.*
- int [force\\_position](#) () const  
*Returns the internal state of the window's `FORCE_POSITION` flag.*
- void [force\\_position](#) (int force)  
*Sets an internal flag that tells FLTK and the window manager to honor position requests.*
- void [free\\_icons](#) ()  
*Deletes all icons previously attached to the window.*
- int [is\\_resizable](#) ()  
*Protected method to determine whether a window is resizable.*

### Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([FI\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const

- Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Additional Inherited Members

### Public Types inherited from FI\_Window

- typedef struct HICON\_\_ \* **HICON**

### Static Public Member Functions inherited from FI\_GI\_Window

- static int **can\_do** (const int \*m)  
*Returns non-zero if the hardware supports the given OpenGL mode.*
- static int **can\_do** (int m)  
*Returns non-zero if the hardware supports the given OpenGL mode.*

### Static Public Member Functions inherited from FI\_Window

- static FI\_Window \* **current** ()  
*Returns the last window that was made current.*
- static void **default\_callback** (FI\_Window \*, void \*v)  
*Back compatibility: Sets the default callback v for win to call on close event.*
- static void **default\_icon** (const FI\_RGB\_Image \*)  
*Sets a single default window icon.*
- static void **default\_icons** (const FI\_RGB\_Image \*[], int)  
*Sets the default window icons.*
- static void **default\_icons** (HICON big\_icon, HICON small\_icon)  
*Sets the default window icons (Windows platform only).*

- static const char \* [default\\_xclass](#) ()  
*Returns the default xclass.*
- static void [default\\_xclass](#) (const char \*)  
*Sets the default window xclass.*
- static bool [is\\_a\\_rescale](#) ()  
*Returns true when a window is being rescaled.*
- static char [show\\_next\\_window\\_iconic](#) ()  
*Returns the static flag whether the next window should be opened iconified.*
- static void [show\\_next\\_window\\_iconic](#) (char stat)  
*Sets a static flag whether the next window should be opened iconified.*

### Static Public Member Functions inherited from [FI\\_Group](#)

- static [FI\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*
- static void [current](#) ([FI\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

- static [FI\\_Window](#) \* [current\\_](#)  
*Stores the last window that was made current.*

#### 13.55.1 Detailed Description

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in glut\_compatibility.cxx):

## 13.55.2 Member Function Documentation

### 13.55.2.1 draw()

```
void Fl_Glut_Window::draw (
 void) [override], [protected], [virtual]
```

Draws the [Fl\\_Gl\\_Window](#).

You **must** subclass [Fl\\_Gl\\_Window](#) and provide an implementation for [draw\(\)](#). You may also provide an implementation of [draw\\_overlay\(\)](#) if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking [valid\(\)](#) at the start of [draw\(\)](#) and only doing the initialization if it is false.

The [draw\(\)](#) method can *only* use OpenGL calls. Do not attempt to call X, any of the functions in [<FL/fl\\_draw.H>](#), or glX directly. Do not call [gl\\_start\(\)](#) or [gl\\_finish\(\)](#).

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.

The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```
void mywindow::draw() {
 if (!valid()) {
 glViewport(0,0,pixel_w(),pixel_h());
 glFrustum(...) or glOrtho(...)
 ...other initialization...
 }
 if (!context_valid()) {
 ...load textures, etc. ...
 }
 // clear screen
 glClearColor(...);
 glClear(...);
 ... draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```
void mywindow::draw() {
 if (!valid()) {
 glLoadIdentity();
 glViewport(0,0,pixel_w(),pixel_h());
 glOrtho(-w(),w(),-h(),h(),-1,1);
 }
 // Clear screen
 glClear(GL_COLOR_BUFFER_BIT);
 // Draw white 'X'
 glColor3f(1.0, 1.0, 1.0);
 glBegin(GL_LINE_STRIP); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
 glBegin(GL_LINE_STRIP); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}
```

Regular FLTK widgets can be added as children to the [Fl\\_Gl\\_Window](#). To correctly overlay the widgets, [Fl\\_Gl\\_Window::draw\(\)](#) must be called after rendering the main scene.

```
void mywindow::draw() {
 // draw 3d graphics scene
 Fl_Gl_Window::draw();
 // -- or --
 draw_begin();
 Fl_Window::draw();
 // other 2d drawing calls, overlays, etc.
 draw_end();
}
```

Reimplemented from [Fl\\_Gl\\_Window](#).

### 13.55.2.2 draw\_overlay()

```
void Fl_Glut_Window::draw_overlay () [override], [protected], [virtual]
```

You must implement this virtual function if you want to draw into the overlay.

The overlay is cleared before this is called. You should draw anything that is not clear using OpenGL. You must use [gl\\_color\(i\)](#) to choose colors (it allocates them from the colormap using system-specific calls), and remember that you are in an indexed OpenGL mode and drawing anything other than flat-shaded will probably not work.

Both this function and [Fl\\_Gl\\_Window::draw\(\)](#) should check [Fl\\_Gl\\_Window::valid\(\)](#) and set the same transformation. If you don't your code may not work on other systems. Depending on the OS, and on whether overlays are real or simulated, the OpenGL context may be the same or different between the overlay and main window.

Reimplemented from [Fl\\_Gl\\_Window](#).

### 13.55.2.3 handle()

```
int Fl_Glut_Window::handle (
 int event) [override], [protected], [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl\\_Gl\\_Window](#).

The documentation for this class was generated from the following files:

- [glut.H](#)
- [glut\\_compatibility.cxx](#)

## 13.56 Fl\_Grid Class Reference

[Fl\\_Grid](#) is a container (layout) widget with multiple columns and rows.

`#include <Fl_Grid.H>`

Inheritance diagram for [Fl\\_Grid](#):

### Classes

- class [Cell](#)

### Public Member Functions

- [Fl\\_Grid::Cell \\* cell](#) ([Fl\\_Widget \\*widget](#)) const  
*Get the grid cell of widget `widget`.*
- [Fl\\_Grid::Cell \\* cell](#) (int row, int col) const  
*Get the grid cell of row `row` and column `col`.*
- virtual void [clear\\_layout](#) ()  
*Reset the layout w/o removing widgets.*
- void [col\\_gap](#) (const int \*value, [size\\_t size](#))  
*Set more than one column gaps at once.*
- int [col\\_gap](#) (int col) const
- void [col\\_gap](#) (int col, int value)  
*Set the gap of column `col`.*
- void [col\\_weight](#) (const int \*value, [size\\_t size](#))  
*Set the weight of more than one column.*
- int [col\\_weight](#) (int col) const
- void [col\\_weight](#) (int col, int value)  
*Set the weight of a column.*

*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [FL\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)

- Changes the size of the widget.*

  - int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- uchar `type` () const

*Gets the widget type.*
- void `type` (uchar t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (uchar i)

*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()

*Destroys the widget.*

### 13.56.1 Detailed Description

**Fl\_Grid** is a container (layout) widget with multiple columns and rows.

This container widget features very flexible layouts in columns and rows w/o the need to position each child widget in x/y coordinates.

Widgets are assigned to grid cells (column, row) with their minimal sizes in `w()` and `h()`. The `x()` and `y()` positions are ignored and can be (0, 0). **Fl\_Grid** calculates widget positions and resizes the widgets to fit into the grid. It is possible to create a single row or column of widgets with **Fl\_Grid**.

You should design your grid with the smallest possible sizes of all widgets in mind. **Fl\_Grid** will automatically assign additional space to cells according to some rules (described later) when resizing the **Fl\_Grid** widget.

**Hint:** You should set a minimum window size to make sure the **Fl\_Grid** is never resized below its minimal sizes. Resizing below the given widget sizes results in undefined behavior.

**Fl\_Grid** and other container widgets (e.g. **Fl\_Group**) can be nested. One main advantage of this usage is that widget coordinates in embedded **Fl\_Group** widgets become relative to the group and will be positioned as expected.

**Todo** This (relative group coordinates of nested groups of **Fl\_Grid**) needs explanation and maybe an example.

**Fl\_Grid** child widgets are handled by its base class **Fl\_Group** but **Fl\_Grid** stores additional data corresponding to each widget in internal grid cells.

**Fl\_Grid** children are allowed to span multiple columns and rows like HTML `<table>` cells. Individual children can have fixed sizes or be aligned inside their cells (left, right, top, bottom, and more) and/or follow their cell sizes when the **Fl\_Grid** container is resized.

Note to resizing: since **Fl\_Grid** uses its own layout algorithm the normal **Fl\_Group::resizable()** widget is ignored (if set). Calling **init\_sizes()** is not necessary.

#### Note

**Fl\_Grid** is, as of FLTK 1.4.x, still in experimental state and should be used with caution. The API can still be changed although it is assumed to be almost stable - as stable as possible for a first release.

Example: Simple 3x3 **Fl\_Grid** with five buttons:

```

#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Grid.H>
#include <FL/Fl_Button.H>

int main(int argc, char **argv) {
 Fl_Double_Window *win = new Fl_Double_Window(320, 180, "3x3 Fl_Grid with Buttons");
 // create the Fl_Grid container with five buttons
 Fl_Grid *grid = new Fl_Grid(0, 0, win->w(), win->h());
 grid->layout(3, 3, 10, 10);
 grid->color(FL_WHITE);
 Fl_Button *b0 = new Fl_Button(0, 0, 0, 0, "New");
 Fl_Button *b1 = new Fl_Button(0, 0, 0, 0, "Options");
 Fl_Button *b3 = new Fl_Button(0, 0, 0, 0, "About");
 Fl_Button *b4 = new Fl_Button(0, 0, 0, 0, "Help");
 Fl_Button *b6 = new Fl_Button(0, 0, 0, 0, "Quit");
 // assign buttons to grid positions
 grid->widget(b0, 0, 0);
 grid->widget(b1, 0, 2);
 grid->widget(b3, 1, 1);
 grid->widget(b4, 2, 0);
 grid->widget(b6, 2, 2);
 grid->show_grid(0); // 1 to display grid helper lines
 grid->end();
 win->end();
 win->resizable(grid);
 win->size_range(300, 100);
 win->show(argc, argv);
 return Fl::run();
}

```

Figure 13.20 show\_grid() set to 1

## 13.56.2 Constructor & Destructor Documentation

### 13.56.2.1 Fl\_Grid()

```
Fl_Grid::Fl_Grid (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Create a new [Fl\\_Grid](#) widget.

**Todo** More documentation of [Fl\\_Grid](#) constructor?

## 13.56.3 Member Function Documentation

### 13.56.3.1 cell() [1/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
 Fl_Widget * widget) const
```

Get the grid cell of widget `widget`.

The pointer to the cell can be used for further assignment of properties like alignment etc.

Hint: If you know the row and column index of the cell you should use `Fl_Grid::cell(int row, int col)` instead because it is **much** faster.

Please see `Fl_Grid::cell(int row, int col)` for details and the validity of cell pointers.

#### Parameters

in	<i>widget</i>	widget whose cell is requested
----	---------------	--------------------------------

## Return values

<code>NULL</code>	if widget is not assigned to a cell
-------------------	-------------------------------------

**13.56.3.2 cell()** [2/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
 int row,
 int col) const
```

Get the grid cell of row `row` and column `col`.

Widgets and other attributes are organized in cells ([Fl\\_Grid::Cell](#)).

This cell is an opaque structure (class) with some public methods. **Don't** assume anything about grid cell sizes and ordering in memory. These are implementation details that can be changed without notice.

The validity of an [Fl\\_Grid::Cell](#) pointer is limited. It will definitely be invalidated when the overall grid layout is changed, for instance by calling `layout(int, int)`.

Adding new cells beyond the current layout limits will also invalidate cell pointers but this is not (yet) implemented. Attempts to assign widgets to out-of-bounds cells are currently ignored.

The only well-defined usage of cell pointers is to set one or more properties like widget alignment of a cell after retrieving the cell pointer. Don't store cell pointers in your program for later reference.

## Parameters

in	<i>row</i>	row index
in	<i>col</i>	column index

## Returns

pointer to cell

## Return values

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds or no widget was assigned
-------------------	------------------------------------------------------------------------------------

**13.56.3.3 clear\_layout()**

```
void Fl_Grid::clear_layout () [virtual]
```

Reset the layout w/o removing widgets.

Removes all cells and sets rows and cols to zero. Existing widgets are kept as children of the [Fl\\_Group](#) (base class) but are hidden.

This method should be rarely used. You may want to call [Fl\\_Grid::clear\(\)](#) to remove all widgets and reset the layout to zero rows and columns.

You must call `layout(int rows, int cols, ...)` to set a new layout, allocate new cells, and assign widgets to new cells.

**Todo** [Fl\\_Grid::clear\(\)](#) needs to be implemented as documented above!

**13.56.3.4 col\_gap()** [1/2]

```
void Fl_Grid::col_gap (
 const int * value,
 size_t size)
```

Set more than one column gaps at once.

## See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value `array` and `size`.

**13.56.3.5 col\_gap() [2/2]**

```
void Fl_Grid::col_gap (
 int col,
 int value)
```

Set the gap of column `col`.

Note that the gap is right of each column except the last one which is ignored. Use [margin\(\)](#) for the right most column.

**Parameters**

in	<i>col</i>	column
in	<i>value</i>	gap size after the column

**13.56.3.6 col\_weight() [1/2]**

```
void Fl_Grid::col_weight (
 const int * value,
 size_t size)
```

Set the weight of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int val[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_weight(val, sizeof(val)/sizeof(val[0]));
```

**Parameters**

in	<i>value</i>	an array of column weights
in	<i>size</i>	the size of the array (number of values)

**13.56.3.7 col\_weight() [2/2]**

```
void Fl_Grid::col_weight (
 int col,
 int value)
```

Set the weight of a column.

Column and row weights are used to distribute additional space when the grid is resized beyond its defined (minimal) size. All weight values are relative and can be chosen freely. Suggested weights are in the range {0 .. 100}, 0 (zero) disables resizing of the column.

How does it work?

Whenever additional space (say: `SPACE` in pixels) is to be distributed to a set of columns the weights of all columns are added to a value `SUM`, then every single column width is increased by the value (in pseudo code):

```
col.width += SPACE * col.weight / SUM
```

Resulting pixel values are rounded to the next integer and rounding differences are added to or subtracted from the column with the highest weight. If more columns have the same weight one of them is chosen.

**Note**

If none of the columns considered for resizing have weights  $> 0$  then [Fl\\_Grid](#) assigns the remaining space to an arbitrary column or to all considered columns evenly. This is implementation defined and can be changed without notice. You can avoid this situation by designing your grid with sensible sizes and weights.

**Parameters**

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	weight, must be $\geq 0$

**13.56.3.8 col\_width()** [1/2]

```
void Fl_Grid::col_width (
 const int * value,
 size_t size)
```

Set minimal widths of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int widths[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_width(widths, sizeof(width)/sizeof(width[0]));
```

**Parameters**

in	<i>value</i>	an array of column widths
in	<i>size</i>	the size of the array (number of values)

**13.56.3.9 col\_width()** [2/2]

```
void Fl_Grid::col_width (
 int col,
 int value)
```

Set the minimal width of a column.

Column widths are calculated by using the maximum of all widget widths in that column and the given column width.

After calculating the width additional space is added when resizing according to the `weight` of the column.

You can set one or more column widths in one call by using [Fl\\_Grid::col\\_width\(const int \\*value, size\\_t size\)](#).

**Parameters**

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	minimal column width, must be $\geq 0$

**See also**

[Fl\\_Grid::col\\_width\(const int \\*value, size\\_t size\)](#)

**13.56.3.10 debug()**

```
void Fl_Grid::debug (
 int level = 127)
```

Output layout information of this [Fl\\_Grid](#) to stderr.

Parameter `level` will be used to define the amount of output.

- 0 = nothing
- 127 = everything
- other values not yet defined

**Note**

It is not yet defined which kind of values `level` will have, either a numerical value (127 = maximum, 0 = nothing) or a bit mask that determines what to output.

**Todo** Add more information about cells and children.

Control output by using `level`.

## Parameters

in	<i>level</i>	not yet used (0-127, default = 127)
----	--------------	-------------------------------------

**13.56.3.11 draw()**

```
void Fl_Grid::draw (
 void) [override], [protected], [virtual]
```

Draws the [Fl\\_Grid](#) widget and all children.

If the layout has been changed [layout\(\)](#) is called before the widget is drawn so all children are arranged as designed.

See also

[layout\(\)](#)

[need\\_layout\(\)](#)

Implements [Fl\\_Widget](#).

**13.56.3.12 draw\_grid()**

```
void Fl_Grid::draw_grid () [protected], [virtual]
```

Draws the grid helper lines for design and debugging purposes.

This method is protected so it can be modified in subclasses.

**13.56.3.13 gap() [1/2]**

```
void Fl_Grid::gap (
 int * row_gap,
 int * col_gap) const
```

Get the default gaps for rows and columns.

## Parameters

out	<i>row_gap</i>	pointer to int to receive column gap, may be NULL
out	<i>col_gap</i>	pointer to int to receive column gap, may be NULL

**13.56.3.14 gap() [2/2]**

```
void Fl_Grid::gap (
 int row_gap,
 int col_gap = -1) [virtual]
```

Set default gaps for rows and columns.

All gaps are positioned below the rows and right of their columns.

The bottom row and the right-most column don't have a gap, i.e. the gap sizes of these columns and rows are ignored. You can use a right or bottom margin instead.

You have to specify at least one argument, `col_gap` is optional. If you don't specify an argument or use a negative value (e.g. -1) then that margin is not affected.

You can also initialize the default gaps with [layout\(int, int, int, int\)](#).

## Parameters

in	<i>row_gap</i>	default gap for all rows
in	<i>col_gap</i>	default gap for all columns

See also

[Fl\\_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

### 13.56.3.15 layout() [1/2]

```
void Fl_Grid::layout () [virtual]
```

Calculate the grid layout and resize and position all widgets.

This is called automatically when the [Fl\\_Grid](#) is resized. You need to call it once after you added widgets or moved widgets between cells.

Calling it once after all modifications are completed is enough.

**Todo** Document when and why to call [layout\(\)](#) w/o args. See [Fl\\_Flex::layout\(\)](#)

See also

[Fl\\_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

### 13.56.3.16 layout() [2/2]

```
void Fl_Grid::layout (
 int rows,
 int cols,
 int margin = -1,
 int gap = -1) [virtual]
```

Set the basic layout parameters of the [Fl\\_Grid](#) widget.

You need to specify at least `rows` and `cols` to define a layout before you can add widgets to the grid.

Parameters `margin` and `gap` are optional.

You can call [layout\(int rows, int cols, int margin, int gap\)](#) again to change the layout but this is inefficient since all cells are reallocated if the layout changed.

Calling this with the same values of `rows` and `cols` is fast and can be used to change `margin` and `gap` w/o reallocating the cells.

`margin` sets all margins (left, top, right, bottom) to the same value. Negative values (e.g. -1) don't change the established margins. The default value set by the constructor is 0.

`gap` sets row and column gaps to the same value. Negative values (e.g. -1) do not affect the established gaps. The default value set by the constructor is 0.

After you added all widgets you must call [layout\(\)](#) once without arguments to calculate the actual layout and to position and resize all widgets.

**Todo** Document when and why to call [layout\(\)](#) w/o args. See [Fl\\_Flex::layout\(\)](#)

#### Parameters

in	<i>rows</i>	number of rows
in	<i>cols</i>	number of columns
in	<i>margin</i>	margin size inside the <a href="#">Fl_Grid</a> 's border
in	<i>gap</i>	gap size between cells

See also

[Fl\\_Grid::layout\(\)](#)

### 13.56.3.17 margin() [1/2]

```
int Fl_Grid::margin (
 int * left,
```

```
int * top,
int * right,
int * bottom) const
```

Returns all outside margin sizes of the grid.

All margin sizes are returned in the given arguments. If any argument is `NULL` the respective value is not returned.

#### Parameters

out	<i>left</i>	returns left margin if not <code>NULL</code>
out	<i>top</i>	returns top margin if not <code>NULL</code>
out	<i>right</i>	returns right margin if not <code>NULL</code>
out	<i>bottom</i>	returns bottom margin if not <code>NULL</code>

#### Returns

whether all margins are equal

#### Return values

1	all margins have the same size
0	at least one margin has a different size

### 13.56.3.18 margin() [2/2]

```
void Fl_Grid::margin (
 int left,
 int top = -1,
 int right = -1,
 int bottom = -1) [virtual]
```

Set all margins (left, top, right, bottom).

All margins are measured in pixels inside the box borders. You need to specify at least one argument, all other arguments are optional. If you don't specify an argument or use a negative value (e.g. -1) then that particular margin is not affected.

#### Parameters

in	<i>left</i>	left margin
in	<i>top</i>	top margin
in	<i>right</i>	right margin
in	<i>bottom</i>	bottom margin

### 13.56.3.19 need\_layout()

```
void Fl_Grid::need_layout (
 int set) [inline]
```

Request or reset the request to calculate the layout of children.

If called with `true` (1) this calls [redraw\(\)](#) to schedule a full [draw\(\)](#). When draw is eventually called, the layout is (re)calculated before actually drawing the widget.

#### Parameters

in	<i>set</i>	1 to request layout calculation, 0 to reset the request
----	------------	------------------------------------------------------------

**13.56.3.20 on\_remove()**

```
void Fl_Grid::on_remove (
 int index) [override], [protected], [virtual]
```

[Fl\\_Group](#) calls this method when a child widget is about to be removed.

Make sure that the widget is also removed from our internal list of children.

Reimplemented from [Fl\\_Group](#).

**13.56.3.21 resize()**

```
void Fl_Grid::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Recalculate the layout and position and resize all widgets.

This method overrides [Fl\\_Group::resize\(\)](#) and calculates all positions and sizes of its children according to its own rules.

**Parameters**

in	<i>X,Y</i>	new widget position
in	<i>W,H</i>	new widget size

Reimplemented from [Fl\\_Widget](#).

**13.56.3.22 row\_gap() [1/2]**

```
void Fl_Grid::row_gap (
 const int * value,
 size_t size)
```

Set more than one row gaps at once.

**See also**

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value [array](#) and [size](#).

**13.56.3.23 row\_gap() [2/2]**

```
void Fl_Grid::row_gap (
 int row,
 int value)
```

Set the gap of row `row`.

Note that the gap is below each row except the last one which is ignored. Use [margin\(\)](#) for the bottom row.

**Parameters**

in	<i>row</i>	row
in	<i>value</i>	gap size below the row

**13.56.3.24 row\_height() [1/2]**

```
void Fl_Grid::row_height (
 const int * value,
 size_t size)
```

Set the minimal row height of more than one row.

## Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array <i>value</i>

## See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value [array](#) and [size](#).

**13.56.3.25 row\_height()** [2/2]

```
void Fl_Grid::row_height (
 int row,
 int value)
```

Set the minimal row height of row *row*.

## Parameters

in	<i>row</i>	<i>row</i>
in	<i>value</i>	minimal height of the row

**13.56.3.26 row\_weight()** [1/2]

```
void Fl_Grid::row_weight (
 const int * value,
 size_t size)
```

Set the weight of more than one row.

## Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array <i>value</i>

## See also

[Fl\\_Grid::col\\_weight\(const int \\*value, size\\_t size\)](#) for handling of the value [array](#) and [size](#).

**13.56.3.27 row\_weight()** [2/2]

```
void Fl_Grid::row_weight (
 int row,
 int value)
```

Set the row weight of row *row*.

## Parameters

in	<i>row</i>	<i>row</i>
in	<i>value</i>	weight of the row

**13.56.3.28 show\_grid()** [1/2]

```
void Fl_Grid::show_grid (
 int set) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

Use this method during the design stage of your [Fl\\_Grid](#) widget or for debugging if widgets are not positioned as intended.

The default is a light green color but you can change it for better contrast if needed, see [show\\_grid\(int set, Fl\\_Color col\)](#).

#### Note

You can define the environment variable `FLTK_GRID_DEBUG=1` to set `show_grid(1)` for all [Fl\\_Grid](#) widgets at construction time. This enables you to debug the grid layout w/o changing code.

#### Parameters

in	set	1 (true) = draw, 0 = don't draw the grid
----	-----	------------------------------------------

#### See also

[show\\_grid\(int set, Fl\\_Color col\)](#)

### 13.56.3.29 show\_grid() [2/2]

```
void Fl_Grid::show_grid (
 int set,
 Fl_Color col) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

This method also sets the color used for the helper lines.

The default is a light green color but you can change it to any color for better contrast if needed.

#### Parameters

in	set	1 (true) = draw, 0 = don't draw the grid
in	col	color to use for the grid helper lines

#### See also

[show\\_grid\(int set\)](#)

### 13.56.3.30 widget() [1/2]

```
Fl_Grid::Cell * Fl_Grid::widget (
 Fl_Widget * wi,
 int row,
 int col,
 Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set its alignment.

This short form sets row and column spanning attributes to (1, 1).

For more information see [Fl\\_Grid::widget\(Fl\\_Widget \\*wi, int row, int col, int rowspan, int colspan, Fl\\_Grid\\_Align align\)](#)

#### Parameters

in	wi	widget to be assigned to the cell
in	row	row
in	col	column
in	align	widget alignment inside the cell

**Returns**

assigned cell

**Return values**

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds
-------------------	----------------------------------------------------------

**See also**
[Fl\\_Grid::widget\(Fl\\_Widget \\*wi, int row, int col, int rowspan, int colspan, Fl\\_Grid\\_Align align\)](#)
**13.56.3.31 widget() [2/2]**

```
Fl_Grid::Cell * Fl_Grid::widget (
 Fl_Widget * wi,
 int row,
 int col,
 int rowspan,
 int colspan,
 Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set cell spanning and alignment.

Default alignment is `FL_GRID_FILL` which stretches the widget in horizontal and vertical directions to fill the whole cell(s) given by `colspan` and `rowspan`.

You can use this method to move a widget from one cell to another; it is automatically removed from its old cell. If the new cell is already assigned to another widget that widget is deassigned but kept as a child of the group.

Before you can assign a widget to a cell it must have been created as a child of the [Fl\\_Grid](#) widget (i.e. its [Fl\\_Group](#)).

**Parameters**

in	<i>wi</i>	widget to be assigned to the cell
in	<i>row</i>	row
in	<i>col</i>	column
in	<i>rowspan</i>	vertical span in cells, default 1
in	<i>colspan</i>	horizontal span in cells, default 1
in	<i>align</i>	widget alignment inside the cell

**Returns**

assigned cell

**Return values**

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds or <code>wi</code> is not a child
-------------------	--------------------------------------------------------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Grid.H](#)
- [Fl\\_Grid.cxx](#)

**13.57 Fl\_Group Class Reference**

The [Fl\\_Group](#) class is the main FLTK container widget.

```
#include <Fl_Group.H>
```

Inheritance diagram for [Fl\\_Group](#):

- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) [color](#) () const

- Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)
- Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)
- Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*
- [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*
- void [deactivate](#) ()
- Deactivates the widget.*
- [FL\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
- Gets the widget height.*
- virtual void [hide](#) ()
- Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

- void [image](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*

- Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()
- Schedules the drawing of the label.*

  - [FI\\_Color selection\\_color](#) () const
- Gets the selection color.*

  - void [selection\\_color](#) ([FI\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [FI\\_Window \\* top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [FI\\_Window \\* top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** when () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual **~Fl\_Widget** ()  
*Destroys the widget.*

### Static Public Member Functions

- static **Fl\_Group** \* **current** ()  
*Returns the currently active group.*
- static void **current** (**Fl\_Group** \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from **Fl\_Widget**

- static void **default\_callback** (**Fl\_Widget** \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Member Functions

- [FI\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw](#) () override  
*Draws the widget.*
- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([FI\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int [flags](#) () const  
*Gets the widget flags mask.*
- void [h](#) (int v)  
*Internal use only.*
- void [set\\_flag](#) (unsigned int c)

- *Sets a flag in the flags mask.*
- void [w](#) (int v)  
*Internal use only.*
- void [x](#) (int v)  
*Internal use only.*
- void [y](#) (int v)  
*Internal use only.*

### 13.57.1 Detailed Description

The [Fl\\_Group](#) class is the main FLTK container widget.

It maintains an ordered list of child widgets. These children can themselves be any widget including [Fl\\_Group](#). The most important subclass of [Fl\\_Group](#) is [Fl\\_Window](#), however groups can also be used to control radio buttons, to enforce resize behavior, or to manage layout of widgets, see [Fl\\_Pack](#), [Fl\\_Flex](#), [Fl\\_Grid](#).

The tab and arrow keys are used to move the focus between widgets of this group, and to other groups. The only modifier grabbed is shift (for shift-tab), so that ctrl-tab, alt-up, and such are free for the app to use as shortcuts.

To remove a widget from the group and destroy it, in 1.3.x (and up) you can simply use:

```
delete some_widget;
```

..and this will trigger proper scheduling of the widget's removal from its parent group.

If used as a child of [Fl\\_Tabs](#), setting `when (FL_WHEN_CLOSED)` will enable the Close button in the corresponding tab. If the user clicks the Close button, the callback of this group will be called with the callback reason `FL_REASON_CLOSED`.

### 13.57.2 Constructor & Destructor Documentation

#### 13.57.2.1 [Fl\\_Group](#)()

```
Fl_Group::Fl_Group (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Group](#) widget using the given position, size, and label string.  
The default boxtype is `FL_NO_BOX`.

### 13.57.2.2 ~FI\_Group()

```
Fl_Group::~~Fl_Group () [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. It is allowed that the [FI\\_Group](#) and all of its children are automatic (local) variables, but you must declare the [FI\\_Group](#) *first*, so that it is destroyed last.

If you add static or automatic (local) variables to an [FI\\_Group](#), then it is your responsibility to remove (or delete) all such static or automatic child widgets *before destroying* the group - otherwise the group will attempt to call delete operator on them leading to undefined behavior!

## 13.57.3 Member Function Documentation

### 13.57.3.1 array()

```
Fl_Widget *const * Fl_Group::array () const
```

Returns a pointer to the internal array of children.

#### Note

This pointer is only valid until the next time a child is added or removed.

### 13.57.3.2 as\_group() [1/2]

```
Fl_Group const * Fl_Group::as_group () const [inline], [override], [virtual]
```

Reimplemented from [FI\\_Widget](#).

### 13.57.3.3 as\_group() [2/2]

```
Fl_Group * Fl_Group::as_group () [inline], [override], [virtual]
```

Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [FI\\_Group](#). If it returns non-NULL, then the widget in question is derived from [FI\\_Group](#), and you can use the returned pointer to access its children or other [FI\\_Group](#)-specific methods.

Example:

```
void my_callback (Fl_Widget *w, void *) {
 Fl_Group *g = w->as_group();
 if (g)
 printf ("This group has %d children\n", g->children());
 else
 printf ("This widget is not a group!\n");
}
```

#### Return values

NULL	if this widget is not derived from <a href="#">FI_Group</a> .
------	---------------------------------------------------------------

#### Note

This method is provided to avoid `dynamic_cast`.

#### See also

[FI\\_Widget::as\\_window\(\)](#), [FI\\_Widget::as\\_gl\\_window\(\)](#)

Reimplemented from [FI\\_Widget](#).

### 13.57.3.4 begin()

```
void Fl_Group::begin ()
```

Sets the current group so you can build the widget tree by just constructing the widgets.

[begin\(\)](#) is automatically called by the constructor for [FI\\_Group](#) (and thus for [FI\\_Window](#) as well). [begin\(\)](#) is exactly the same as `current(this)`. *Don't forget to [end\(\)](#) the group or window!*

### 13.57.3.5 bounds()

```
Fl_Rect * Fl_Group::bounds () [protected]
```

Returns the internal array of widget sizes and positions.

If the `bounds()` array does not exist, it will be allocated and filled with the current widget sizes and positions.

The `bounds()` array stores the initial positions of widgets as `Fl_Rect`'s. The size of the array is `children() + 2`.

- The first `Fl_Rect` is the group,
- the second is the resizable (clipped to the group),
- the rest are the children.

This is a convenient order for the resize algorithm.

If the group and/or the `resizable()` is a `Fl_Window` (or subclass) then the `x()` and `y()` coordinates of their respective `Fl_Rect`'s are zero.

#### Note

You should never need to use this *protected* method directly, unless you have special needs to rearrange the children of a `Fl_Group`. `Fl_Tile` uses this to rearrange its widget positions. The returned array should be considered read-only. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call `init_sizes()`.

#include <FL/Fl\_Rect.H> if you want to access the `bounds()` array in your derived class. `Fl_Rect.H` is intentionally not included by `Fl_Group.H` to avoid unnecessary dependencies.

#### Returns

Array of `Fl_Rect`'s with widget positions and sizes. The returned array is only valid until `init_sizes()` is called or widgets are added to or removed from the group.

#### See also

`init_sizes()`

#### Since

FLTK 1.4.0

### 13.57.3.6 child()

```
Fl_Widget * Fl_Group::child (
 int n) const [inline]
```

Returns the n'th child.

Returns `nullptr` if `n` is out of range (since FLTK 1.4.0).

*No range checking was done in FLTK 1.3 and older versions!*

#### Parameters

in	<i>n</i>	index of child (0 .. <code>children()</code> - 1)
----	----------	---------------------------------------------------

#### Returns

pointer to the n'th child or `nullptr` if out of range

### 13.57.3.7 clear()

```
void Fl_Group::clear (
 void)
```

Deletes all child widgets from memory recursively.

This method differs from the [remove\(\)](#) method in that it affects all child widgets and deletes them from memory.

The [resizable\(\)](#) widget of the [Fl\\_Group](#) is set to the [Fl\\_Group](#) itself.

### 13.57.3.8 clip\_children() [1/2]

```
unsigned int Fl_Group::clip_children () const [inline]
```

Returns the current clipping mode.

Returns

true, if clipping is enabled, false otherwise.

See also

void [Fl\\_Group::clip\\_children\(int c\)](#)

### 13.57.3.9 clip\_children() [2/2]

```
void Fl_Group::clip_children (
 int c) [inline]
```

Controls whether the group widget clips the drawing of child widgets to its bounding box.

Set *c* to 1 if you want to clip the child widgets to the bounding box.

The default is to not clip (0) the drawing of child widgets.

### 13.57.3.10 current() [1/2]

```
Fl_Group * Fl_Group::current () [static]
```

Returns the currently active group.

The [Fl\\_Widget](#) constructor automatically does [current\(\)](#)->add(widget) if this is not null. To prevent new widgets from being added to a group, call [Fl\\_Group::current\(0\)](#).

### 13.57.3.11 current() [2/2]

```
void Fl_Group::current (
 Fl_Group * g) [static]
```

Sets the current group.

See also

[Fl\\_Group::current\(\)](#)

### 13.57.3.12 delete\_child()

```
int Fl_Group::delete_child (
 int index) [virtual]
```

Removes the widget at *index* from the group and deletes it.

This method does nothing if *index* is out of bounds.

This method differs from the [remove\(\)](#) method in that it deletes the widget from memory. Since this method is virtual it can be reimplemented in subclasses with additional requirements and consequences. See the documentation of subclasses.

Many subclasses don't need to reimplement this method.

Note

This method **may** refuse to remove and delete the widget if it is an essential part of the [Fl\\_Group](#), for instance a scrollbar in an [Fl\\_Scroll](#) group. In this case the widget is neither removed nor deleted.

This method does not call [init\\_sizes\(\)](#) or [redraw\(\)](#). This is left to user code if necessary.

Returns 0 if the widget was removed and deleted. Return values > 0 are reserved for use by FLTK core widgets.

Return values < 0 are free to be used by user defined widgets.

**Todo** Reimplementation of [Fl\\_Group::delete\\_child\(int\)](#) in more FLTK subclasses. This is not yet complete.

## Parameters

<code>in</code>	<i>index</i>	index of child to be removed
-----------------	--------------	------------------------------

## Returns

success (0) or error code

## Return values

0	success
1	index out of range
2	widget not allowed to be removed (see note)
>2	reserved for FLTK use

## Since

FLTK 1.4.0

Reimplemented in [Fl\\_Scroll](#).

**13.57.3.13 draw()**

```
void Fl_Group::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Help\\_View](#), [Fl\\_Input\\_Choice](#), [Fl\\_Pack](#), [Fl\\_Scroll](#), [Fl\\_Spinner](#), [Fl\\_Table](#), [Fl\\_Tabs](#), [Fl\\_Text\\_Display](#), [Fl\\_Tree](#), [Fl\\_Window](#), [Fl\\_Wizard](#), and [Fl\\_Terminal](#).

**13.57.3.14 draw\_child()**

```
void Fl_Group::draw_child (
 Fl_Widget & widget) const [protected]
```

Forces a child to redraw.

This draws a child widget, if it is not clipped. The damage bits are cleared after drawing.

**13.57.3.15 draw\_children()**

```
void Fl_Group::draw_children () [protected]
```

Draws all children of the group.

This is useful, if you derived a widget from [Fl\\_Group](#) and want to draw a special border or background. You can call [draw\\_children\(\)](#) from the derived [draw\(\)](#) method after drawing the box, border, or background.

**13.57.3.16 end()**

```
void Fl_Group::end ()
```

*Exactly the same as* [current\(this->parent\(\)\)](#).

Any new widgets added to the widget tree will be added to the parent of the group.

**13.57.3.17 find()**

```
int Fl_Group::find (
 const Fl_Widget * o) const
```

Searches the children for the widget and returns the index.  
Returns [children\(\)](#) if the widget is NULL or not found.

**13.57.3.18 handle()**

```
int Fl_Group::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget. When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise. Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval. One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class. In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

**Parameters**

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

**Return values**

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

**See also**

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Text\\_Editor](#), [Fl\\_Tree](#), [Fl\\_Spinner](#), [Fl\\_Table\\_Row](#), [Fl\\_Tile](#), [Fl\\_Help\\_View](#), [Fl\\_Scroll](#), [Fl\\_Tabs](#), and [Fl\\_Window](#).

**13.57.3.19 init\_sizes()**

```
void Fl_Group::init_sizes ()
```

Resets the internal array of widget sizes and positions.

The [Fl\\_Group](#) widget keeps track of the original widget sizes and positions when resizing occurs so that if you resize a window back to its original size the widgets will be in the correct places. If you rearrange the widgets in your group, call this method to register the new arrangement with the [Fl\\_Group](#) that contains them.

If you add or remove widgets, this will be done automatically.

**Note**

The internal array of widget sizes and positions will be allocated and filled when the next [resize\(\)](#) occurs. For more information on the contents and structure of the [bounds\(\)](#) array see [bounds\(\)](#).

**See also**

[bounds\(\)](#)

[sizes\(\)](#) (deprecated)

**13.57.3.20 insert()** [1/2]

```
void Fl_Group::insert (
 Fl_Widget & o,
 int index)
```

The widget is removed from its current group (if any) and then inserted into this group.

It is put at index *n* - or at the end, if *n* >= [children\(\)](#). This can also be used to rearrange the widgets inside a group.

**13.57.3.21 insert()** [2/2]

```
void Fl_Group::insert (
 Fl_Widget & o,
 Fl_Widget * before) [inline]
```

This does `insert(w, find(before))`.

This will append the widget if *before* is not in the group.

**13.57.3.22 on\_insert()**

```
int Fl_Group::on_insert (
 Fl_Widget * candidate,
 int index) [protected], [virtual]
```

Allow derived groups to act when a widget is added as a child.

Widgets derived from [Fl\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to generate these data structures just before the child is added.

This method usually returns the same index that was given in the parameters. By setting a new index, the position of other widgets in the list of children can be preserved (e.g. [Fl\\_Scroll](#) keeps its scroll bars as the last two children). By returning -1, [Fl\\_Group::insert](#) will not add the child to the group. This is not recommended, but [Fl\\_Table](#) does something similar to forward children to a hidden group.

**Parameters**

<i>candidate</i>	the candidate will be added to the child vector after this method returns.
<i>index</i>	add the child at this position in the list of children

**Returns**

index to position the child as planned

a new index to force the child to a different position

-1 to keep the group from adding the candidate

Reimplemented in [Fl\\_Scroll](#), [Fl\\_Tabs](#), and [Fl\\_Tile](#).

**13.57.3.23 on\_move()**

```
int Fl_Group::on_move (
 int oldIndex,
 int newIndex) [protected], [virtual]
```

Allow derived groups to act when a widget is moved within the group.

Widgets derived from [Fl\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to move these data structures just before the child itself is moved.

This method usually returns the new index that was given in the parameters. By setting a different destination index, the position of other widgets in the list of children can be preserved.

By returning -1, [Fl\\_Group::insert](#) will not move the child.

**Parameters**

<i>oldIndex</i>	the current index of the child that will be moved
<i>newIndex</i>	the new index of the child

**Returns**

newIndex to position the child as planned  
 a different index to force the child to a different position  
 -1 to keep the group from moving the child

Reimplemented in [Fl\\_Scroll](#), [Fl\\_Tabs](#), and [Fl\\_Tile](#).

**13.57.3.24 on\_remove()**

```
void Fl_Group::on_remove (
 int index) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group.

Widgets derived from [Fl\\_Group](#) may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

**Parameters**

<i>index</i>	remove the child at this position
--------------	-----------------------------------

Reimplemented in [Fl\\_Flex](#), [Fl\\_Grid](#), [Fl\\_Tabs](#), and [Fl\\_Tile](#).

**13.57.3.25 remove() [1/3]**

```
void Fl_Group::remove (
 Fl_Widget & o)
```

Removes a widget from the group but does not delete it.

This method does nothing if the widget is not a child of the group.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

**Note**

If you have the child's index anyway, use [remove\(int index\)](#) instead, because this doesn't need a child lookup in the group's table of children. This can be much faster, if there are lots of children.

**13.57.3.26 remove() [2/3]**

```
void Fl_Group::remove (
 Fl_Widget * o) [inline]
```

Removes the widget *o* from the group.

**See also**

void [remove\(Fl\\_Widget&\)](#)

**13.57.3.27 remove() [3/3]**

```
void Fl_Group::remove (
 int index)
```

Removes the widget at *index* from the group but does not delete it.

This method does nothing if *index* is out of bounds.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

**Since**

FLTK 1.3.0

**13.57.3.28 resizable() [1/3]**

```
Fl_Widget * Fl_Group::resizable () const [inline]
```

Returns the group's resizable widget.

See void [Fl\\_Group::resizable\(Fl\\_Widget \\*\)](#)

**13.57.3.29 resizable()** [2/3]

```
void Fl_Group::resizable (
 Fl_Widget & o) [inline]
```

Sets the group's resizable widget.

See void [Fl\\_Group::resizable\(Fl\\_Widget \\*o\)](#)

**13.57.3.30 resizable()** [3/3]

```
void Fl_Group::resizable (
 Fl_Widget * o) [inline]
```

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

If the resizable is NULL the group's size is fixed and all of the widgets in the group remain a fixed size and distance from the top-left corner. This is the default for groups derived from [Fl\\_Window](#) and [Fl\\_Pack](#).

The resizable may be set to the group itself, in which case all of the widgets that are its direct children are resized proportionally. This is the default value for [Fl\\_Group](#).

The resizable widget defines the resizing box for the group, which could be the group itself or one of the group's direct children. When the group is resized it calculates a new size and position for all of its children. Widgets that are horizontally or vertically inside the dimensions of the box are scaled to the new size. Widgets outside the box are moved.

**Note**

The resizable of a group **must** be one of

- NULL
- the group itself
- a direct child of the group.

If you set any other widget that is not a direct child of the group as its resizable then the behavior is undefined. This is **not** checked by [Fl\\_Group](#) for historical reasons.

In these examples the gray area is the resizable:

**Figure 13.21 before resize**

Figure 13.22 after resize

It is possible to achieve any type of resize behavior by using an invisible [Fl\\_Box](#) as the resizable and/or by using a hierarchy of [Fl\\_Group](#) widgets, each with their own resizing strategies.

See the [How Does Resizing Work?](#) chapter for more examples and detailed explanation.

#### Note

The [resizable\(\)](#) widget of a window can also affect the window's resizing behavior if [Fl\\_Window::size\\_range\(\)](#) is not called. Please see [Fl\\_Window::default\\_size\\_range\(\)](#) for more information on how the default size range is calculated.

#### See also

[Fl\\_Window::size\\_range\(\)](#)

[Fl\\_Window::default\\_size\\_range\(\)](#)

### 13.57.3.31 [resize\(\)](#)

```
void Fl_Group::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Group](#) widget and all of its children.

The [Fl\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

#### See also

[Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Input\\_Choice](#), [Fl\\_Pack](#), [Fl\\_Scroll](#), [Fl\\_Spinner](#), [Fl\\_Table](#), [Fl\\_Terminal](#), [Fl\\_Text\\_Display](#), [Fl\\_Tile](#), [Fl\\_Window](#), [Fl\\_Help\\_View](#), [Fl\\_Overlay\\_Window](#), [Fl\\_Tabs](#), and [Fl\\_Tree](#).

### 13.57.3.32 [sizes\(\)](#)

```
int * Fl_Group::sizes () [protected]
```

Returns the internal array of widget sizes and positions.

For backward compatibility with FLTK versions before 1.4.

The [sizes\(\)](#) array stores the initial positions of widgets as (left, right, top, bottom) quads. The first quad is the group, the second is the resizable (clipped to the group), and the rest are the children. If the group and/or the [resizable\(\)](#) is a [Fl\\_Window](#), then the first (left) and third (top) entries of their respective quads (x,y) are zero.

**Deprecated** Deprecated since 1.4.0. Please use [bounds\(\)](#) instead.

#### Note

This method will be removed in a future FLTK version (1.5.0 or higher).

#### Returns

Array of int's with widget positions and sizes. The returned array is only valid until [init\\_sizes\(\)](#) is called or widgets are added to or removed from the group.

#### Note

Since FLTK 1.4.0 the returned array is a **read-only** and re-ordered copy of the internal [bounds\(\)](#) array. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call [init\\_sizes\(\)](#).

#### See also

[bounds\(\)](#)

### 13.57.3.33 update\_child()

```
void Fl_Group::update_child (
 Fl_Widget & widget) const [protected]
```

Draws a child only if it needs it.

This draws a child widget, if it is not clipped *and* if any [damage\(\)](#) bits are set. The damage bits are cleared after drawing.

#### See also

[Fl\\_Group::draw\\_child\(Fl\\_Widget& widget\) const](#)

*Sets or gets the default text size for the help view.*
- void **topline** (const char \*n)  
*Sets the top line in the [FI\\_Help\\_View](#) widget to the named or numbered line.*
- void **topline** (int n)  
*Sets the top line in the [FI\\_Help\\_View](#) widget to the named or numbered line.*
- const char \* **value** () const  
*The first form sets the current buffer to the string provided and reformats the text.*
- void **value** (const char \*f)  
*The first form sets the current buffer to the string provided and reformats the text.*
- int **visible** ()  
*Returns 1 if the [FI\\_Help\\_Dialog](#) window is visible.*
- int **w** ()  
*Returns the position and size of the help dialog.*
- int **x** ()  
*Returns the position and size of the help dialog.*
- int **y** ()  
*Returns the position and size of the help dialog.*
- ~**FI\_Help\_Dialog** ()  
*The destructor destroys the widget and frees all memory that has been allocated for the current file.*

### 13.58.1 Detailed Description

The [FI\\_Help\\_Dialog](#) widget displays a standard help dialog window using the [FI\\_Help\\_View](#) widget.

The [FI\\_Help\\_Dialog](#) class is not part of the FLTK core library, but instead of *fltk\_images*. Use `--use-images` when compiling with `fltk-config`.

P

Figure 13.23 FI\_Help\_Dialog

## 13.58.2 Member Function Documentation

### 13.58.2.1 load()

```
int Fl_Help_Dialog::load (
 const char * f)
```

Loads the specified HTML file into the [Fl\\_Help\\_View](#) widget.

The filename can also contain a target name ("filename.html#target"). Always use forward slashes as path delimiters, Windows-style backslashes are not supported here.

#### Parameters

<code>in</code>	<code>f</code>	the name and path of an HTML file
-----------------	----------------	-----------------------------------

#### Returns

0 on success, -1 on error

#### See also

[Fl\\_Help\\_View::load\(\)](#), [fl\\_load\\_uri\(\)](#)

### 13.58.2.2 show()

```
void Fl_Help_Dialog::show ()
```

Shows the [Fl\\_Help\\_Dialog](#) window.

Shows the main Help Dialog Window Delegates call to encapsulated window\_ void [Fl\\_Window::show\(\)](#) method.

### 13.58.2.3 textsize()

```
void Fl_Help_Dialog::textsize (
 Fl_Fontsize s)
```

Sets or gets the default text size for the help view.

Sets the internal [Fl\\_Help\\_View](#) instance text size.

Delegates call to encapsulated view\_ void [Fl\\_Help\\_View::textsize\(Fl\\_Fontsize s\)](#) instance method

### 13.58.2.4 value() [1/2]

```
const char * Fl_Help_Dialog::value () const
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

### 13.58.2.5 value() [2/2]

```
void Fl_Help_Dialog::value (
 const char * v)
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

The documentation for this class was generated from the following files:

- [Fl\\_Help\\_Dialog.H](#)
- [Fl\\_Help\\_Dialog.cxx](#)
- [Fl\\_Help\\_Dialog\\_Dox.cxx](#)

## 13.59 Fl\_Help\_View Class Reference

A widget to display formatted text, formatted in a subset of HTML.

```
#include <Fl_Help_View.H>
```

Inheritance diagram for Fl\_Help\_View:

### Public Member Functions

- void **clear\_selection** ()  
*Removes the current text selection.*
- int **copy** (int clipboard=1)  
*If text is selected in this view, copy it to a clipboard.*
- const char \* **directory** () const  
*Return the current directory for the text in the buffer.*
- const char \* **filename** () const  
*Return the current filename for the text in the buffer.*
- int **find** (const char \*s, int p=0)  
*Finds the specified string s at starting position p.*
- **Fl\_Help\_View** (int xx, int yy, int ww, int hh, const char \*l=0)  
*Creates the Fl\_Help\_View widget at the specified position and size.*
- int **handle** (int) override  
*Handles events in the widget.*
- **Fl\_Scrollbar** \* **hscrollbar** ()  
*Return pointer to horizontal scrollbar.*
- int **leftline** () const  
*Get the left position in pixels.*
- void **leftline** (int)  
*Scrolls the text to the indicated position, given a pixel column.*
- void **link** (Fl\_Help\_Func \*fn)  
*Set a callback function for following links.*
- int **load** (const char \*f)  
*Loads the specified file.*
- void **resize** (int, int, int, int) override  
*Override the superclass's resize method.*
- **Fl\_Scrollbar** \* **scrollbar** ()  
*Return pointer to vertical scrollbar.*
- int **scrollbar\_size** () const  
*Get the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)  
*Set the pixel size of the scrollbars' troughs to newSize, in pixels.*
- void **select\_all** ()  
*Selects all the text in the view.*
- int **size** () const  
*Return the document height in pixels.*
- void **size** (int W, int H)
- int **text\_selected** () const  
*Check if the user selected text in this view.*

- **FL\_Color** **textcolor** () const  
*Return the current default text color.*
- void **textcolor** (**FL\_Color** c)  
*Set the default text color.*
- **FL\_Font** **textfont** () const  
*Return the default text font.*
- void **textfont** (**FL\_Font** f)  
*Set the default text font.*
- **FL\_Fontsize** **textsize** () const  
*Get the default text size.*
- void **textsize** (**FL\_Fontsize** s)  
*Set the default text size.*
- const char \* **title** () const  
*Return the title of the current document.*
- int **topline** () const  
*Get the current top line in pixels.*
- void **topline** (const char \*n)  
*Scroll the text to the given anchor.*
- void **topline** (int)  
*Scrolls the text to the indicated position, given a pixel line.*
- const char \* **value** () const  
*Return a pointer to the internal text buffer.*
- void **value** (const char \*val)  
*Sets the current help text buffer to the string provided and reformats the text.*
- **~FL\_Help\_View** () override  
*Destroys the **FL\_Help\_View** widget.*

## Public Member Functions inherited from **FL\_Group**

- **FL\_Widget** \*& **\_ddfdesign\_kludge** ()  
*This is for forms compatibility only.*
- void **add** (**FL\_Widget** &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** (**FL\_Widget** \*o)  
*See void **FL\_Group::add(FL\_Widget &w)***
- void **add\_resizable** (**FL\_Widget** &o)  
*Adds a widget to the group and makes it the resizable widget.*
- **FL\_Widget** \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- **FL\_Group** const \* **as\_group** () const override
- **FL\_Group** \* **as\_group** () override  
*Returns an **FL\_Group** pointer if this widget is an **FL\_Group**.*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- **FL\_Widget** \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const

- Returns the current clipping mode.*
- void `clip_children` (int c)
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int `delete_child` (int n)
  - Removes the widget at `index` from the group and deletes it.*
- void `end` ()
  - Exactly the same as `current(this->parent())`.*
- int `find` (const `FL_Widget` &o) const
  - See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` \*) const
  - Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \*s=0)
  - Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()
  - This is for forms compatibility only.*
- void `init_sizes` ()
  - Resets the internal array of widget sizes and positions.*
- void `insert` (`FL_Widget` &, int i)
  - The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)
  - This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)
  - Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)
  - Removes the widget o from the group.*
- void `remove` (int index)
  - Removes the widget at `index` from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const
  - Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)
  - Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual `~FL_Group` ()
  - The destructor also deletes all the children.*

## Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  - Activates the widget.*
- unsigned int `active` () const
  - Returns whether the widget is active.*
- int `active_r` () const
  - Returns whether the widget and all of its parents are active.*
- `FL_Align` `align` () const
  - Gets the label alignment.*
- void `align` (`FL_Align` alignment)
  - Sets the label alignment.*
- long `argument` () const

- Gets the current user data (long) argument that is passed to the callback function.*

    - void [argument](#) (long v)
  - Sets the current user data (long) argument that is passed to the callback function.*

    - virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()

*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

    - virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
    - virtual [FI\\_Window](#) \* [as\\_window](#) ()

*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

    - virtual [FI\\_Window](#) const \* [as\\_window](#) () const
    - void [bind\\_deimage](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

    - void [bind\\_deimage](#) (int f)

*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

    - void [bind\\_image](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*

    - void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

  - [FI\\_Boxtype](#) [box](#) () const
- Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)
- Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const
- Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)
- Clears or sets the damage flags.*
- void [clear\\_output](#) ()
- Sets a widget to accept input.*
- void [clear\\_visible](#) ()
- Hides the widget.*
- void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const
- Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)
- Sets the background color of the widget.*

- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FL\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

- Sets the image to use as part of the widget label when in the active state.*

  - int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FL_Color` c)

*Sets the label color.*
- `FL_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FL_Font` f)

*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const

*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)

*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const

*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)

*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FL_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FL_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*

- [FI\\_Color selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

- Get the spacing between the label and the vertical edge of the widget.*

  - void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `FL_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (uchar i)

*Sets the flags used to decide when a callback is called.*
- `FL_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~FL_Widget` ()

*Destroys the widget.*

### Static Public Attributes

- static const char \* `copy_menu_text` = "Copy"

*This text may be customized at run-time.*

### Protected Member Functions

- void `draw` () override

*Draws the `FL_Help_View` widget.*

### Protected Member Functions inherited from `FL_Group`

- `FL_Rect` \* `bounds` ()

*Returns the internal array of widget sizes and positions.*
- void `draw_child` (`FL_Widget` &widget) const

*Forces a child to redraw.*
- void `draw_children` ()

*Draws all children of the group.*
- void `draw_outside_label` (const `FL_Widget` &widget) const

*Parents normally call this to draw outside labels of child widgets.*
- virtual int `on_insert` (`FL_Widget` \*, int)

*Allow derived groups to act when a widget is added as a child.*
- virtual int `on_move` (int, int)

*Allow derived groups to act when a widget is moved within the group.*
- virtual void `on_remove` (int)

*Allow derived groups to act when a child widget is removed from the group.*

- `int * sizes ()`  
*Returns the internal array of widget sizes and positions.*
- `void update_child (FI_Widget &widget) const`  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from FI\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FI_Boxtype t, FI_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FI_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*
- `void h (int v)`  
*Internal use only.*
- `void set_flag (unsigned int c)`  
*Sets a flag in the flags mask.*
- `void w (int v)`  
*Internal use only.*
- `void x (int v)`  
*Internal use only.*
- `void y (int v)`  
*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Group

- `static FI_Group * current ()`  
*Returns the currently active group.*
- `static void current (FI_Group *g)`  
*Sets the current group.*

## Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from [FI\\_Widget](#)

- enum {  
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,  
[FORCE\\_POSITION](#) = 1<<4 , [NON\\_MODAL](#) = 1<<5 , [SHORTCUT\\_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7  
, [OVERRIDE](#) = 1<<8 , [VISIBLE\\_FOCUS](#) = 1<<9 , [COPIED\\_LABEL](#) = 1<<10 , [CLIP\\_CHILDREN](#) = 1<<11  
, [MENU\\_WINDOW](#) = 1<<12 , [TOOLTIP\\_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO\\_OVERLAY](#) = 1<<15  
, [GROUP\\_RELATIVE](#) = 1<<16 , [COPIED\\_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC\\_USE\\_ACCENTS\\_MENU](#)  
= 1<<19 ,  
[NEEDS\\_KEYBOARD](#) = 1<<20 , [IMAGE\\_BOUND](#) = 1<<21 , [DEIMAGE\\_BOUND](#) = 1<<22 ,  
[AUTO\\_DELETE\\_USER\\_DATA](#) = 1<<23 ,  
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,  
[USERFLAG1](#) = 1<<31 }  
*flags possible values enumeration.*

### 13.59.1 Detailed Description

A widget to display formatted text, formatted in a subset of HTML.

The [FI\\_Help\\_View](#) widget displays HTML text. Most HTML 2.0 elements are supported, as well as a primitive implementation of tables. GIF, JPEG, and PNG images are displayed inline.

Supported HTML tags:

- A: HREF/NAME
- B
- BODY: BGCOLOR/TEXT/LINK
- BR
- CENTER
- CODE
- DD
- DL
- DT
- EM
- FONT: COLOR/SIZE/FACE=(helvetica/arial/sans/times/serif/symbol/courier)
- H1/H2/H3/H4/H5/H6
- HEAD
- HR
- I

- IMG: SRC/WIDTH/HEIGHT/ALT
- KBD
- LI
- OL
- P
- PRE
- STRONG
- TABLE: TH/TD/TR/BORDER/BGCOLOR/COLSPAN/ALIGN=CENTER|RIGHT|LEFT
- TITLE
- TT
- U
- UL
- VAR

Supported color names:

- black,red,green,yellow,blue,magenta,fuchsia,cyan,aqua,white,gray,grey,lime,maroon,navy,olive,purple,silver,teal.

Supported urls:

- Internal: file:
- External: http: ftp: https: ipp: mailto: news:

Quoted char names:

- Aacute aacute Acirc acirc acute AElig aelig Agrave agrave amp Aring aring Atilde atilde Auml auml
- brvbar bull

- Uacute uacute Ucirc ucirc Ugrave ugrave uml Uuml uuml
- Yacute yacute
- yen Yuml yuml

#### Note

You can't effectively set the `box()` to `FL_NO_BOX`, this would result in `FL_DOWN_BOX` being used as the boxtype of the widget. This is unexpected but can't be changed for backwards compatibility. If you don't want a frame around the widget you can use `FL_FLAT_BOX` instead.

## 13.59.2 Constructor & Destructor Documentation

### 13.59.2.1 Fl\_Help\_View()

```
Fl_Help_View::Fl_Help_View (
 int xx,
 int yy,
 int ww,
 int hh,
 const char * l = 0)
```

Creates the `Fl_Help_View` widget at the specified position and size.

#### Parameters

in	<i>xx,yy,ww,hh</i>	Position and size of the widget
in	<i>l</i>	Label for the widget, can be nullptr

### 13.59.2.2 ~Fl\_Help\_View()

```
Fl_Help_View::~~Fl_Help_View () [override]
```

Destroys the `Fl_Help_View` widget.

The destructor destroys the widget and frees all memory that has been allocated for the current document.

## 13.59.3 Member Function Documentation

### 13.59.3.1 copy()

```
int Fl_Help_View::copy (
 int clipboard = 1)
```

If text is selected in this view, copy it to a clipboard.

#### Parameters

in	<i>clipboard</i>	for x11 only, 0=selection buffer, 1=clipboard, 2=both
----	------------------	-------------------------------------------------------

#### Returns

1 if text is selected, 0 if no text is selected

### 13.59.3.2 directory()

```
const char * Fl_Help_View::directory () const
```

Return the current directory for the text in the buffer.

`Fl_Help_View` remains the owner of the allocated memory. If the directory changes, the returned pointer will become stale.

**Returns**

nullptr if the directory name is empty

**13.59.3.3 draw()**

```
void Fl_Help_View::draw (
 void) [override], [protected], [virtual]
```

Draws the [Fl\\_Help\\_View](#) widget.

Reimplemented from [Fl\\_Group](#).

**13.59.3.4 filename()**

```
const char * Fl_Help_View::filename () const
```

Return the current filename for the text in the buffer.

[Fl\\_Help\\_View](#) remains the owner of the allocated memory. If the filename changes, the returned pointer will become stale.

**Returns**

nullptr if the filename is empty

**13.59.3.5 find()**

```
int Fl_Help_View::find (
 const char * s,
 int p = 0)
```

Finds the specified string *s* at starting position *p*.

The argument *p* and the return value are offsets in [Fl\\_Help\\_View::value\(\)](#), counting from 0. If *p* is out of range, 0 is used.

The string comparison is simple but honors some special cases:

- the specified string *s* must be in UTF-8 encoding
- HTML tags in [value\(\)](#) are filtered (not compared as such, they never match)
- HTML entities like '&lt;';' or '&#x20ac;';' are converted to Unicode (UTF-8)
- ASCII characters (7-bit, < 0x80) are compared case insensitive
- every newline (LF, '\n') in [value\(\)](#) is treated like a single space
- all other strings are compared as-is (byte by byte)

**Parameters**

in	<i>s</i>	search string in UTF-8 encoding
in	<i>p</i>	starting position for search (0,...), Default = 0

**Returns**

the matching position or -1 if not found

**13.59.3.6 handle()**

```
int Fl_Help_View::handle (
 int event) [override], [virtual]
```

Handles events in the widget.

## Parameters

in	<i>event</i>	Event to handle.
----	--------------	------------------

## Returns

1 if the event was handled, 0 otherwise.

Reimplemented from [Fl\\_Group](#).

**13.59.3.7 leftline()**

```
void Fl_Help_View::leftline (
 int left)
```

Scrolls the text to the indicated position, given a pixel column.

If the given pixel value `left` is out of range, then the text is scrolled to the left or right side of the document, resp.

## Parameters

in	<i>left</i>	left column number in pixels (0 = left side)
----	-------------	----------------------------------------------

**13.59.3.8 link()**

```
void Fl_Help_View::link (
 Fl_Help_Func * fn)
```

Set a callback function for following links.

This method assigns a callback function to use when a link is followed or a file is loaded (via [Fl\\_Help\\_View::load\(\)](#)) that requires a different file or path.

The callback function receives a pointer to the [Fl\\_Help\\_View](#) widget and the URI or full pathname for the file in question. It must return a pathname that can be opened as a local file or nullptr:

```
const char *fn(Fl_Widget *w, const char *uri);
```

The link function can be used to retrieve remote or virtual documents, returning a temporary file that contains the actual data. If the link function returns nullptr, the value of the [Fl\\_Help\\_View](#) widget will remain unchanged.

If the link callback cannot handle the URI scheme, it should return the uri value unchanged or set the [value\(\)](#) of the widget before returning nullptr.

## Parameters

in	<i>fn</i>	Pointer to the callback function
----	-----------	----------------------------------

**13.59.3.9 load()**

```
int Fl_Help_View::load (
 const char * f)
```

Loads the specified file.

This method loads the specified file or URL. The filename may end in a `#name` style target.

If the URL starts with *ftp*, *http*, *https*, *ipp*, *mailto*, or *news*, followed by a colon, FLTK will use [fl\\_open\\_uri\(\)](#) to show the requested page in an external browser.

In all other cases, the URL is interpreted as a filename. The file is read and displayed in this browser. Note that Windows style backslashes are not supported in the file name.

## Parameters

in	<i>f</i>	filename or URL
----	----------	-----------------

**Returns**

0 on success, -1 on error

**See also**

[fl\\_open\\_uri\(\)](#)

**13.59.3.10 resize()**

```
void Fl_Help_View::resize (
 int xx,
 int yy,
 int ww,
 int hh) [override], [virtual]
```

Override the superclass's resize method.

**Parameters**

in	<i>xx,yy,ww,hh</i>	New position and size of the widget
----	--------------------	-------------------------------------

Reimplemented from [Fl\\_Group](#).

**13.59.3.11 scrollbar\_size() [1/2]**

```
int Fl_Help_View::scrollbar_size () const
```

Get the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**13.59.3.12 scrollbar\_size() [2/2]**

```
void Fl_Help_View::scrollbar_size (
 int newSize)
```

Set the pixel size of the scrollbars' troughs to *newSize*, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting *newSize* to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

**Parameters**

in	<i>newSize</i>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
----	----------------	-----------------------------------------------------------------------------------------------------------------------------

**See also**

[Fl::scrollbar\\_size\(\)](#)

**13.59.3.13 text\_selected()**

```
int Fl_Help_View::text_selected () const
```

Check if the user selected text in this view.

**Returns**

1 if text is selected, 0 if no text is selected

**13.59.3.14 title()**

```
const char * Fl_Help_View::title () const
```

Return the title of the current document.

[Fl\\_Help\\_View](#) remains the owner of the allocated memory. If the document changes, the returned pointer will become stale.

**Returns**

empty string if the directory name is empty

**13.59.3.15 topline() [1/2]**

```
void Fl_Help_View::topline (
 const char * anchor)
```

Scroll the text to the given anchor.

**Parameters**

in	<i>anchor</i>	scroll to this named anchor
----	---------------	-----------------------------

**13.59.3.16 topline() [2/2]**

```
void Fl_Help_View::topline (
 int top)
```

Scrolls the text to the indicated position, given a pixel line.

If the given pixel value `top` is out of range, then the text is scrolled to the top or bottom of the document, resp.

**Parameters**

in	<i>top</i>	top line number in pixels (0 = start of document)
----	------------	---------------------------------------------------

**13.59.3.17 value()**

```
void Fl_Help_View::value (
 const char * val)
```

Sets the current help text buffer to the string provided and reformats the text.

The provided character string `val` is copied internally and will be freed when [value\(\)](#) is called again, or when the widget is destroyed.

If `val` is nullptr, then the widget is cleared.

**Parameters**

in	<i>val</i>	Text to view, or nullptr to clear the widget, <a href="#">Fl_Help_View</a> will creat a local copy of the string.
----	------------	-------------------------------------------------------------------------------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Help\\_View.H](#)
- [Fl\\_Help\\_View.cxx](#)

## 13.60 Fl\_Hold\_Browser Class Reference

The [Fl\\_Hold\\_Browser](#) is a subclass of [Fl\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

```
#include <Fl_Hold_Browser.H>
```

Inheritance diagram for [Fl\\_Hold\\_Browser](#):

### Public Member Functions

- [Fl\\_Hold\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Hold\\_Browser](#) widget using the given position, size, and label string.*

### Public Member Functions inherited from [Fl\\_Browser](#)

- void [add](#) (const char \*newtext, void \*d=0)  
*Adds a new line to the end of the browser.*
- void [bottomline](#) (int line)  
*Scrolls the browser so the bottom item in the browser is showing the specified *line*.*
- void [clear](#) ()  
*Removes all the lines in the browser.*
- char [column\\_char](#) () const  
*Gets the current column separator character.*
- void [column\\_char](#) (char c)  
*Sets the column separator to *c*.*
- const int \* [column\\_widths](#) () const  
*Gets the current column width array.*
- void [column\\_widths](#) (const int \*arr)  
*Sets the current array to *arr*.*
- void \* [data](#) (int line) const  
*Returns the user *data()* for specified *line*.*
- void [data](#) (int line, void \*d)  
*Sets the user data for specified *line* to *d*.*
- void [display](#) (int line, int val=1)  
*For back compatibility.*
- int [displayed](#) (int line) const  
*Returns non-zero if *line* has been scrolled to a position where it is being displayed.*
- [Fl\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor makes an empty browser.*
- char [format\\_char](#) () const  
*Gets the current format code prefix character, which by default is '@'.*

- void **format\_char** (char c)  
*Sets the current format code prefix character to c.*
- void **hide** () override  
*Hides the entire [FL\\_Browser](#) widget – opposite of [show\(\)](#).*
- void **hide** (int line)  
*Makes line invisible, preventing selection by the user.*
- [FL\\_Image](#) \* **icon** (int line) const  
*Returns the icon currently defined for line.*
- void **icon** (int line, [FL\\_Image](#) \*icon)  
*Set the image icon for line to the value icon.*
- void **insert** (int line, const char \*newtext, void \*d=0)  
*Insert a new entry whose label is newtext above given line, optional data d.*
- void **lineposition** (int line, [FL\\_Line\\_Position](#) pos)  
*Updates the browser so that line is shown at position pos.*
- int **load** (const char \*filename)  
*Clears the browser and reads the file, adding each line from the file to the browser.*
- void **make\_visible** (int line)  
*Make the item at the specified line [visible\(\)](#).*
- void **middleline** (int line)  
*Scrolls the browser so the middle item in the browser is showing the specified line.*
- void **move** (int to, int from)  
*Line from is removed and reinserted at to.*
- void **remove** (int line)  
*Remove entry for given line number, making the browser one line shorter.*
- void **remove\_icon** (int line)  
*Removes the icon for line.*
- void **replace** (int a, const char \*b)  
*For back compatibility only.*
- int **select** (int line, int val=1)  
*Sets the selection state of the item at line to the value val.*
- int **selected** (int line) const  
*Returns 1 if specified line is selected, 0 if not.*
- void **show** () override  
*Shows the entire [FL\\_Browser](#) widget – opposite of [hide\(\)](#).*
- void **show** (int line)  
*Makes line visible, and available for selection by user.*
- int **size** () const  
*Returns how many lines are in the browser.*
- void **size** (int W, int H)
- void **swap** (int a, int b)  
*Swaps two browser lines a and b.*
- const char \* **text** (int line) const  
*Returns the label text for the specified line.*
- void **text** (int line, const char \*newtext)  
*Sets the text for the specified line to newtext.*
- [FL\\_Fontsize](#) **textsize** () const  
*Gets the default text size (in pixels) for the lines in the browser.*
- void **textsize** ([FL\\_Fontsize](#) newSize)  
*Sets the default text size (in pixels) for the lines in the browser to newSize.*
- int **topline** () const  
*Returns the line that is currently visible at the top of the browser.*

- void **topline** (int line)  
*Scrolls the browser so the top item in the browser is showing the specified line.*
- int **value** () const  
*Returns the line number of the currently selected line, or 0 if none selected.*
- void **value** (int line)  
*Sets the browser's value(), which selects the specified line.*
- int **visible** (int line) const  
*Returns non-zero if the specified line is visible, 0 if hidden.*
- ~**FI\_Browser** ()  
*The destructor deletes all list items and destroys the browser.*

## Public Member Functions inherited from FI\_Browser\_

- int **deselect** (int docallbacks=0)  
*Deselects all items in the list and returns 1 if the state changed or 0 if it did not.*
- void **display** (void \*item)  
*Displays the item, scrolling the list as necessary.*
- int **handle** (int event) override  
*Handles the event within the normal widget bounding box.*
- uchar **has\_scrollbar** () const  
*Returns the current scrollbar mode, see FI\_Browser\_::has\_scrollbar(uchar)*
- void **has\_scrollbar** (uchar mode)  
*Sets whether the widget should have scrollbars or not (default FI\_Browser\_::BOTH).*
- int **hposition** () const  
*Gets the horizontal scroll position of the list as a pixel position pos.*
- void **hposition** (int)  
*Sets the horizontal scroll position of the list to pixel position pos.*
- int **linespacing** () const  
*Return the height of additional spacing between browser lines.*
- void **linespacing** (int pixels)  
*Add some space between browser lines.*
- int **position** () const
- void **position** (int pos)
- void **position** (int x, int y)
- void **resize** (int X, int Y, int W, int H) override  
*Repositions and/or resizes the browser.*
- void **scrollbar\_left** ()  
*Moves the vertical scrollbar to the lefthand side of the list.*
- void **scrollbar\_right** ()  
*Moves the vertical scrollbar to the righthand side of the list.*
- int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- int **select** (void \*item, int val=1, int docallbacks=0)  
*Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.*
- int **select\_only** (void \*item, int docallbacks=0)  
*Selects item and returns 1 if the state changed or 0 if it did not.*
- void **sort** (int flags=0)  
*Sort the items in the browser based on flags.*
- FI\_Color **textcolor** () const

- Gets the default text color for the lines in the browser.*
- void **textcolor** ([FL\\_Color](#) col)
  - Sets the default text color for the lines in the browser to color `col`.*
- [FL\\_Font](#) **textfont** () const
  - Gets the default text font for the lines in the browser.*
- void **textfont** ([FL\\_Font](#) font)
  - Sets the default text font for the lines in the browser to `font`.*
- [FL\\_Fontsize](#) **textsize** () const
  - Gets the default text size (in pixels) for the lines in the browser.*
- void **textsize** ([FL\\_Fontsize](#) newSize)
  - Sets the default text size (in pixels) for the lines in the browser to `size`.*
- int **vposition** () const
  - Gets the vertical scroll position of the list as a pixel position `pos`.*
- void **vposition** (int pos)
  - Sets the vertical scroll position of the list to pixel position `pos`.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \***&\_ddfdesign\_kludge** ()
  - This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)
  - The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)
  - See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)
  - Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const
  - Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override
  - Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()
  - Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const
  - Returns the `n`'th child.*
- int **children** () const
  - Returns how many child widgets the group has.*
- void **clear** ()
  - Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const
  - Returns the current clipping mode.*
- void **clip\_children** (int c)
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)
  - Removes the widget at `index` from the group and deletes it.*
- void **end** ()
  - Exactly the same as `current(this->parent())`.*
- int **find** (const [FL\\_Widget](#) &o) const
  - See int [FL\\_Group::find\(const FL\\_Widget \\*w\) const](#).*
- int **find** (const [FL\\_Widget](#) \*) const
  - Searches the children for the widget and returns the index.*

- **FL\_Group** (int, int, int, int, const char \* = 0)  
*Creates a new **FL\_Group** widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- int **handle** (int) override  
*Handles the specified event.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** (**FL\_Widget** &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** (**FL\_Widget** & o, **FL\_Widget** \* before)  
*This does insert(w, find(before)).*
- void **remove** (**FL\_Widget** &)  
*Removes a widget from the group but does not delete it.*
- void **remove** (**FL\_Widget** \* o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at index from the group but does not delete it.*
- **FL\_Widget** \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (**FL\_Widget** & o)  
*Sets the group's resizable widget.*
- void **resizable** (**FL\_Widget** \* o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- void **resize** (int, int, int, int) override  
*Resizes the **FL\_Group** widget and all of its children.*
- virtual ~**FL\_Group** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from **FL\_Widget**

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FL\_Align** **align** () const  
*Gets the label alignment.*
- void **align** (**FL\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FL\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an **FL\_Gl\_Window** pointer if this widget is an **FL\_Gl\_Window**.*
- virtual class **FL\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FL\_Window** \* **as\_window** ()

- Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*

  - virtual [FL\\_Window](#) const \* **as\_window** () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)

*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) **box** () const

*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) **callback** () const

*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

*Sets a widget to accept input.*
- void [clear\\_visible](#) ()

*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) **color** () const

*Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)

*Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)

*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const

*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

- Sets the current tooltip text.*
- `uchar damage () const`
  - Returns non-zero if `draw()` needs to be called.*
- `void damage (uchar c)`
  - Sets the damage bits for the widget.*
- `void damage (uchar c, int x, int y, int w, int h)`
  - Sets the damage bits for an area inside the widget.*
- `int damage_resize (int, int, int, int)`
  - Internal use only.*
- `void deactivate ()`
  - Deactivates the widget.*
- `FL_Image * deimage ()`
  - Gets the image that is used as part of the widget label when in the inactive state.*
- `const FL_Image * deimage () const`
  - Gets the image that is used as part of the widget label when in the inactive state.*
- `void deimage (FL_Image &img)`
  - Sets the image to use as part of the widget label when in the inactive state.*
- `void deimage (FL_Image *img)`
  - Sets the image to use as part of the widget label when in the inactive state.*
- `int deimage_bound () const`
  - Returns whether the inactive image is managed by the widget.*
- `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with default arguments.*
- `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with arbitrary arguments.*
- `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
  - Calls the widget callback function with arbitrary arguments.*
- `void draw_label (int, int, int, int, FL_Align) const`
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- `int h () const`
  - Gets the widget height.*
- `int horizontal_label_margin ()`
  - Get the spacing between the label and the horizontal edge of the widget.*
- `void horizontal_label_margin (int px)`
  - Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image * image ()`
  - Gets the image that is used as part of the widget label when in the active state.*
- `const FL_Image * image () const`
  - Gets the image that is used as part of the widget label when in the active state.*
- `void image (FL_Image &img)`
  - Sets the image to use as part of the widget label when in the active state.*
- `void image (FL_Image *img)`
  - Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`
  - Returns whether the image is managed by the widget.*
- `int inside (const FL_Widget *wgt) const`
  - Checks if this widget is a child of `wgt`.*
- `int is_label_copied () const`
  - Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`
  - Gets the current label text.*

- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) (FI\_Labeltype a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- FI\_Color [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) (FI\_Color c)  
*Sets the label color.*
- FI\_Font [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) (FI\_Font f)  
*Sets the font to use.*
- FI\_Fonsize [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) (FI\_Fonsize pix)  
*Sets the font size in pixels.*
- FI\_Labeltype [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) (FI\_Labeltype a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- FI\_Group \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) (FI\_Group \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- FI\_Color [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) (FI\_Color a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()

*Sets a widget to output only.*
- void [set\\_visible](#) ()

*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*

- `int w () const`  
*Gets the widget width.*
- `FI_When when () const`  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `FI_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FI_Widget ()`  
*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from `FI_Browser`

- `enum FI_Line_Position { TOP , BOTTOM , MIDDLE }`  
*For internal use only?*

### Public Types inherited from `FI_Browser_`

- `enum {`  
`HORIZONTAL = 1 , VERTICAL = 2 , BOTH = 3 , ALWAYS_ON = 4 ,`  
`HORIZONTAL_ALWAYS = 5 , VERTICAL_ALWAYS = 6 , BOTH_ALWAYS = 7 }`  
*Values for `has_scrollbar()`.*

### Static Public Member Functions inherited from `FI_Group`

- `static FI_Group * current ()`  
*Returns the currently active group.*
- `static void current (FI_Group *g)`  
*Sets the current group.*

### Static Public Member Functions inherited from `FI_Widget`

- `static void default_callback (FI_Widget *widget, void *data)`  
*The default callback for all widgets that don't set a callback.*
- `static unsigned int label_shortcut (const char *t)`  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- `static int test_shortcut (const char *, const bool require_alt=false)`  
*Returns true if the given text `t` contains the entered '&x' shortcut.*

### Public Attributes inherited from `FI_Browser_`

- `FI_Scrollbar hscrollbar`  
*Horizontal scrollbar.*
- `FI_Scrollbar scrollbar`  
*Vertical scrollbar.*

- const char \* **bline\_txt** (const FL\_BLINE \*b) const  
*Get FL\_BLINE text.*
- char \* **bline\_txt** (FL\_BLINE \*b) const  
*Get writable reference to FL\_BLINE text.*
- FL\_BLINE \* **find\_line** (int line) const  
*Returns the item for specified line.*
- int **full\_height** () const override  
*The height of the entire list of all [visible\(\)](#) items in pixels.*
- int **incr\_height** () const override  
*The default 'average' item height (including inter-item spacing) in pixels.*
- void **insert** (int line, FL\_BLINE \*item)  
*Insert specified item above line.*
- void \* **item\_at** (int line) const override  
*Return the item at specified line.*
- void **item\_draw** (void \*item, int X, int Y, int W, int H) const override  
*Draws item at the position specified by X Y W H.*
- void \* **item\_first** () const override

- Returns the very first item in the list.*

  - int [item\\_height](#) (void \*item) const override

*Returns height of *item* in pixels.*
- void \* [item\\_last](#) () const override

*Returns the very last item in the list.*
- void \* [item\\_next](#) (void \*item) const override

*Returns the next item after *item*.*
- void \* [item\\_prev](#) (void \*item) const override

*Returns the previous item before *item*.*
- void [item\\_select](#) (void \*item, int val) override

*Change the selection state of *item* to the value *val*.*
- int [item\\_selected](#) (void \*item) const override

*See if *item* is selected.*
- void [item\\_swap](#) (void \*a, void \*b) override

*Swap the items *a* and *b*.*
- const char \* [item\\_text](#) (void \*item) const override

*Returns the label text for *item*.*
- int [item\\_width](#) (void \*item) const override

*Returns width of *item* in pixels.*
- int [lineno](#) (void \*item) const

*Returns line number corresponding to *item*, or zero if not found.*
- void [swap](#) (FL\_BLINE \*a, FL\_BLINE \*b)

*Swap the two items *a* and *b*.*

### Protected Member Functions inherited from [FI\\_Browser\\_](#)

- void [bbox](#) (int &X, int &Y, int &W, int &H) const

*Returns the bounding box for the interior of the list's display window, inside the scrollbars.*
- void [deleting](#) (void \*item)

*This method should be used when *item* is being deleted from the list.*
- int [displayed](#) (void \*item) const

*Returns non-zero if *item* has been scrolled to a position where it is being displayed.*
- void [draw](#) () override

*Draws the list within the normal widget bounding box.*
- void \* [find\\_item](#) (int ypos)

*This method returns the item under mouse *y* position *ypos*.*
- [FI\\_Browser\\_](#) (int X, int Y, int W, int H, const char \*L=0)

*The constructor makes an empty browser.*
- virtual int [full\\_width](#) () const

*This method may be provided by the subclass to indicate the full width of the item list, in pixels.*
- void [inserting](#) (void \*a, void \*b)

*This method should be used when an item is in the process of being inserted into the list.*
- virtual int [item\\_quick\\_height](#) (void \*item) const

*This method may be provided by the subclass to return the height of the *item*, in pixels.*
- int [leftedge](#) () const

*This method returns the *X* position of the left edge of the list area after adjusting for the scrollbar and border, if any.*
- void [new\\_list](#) ()

*This method should be called when the list data is completely replaced or cleared.*
- void [redraw\\_line](#) (void \*item)

*This method should be called when the contents of *item* has changed, but not its height.*
- void [redraw\\_lines](#) ()

*This method will cause the entire list to be redrawn.*

- void **replacing** (void \*a, void \*b)

*This method should be used when item a is being replaced by item b.*

- void \* **selection** () const

*Returns the item currently selected, or NULL if there is no selection.*

- void **swapping** (void \*a, void \*b)

*This method should be used when two items a and b are being swapped.*

- void \* **top** () const

*Returns the item that appears at the top of the list.*

## Protected Member Functions inherited from FI\_Group

- FI\_Rect \* **bounds** ()

*Returns the internal array of widget sizes and positions.*

- void **draw** () override

*Draws the widget.*

- void **draw\_child** (FI\_Widget &widget) const

*Forces a child to redraw.*

- void **draw\_children** ()

*Draws all children of the group.*

- void **draw\_outside\_label** (const FI\_Widget &widget) const

*Parents normally call this to draw outside labels of child widgets.*

- virtual int **on\_insert** (FI\_Widget \*, int)

*Allow derived groups to act when a widget is added as a child.*

- virtual int **on\_move** (int, int)

*Allow derived groups to act when a widget is moved within the group.*

- virtual void **on\_remove** (int)

*Allow derived groups to act when a child widget is removed from the group.*

- int \* **sizes** ()

*Returns the internal array of widget sizes and positions.*

- void **update\_child** (FI\_Widget &widget) const

*Draws a child only if it needs it.*

## Protected Member Functions inherited from FI\_Widget

- void **clear\_flag** (unsigned int c)

*Clears a flag in the flags mask.*

- void **draw\_backdrop** () const

*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*

- void **draw\_box** () const

*Draws the widget box according to its box style.*

- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const

*Draws a box of type t, of color c at the widget's position and size.*

- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const

*Draws a box of type t, of color c at the position X,Y and size W,H.*

- void **draw\_focus** () const

*Draws a focus rectangle around the widget.*

- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const

*Draws a focus rectangle around the widget.*

- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const

*Draws a focus box for the widget at the given position and size.*

- void **draw\_label** () const

- Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `Fl_Widget` (int `x`, int `y`, int `w`, int `h`, const char \*`label=0L`)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int `v`)  
*Internal use only.*
- void `set_flag` (unsigned int `c`)  
*Sets a flag in the flags mask.*
- void `w` (int `v`)  
*Internal use only.*
- void `x` (int `v`)  
*Internal use only.*
- void `y` (int `v`)  
*Internal use only.*

## Static Protected Attributes inherited from `Fl_Browser`

- static constexpr char `BLINE_NOTDISPLAYED` = 2
- static constexpr char `BLINE_SELECTED` = 1

### 13.60.1 Detailed Description

The `Fl_Hold_Browser` is a subclass of `Fl_Browser` which lets the user select a single item, or no items by clicking on the empty space.

Figure 13.24 `Fl_Hold_Browser`

As long as the mouse button is held down the item pointed to by it is highlighted, and this highlighting remains on when the mouse button is released. Normally the callback is done when the user releases the mouse, but you can change this with `when()`.

See `Fl_Browser` for methods to add and remove lines from the browser.

### 13.60.2 Constructor & Destructor Documentation

#### 13.60.2.1 `Fl_Hold_Browser()`

```
Fl_Hold_Browser::Fl_Hold_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Hold_Browser` widget using the given position, size, and label string.

The default boxtype is `FL_DOWN_BOX`. The constructor specializes `Fl_Browser()` by setting the type to `FL_HOLD_BROWSER`. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- `Fl_Hold_Browser.H`
- `Fl_Browser.cxx`

## 13.61 Fl\_Hor\_Fill\_Slider Class Reference

Inheritance diagram for Fl\_Hor\_Fill\_Slider:

### Public Member Functions

- **Fl\_Hor\_Fill\_Slider** (int X, int Y, int W, int H, const char \*L=0)

### Public Member Functions inherited from [Fl\\_Slider](#)

- void [bounds](#) (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- [Fl\\_Slider](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Slider](#) widget using the given position, size, and label string.*
- **Fl\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new [Fl\\_Slider](#) widget using the given type, position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- [uchar num\\_ticks](#) () const  
*Gets the number of tick marks.*
- [Scale\\_Type scale](#) () const  
*Gets the scale type.*
- void [scale](#) ([Scale\\_Type](#) s)  
*Sets the scale type.*
- int [scrollvalue](#) (int pos, int [size](#), int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- [Fl\\_Boxtype slider](#) () const  
*Gets the slider box type.*
- void **slider** ([Fl\\_Boxtype](#) c)  
*Sets the slider box type.*
- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void [slider\\_size](#) (double v)  
*Set the dimensions of the moving piece of slider.*
- [uchar ticks](#) () const  
*Gets the tick mark position.*
- void [ticks](#) (uchar t, [uchar num\\_ticks](#)=11)  
*Sets the tick mark position for [Fl\\_Nice\\_Slider](#).*

## Public Member Functions inherited from [FI\\_Valuator](#)

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for [FI\\_Valuator::format\(char\\* buffer\)](#).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [FI\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [FI\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [FI\\_Valuator::step\(\)](#) const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- **~FI\_Valuator** () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const

- Returns whether the widget and all of its parents are active.*
- `FL_Align align () const`  
*Gets the label alignment.*
- `void align (FL_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `FL_Gl_Window * as_gl_window ()`  
*Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.*
- virtual class `FL_Gl_Window const * as_gl_window () const`
- virtual `FL_Group * as_group ()`  
*Returns an `FL_Group` pointer if this widget is an `FL_Group`.*
- virtual `FL_Group const * as_group () const`
- virtual `FL_Window * as_window ()`  
*Returns an `FL_Window` pointer if this widget is an `FL_Window`.*
- virtual `FL_Window const * as_window () const`
- `void bind_deimage (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FL_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (FL_Boxtype new_box)`  
*Sets the box type for the widget.*
- `FL_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (FL_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (FL_Callback *cb, FL_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*
- `void callback (FL_Callback *cb, void *p)`  
*Sets the current callback function and data for the widget.*
- `void callback (FL_Callback0 *cb)`  
*Sets the current callback function for the widget.*
- `void callback (FL_Callback1 *cb, long p=0)`  
*Sets the current callback function for the widget.*
- `unsigned int changed () const`  
*Checks if the widget value changed since the last callback.*
- `void clear_active ()`  
*Marks the widget as inactive without sending events or changing focus.*
- `void clear_changed ()`  
*Marks the value of the widget as unchanged.*
- `void clear_damage (uchar c=0)`  
*Clears or sets the damage flags.*
- `void clear_output ()`

- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - virtual void `hide` ()
- Makes a widget invisible.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const

- Returns a pointer to the parent widget.*

  - void `parent` (`Fl_Group *p`)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- `Fl_Color selection_color` () const

*Gets the selection color.*
- void `selection_color` (`Fl_Color a`)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type` () const

*Gets the widget type.*

- void **type** (uchar t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- FI\_When **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- FI\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~FI\_Widget ()  
*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from FI\_Slider

- enum **Scale\_Type** : uchar { **LINEAR\_SCALE** = 0 , **LOG\_SCALE** }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*
- enum **Tick\_Position** : uchar {  
**TICKS\_NONE** = 0x00 , **TICKS\_BELOW** = 0x01 , **TICKS\_ABOVE** = 0x02 , **TICKS\_LEFT** = 0x01 ,  
**TICKS\_RIGHT** = 0x02 }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*

## Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from [FI\\_Widget](#)

- enum {

*flags possible values enumeration.*

## Protected Member Functions inherited from [FI\\_Slider](#)

- void [draw](#) () override  
*Draws the widget.*
- void [draw](#) (int, int, int, int)
- void [draw\\_ticks](#) (const [FI\\_Rect](#) &r, int S)  
*Draw tick marks.*
- int [handle](#) (int, int, int, int, int)
- double [increment\\_lin\\_log](#) (double v, int n, int [range](#))  
*Adds a sensible step value to the passed value.*
- double [position\\_to\\_value](#) (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double [value\\_to\\_position](#) (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from [FI\\_Valuator](#)

- [FI\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FI\\_Valuator](#) widget using the given position, size, and label string.*
- void [handle\\_drag](#) (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void [handle\\_push](#) ()  
*Stores the current value in the previous value.*
- void [handle\\_release](#) ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int [horizontal](#) () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*

- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value\_damage** ()  
*Asks for partial redraw.*

### Protected Member Functions inherited from FI\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

The documentation for this class was generated from the following files:

- FI\_Hor\_Fill\_Slider.H
- FI\_Slider.cxx

## 13.62 FI\_Hor\_Nice\_Slider Class Reference

Single thumb tab slider.

```
#include <FI_Hor_Nice_Slider.H>
```

Inheritance diagram for FI\_Hor\_Nice\_Slider:

### Public Member Functions

- **FI\_Hor\_Nice\_Slider** (int X, int Y, int W, int H, const char \*L=0)

### Public Member Functions inherited from [FI\\_Slider](#)

- void [bounds](#) (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- [FI\\_Slider](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [FI\\_Slider](#) widget using the given position, size, and label string.*
- **FI\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new [FI\\_Slider](#) widget using the given type, position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- uchar [num\\_ticks](#) () const  
*Gets the number of tick marks.*
- [Scale\\_Type](#) [scale](#) () const  
*Gets the scale type.*
- void [scale](#) ([Scale\\_Type](#) s)  
*Sets the scale type.*
- int [scrollvalue](#) (int pos, int [size](#), int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- [FI\\_Boxtype](#) [slider](#) () const  
*Gets the slider box type.*
- void [slider](#) ([FI\\_Boxtype](#) c)  
*Sets the slider box type.*
- float [slider\\_size](#) () const  
*Get the dimensions of the moving piece of slider.*
- void [slider\\_size](#) (double v)  
*Set the dimensions of the moving piece of slider.*
- uchar [ticks](#) () const  
*Gets the tick mark position.*
- void [ticks](#) (uchar t, uchar [num\\_ticks](#)=11)  
*Sets the tick mark position for [FI\\_Nice\\_Slider](#).*

## Public Member Functions inherited from FI\_Valuator

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for FI\_Valuator::format(char\* buffer).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double FI\_Valuator::step() const*
- void **step** (double s)  
*See double FI\_Valuator::step() const.*
- void **step** (int a)  
*See double FI\_Valuator::step() const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- ~FI\_Valuator () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const

- Returns whether the widget and all of its parents are active.*
- [Fl\\_Align align](#) () const  
*Gets the label alignment.*
- void [align](#) ([Fl\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [Fl\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).*
- virtual class [Fl\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [Fl\\_Group](#) \* [as\\_group](#) ()  
*Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).*
- virtual [Fl\\_Group](#) const \* [as\\_group](#) () const
- virtual [Fl\\_Window](#) \* [as\\_window](#) ()  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- virtual [Fl\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([Fl\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [Fl\\_Callback\\_p callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([Fl\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - virtual void `hide` ()
- Makes a widget invisible.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const

- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [FI\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*
- void [set\\_visible](#) ()

*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

*Makes a widget visible.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*

- void **type** (uchar t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- FI\_When **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- FI\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~FI\_Widget ()  
*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from FI\_Slider

- enum **Scale\_Type** : uchar { **LINEAR\_SCALE** = 0 , **LOG\_SCALE** }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*
- enum **Tick\_Position** : uchar {  
**TICKS\_NONE** = 0x00 , **TICKS\_BELOW** = 0x01 , **TICKS\_ABOVE** = 0x02 , **TICKS\_LEFT** = 0x01 ,  
**TICKS\_RIGHT** = 0x02 }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*

## Static Public Member Functions inherited from FI\_Widget

- static void `default_callback` (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from FI\_Widget

- enum {  
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,  
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7  
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11  
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15  
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`  
= 1<<19 ,  
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,  
`AUTO_DELETE_USER_DATA` = 1<<23 ,  
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,  
`USERFLAG1` = 1<<31 }  
*flags possible values enumeration.*

## Protected Member Functions inherited from FI\_Slider

- void `draw` () override  
*Draws the widget.*
- void `draw` (int, int, int, int)
- void `draw_ticks` (const FI\_Rect &r, int S)  
*Draw tick marks.*
- int `handle` (int, int, int, int, int)
- double `increment_lin_log` (double v, int n, int range)  
*Adds a sensible step value to the passed value.*
- double `position_to_value` (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double `value_to_position` (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from FI\_Valuator

- FI\_Valuator (int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Valuator widget using the given position, size, and label string.*
- void `handle_drag` (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void `handle_push` ()  
*Stores the current value in the previous value.*
- void `handle_release` ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int `horizontal` () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*

- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value\_damage** ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from **Fl\_Widget**

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (Fl\_Boxtype t, Fl\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (Fl\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (Fl\_Boxtype t, int x, int y, int w, int h, Fl\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **Fl\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.62.1 Detailed Description

Single thumb tab slider.

Figure 13.25 Fl\_Hor\_Nice\_Slider with various Fl::scheme() values

The documentation for this class was generated from the following files:

- Fl\_Hor\_Nice\_Slider.H
- Fl\_Slider.cxx

## 13.63 Fl\_Hor\_Slider Class Reference

Horizontal Slider class.

```
#include <Fl_Hor_Slider.H>
```

Inheritance diagram for Fl\_Hor\_Slider:

### Public Member Functions

- **Fl\_Hor\_Slider** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Hor\\_Slider](#) widget using the given position, size, and label string.*

### Public Member Functions inherited from [Fl\\_Slider](#)

- void [bounds](#) (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- [Fl\\_Slider](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Slider](#) widget using the given position, size, and label string.*
- **Fl\_Slider** (uchar t, int X, int Y, int W, int H, const char \*l)  
*Creates a new [Fl\\_Slider](#) widget using the given type, position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- uchar [num\\_ticks](#) () const  
*Gets the number of tick marks.*
- [Scale\\_Type](#) [scale](#) () const  
*Gets the scale type.*
- void [scale](#) ([Scale\\_Type](#) s)

- Sets the scale type.*
  - int **scrollvalue** (int pos, int **size**, int first, int total)
- Sets the size and position of the sliding knob in the box.*
  - **FI\_Boxtype slider** () const
- Gets the slider box type.*
  - void **slider** (**FI\_Boxtype** c)
- Sets the slider box type.*
  - float **slider\_size** () const
- Get the dimensions of the moving piece of slider.*
  - void **slider\_size** (double v)
- Set the dimensions of the moving piece of slider.*
  - **uchar ticks** () const
- Gets the tick mark position.*
  - void **ticks** (**uchar** t, **uchar** num\_ticks=11)
- Sets the tick mark position for **FI\_Nice\_Slider**.*

## Public Member Functions inherited from **FI\_Valuator**

- void **bounds** (double a, double b)*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()*C++11 API for **FI\_Valuator::format(char\* buffer)**.*
- double **increment** (double, int)*Adds n times the step value to the passed value.*
- double **maximum** () const*Gets the maximum value for the valuator.*
- void **maximum** (double a)*Sets the maximum value for the valuator.*
- double **minimum** () const*Gets the minimum value for the valuator.*
- void **minimum** (double a)*Sets the minimum value for the valuator.*
- void **precision** (int digits)*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)*Sets the minimum and maximum values for the valuator.*
- double **round** (double)*Round the passed value to the nearest step increment.*
- double **step** () const*Gets or sets the step value.*
- void **step** (double a, int b)*See double **FI\_Valuator::step()** const*
- void **step** (double s)*See double **FI\_Valuator::step()** const.*
- void **step** (int a)*See double **FI\_Valuator::step()** const*

- double [value](#) () const  
*Gets the floating point(double) value.*
- int [value](#) (double)  
*Sets the current value.*
- [~FI\\_Valuator](#) () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

- Sets the current callback function and managed user data for the widget.*

  - void `callback` (`FI_Callback` \*cb, void \*p)

*Sets the current callback function and data for the widget.*

  - void `callback` (`FI_Callback0` \*cb)

*Sets the current callback function for the widget.*

  - void `callback` (`FI_Callback1` \*cb, long p=0)

*Sets the current callback function for the widget.*

  - unsigned int `changed` () const

*Checks if the widget value changed since the last callback.*

  - void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*

  - void `clear_changed` ()

*Marks the value of the widget as unchanged.*

  - void `clear_damage` (`uchar` c=0)

*Clears or sets the damage flags.*

  - void `clear_output` ()

*Sets a widget to accept input.*

  - void `clear_visible` ()

*Hides the widget.*

  - void `clear_visible_focus` ()

*Disables keyboard focus navigation with this widget.*

  - `FI_Color` `color` () const

*Gets the background color of the widget.*

  - void `color` (`FI_Color` bg)

*Sets the background color of the widget.*

  - void `color` (`FI_Color` bg, `FI_Color` sel)

*Sets the background and selection color of the widget.*

  - int `contains` (const `FI_Widget` \*w) const

*Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)

*Sets the current label.*

  - void `copy_tooltip` (const char \*text)

*Sets the current tooltip text.*

  - `uchar` `damage` () const

*Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)

*Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)

*Internal use only.*

  - void `deactivate` ()

*Deactivates the widget.*

  - `FI_Image` \* `deimage` ()

*Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FI_Image` \* `deimage` () const

*Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FI_Image` &img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FI_Image` \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) (FI\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) (FI\_Widget \*widget, long arg, FI\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) (FI\_Widget \*widget, void \*arg=0, FI\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, FI\_Align) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- FI\_Image \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const FI\_Image \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) (FI\_Image &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) (FI\_Image \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const FI\_Widget \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) (FI\_Labeltype a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- FI\_Color [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) (FI\_Color c)  
*Sets the label color.*
- FI\_Font [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) (FI\_Font f)  
*Sets the font to use.*
- FI\_Fonsize [labelsize](#) () const

- Gets the font size in pixels.*

  - void [labelsize](#) ([Fl\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [Fl\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([Fl\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [Fl\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([Fl\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()
- Schedules the drawing of the label.*

  - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

  - [Fl\\_Color](#) [selection\\_color](#) () const
- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- uchar [type](#) () const  
*Gets the widget type.*
- void [type](#) (uchar t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()  
*Destroys the widget.*

## Additional Inherited Members

### Public Types inherited from [FI\\_Slider](#)

- enum [Scale\\_Type](#) : uchar { [LINEAR\\_SCALE](#) = 0 , [LOG\\_SCALE](#) }  
*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*
- enum [Tick\\_Position](#) : uchar {  
[TICKS\\_NONE](#) = 0x00 , [TICKS\\_BELOW](#) = 0x01 , [TICKS\\_ABOVE](#) = 0x02 , [TICKS\\_LEFT](#) = 0x01 ,  
[TICKS\\_RIGHT](#) = 0x02 }  
*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from [FI\\_Widget](#)

- enum {  
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,  
[FORCE\\_POSITION](#) = 1<<4 , [NON\\_MODAL](#) = 1<<5 , [SHORTCUT\\_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7  
,  
[OVERRIDE](#) = 1<<8 , [VISIBLE\\_FOCUS](#) = 1<<9 , [COPIED\\_LABEL](#) = 1<<10 , [CLIP\\_CHILDREN](#) = 1<<11  
,  
[MENU\\_WINDOW](#) = 1<<12 , [TOOLTIP\\_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO\\_OVERLAY](#) = 1<<15  
,  
[GROUP\\_RELATIVE](#) = 1<<16 , [COPIED\\_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC\\_USE\\_ACCENTS\\_MENU](#)  
= 1<<19 ,  
[NEEDS\\_KEYBOARD](#) = 1<<20 , [IMAGE\\_BOUND](#) = 1<<21 , [DEIMAGE\\_BOUND](#) = 1<<22 ,  
[AUTO\\_DELETE\\_USER\\_DATA](#) = 1<<23 ,  
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,  
[USERFLAG1](#) = 1<<31 }  
*flags possible values enumeration.*

### Protected Member Functions inherited from [FI\\_Slider](#)

- void [draw](#) () override  
*Draws the widget.*
- void [draw](#) (int, int, int, int)
- void [draw\\_ticks](#) (const [FI\\_Rect](#) &r, int S)  
*Draw tick marks.*
- int [handle](#) (int, int, int, int, int)
- double [increment\\_lin\\_log](#) (double v, int n, int range)  
*Adds a sensible step value to the passed value.*
- double [position\\_to\\_value](#) (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double [value\\_to\\_position](#) (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from [FL\\_Valuator](#)

- [FL\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FL\\_Valuator](#) widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from [FL\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FL\\_Boxtype](#) t, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FL\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)

*Internal use only.*

- void **x** (int v)

*Internal use only.*

- void **y** (int v)

*Internal use only.*

### 13.63.1 Detailed Description

Horizontal Slider class.

See also

class [Fl\\_Slider](#).

The documentation for this class was generated from the following files:

- Fl\_Hor\_Slider.H
- Fl\_Slider.cxx

## 13.64 Fl\_Hor\_Value\_Slider Class Reference

Inheritance diagram for Fl\_Hor\_Value\_Slider:

### Public Member Functions

- **Fl\_Hor\_Value\_Slider** (int X, int Y, int W, int H, const char \*l=0)

### Public Member Functions inherited from [Fl\\_Value\\_Slider](#)

- [Fl\\_Value\\_Slider](#) (int x, int y, int w, int h, const char \*l=0)  
*Creates a new [Fl\\_Value\\_Slider](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- [Fl\\_Color](#) **textcolor** () const  
*Gets the color of the text in the value box.*
- void **textcolor** ([Fl\\_Color](#) s)  
*Sets the color of the text in the value box.*
- [Fl\\_Font](#) **textfont** () const  
*Gets the typeface of the text in the value box.*
- void **textfont** ([Fl\\_Font](#) s)  
*Sets the typeface of the text in the value box.*
- [Fl\\_Fonsize](#) **textsize** () const  
*Gets the size of the text in the value box.*

- void **textsize** (FI\_Fontsize s)  
*Sets the size of the text in the value box.*
- int **value\_height** () const  
*Gets the height of the value box in pixels (vertical mode only).*
- void **value\_height** (int s)  
*Sets the height of the value box in pixels (vertical mode only).*
- int **value\_width** () const  
*Gets the width of the value box in pixels (horizontal mode only).*
- void **value\_width** (int s)  
*Sets the width of the value box in pixels (horizontal mode only).*

### Public Member Functions inherited from FI\_Slider

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- **FI\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new FI\_Slider widget using the given position, size, and label string.*
- **FI\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Slider widget using the given type, position, size, and label string.*
- **uchar num\_ticks** () const  
*Gets the number of tick marks.*
- **Scale\_Type scale** () const  
*Gets the scale type.*
- void **scale** (Scale\_Type s)  
*Sets the scale type.*
- int **scrollvalue** (int pos, int size, int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- **FI\_Boxtype slider** () const  
*Gets the slider box type.*
- void **slider** (FI\_Boxtype c)  
*Sets the slider box type.*
- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void **slider\_size** (double v)  
*Set the dimensions of the moving piece of slider.*
- **uchar ticks** () const  
*Gets the tick mark position.*
- void **ticks** (uchar t, uchar num\_ticks=11)  
*Sets the tick mark position for FI\_Nice\_Slider.*

### Public Member Functions inherited from FI\_Valuator

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for FI\_Valuator::format(char\* buffer).*
- double **increment** (double, int)

- Adds n times the step value to the passed value.*

  - double **maximum** () const
  - Gets the maximum value for the valuator.*
  - void **maximum** (double a)
  - Sets the maximum value for the valuator.*
  - double **minimum** () const
  - Gets the minimum value for the valuator.*
  - void **minimum** (double a)
  - Sets the minimum value for the valuator.*
  - void **precision** (int digits)
  - Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
  - void **range** (double a, double b)
  - Sets the minimum and maximum values for the valuator.*
  - double **round** (double)
  - Round the passed value to the nearest step increment.*
  - double **step** () const
  - Gets or sets the step value.*
  - void **step** (double a, int b)
  - See double [FI\\_Valuator::step\(\)](#) const*
  - void **step** (double s)
  - See double [FI\\_Valuator::step\(\)](#) const.*
  - void **step** (int a)
  - See double [FI\\_Valuator::step\(\)](#) const*
  - double **value** () const
  - Gets the floating point(double) value.*
  - int **value** (double)
  - Sets the current value.*
  - **~FI\_Valuator** () override
  - Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()
- Activates the widget.*
- unsigned int **active** () const
- Returns whether the widget is active.*
- int **active\_r** () const
- Returns whether the widget and all of its parents are active.*
- **FI\_Align align** () const
- Gets the label alignment.*
- void **align** (**FI\_Align** alignment)
- Sets the label alignment.*
- long **argument** () const
- Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
- Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()
- Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

- virtual class [FI\\_GI\\_Window](#) const \* **as\_gi\_window** () const
- virtual [FI\\_Group](#) \* **as\_group** ()
  - Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* **as\_group** () const
- virtual [FI\\_Window](#) \* **as\_window** ()
  - Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) **box** () const
  - Gets the box type of the widget.*
- void **box** ([FI\\_Boxtype](#) new\_box)
  - Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) **callback** () const
  - Gets the current callback function for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb)
  - Sets the current callback function for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
  - Sets the current callback function and managed user data for the widget.*
- void **callback** ([FI\\_Callback](#) \*cb, void \*p)
  - Sets the current callback function and data for the widget.*
- void **callback** ([FI\\_Callback0](#) \*cb)
  - Sets the current callback function for the widget.*
- void **callback** ([FI\\_Callback1](#) \*cb, long p=0)
  - Sets the current callback function for the widget.*
- unsigned int **changed** () const
  - Checks if the widget value changed since the last callback.*
- void **clear\_active** ()
  - Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()
  - Marks the value of the widget as unchanged.*
- void **clear\_damage** (uchar c=0)
  - Clears or sets the damage flags.*
- void **clear\_output** ()
  - Sets a widget to accept input.*
- void **clear\_visible** ()
  - Hides the widget.*
- void **clear\_visible\_focus** ()
  - Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) **color** () const
  - Gets the background color of the widget.*
- void **color** ([FI\\_Color](#) bg)
  - Sets the background color of the widget.*
- void **color** ([FI\\_Color](#) bg, [FI\\_Color](#) sel)
  - Sets the background and selection color of the widget.*

- int [contains](#) (const [Fl\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [Fl\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, long arg, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*arg=0, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [Fl\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [Fl\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [Fl\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

- Returns whether the image is managed by the widget.*

  - int `inside` (const `FL_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FL_Color` c)

*Sets the label color.*
- `FL_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FL_Font` f)

*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const

*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)

*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const

*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)

*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FL_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FL_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*

- [Fl\\_Color selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [FI\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)

*Sets the flags used to decide when a callback is called.*
- [FI\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*
- int [y](#) () const

*Gets the widget position in its window.*
- virtual [~FI\\_Widget](#) ()

*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from [FI\\_Slider](#)

- enum [Scale\\_Type](#) : uchar { [LINEAR\\_SCALE](#) = 0 , [LOG\\_SCALE](#) }

*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*
- enum [Tick\\_Position](#) : uchar {  
[TICKS\\_NONE](#) = 0x00 , [TICKS\\_BELOW](#) = 0x01 , [TICKS\\_ABOVE](#) = 0x02 , [TICKS\\_LEFT](#) = 0x01 ,  
[TICKS\\_RIGHT](#) = 0x02 }

*Bitset for tick mark positions for [FI\\_Nice\\_Slider](#).*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)

*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)

*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)

*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from [FI\\_Widget](#)

- enum {  
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,  
[FORCE\\_POSITION](#) = 1<<4 , [NON\\_MODAL](#) = 1<<5 , [SHORTCUT\\_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7  
, [OVERRIDE](#) = 1<<8 , [VISIBLE\\_FOCUS](#) = 1<<9 , [COPIED\\_LABEL](#) = 1<<10 , [CLIP\\_CHILDREN](#) = 1<<11

[USERFLAG1](#) = 1<<31 }

*flags possible values enumeration.*

## Protected Member Functions inherited from [FI\\_Value\\_Slider](#)

- void [draw](#) () override

*Draws the widget.*

## Protected Member Functions inherited from [FI\\_Slider](#)

- void [draw](#) (int, int, int, int)
- void [draw\\_ticks](#) (const [FI\\_Rect](#) &r, int S)  
*Draw tick marks.*
- int [handle](#) (int, int, int, int, int)
- double [increment\\_lin\\_log](#) (double v, int n, int [range](#))  
*Adds a sensible step value to the passed value.*
- double [position\\_to\\_value](#) (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double [value\\_to\\_position](#) (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from [FI\\_Valuator](#)

- [FI\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FI\\_Valuator](#) widget using the given position, size, and label string.*
- void [handle\\_drag](#) (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void [handle\\_push](#) ()  
*Stores the current value in the previous value.*
- void [handle\\_release](#) ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int [horizontal](#) () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double [previous\\_value](#) () const  
*Gets the previous floating point value before an event changed it.*
- void [set\\_value](#) (double v)  
*Sets the current floating point value.*
- double [softclamp](#) (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from FI\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

The documentation for this class was generated from the following files:

- FI\_Hor\_Value\_Slider.H
- FI\_Value\_Slider.cxx

## 13.65 FI\_ICO\_Image Class Reference

The [FI\\_ICO\\_Image](#) class supports loading, caching, and drawing of Windows icon (.ico) files.

```
#include <FI_ICO_Image.H>
```

Inheritance diagram for FI\_ICO\_Image:

## Classes

- struct [IconDirEntry](#)  
*Windows ICONDIRENTRY structure*

## Public Member Functions

- [FI\\_ICO\\_Image](#) (const char \*filename, int id=-1, const unsigned char \*data=NULL, const size\_t datasize=0)  
*Loads the named icon image from the given .ico filename or from memory.*
- const [IconDirEntry](#) \* [icondirentry](#) () const  
*Returns the array of [idcount\(\)](#) loaded [IconDirEntry](#) structures.*
- int [idcount](#) () const  
*Returns the number of icons of various resolutions present in the ICO object.*
- ~[FI\\_ICO\\_Image](#) ()  
*Destructor.*

## Public Member Functions inherited from [FI\\_BMP\\_Image](#)

- [FI\\_BMP\\_Image](#) (const char \*filename)  
*This constructor loads the named BMP image from the given BMP filename.*
- [FI\\_BMP\\_Image](#) (const char \*imagename, const unsigned char \*data, const long length=-1)  
*This constructor loads a BMP image from memory.*

## Public Member Functions inherited from [FI\\_RGB\\_Image](#)

- virtual [FI\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) ()  
*Returns whether an RGB image is an [FI\\_SVG\\_Image](#) or not.*
- virtual const [FI\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) () const  
*Returns whether an RGB image is an [FI\\_SVG\\_Image](#) or not.*
- int [cache\\_h](#) () const
- int [cache\\_w](#) () const
- void [color\\_average](#) ([FI\\_Color](#) c, float i) override  
*The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.*
- [FI\\_Image](#) \* [copy](#) () const
- [FI\\_Image](#) \* [copy](#) (int W, int H) const override  
*Creates a resized copy of the image.*
- void [desaturate](#) () override  
*The [desaturate\(\)](#) method converts an image to grayscale.*
- void [draw](#) (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draws the image to the current drawing surface with a bounding box.*
- [FI\\_RGB\\_Image](#) (const [FI\\_Pixmap](#) \*pxm, [FI\\_Color](#) bg=FL\_GRAY)

- The constructor creates a new RGBA image from the specified [FI\\_Pixmap](#).

  - [FI\\_RGB\\_Image](#) (const [uchar](#) \*bits, int bits\_length, int W, int H, int D, int LD)

The constructor creates a new image from the specified data.

  - [FI\\_RGB\\_Image](#) (const [uchar](#) \*bits, int W, int H, int D=3, int LD=0)

The constructor creates a new image from the specified data.

  - void [label](#) ([FI\\_Menu\\_Item](#) \*m) override

This method is an obsolete way to set the image attribute of a menu item.

  - void [label](#) ([FI\\_Widget](#) \*w) override

This method is an obsolete way to set the image attribute of a widget or menu item.

  - virtual void [normalize](#) ()

Makes sure the object is fully initialized.

  - void [uncache](#) () override

If the image has been cached for display, delete the cache data.

  - ~[FI\\_RGB\\_Image](#) () override

The destructor frees all memory and server resources that are used by the image.

## Public Member Functions inherited from [FI\\_Image](#)

- virtual class [FI\\_Shared\\_Image](#) \* [as\\_shared\\_image](#) ()
- Returns whether an image is an [FI\\_Shared\\_Image](#) or not.
- [FI\\_Image](#) \* [copy](#) () const
- Creates a copy of the image in the same size.
- int [count](#) () const
- Returns the number of data values associated with the image.
- int [d](#) () const
- Returns the image depth.
- const char \*const \* [data](#) () const
- Returns a pointer to the current image data array.
- int [data\\_h](#) () const
- Returns the height of the image data.
- int [data\\_w](#) () const
- Returns the width of the image data.
- void [draw](#) (int X, int Y)
- Draws the image to the current drawing surface.
- int [fail](#) () const
- Returns a value that is not 0 if there is currently no image available.
- [FI\\_Image](#) (int W, int H, int D)
- The constructor creates an empty image with the specified width, height, and depth.
- int [h](#) () const
- Returns the current image drawing height in FLTK units.
- void [inactive](#) ()
- The [inactive\(\)](#) method calls [color\\_average\(FL\\_BACKGROUND\\_COLOR, 0.33f\)](#) to produce an image that appears grayed out.
- int [ld](#) () const
- Returns the current line data size in bytes.
- virtual void [release](#) ()
- Releases an [FI\\_Image](#) - the same as 'delete this'.
- virtual void [scale](#) (int width, int height, int proportional=1, int can\_expand=0)
- Sets the drawing size of the image.
- int [w](#) () const
- Returns the current image drawing width in FLTK units.
- virtual ~[FI\\_Image](#) ()
- The destructor is a virtual method that frees all memory used by the image.

## Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_RGB\\_Image](#)

- static `size_t max_size ()`  
*Returns the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*
- static void `max_size (size_t size)`  
*Sets the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*

### Static Public Member Functions inherited from [FI\\_Image](#)

- static `FI_Labeltype define_FL_IMAGE_LABEL ()`
- static `FI_RGB_Scaling RGB_scaling ()`  
*Returns the currently used RGB image scaling method.*
- static void `RGB_scaling (FI_RGB_Scaling)`  
*Sets the RGB image scaling method used for copy(int, int).*
- static `FI_RGB_Scaling scaling_algorithm ()`  
*Gets what algorithm is used when resizing a source image to draw it.*
- static void `scaling_algorithm (FI_RGB_Scaling algorithm)`  
*Sets what algorithm is used when resizing a source image to draw it.*

### Public Attributes inherited from [FI\\_RGB\\_Image](#)

- int `alloc_array`  
*If non-zero, the object's data array is delete[]'d when deleting the object.*
- const `uchar * array`  
*Points to the start of the object's data array.*

### Static Public Attributes inherited from [FI\\_Image](#)

- static const int `ERR_FILE_ACCESS = -2`
- static const int `ERR_FORMAT = -3`
- static const int `ERR_MEMORY_ACCESS = -4`
- static const int `ERR_NO_IMAGE = -1`
- static bool `register_images_done = false`  
*True after [fl\\_register\\_images\(\)](#) was called, false before.*

### Protected Member Functions inherited from [FI\\_BMP\\_Image](#)

- void `load_bmp_ (class FI\_Image\_Reader &rdr, int ico_height=0, int ico_width=0)`

### Protected Member Functions inherited from [FI\\_Image](#)

- void `d (int D)`  
*Sets the current image depth.*
- void `data (const char *const *p, int c)`  
*Sets the current data pointer and count of pointers in the array.*
- void `draw_empty (int X, int Y)`  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int `draw_scaled (int X, int Y, int W, int H)`  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void `h (int H)`  
*Sets the height of the image data.*
- void `ld (int LD)`

*Sets the current line data size in bytes.*

- void **w** (int W)

*Sets the width of the image data.*

## Static Protected Member Functions inherited from Fl\_Image

- static void **labeltype** (const [Fl\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [Fl\\_Align](#) la)
- static void **measure** (const [Fl\\_Label](#) \*lo, int &lw, int &lh)

### 13.65.1 Detailed Description

The [Fl\\_ICO\\_Image](#) class supports loading, caching, and drawing of Windows icon (.ico) files.

### 13.65.2 Constructor & Destructor Documentation

#### 13.65.2.1 Fl\_ICO\_Image()

```
Fl_ICO_Image::Fl_ICO_Image (
 const char * filename,
 int id = -1,
 const unsigned char * data = NULL,
 const size_t datasize = 0)
```

Loads the named icon image from the given .ico filename or from memory.

#### Parameters

<i>filename</i>	Name of a .ico file, or of the in-memory image
<i>id</i>	When id is -1 (default), the highest-resolution icon is loaded; when id 0, load the icon with this ID; when id = -2, load all <a href="#">IconDirEntry</a> structures but no image.
<i>data</i>	NULL, or in-memory icon data
<i>datasize</i>	Size in bytes of the <i>data</i> byte array (used when <i>data</i> is not NULL)

The documentation for this class was generated from the following files:

- Fl\_ICO\_Image.H
- Fl\_ICO\_Image.cxx

## 13.66 Fl\_Image Class Reference

Base class for image caching, scaling and drawing.

```
#include <Fl_Image.H>
```

Inheritance diagram for Fl\_Image:

## Public Member Functions

- virtual class `Fl_Shared_Image * as_shared_image ()`  
*Returns whether an image is an `Fl_Shared_Image` or not.*
- virtual void `color_average (Fl_Color c, float i)`  
*The `color_average()` method averages the colors in the image with the provided FLTK color value.*
- `Fl_Image * copy () const`  
*Creates a copy of the image in the same size.*
- virtual `Fl_Image * copy (int W, int H) const`

## 13.66.1 Detailed Description

Base class for image caching, scaling and drawing.

[Fl\\_Image](#) is the base class used for caching, scaling and drawing all kinds of images in FLTK. This class keeps track of common image data such as the pixels, colormap, width, height, and depth. Virtual methods are used to provide type-specific image handling.

Each image possesses two (width, height) pairs:

1. The width and height of the raw image data are returned by `data_w()` and `data_h()`. These values are set when the image is created and remain unchanged.
2. The width and height of the area filled by the image when it gets drawn are returned by `w()` and `h()`. These values are equal to `data_w()` and `data_h()` when the image is created and can be changed by the `scale()` member function.

Since the `Fl_Image` class does not support image drawing by itself, calling the `Fl_Image::draw()` method results in a box with an X in it being drawn instead.

## 13.66.2 Constructor & Destructor Documentation

### 13.66.2.1 `Fl_Image()`

```
Fl_Image::Fl_Image (
 int W,
 int H,
 int D)
```

The constructor creates an empty image with the specified width, height, and depth.

The width and height are in pixels. The depth is 0 for bitmaps, 1 for pixmap (colormap) images, and 1 to 4 for color images.

## 13.66.3 Member Function Documentation

### 13.66.3.1 `as_shared_image()`

```
virtual class Fl_Shared_Image * Fl_Image::as_shared_image () [inline], [virtual]
```

Returns whether an image is an `Fl_Shared_Image` or not.

This virtual method returns a pointer to an `Fl_Shared_Image` if this object is an instance of `Fl_Shared_Image` or NULL if not. This can be used to detect if a given `Fl_Image` object is a shared image, i.e. derived from `Fl_Shared_Image`.

Since

1.4.0

Reimplemented in `Fl_Shared_Image`.

### 13.66.3.2 `color_average()`

```
void Fl_Image::color_average (
 Fl_Color c,
 float i) [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented in `Fl_Anim_GIF_Image`, `Fl_RGB_Image`, `Fl_Pixmap`, `Fl_Shared_Image`, `Fl_SVG_Image`, and `Fl_Tiled_Image`.

### 13.66.3.3 `copy()` [1/2]

```
Fl_Image * Fl_Image::copy () const [inline]
```

Creates a copy of the image in the same size.

The new image should be released when you are done with it.

This does exactly the same as '`Fl_Image::copy(int W, int H) const`' where W and H are the width and height of the source image, respectively. This applies also to all subclasses of `Fl_Image` in the FLTK library.

The following two `copy()` calls are equivalent:

```
Fl_Image *img1 = new Fl_Image(...);
// ...
```

```
Fl_Image *img2 = img1->copy();
Fl_Image *img3 = img1->copy(img1->w(), img1->h());
```

For details see '[Fl\\_Image::copy\(int w, int h\) const](#)'.

See also

[Fl\\_Image::release\(\)](#)

#### Note

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

### 13.66.3.4 copy() [2/2]

```
Fl_Image * Fl_Image::copy (
 int W,
 int H) const [virtual]
```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl\\_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

### 13.66.3.5 count()

```
int Fl_Image::count () const [inline]
```

Returns the number of data values associated with the image.

The value will be 0 for images with no associated data, 1 for bitmap and color images, and greater than 2 for pixmap images.

See also

[data\(\)](#)

### 13.66.3.6 d()

```
int Fl_Image::d () const [inline]
```

Returns the image depth.

The return value will be 0 for bitmaps, 1 for pixmaps, and 1 to 4 for color images.

### 13.66.3.7 data() [1/2]

```
const char *const * Fl_Image::data () const [inline]
```

Returns a pointer to the current image data array.

There can be 0, 1, or more pointers to actual image data in an image.

Use the [count\(\)](#) method to find the size of the data array. You must not dereference the [data\(\)](#) pointer if [count\(\)](#) equals zero.

Note

[data\(\)](#) may return NULL.

Example:

[Fl\\_RGB\\_Image](#) has exactly one pointer which points at the R, G, B [, A] data array of the image. The total size of this array depends on several attributes like [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#) and [ld\(\)](#) and is basically [data\\_w\(\)](#) \* [data\\_h\(\)](#) \* [d\(\)](#) but there are exceptions if [ld\(\)](#) is non-zero: see description of [ld\(\)](#). Since FLTK 1.4.0 [w\(\)](#) and [h\(\)](#) are no longer significant for the image data size if [scale\(\)](#) has been called on the image to set a different display size.

Other image types have different numbers and types of data pointers which are implementation details and not documented here.

See also

[count\(\)](#), [w\(\)](#), [h\(\)](#), [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#), [ld\(\)](#)

### 13.66.3.8 data() [2/2]

```
void Fl_Image::data (
 const char *const * p,
 int c) [inline], [protected]
```

Sets the current data pointer and count of pointers in the array.

There can be 0, 1, or more pointers to actual image data in an image.

See also

[const char\\* const\\*](#) [data\(\)](#), [count\(\)](#), [w\(\)](#), [h\(\)](#), [data\\_w\(\)](#), [data\\_h\(\)](#), [d\(\)](#), [ld\(\)](#)

### 13.66.3.9 desaturate()

```
void Fl_Image::desaturate () [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

### 13.66.3.10 draw() [1/2]

```
void Fl_Image::draw (
 int X,
 int Y) [inline]
```

Draws the image to the current drawing surface.

## Parameters

<i>X,Y</i>	specify the upper-lefthand corner of the image.
------------	-------------------------------------------------

**13.66.3.11 draw()** [2/2]

```
void Fl_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments *X*, *Y*, *W*, *H* specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the *cx* and *cy* arguments.

Another way to see what part of the image gets drawn and where, is to consider this alternative writing producing the same output:

```
fl_push_clip(X,Y,W,H);
this->draw(X - cx, Y - cy);
fl_pop_clip();
```

Repeated calls to this member function with the same image but varying *W*, *H*, *cx*, or *cy* arguments can be more efficiently processed using the above alternative writing.

Reimplemented in [Fl\\_Anim\\_GIF\\_Image](#), [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Shared\\_Image](#), [Fl\\_SVG\\_Image](#), and [Fl\\_Tiled\\_Image](#).

**13.66.3.12 draw\_empty()**

```
void Fl_Image::draw_empty (
 int X,
 int Y) [protected]
```

The protected method [draw\\_empty\(\)](#) draws a box with an X in it.

It can be used to draw any image that lacks image data.

**13.66.3.13 draw\_scaled()**

```
int Fl_Image::draw_scaled (
 int X,
 int Y,
 int W,
 int H) [protected]
```

Draw the image to the current drawing surface rescaled to a given width and height.

Intended for internal use by the FLTK library.

## Parameters

<i>X,Y</i>	position of the image's top-left
<i>W,H</i>	width and height for the drawn image

## Returns

1

**Deprecated** Only for API compatibility with FLTK 1.3.4.

### 13.66.3.14 fail()

```
int Fl_Image::fail () const
```

Returns a value that is not 0 if there is currently no image available.

Example use:

```
// [...]
Fl_Box box(X, Y, W, H);
Fl_JPEG_Image jpg("/tmp/foo.jpg");
switch (jpg.fail()) {
 case Fl_Image::ERR_NO_IMAGE:
 case Fl_Image::ERR_FILE_ACCESS:
 fl_alert("/tmp/foo.jpg: %s", strerror(errno)); // shows actual os error to user
 exit(1);
 case Fl_Image::ERR_FORMAT:
 fl_alert("/tmp/foo.jpg: couldn't decode image");
 exit(1);
}
box.image(jpg);
```

#### Returns

Image load failure if non-zero

#### Return values

<i>0</i>	the image was loaded successfully
<i>ERR_NO_IMAGE</i>	no image was found
<i>ERR_FILE_ACCESS</i>	there was a file access related error (errno should be set)
<i>ERR_FORMAT</i>	image decoding failed
<i>ERR_MEMORY_ACCESS</i>	image decoder tried to access memory outside of given memory block

### 13.66.3.15 h() [1/2]

```
int Fl_Image::h () const [inline]
```

Returns the current image drawing height in FLTK units.

The values of [h\(\)](#) and [data\\_h\(\)](#) are identical unless [scale\(\)](#) has been called after which they may differ.

### 13.66.3.16 h() [2/2]

```
void Fl_Image::h (
 int H) [inline], [protected]
```

Sets the height of the image data.

This protected function sets both image heights: the height of the image data returned by [data\\_h\(\)](#) and the image drawing height in FLTK units returned by [h\(\)](#).

### 13.66.3.17 inactive()

```
void Fl_Image::inactive () [inline]
```

The [inactive\(\)](#) method calls [color\\_average\(FL\\_BACKGROUND\\_COLOR, 0.33f\)](#) to produce an image that appears grayed out.

An internal copy is made of the original image before changes are applied, to avoid modifying the original image.

#### Note

The RGB color of [FL\\_BACKGROUND\\_COLOR](#) may change when the connection to the display is made. See [fl\\_open\\_display\(\)](#).

### 13.66.3.18 label() [1/2]

```
void Fl_Image::label (
 Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented in [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), and [Fl\\_Pixmap](#).

### 13.66.3.19 label() [2/2]

```
void Fl_Image::label (
 Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented in [Fl\\_Bitmap](#), [Fl\\_RGB\\_Image](#), and [Fl\\_Pixmap](#).

### 13.66.3.20 ld() [1/2]

```
int Fl_Image::ld () const [inline]
```

Returns the current line data size in bytes.

See also

[ld\(int\)](#)

### 13.66.3.21 ld() [2/2]

```
void Fl_Image::ld (
 int LD) [inline], [protected]
```

Sets the current line data size in bytes.

Color images may contain extra data (padding) that is included after every line of color image data and is normally not present.

If LD is zero, then line data size is assumed to be [data\\_w\(\)](#) \* [d\(\)](#) bytes.

If LD is non-zero, then it must be positive and larger than [data\\_w\(\)](#) \* [d\(\)](#) to account for the extra data per line.

### 13.66.3.22 release()

```
virtual void Fl_Image::release () [inline], [virtual]
```

Releases an [Fl\\_Image](#) - the same as 'delete this'.

This virtual method is for almost all image classes the same as calling `delete image;`

where image is an [Fl\\_Image](#) \* pointer.

However, for subclass [Fl\\_Shared\\_Image](#) and its subclasses this virtual method is reimplemented and maintains shared images.

This virtual method makes it possible to destroy all image types in the same way by calling

```
image->release();
```

Reasoning: If you have an '[Fl\\_Image](#) \*' base class pointer and don't know if the object is one of the class [Fl\\_Shared\\_Image](#) or any other subclass of [Fl\\_Image](#) (for instance [Fl\\_RGB\\_Image](#)) then you can't just use operator delete since this is not appropriate for [Fl\\_Shared\\_Image](#) objects.

The virtual method [release\(\)](#) handles this properly.

Since

1.4.0 in the base class [Fl\\_Image](#) and virtual in [Fl\\_Shared\\_Image](#)

Reimplemented in [Fl\\_Shared\\_Image](#).

### 13.66.3.23 RGB\_scaling()

```
void Fl_Image::RGB_scaling (
 Fl_RGB_Scaling method) [static]
```

Sets the RGB image scaling method used for copy(int, int).

Applies to all RGB images, defaults to FL\_RGB\_SCALING\_NEAREST.

### 13.66.3.24 `scale()`

```
void Fl_Image::scale (
 int width,
 int height,
 int proportional = 1,
 int can_expand = 0) [virtual]
```

Sets the drawing size of the image.

This function controls the values returned by member functions `w()` and `h()` which in turn control how the image is drawn: the full image data (whose size is given by `data_w()` and `data_h()`) are drawn scaled to an area of the drawing surface sized at `w()` x `h()` FLTK units. This can make a difference if the drawing surface has more than 1 pixel per FLTK unit because the image can be drawn at the full resolution of the drawing surface. Examples of such drawing surfaces: HiDPI displays, laser printers, PostScript files, PDF printers.

#### Parameters

<i>width,height</i>	maximum values, in FLTK units, that <code>w()</code> and <code>h()</code> should return
<i>proportional</i>	if not null, keep the values returned by <code>w()</code> and <code>h()</code> proportional to <code>data_w()</code> and <code>data_h()</code>
<i>can_expand</i>	if null, the values returned by <code>w()</code> and <code>h()</code> will not be larger than <code>data_w()</code> and <code>data_h()</code> , respectively

#### Note

This function generally changes the values returned by the `w()` and `h()` member functions. In contrast, the values returned by `data_w()` and `data_h()` remain unchanged.

If the processed image is an `Fl_SVG_Image`, setting `Fl_SVG_Image::proportional` to `false` is required if `proportional` here is null.

#### Version

1.4 (1.3.4 and `FL_ABI_VERSION` for `Fl_Shared_Image` only)

Example code: scale an image to fit in a box

```
Fl_Box *b = ... // a box
Fl_Image *img = new Fl_PNG_Image("/path/to/picture.png"); // read a picture file
// set the drawing size of the image to the size of the box keeping its aspect ratio
img->scale(b->w(), b->h());
b->image(img); // use the image as the box image
```

Reimplemented in `Fl_SVG_Image`.

### 13.66.3.25 `scaling_algorithm()`

```
static void Fl_Image::scaling_algorithm (
 Fl_RGB_Scaling algorithm) [inline], [static]
```

Sets what algorithm is used when resizing a source image to draw it.

The default algorithm is `FL_RGB_SCALING_BILINEAR`. Drawing an `Fl_Image` is sometimes performed by first resizing the source image and then drawing the resized copy. This occurs, e.g., when drawing to screen under X11 without Xrender support after having called `scale()`. This function controls what method is used when the image to be resized is an `Fl_RGB_Image`.

#### Version

1.4

### 13.66.3.26 `uncache()`

```
void Fl_Image::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented in `Fl_Anim_GIF_Image`, `Fl_Bitmap`, `Fl_RGB_Image`, `Fl_Pixmap`, and `Fl_Shared_Image`.

**13.66.3.27 w()** [1/2]

```
int Fl_Image::w () const [inline]
```

Returns the current image drawing width in FLTK units.

The values of [w\(\)](#) and [data\\_w\(\)](#) are identical unless [scale\(\)](#) has been called after which they may differ.

**13.66.3.28 w()** [2/2]

```
void Fl_Image::w (
 int W) [inline], [protected]
```

Sets the width of the image data.

This protected function sets both image widths: the width of the image data returned by [data\\_w\(\)](#) and the image drawing width in FLTK units returned by [w\(\)](#).

The documentation for this class was generated from the following files:

*horizontal offset to the origin of graphics coordinates*
- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

### 13.68.1 Detailed Description

Directs all graphics requests to an [Fl\\_Image](#).

After creation of an [Fl\\_Image\\_Surface](#) object, make it the current drawing surface calling [Fl\\_Surface\\_Device::push\\_current\(\)](#), and all subsequent graphics requests will be recorded in the image. It's possible to draw widgets (using [Fl\\_Image\\_Surface::draw\(\)](#)) or to use any of the [Drawing functions](#) or the [Color & Font functions](#). Finally, call [image\(\)](#) on the object to obtain a newly allocated [Fl\\_RGB\\_Image](#) object. [Fl\\_Gl\\_Window](#) objects can be drawn in the image as well.

Usage example:

```
// this is the widget that you want to draw into an image
Fl_Widget *g = ...;

// create an Fl_Image_Surface object
Fl_Image_Surface *image_surface = new Fl_Image_Surface(g->w(), g->h());

// direct all further graphics requests to the image
Fl_Surface_Device::push_current(image_surface);

// draw a white background
fl_color(FL_WHITE);
fl_rectf(0, 0, g->w(), g->h());

// draw the g widget in the image
image_surface->draw(g);

// get the resulting image
Fl_RGB_Image* image = image_surface->image();

// direct graphics requests back to their previous destination
Fl_Surface_Device::pop_current();

// delete the image_surface object, but not the image itself
delete image_surface;
```

## 13.68.2 Constructor & Destructor Documentation

### 13.68.2.1 Fl\_Image\_Surface()

```
Fl_Image_Surface::Fl_Image_Surface (
 int w,
 int h,
 int high_res = 0,
 Fl_Offscreen off = 0)
```

Constructor with optional high resolution.

#### Parameters

<i>w,h</i>	Width and height of the resulting image. The value of the <code>high_res</code> parameter controls whether <code>w</code> and <code>h</code> are interpreted as pixels or FLTK units.
<i>high_res</i>	If zero, the created image surface is sized at <code>w</code> x <code>h</code> pixels. If non-zero, the pixel size of the created image surface depends on the value of the display scale factor (see <a href="#">Fl::screen_scale(int)</a> ): the resulting image has the same number of pixels as an area of the display of size <code>w</code> x <code>h</code> expressed in FLTK units.
<i>off</i>	If not null, the image surface is constructed around a pre-existing <code>Fl_Offscreen</code> . The caller is responsible for both construction and destruction of this <code>Fl_Offscreen</code> object. Is mostly intended for internal use by FLTK.

#### Version

1.3.4 (1.3.3 without the `highres` parameter)

## 13.68.3 Member Function Documentation

### 13.68.3.1 highres\_image()

```
Fl_Shared_Image * Fl_Image_Surface::highres_image ()
```

Returns a possibly high resolution image made of all drawings sent to the [Fl\\_Image\\_Surface](#) object.

The [Fl\\_Image\\_Surface](#) object should have been constructed with [Fl\\_Image\\_Surface\(W, H, 1\)](#). The returned [Fl\\_Shared\\_Image](#) object is scaled to a size of `W`x`H` FLTK units and may have a pixel size larger than these values. The returned object should be deallocated with [Fl\\_Shared\\_Image::release\(\)](#) after use.

**Deprecated** Use [image\(\)](#) instead.

#### Version

1.4 (1.3.4 for MacOS platform only)

### 13.68.3.2 image()

```
Fl_RGB_Image * Fl_Image_Surface::image ()
```

Returns a depth-3 image made of all drawings sent to the [Fl\\_Image\\_Surface](#) object.

The returned object contains its own copy of the RGB data; the caller is responsible for deleting it.

#### See also

```
Fl_Image_Surface::mask(Fl_RGB_Image*)
```

### 13.68.3.3 is\_current()

```
bool Fl_Image_Surface::is_current () [override], [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

### 13.68.3.4 mask()

```
void Fl_Image_Surface::mask (
 const Fl_RGB_Image * mask)
```

Defines a mask applied to drawings made after use of this function.

The mask is an [Fl\\_RGB\\_Image](#) made of a white scene drawn on a solid black background; the drawable part of the image surface is reduced to the white areas of the mask after this member function gets called. If necessary, the `mask` image is internally replaced by a copy resized to the surface's pixel size. Overall, the image returned by [Fl\\_Image\\_Surface::image\(\)](#) contains all drawings made until the `mask()` method assigned a mask, at which point subsequent drawing operations to the image surface were passed through the white areas of the mask. On some platforms, shades of gray in the mask image control the blending of foreground and background pixels; mask pixels closer in color to white produce image pixels closer to the image surface pixel, those closer to black produce image pixels closer to what the image surface pixel was before the call to `mask()`.

The mask is easily constructed using an [Fl\\_Image\\_Surface](#) object, drawing white areas on a black background there, and calling [Fl\\_Image\\_Surface::image\(\)](#).

#### Parameters

<i>mask</i>	A depth-3 image determining the drawable areas of the image surface. The <code>mask</code> object is not used after return from this member function.
-------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

#### Note

- The image surface must not be the current drawing surface when this function gets called.
- The mask can have any size but is best when it has the size of the image surface.
- It's possible to use several masks in succession on the same image surface provided member function [Fl\\_Image\\_Surface::image\(\)](#) is called between successive calls to [Fl\\_Image\\_Surface::mask\(const Fl\\_RGB\\_Image\\*\)](#).

Example of procedure to construct a masked image:

```
int W = ..., H = ...; // width and height of the image under construction
Fl_Image_Surface *surf = new Fl_Image_Surface(W, H, 1);
// first, construct the mask
Fl_Surface_Device::push_current(surf);
fl_color(FL_BLACK); // draw a black background
fl_rectf(0, 0, W, H);
fl_color(FL_WHITE); // next, draw in white what the mask should not filter out
fl_pie(0, 0, W, H, 0, 360); // here, an ellipse with axes lengths WxH
Fl_RGB_Image *mask = surf->image(); // get the mask
// second, draw the image background
fl_color(FL_YELLOW); // here, draw a yellow background
fl_rectf(0, 0, W, H);
// third, apply the mask
Fl_Surface_Device::pop_current();
surf->mask(mask);
delete mask; // the mask image can be safely deleted at this point
Fl_Surface_Device::push_current(surf);
// fourth, draw the image foreground, part of which will be filtered out by the mask
surf->draw(widget, 0, 0); // here the foreground is a drawn widget
// fifth, get the final result, masked_image, as a depth-3 Fl_RGB_Image
Fl_RGB_Image *masked_image = surf->image();
// Only the part of the foreground, here a drawn widget, that has not been
// filtered out by the mask, here the white ellipse, is in masked_image;
// the background, here solid yellow, shows up in the remaining areas of masked_image.
Fl_Surface_Device::pop_current();
delete surf;
```

#### Since

1.4.0

### 13.68.3.5 offscreen()

```
Fl_Offscreen Fl_Image_Surface::offscreen ()
```

Returns the [Fl\\_Offscreen](#) object associated to the image surface.

The returned [Fl\\_Offscreen](#) object is deleted when the [Fl\\_Image\\_Surface](#) object is deleted, unless the [Fl\\_Image\\_Surface](#) was constructed with non-null [Fl\\_Offscreen](#) argument.

**13.68.3.6 origin()** [1/2]

```
void Fl_Image_Surface::origin (
 int * x,
 int * y) [override], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.68.3.7 origin()** [2/2]

```
void Fl_Image_Surface::origin (
 int x,
 int y) [override], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.68.3.8 printable\_rect()**

```
int Fl_Image_Surface::printable_rect (
 int * w,
 int * h) [override], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.68.3.9 rescale()**

```
void Fl_Image_Surface::rescale ()
```

Adapts the [Fl\\_Image\\_Surface](#) object to the new value of the GUI scale factor.

The [Fl\\_Image\\_Surface](#) object must not be the current drawing surface. This function is useful only for an object constructed with non-zero `high_res` parameter.

**Version**

1.4

**13.68.3.10 set\_current()**

```
void Fl_Image_Surface::set_current (
 void) [override], [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [FI\\_Surface\\_Device::push\\_current\(\)](#) / [FI\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [FI\\_Printer](#) or an [FI\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [FI\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#);  
don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [FI\\_Surface\\_Device::push\\_current\(\)](#) and [FI\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [FI\\_Surface\\_Device](#).

#### 13.68.3.11 translate()

```
void FI_Image_Surface::translate (
 int x,
 int y) [override], [protected], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [FI\\_Widget\\_Surface](#).

#### 13.68.3.12 untranslate()

```
void FI_Image_Surface::untranslate (
 void) [override], [protected], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [FI\\_Widget\\_Surface](#).

The documentation for this class was generated from the following files:

- [FI\\_Image\\_Surface.H](#)
- [FI\\_Image\\_Surface.cxx](#)

## 13.69 FI\_Input Class Reference

This is the FLTK text input widget.

```
#include <FI_Input.H>
```

Inheritance diagram for [FI\\_Input](#):

#### Public Member Functions

- [FI\\_Input](#) (int, int, int, int, const char \*=0)  
*Creates a new [FI\\_Input](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

## Public Member Functions inherited from [Fl\\_Input\\_](#)

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool [can\\_redo](#) () const  
*Check if there is a redo action available.*
- bool [can\\_undo](#) () const  
*Check if the last operation can be undone.*
- int [copy](#) (int clipboard)  
*Put the current selection into the clipboard.*
- int [copy\\_cuts](#) ()  
*Copies the yank buffer to the clipboard.*
- [Fl\\_Color](#) [cursor\\_color](#) () const  
*Gets the color of the cursor.*
- void [cursor\\_color](#) ([Fl\\_Color](#) n)  
*Sets the color of the cursor.*
- int [cut](#) ()  
*Deletes the current selection.*
- int [cut](#) (int a, int b)  
*Deletes all characters between index a and b.*
- int [cut](#) (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double [dvalue](#) () const  
*Returns the widget text interpreted as a floating point number.*
- [Fl\\_Input\\_](#) (int, int, int, int, const char \*m=0)  
*Creates a new [Fl\\_Input\\_](#) widget.*
- unsigned int [index](#) (int i) const  
*Returns the character at index i.*
- int [input\\_type](#) () const  
*Gets the input field type.*
- void [input\\_type](#) (int t)  
*Sets the input field type.*
- int [insert](#) (const char \*t, int l=0)  
*Inserts text at the cursor position.*
- int [insert\\_position](#) () const  
*Gets the position of the text cursor.*
- int [insert\\_position](#) (int p)  
*Sets the cursor position and mark.*
- int [insert\\_position](#) (int p, int m)  
*Sets the index for the cursor and mark.*
- int [ivalue](#) () const  
*Returns the widget text interpreted as a signed integer.*
- int [mark](#) () const  
*Gets the current selection mark.*
- int [mark](#) (int m)  
*Sets the current selection mark.*
- int [maximum\\_size](#) () const  
*Gets the maximum length of the input field in characters.*
- void [maximum\\_size](#) (int m)  
*Sets the maximum length of the input field in characters.*
- const char \* [placeholder](#) () const

- Get the placeholder text.*
- void [placeholder](#) (const char \*text)
- Set the placeholder text.*
- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const
- Gets the read-only state of the input field.*
- void [readonly](#) (int b)
- Sets the read-only state of the input field.*
- int [redo](#) ()
- Redo previous undo operation.*
- int [replace](#) (int b, int e, const char \*text, int llen=0)
- Deletes text from b to e and inserts the new string text.*
- void [resize](#) (int, int, int, int) override
- Changes the size of the widget.*
- int [shortcut](#) () const
- Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)
- Sets the shortcut key associated with this widget.*
- int [size](#) () const
- Returns the number of bytes in value().*
- void [size](#) (int W, int H)
- Sets the width and height of this widget.*
- int [static\\_value](#) (const char \*)
- Changes the widget text.*
- int [static\\_value](#) (const char \*, int)
- Changes the widget text.*
- int [tab\\_nav](#) () const
- Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)
- Sets whether the Tab key does focus navigation, or inserts tab characters into [FI\\_Multiline\\_Input](#).*
- [FI\\_Color](#) [textcolor](#) () const
- Gets the color of the text in the input field.*
- void [textcolor](#) ([FI\\_Color](#) n)
- Sets the color of the text in the input field.*
- [FI\\_Font](#) [textfont](#) () const
- Gets the font of the text in the input field.*
- void [textfont](#) ([FI\\_Font](#) s)
- Sets the font of the text in the input field.*
- [FI\\_Fontsize](#) [textsize](#) () const
- Gets the size of the text in the input field.*
- void [textsize](#) ([FI\\_Fontsize](#) s)
- Sets the size of the text in the input field.*
- int [undo](#) ()
- Undoes previous changes to the text buffer.*
- const char \* [value](#) () const
- Returns the text displayed in the widget.*
- int [value](#) (const char \*)
- Changes the widget text.*
- int [value](#) (const char \*, int)

- Changes the widget text.*
  - int [value](#) (double value)
    - Changes the widget text to a floating point number ("%g").*
  - int [value](#) (int value)
    - Changes the widget text to a signed integer number.*
  - int [wrap](#) () const
    - Gets the word wrapping state of the input field.*
  - void [wrap](#) (int b)
    - Sets the word wrapping state of the input field.*
  - [~FI\\_Input\\_](#) ()
    - Destroys the widget.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()
  - Activates the widget.*
- unsigned int [active](#) () const
  - Returns whether the widget is active.*
- int [active\\_r](#) () const
  - Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const
  - Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)
  - Sets the label alignment.*
- long [argument](#) () const
  - Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
  - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()
  - Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

- virtual [FI\\_Group](#) \* [as\\_group](#) ()
  - Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()
  - Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const
  - Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)
  - Sets the box type for the widget.*

- [FI\\_Callback\\_p callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const

- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const

*Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const

*Gets the widget height.*

  - virtual void `hide` ()

*Makes a widget invisible.*

  - int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*

  - void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*

  - `FL_Image` \* `image` ()

*Gets the image that is used as part of the widget label when in the active state.*

  - const `FL_Image` \* `image` () const

*Gets the image that is used as part of the widget label when in the active state.*

  - void `image` (`FL_Image` &img)

*Sets the image to use as part of the widget label when in the active state.*

  - void `image` (`FL_Image` \*img)

*Sets the image to use as part of the widget label when in the active state.*

  - int `image_bound` () const

*Returns whether the image is managed by the widget.*

  - int `inside` (const `FL_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*

  - int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*

  - const char \* `label` () const

*Gets the current label text.*

  - void `label` (const char \*text)

*Sets the current label pointer.*

  - void `label` (`FL_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*

  - int `label_image_spacing` ()

*Return the gap size between the label and the image.*

  - void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*

  - `FL_Color` `labelcolor` () const

*Gets the label color.*

  - void `labelcolor` (`FL_Color` c)

*Sets the label color.*

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

- Makes a widget visible.*

  - void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*

- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~FI\\_Widget](#) ()  
*Destroys the widget.*

### 13.69.1 Detailed Description

This is the FLTK text input widget.

It displays a single line of text and lets the user edit it. Normally it is drawn with an inset box and a white background. The text may contain any characters, and will correctly display any UTF text, using ^X notation for unprintable control characters. It assumes the font can draw any characters of the used scripts, which is true for standard fonts under Windows and Mac OS X. Characters can be input using the keyboard or the character palette/map. Character composition is done using dead keys and/or a compose key as defined by the operating system.

**Table 13.286 Keyboard and mouse bindings.**

<b>Mouse button 1</b>	Moves the cursor to this point. Drag selects characters. Double click selects words. Triple click selects all line. Shift+click extends the selection. When you select text it is automatically copied to the selection buffer.
<b>Mouse button 2</b>	Insert the selection buffer at the point clicked. You can also select a region and replace it with the selection buffer by selecting the region with mouse button 2.
<b>Mouse button 3</b>	Currently acts like button 1.
<b>Backspace</b>	Deletes one character to the left, or deletes the selected region.
<b>Delete</b>	Deletes one character to the right, or deletes the selected region. Combine with Shift for equivalent of ^X (copy+cut).
<b>Enter</b>	May cause the callback, see <a href="#">when()</a> .

**Table 13.287 Platform specific keyboard bindings.**

Windows/Linux	Mac	Function
<b>^A</b>	<b>Command-A</b>	<b>Selects all text in the widget.</b>
<b>^C</b>	<b>Command-C</b>	<b>Copy the current selection to the clipboard.</b>
<b>^I</b>	<b>^I</b>	<b>Insert a tab.</b>
<b>^J</b>	<b>^J</b>	<b>Insert a Line Feed.</b> (Similar to literal 'Enter' character)
<b>^L</b>	<b>^L</b>	<b>Insert a Form Feed.</b>
<b>^M</b>	<b>^M</b>	<b>Insert a Carriage Return.</b>

<b>^V, Shift-Insert</b>	<b>Command-V</b>	<b>Paste the clipboard.</b> (Macs keyboards don't have "Insert" keys, but if they did, Shift-Insert would work)
<b>^X, Shift-Delete</b>	<b>Command-X, Shift-Delete</b>	<b>Cut.</b> Copy the selection to the clipboard and delete it. (If there's no selection, Shift-Delete acts like Delete)
<b>^Z</b>	<b>Command-Z</b>	<b>Undo.</b> This is a single-level undo mechanism, but all adjacent deletions and insertions are concatenated into a single "undo". Often this will undo a lot more than you expected.
<b>Shift-^Z</b>	<b>Shift-Command-Z</b>	<b>Redo.</b> Currently same behavior as ^Z. Reserved for future multilevel undo/redo.
<b>Arrow Keys</b>	<b>Arrow Keys</b>	<b>Standard cursor movement.</b> Can be combined with Shift to extend selection.
<b>Home</b>	<b>Command-Up, Command-Left</b>	<b>Move to start of line.</b> Can be combined with Shift to extend selection.
<b>End</b>	<b>Command-Down, Command-Right</b>	<b>Move to end of line.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Home</b>	<b>Command-Up, Command-PgUp, Ctrl-Left</b>	<b>Move to top of document/field.</b> In single line input, moves to start of line. In multiline input, moves to start of top line. Can be combined with Shift to extend selection.
<b>Ctrl-End</b>	<b>Command-End, Command-PgDn, Ctrl-Right</b>	<b>Move to bottom of document/field.</b> In single line input, moves to end of line. In multiline input, moves to end of last line. Can be combined with Shift to extend selection.
<b>Ctrl-Left</b>	<b>Alt-Left</b>	<b>Word left.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Right</b>	<b>Alt-Right</b>	<b>Word right.</b> Can be combined with Shift to extend selection.
<b>Ctrl-Backspace</b>	<b>Alt-Backspace</b>	<b>Delete word left.</b>
<b>Ctrl-Delete</b>	<b>Alt-Delete</b>	<b>Delete word right.</b>

## 13.69.2 Constructor & Destructor Documentation

### 13.69.2.1 Fl\_Input()

```
Fl_Input::Fl_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Input](#) widget using the given position, size, and label string. The default boxtype is FL\_DOWN\_BOX.

### 13.69.3 Member Function Documentation

#### 13.69.3.1 draw()

```
void Fl_Input::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 13.69.3.2 handle()

```
int Fl_Input::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

##### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

##### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

##### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Spinner::Fl\\_Spinner\\_Input](#), and [Fl\\_Secret\\_Input](#).

#### 13.69.3.3 handle\_key()

```
int Fl_Input::handle_key () [protected]
```

Handles a keystroke.

This `protected` method handles a keystroke in an [Fl\\_Input](#) or derived class. It handles compose key sequences and can also be used e.g. in [Fl\\_Multiline\\_Input](#), [Fl\\_Float\\_Input](#) and several more derived classes.

The method first checks in [Fl::compose](#) if the keystroke is a text entry or a control key. If it is text, the method inserts the composed characters into the input field, taking into account the input type (e.g., numeric fields).

If the keystroke is a control key as determined by [Fl::compose](#), the method handles key combinations for Insert, Enter, and Tab depending on the widget's [input\\_type\(\)](#).

The method then checks for Ctrl key combinations, such as Ctrl-A, Ctrl-C, Ctrl-V, Ctrl-X, and Ctrl-Z, which are commonly used for select all, copy, paste, cut, and undo operations.

Finally, the method checks for ASCII control characters, such as Ctrl-H, Ctrl-I, Ctrl-J, Ctrl-L, and Ctrl-M, which can be used to insert literal control characters into the input field.

If none of the above cases match, the method returns 0, indicating that the keystroke was not handled.

#### Returns

1 if the keystroke is handled by us, 0 if not.

#### 13.69.3.4 handle\_rmb()

```
int Fl_Input::handle_rmb () [protected]
```

Handle right mouse button down events.

#### Returns

1

The documentation for this class was generated from the following files:

- Fl\_Input.H
- Fl\_Input.cxx

## 13.70 Fl\_Input\_ Class Reference

This class provides a low-overhead text input field.

```
#include <Fl_Input_.H>
```

Inheritance diagram for Fl\_Input\_:

#### Public Member Functions

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool [can\\_redo](#) () const  
*Check if there is a redo action available.*
- bool [can\\_undo](#) () const  
*Check if the last operation can be undone.*
- int [copy](#) (int clipboard)  
*Put the current selection into the clipboard.*
- int [copy\\_cuts](#) ()  
*Copies the yank buffer to the clipboard.*
- [Fl\\_Color](#) [cursor\\_color](#) () const  
*Gets the color of the cursor.*
- void [cursor\\_color](#) ([Fl\\_Color](#) n)  
*Sets the color of the cursor.*
- int [cut](#) ()  
*Deletes the current selection.*
- int [cut](#) (int a, int b)  
*Deletes all characters between index a and b.*
- int [cut](#) (int n)

- Deletes the next  $n$  bytes rounded to characters before or after the cursor.*
- double `dvalue` () const
  - Returns the widget text interpreted as a floating point number.*
- `FI_Input_` (int, int, int, int, const char \*=0)
  - Creates a new `FI_Input_` widget.*
- unsigned int `index` (int i) const
  - Returns the character at index  $i$ .*
- int `input_type` () const
  - Gets the input field type.*
- void `input_type` (int t)
  - Sets the input field type.*
- int `insert` (const char \*t, int l=0)
  - Inserts text at the cursor position.*
- int `insert_position` () const
  - Gets the position of the text cursor.*
- int `insert_position` (int p)
  - Sets the cursor position and mark.*
- int `insert_position` (int p, int m)
  - Sets the index for the cursor and mark.*
- int `ivalue` () const
  - Returns the widget text interpreted as a signed integer.*
- int `mark` () const
  - Gets the current selection mark.*
- int `mark` (int m)
  - Sets the current selection mark.*
- int `maximum_size` () const
  - Gets the maximum length of the input field in characters.*
- void `maximum_size` (int m)
  - Sets the maximum length of the input field in characters.*
- const char \* `placeholder` () const
  - Get the placeholder text.*
- void `placeholder` (const char \*text)
  - Set the placeholder text.*
- int `position` () const
- int `position` (int p)
- int `position` (int p, int m)
- int `readonly` () const
  - Gets the read-only state of the input field.*
- void `readonly` (int b)
  - Sets the read-only state of the input field.*
- int `redo` ()
  - Redo previous undo operation.*
- int `replace` (int b, int e, const char \*text, int llen=0)
  - Deletes text from  $b$  to  $e$  and inserts the new string  $text$ .*
- void `resize` (int, int, int, int) override
  - Changes the size of the widget.*
- int `shortcut` () const
  - Return the shortcut key associated with this widget.*
- void `shortcut` (int s)
  - Sets the shortcut key associated with this widget.*
- int `size` () const

- Returns the number of bytes in [value\(\)](#).*

    - void [size](#) (int W, int H)

*Sets the width and height of this widget.*

  - int [static\\_value](#) (const char \*)
- Changes the widget text.*
- int [static\\_value](#) (const char \*, int)
- Changes the widget text.*
- int [tab\\_nav](#) () const
- Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)
- Sets whether the Tab key does focus navigation, or inserts tab characters into [Fl\\_Multiline\\_Input](#).*
- [Fl\\_Color](#) [textcolor](#) () const
- Gets the color of the text in the input field.*
- void [textcolor](#) ([Fl\\_Color](#) n)
- Sets the color of the text in the input field.*
- [Fl\\_Font](#) [textfont](#) () const
- Gets the font of the text in the input field.*
- void [textfont](#) ([Fl\\_Font](#) s)
- Sets the font of the text in the input field.*
- [Fl\\_Fontsize](#) [textsize](#) () const
- Gets the size of the text in the input field.*
- void [textsize](#) ([Fl\\_Fontsize](#) s)
- Sets the size of the text in the input field.*
- int [undo](#) ()
- Undoes previous changes to the text buffer.*
- const char \* [value](#) () const
- Returns the text displayed in the widget.*
- int [value](#) (const char \*)
- Changes the widget text.*
- int [value](#) (const char \*, int)
- Changes the widget text.*
- int [value](#) (double value)
- Changes the widget text to a floating point number ("%g").*
- int [value](#) (int value)
- Changes the widget text to a signed integer number.*
- int [wrap](#) () const
- Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)
- Sets the word wrapping state of the input field.*
- [~Fl\\_Input\\_](#) ()
- Destroys the widget.*

## Public Member Functions inherited from [Fl\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
  - void [\\_set\\_fullscreen](#) ()
  - void [activate](#) ()
- Activates the widget.*
- unsigned int [active](#) () const
- Returns whether the widget is active.*
- int [active\\_r](#) () const

- Returns whether the widget and all of its parents are active.*
- `Fl_Align align () const`  
*Gets the label alignment.*
- `void align (Fl_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `Fl_Gl_Window * as_gl_window ()`  
*Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.*

- virtual `Fl_Group * as_group ()`  
*Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.*
- virtual `Fl_Group const * as_group () const`
- virtual `Fl_Window * as_window ()`  
*Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.*
- virtual `Fl_Window const * as_window () const`
- `void bind_deimage (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `Fl_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (Fl_Boxtype new_box)`  
*Sets the box type for the widget.*
- `Fl_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (Fl_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (Fl_Callback *cb, Fl_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*
- `void callback (Fl_Callback *cb, void *p)`  
*Sets the current callback function and data for the widget.*
- `void callback (Fl_Callback0 *cb)`  
*Sets the current callback function for the widget.*
- `void callback (Fl_Callback1 *cb, long p=0)`  
*Sets the current callback function for the widget.*
- `unsigned int changed () const`  
*Checks if the widget value changed since the last callback.*
- `void clear_active ()`  
*Marks the widget as inactive without sending events or changing focus.*
- `void clear_changed ()`  
*Marks the value of the widget as unchanged.*
- `void clear_damage (uchar c=0)`  
*Clears or sets the damage flags.*
- `void clear_output ()`

- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - virtual void `draw` ()=0
- Draws the widget.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - virtual int `handle` (int event)
- Handles the specified event.*

- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

- Sets whether this widget needs a keyboard.*

  - unsigned int `output` () const

*Returns if a widget is used for output only.*
- `Fl_Group * parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`Fl_Group *p`)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- `Fl_Color selection_color` () const

*Gets the selection color.*
- void `selection_color` (`Fl_Color a`)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*

- `uchar type () const`  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data () const`  
*Gets the user data for this widget.*
- `void user_data (FI_Callback_User_Data *v, bool auto_free)`  
*Sets the user data for this widget.*
- `void user_data (void *v)`  
*Sets the user data for this widget.*
- `int vertical_label_margin ()`  
*Get the spacing between the label and the vertical edge of the widget.*
- `void vertical_label_margin (int px)`  
*Set the spacing between the label and the vertical edge of the widget.*
- `unsigned int visible () const`  
*Returns whether a widget is visible.*
- `unsigned int visible_focus () const`  
*Checks whether this widget has a visible focus.*
- `void visible_focus (int v)`  
*Modifies keyboard focus navigation.*
- `int visible_r () const`  
*Returns whether a widget and all its parents are visible.*
- `int w () const`  
*Gets the widget width.*
- `FI_When when () const`  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `FI_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FI_Widget ()`  
*Destroys the widget.*

### Protected Member Functions

- `int apply_undo ()`  
*Apply the current undo/redo operation.*
- `void drawtext (int, int, int, int)`  
*Draws the text in the passed bounding box.*
- `void drawtext (int, int, int, int, bool draw_active)`  
*Draws the text in the passed bounding box.*
- `void handle_mouse (int, int, int, int, int keepmark=0)`  
*Handles mouse clicks and mouse moves.*
- `int handletext (int e, int, int, int, int)`  
*Handles all kinds of text field related events.*

- int **line\_end** (int i) const  
*Finds the end of a line.*

*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

## Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void [default\\_callback](#) (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

*flags possible values enumeration.*

## 13.70.1 Detailed Description

This class provides a low-overhead text input field.

This is a virtual base class below [FI\\_Input](#). It has all the same interfaces, but lacks the [handle\(\)](#) and [draw\(\)](#) method. You may want to subclass it if you are one of those people who likes to change how the editing keys work. It may also be useful for adding scrollbars to the input field.

This can act like any of the subclasses of [FI\\_Input](#), by setting [type\(\)](#) to one of the following values:

```
#define FL_NORMAL_INPUT 0
#define FL_FLOAT_INPUT 1
#define FL_INT_INPUT 2
#define FL_MULTILINE_INPUT 4
#define FL_SECRET_INPUT 5
#define FL_INPUT_TYPE 7
#define FL_INPUT_READONLY 8
#define FL_NORMAL_OUTPUT (FL_NORMAL_INPUT | FL_INPUT_READONLY)
#define FL_MULTILINE_OUTPUT (FL_MULTILINE_INPUT | FL_INPUT_READONLY)
#define FL_INPUT_WRAP 16
#define FL_MULTILINE_INPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_WRAP)
#define FL_MULTILINE_OUTPUT_WRAP (FL_MULTILINE_INPUT | FL_INPUT_READONLY | FL_INPUT_WRAP)
```

All variables that represent an index into a text buffer are byte-oriented, not character oriented, counting from 0 (at or before the first character) to [size\(\)](#) (at the end of the buffer, after the last byte). Since UTF-8 characters can be up to six bytes long, simply incrementing such an index will not reliably advance to the next character in the text buffer. Indices and pointers into the text buffer should always point at a 7 bit ASCII character or the beginning of a UTF-8 character sequence. Behavior for false UTF-8 sequences and pointers into the middle of a sequence are undefined.

## 13.70.2 Constructor & Destructor Documentation

### 13.70.2.1 FI\_Input\_()

```
Fl_Input_::Fl_Input_ (
```

```

 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)

```

Creates a new [Fl\\_Input\\_](#) widget.

This function creates a new [Fl\\_Input\\_](#) widget and adds it to the current [Fl\\_Group](#). The [value\(\)](#) is set to `NULL`. The default boxtype is `FL_DOWN_BOX`.

#### Parameters

<i>X,Y,W,H</i>	the dimensions of the new widget
<i>l</i>	an optional label text

### 13.70.2.2 ~Fl\_Input\_()

```
Fl_Input_::~~Fl_Input_ ()
```

Destroys the widget.

The destructor clears all allocated buffers and removes the widget from the parent [Fl\\_Group](#).

## 13.70.3 Member Function Documentation

### 13.70.3.1 append()

```

int Fl_Input_::append (
 const char * t,
 int l = 0,
 char keep_selection = 0)

```

Append text at the end.

This function appends the string in *t* to the end of the text. It does not moves the new position or mark.

#### Parameters

in	<i>t</i>	text that will be appended
in	<i>l</i>	length of text, or 0 if the string is terminated by <code>nul</code> .
in	<i>keep_selection</i>	if this is 1, the current text selection will remain, if 0, the cursor will move to the end of the inserted text.

#### Returns

0 if no text was appended

### 13.70.3.2 apply\_undo()

```
int Fl_Input_::apply_undo () [protected]
```

Apply the current undo/redo operation.

It's up to [undo\(\)](#) and [redo\(\)](#) to push and pop actions to and from the lists.

#### Returns

1 if the current action changed any text.

#### See also

[undo\(\)](#), [redo\(\)](#)

**13.70.3.3 can\_redo()**

```
bool Fl_Input_::can_redo () const
```

Check if there is a redo action available.

**Returns**

true if the widget can redo the last undo action

**13.70.3.4 can\_undo()**

```
bool Fl_Input_::can_undo () const
```

Check if the last operation can be undone.

**Returns**

true if the widget can undo the last change

**13.70.3.5 copy()**

```
int Fl_Input_::copy (
 int clipboard)
```

Put the current selection into the clipboard.

This function copies the current selection between [mark\(\)](#) and [position\(\)](#) into the specified `clipboard`. This does not replace the old clipboard contents if [position\(\)](#) and [mark\(\)](#) are equal. Clipboard 0 maps to the current text selection and clipboard 1 maps to the cut/paste clipboard.

**Parameters**

<i>clipboard</i>	the clipboard destination 0 or 1
------------------	----------------------------------

**Returns**

0 if no text is selected, 1 if the selection was copied

**See also**

`Fl::copy(const char *, int, int)`

**13.70.3.6 copy\_cuts()**

```
int Fl_Input_::copy_cuts ()
```

Copies the *yank* buffer to the clipboard.

This method copies all the previous contiguous cuts from the undo information to the clipboard. This function implements the <sup>^</sup>K shortcut key.

**Returns**

0 if the operation did not change the clipboard

**See also**

[copy\(int\), cut\(\)](#)

**13.70.3.7 cursor\_color()** [1/2]

```
Fl_Color Fl_Input_::cursor_color () const [inline]
```

Gets the color of the cursor.

**Returns**

the current cursor color

**13.70.3.8 cursor\_color()** [2/2]

```
void Fl_Input_::cursor_color (
 Fl_Color n) [inline]
```

Sets the color of the cursor.

The default color for the cursor is FL\_BLACK.

**Parameters**

in	n	the new cursor color
----	---	----------------------

**13.70.3.9 cut()** [1/3]

```
int Fl_Input_::cut () [inline]
```

Deletes the current selection.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Returns**

0 if no data was copied

**13.70.3.10 cut()** [2/3]

```
int Fl_Input_::cut (
 int a,
 int b) [inline]
```

Deletes all characters between index a and b.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Parameters**

a,b	range of bytes rounded to full characters and clamped to the buffer
-----	---------------------------------------------------------------------

**Returns**

0 if no data was copied

**13.70.3.11 cut()** [3/3]

```
int Fl_Input_::cut (
 int n) [inline]
```

Deletes the next n bytes rounded to characters before or after the cursor.

This function deletes the currently selected text *without* storing it in the clipboard. To use the clipboard, you may call [copy\(\)](#) first or [copy\\_cuts\(\)](#) after this call.

**Parameters**

n	number of bytes rounded to full characters and clamped to the buffer. A negative number will cut characters to the left of the cursor.
---	----------------------------------------------------------------------------------------------------------------------------------------

**Returns**

0 if no data was copied

**13.70.3.12 drawtext()** [1/2]

```
void Fl_Input_::drawtext (
 int X,
 int Y,
 int W,
 int H) [protected]
```

Draws the text in the passed bounding box.

If [damage\(\)](#) & FL\_DAMAGE\_ALL is true, this assumes the area has already been erased to [color\(\)](#). Otherwise it does minimal update and erases the area itself.

**Parameters**

<i>X,Y,W,H</i>	area that must be redrawn
----------------	---------------------------

**13.70.3.13 drawtext()** [2/2]

```
void Fl_Input_::drawtext (
 int X,
 int Y,
 int W,
 int H,
 bool draw_active) [protected]
```

Draws the text in the passed bounding box.

This version of `drawtext` allows the user to control whether the widget is drawn as active, i.e. with the text cursor, or inactive. This is useful for compound widgets where the input should be shown as active when actually the container widget is the active one.

A caller should not draw the widget with `active` set if another text widget may indeed be the active widget.

**Parameters**

<i>X,Y,W,H</i>	area that must be redrawn
<i>draw_active</i>	if set, the cursor will be drawn, even if the widget is not active

**See also**

[Fl\\_Input\\_::drawtext\(int X, int Y, int W, int H\)](#)

**13.70.3.14 dvalue()**

```
double Fl_Input_::dvalue () const
```

Returns the widget text interpreted as a floating point number.

**Returns**

double precision floating point value

**See also**

[Fl\\_Input\\_::ivalue\(\)](#)

[Fl\\_Input\\_::value\(double\)](#)

**13.70.3.15 handle\_mouse()**

```
void Fl_Input_::handle_mouse (
 int X,
 int Y,
```

```

 int ,
 int ,
 int drag = 0) [protected]

```

Handles mouse clicks and mouse moves.

**Todo** Add comment and parameters

### 13.70.3.16 handletext()

```

int Fl_Input_::handletext (
 int event,
 int X,
 int Y,
 int W,
 int H) [protected]

```

Handles all kinds of text field related events.  
This is called by derived classes.

**Todo** Add comment and parameters

### 13.70.3.17 index()

```

unsigned int Fl_Input_::index (
 int i) const

```

Returns the character at index *i*.

This function returns the UTF-8 character at *i* as a ucs4 character code.

#### Parameters

in	<i>i</i>	index into the value field
----	----------	----------------------------

#### Returns

the character at index *i*

### 13.70.3.18 input\_type() [1/2]

```

int Fl_Input_::input_type () const [inline]

```

Gets the input field type.

#### Returns

the current input type

### 13.70.3.19 input\_type() [2/2]

```

void Fl_Input_::input_type (
 int t) [inline]

```

Sets the input field type.

A [redraw\(\)](#) is required to reformat the input field.

#### Parameters

in	<i>t</i>	new input type
----	----------	----------------

**13.70.3.20 insert()**

```
int Fl_Input_::insert (
 const char * t,
 int l = 0) [inline]
```

Inserts text at the cursor position.

This function inserts the string in `t` at the cursor [position\(\)](#) and moves the new position and mark to the end of the inserted text.

**Parameters**

in	<i>t</i>	text that will be inserted
in	<i>l</i>	length of text, or 0 if the string is terminated by nul.

**Returns**

0 if no text was inserted

**13.70.3.21 insert\_position() [1/3]**

```
int Fl_Input_::insert_position () const [inline]
```

Gets the position of the text cursor.

**Returns**

the cursor position as an index in the range 0..[size\(\)](#)

**See also**

[insert\\_position\(int, int\)](#)

**13.70.3.22 insert\_position() [2/3]**

```
int Fl_Input_::insert_position (
 int p) [inline]
```

Sets the cursor position and mark.

`position(n)` is the same as `position(n, n)`.

**Parameters**

<i>p</i>	new index for cursor and mark
----------	-------------------------------

**Returns**

0 if no positions changed

**See also**

[insert\\_position\(int, int\)](#), [insert\\_position\(\)](#), [mark\(int\)](#)

**13.70.3.23 insert\_position() [3/3]**

```
int Fl_Input_::insert_position (
 int p,
 int m)
```

Sets the index for the cursor and mark.

The input widget maintains two pointers into the string. The *position* (*p*) is where the cursor is. The *mark* (*m*) is the other end of the selected text. If they are equal then there is no selection. Changing this does not affect the clipboard (use [copy\(\)](#) to do that).

Changing these values causes a [redraw\(\)](#). The new values are bounds checked.

#### Parameters

<i>p</i>	index for the cursor position
<i>m</i>	index for the mark

#### Returns

0 if no positions changed

#### See also

[position\(int\)](#), [position\(\)](#), [mark\(int\)](#)

#### 13.70.3.24 [ivalue\(\)](#)

```
int Fl_Input_::ivalue () const
```

Returns the widget text interpreted as a signed integer.

#### Returns

signed integer value

#### See also

[Fl\\_Input\\_::dvalue\(\)](#)

[Fl\\_Input\\_::value\(int\)](#)

#### 13.70.3.25 [line\\_end\(\)](#)

```
int Fl_Input_::line_end (
 int i) const [protected]
```

Finds the end of a line.

This call calculates the end of a line based on the given index *i*.

#### Parameters

<i>in</i>	<i>i</i>	starting index for the search
-----------	----------	-------------------------------

#### Returns

end of the line

#### 13.70.3.26 [line\\_start\(\)](#)

```
int Fl_Input_::line_start (
 int i) const [protected]
```

Finds the start of a line.

This call calculates the start of a line based on the given index *i*.

#### Parameters

<i>in</i>	<i>i</i>	starting index for the search
-----------	----------	-------------------------------

**Returns**

start of the line

**13.70.3.27 mark() [1/2]**

```
int Fl_Input_::mark () const [inline]
```

Gets the current selection mark.

**Returns**

index into the text

**13.70.3.28 mark() [2/2]**

```
int Fl_Input_::mark (
 int m) [inline]
```

Sets the current selection mark.

mark(n) is the same as `insert_position(insert_position(),n)`.

**Parameters**

<i>m</i>	new index of the mark
----------	-----------------------

**Returns**

0 if the mark did not change

**See also**

[insert\\_position\(\)](#), [insert\\_position\(int, int\)](#)

**13.70.3.29 maximum\_size() [1/2]**

```
int Fl_Input_::maximum_size () const [inline]
```

Gets the maximum length of the input field in characters.

**See also**

[maximum\\_size\(int\)](#).

**13.70.3.30 maximum\_size() [2/2]**

```
void Fl_Input_::maximum_size (
 int m) [inline]
```

Sets the maximum length of the input field in characters.

This limits the number of **characters** that can be inserted in the widget.

Since FLTK 1.3 this is different than the buffer size, since one character can be more than one byte in UTF-8 encoding. In FLTK 1.1 this was the same (one byte = one character).

**13.70.3.31 placeholder() [1/2]**

```
const char * Fl_Input_::placeholder () const
```

Get the placeholder text.

**Returns**

pointer to an internal buffer to the placeholder text, or nullptr. The buffer will be freed when the widget is destroyed or a new placeholder is set.

**13.70.3.32 placeholder()** [2/2]

```
void Fl_Input_::placeholder (
 const char * text)
```

Set the placeholder text.

**Parameters**

in	<i>text</i>	the placeholder text
----	-------------	----------------------

**13.70.3.33 position()** [1/3]

```
int Fl_Input_::position () const [inline]
```

**Deprecated** "since 1.4.0 - use insert\_position() instead"

**13.70.3.34 position()** [2/3]

```
int Fl_Input_::position (
 int p) [inline]
```

**Deprecated** "since 1.4.0 - use insert\_position(p) instead"

**13.70.3.35 position()** [3/3]

```
int Fl_Input_::position (
 int p,
 int m) [inline]
```

**Deprecated** "since 1.4.0 - use insert\_position(p, m) or Fl\_Widget::position(x, y) instead"

**13.70.3.36 readonly()** [1/2]

```
int Fl_Input_::readonly () const [inline]
```

Gets the read-only state of the input field.

**Returns**

non-zero if this widget is read-only

**13.70.3.37 readonly()** [2/2]

```
void Fl_Input_::readonly (
 int b) [inline]
```

Sets the read-only state of the input field.

**Parameters**

in	<i>b</i>	if <i>b</i> is 0, the text in this widget can be edited by the user
----	----------	---------------------------------------------------------------------

**13.70.3.38 redo()**

```
int Fl_Input_::redo ()
```

Redo previous undo operation.

This call reapplies previously executed undo operations.

**Returns**

non-zero if any change was made.

**13.70.3.39 replace()**

```
int Fl_Input_::replace (
 int b,
 int e,
 const char * text,
 int ilen = 0)
```

Deletes text from `b` to `e` and inserts the new string `text`.

All changes to the text buffer go through this function. It deletes the region between `b` and `e` (either one may be less or equal to the other), and then inserts the string `text` at that point and moves the [mark\(\)](#) and [position\(\)](#) to the end of the insertion. Does the callback if [when\(\)](#) & `FL_WHEN_CHANGED` and there is a change.

Set `b` and `e` equal to not delete anything. Set `text` to `NULL` to not insert anything.

`ilen` can be zero or `strlen(text)`, which saves a tiny bit of time if you happen to already know the length of the insertion, or can be used to insert a portion of a string. If `ilen` is zero, `strlen(text)` is used instead.

`b` and `e` are clamped to the `0..size()` range, so it is safe to pass any values. `b`, `e`, and `ilen` are used as numbers of bytes (not characters), where `b` and `e` count from 0 to [size\(\)](#) (end of buffer).

If `b` and/or `e` don't point to a valid UTF-8 character boundary, they are adjusted to the previous (`b`) or the next (`e`) valid UTF-8 character boundary, resp..

If the current number of characters in the buffer minus deleted characters plus inserted characters in `text` would overflow the number of allowed characters ([maximum\\_size\(\)](#)), then only the first characters of the string are inserted, so that [maximum\\_size\(\)](#) is not exceeded.

[cut\(\)](#) and [insert\(\)](#) are just inline functions that call [replace\(\)](#).

**Parameters**

in	<i>b</i>	beginning index of text to be deleted
in	<i>e</i>	ending index of text to be deleted and insertion position
in	<i>text</i>	string that will be inserted
in	<i>ilen</i>	length of <code>text</code> or 0 for nul terminated strings

**Returns**

0 if nothing changed

**Note**

If `text` does not point to a valid UTF-8 character or includes invalid UTF-8 sequences, the text is inserted nevertheless (counting invalid UTF-8 bytes as one character each).

**13.70.3.40 resize()**

```
void Fl_Input_::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Changes the size of the widget.

This call updates the text layout so that the cursor is visible.

## Parameters

in	<i>X,Y,W,H</i>	new size of the widget
----	----------------	------------------------

## See also

[Fl\\_Widget::resize\(int, int, int, int\)](#)

Reimplemented from [Fl\\_Widget](#).

**13.70.3.41 shortcut()** [1/2]

```
int Fl_Input_::shortcut () const [inline]
```

Return the shortcut key associated with this widget.

## Returns

shortcut keystroke

## See also

[Fl\\_Button::shortcut\(\)](#)

**13.70.3.42 shortcut()** [2/2]

```
void Fl_Input_::shortcut (
 int s) [inline]
```

Sets the shortcut key associated with this widget.

Pressing the shortcut key gives text editing focus to this widget.

## Parameters

in	<i>s</i>	new shortcut keystroke
----	----------	------------------------

## See also

[Fl\\_Button::shortcut\(\)](#)

**13.70.3.43 size()** [1/2]

```
int Fl_Input_::size () const [inline]
```

Returns the number of bytes in [value\(\)](#).

This may be greater than `strlen(value())` if there are nul characters in the text.

## Returns

number of bytes in the text

**13.70.3.44 size()** [2/2]

```
void Fl_Input_::size (
 int W,
 int H) [inline]
```

Sets the width and height of this widget.

## Parameters

in	<i>W,H</i>	new width and height
----	------------	----------------------

See also

[Fl\\_Widget::size\(int, int\)](#)

### 13.70.3.45 static\_value() [1/2]

```
int Fl_Input_::static_value (
 const char * str)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is *not* copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the [Fl\\_Input](#) is destroyed or [value\(\)](#) is called again.

Parameters

in	<i>str</i>	the new text
----	------------	--------------

Returns

non-zero if the new value is different than the current one

### 13.70.3.46 static\_value() [2/2]

```
int Fl_Input_::static_value (
 const char * str,
 int len)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is *not* copied. If the user edits the string it is copied to the internal buffer then. This can save a great deal of time and memory if your program is rapidly changing the values of text fields, but this will only work if the passed string remains unchanged until either the [Fl\\_Input](#) is destroyed or [value\(\)](#) is called again.

You can use the `len` parameter to directly set the length if you know it already or want to put `nul` characters in the text.

Parameters

in	<i>str</i>	the new text
in	<i>len</i>	the length of the new text

Returns

non-zero if the new value is different than the current one

### 13.70.3.47 tab\_nav() [1/2]

```
int Fl_Input_::tab_nav () const [inline]
```

Gets whether the Tab key causes focus navigation in multiline input fields or not.

If enabled (default), hitting Tab causes focus navigation to the next widget.

If disabled, hitting Tab inserts a tab character into the text field.

Returns

1 if Tab advances focus (default), 0 if Tab inserts tab characters.

See also

[tab\\_nav\(int\)](#), [Fl::OPTION\\_ARROW\\_FOCUS](#).

**13.70.3.48 tab\_nav()** [2/2]

```
void Fl_Input_::tab_nav (
 int val) [inline]
```

Sets whether the Tab key does focus navigation, or inserts tab characters into [Fl\\_Multiline\\_Input](#).

By default this flag is enabled to provide the 'normal' behavior most users expect; Tab navigates focus to the next widget. To inserting an actual Tab character, users can use Ctrl-I or copy/paste.

Disabling this flag gives the old FLTK behavior where Tab inserts a tab character into the text field, in which case only the mouse can be used to navigate to the next field.

History: This flag was provided for backwards support of FLTK's old 1.1.x behavior where Tab inserts a tab character instead of navigating focus to the next widget. This behavior was unique to [Fl\\_Multiline\\_Input](#). With the advent of [Fl\\_Text\\_Editor](#), this old behavior has been deprecated.

**Parameters**

in	val	If val is 1, Tab advances focus (default). If val is 0, Tab inserts a tab character (old FLTK behavior).
----	-----	-------------------------------------------------------------------------------------------------------------

**See also**

[tab\\_nav\(\)](#), [Fl::OPTION\\_ARROW\\_FOCUS](#).

**13.70.3.49 textcolor()** [1/2]

```
Fl_Color Fl_Input_::textcolor () const [inline]
```

Gets the color of the text in the input field.

**Returns**

the text color

**See also**

[textcolor\(Fl\\_Color\)](#)

**13.70.3.50 textcolor()** [2/2]

```
void Fl_Input_::textcolor (
 Fl_Color n) [inline]
```

Sets the color of the text in the input field.

The text color defaults to [FL\\_FOREGROUND\\_COLOR](#).

**Parameters**

in	n	new text color
----	---	----------------

**See also**

[textcolor\(\)](#)

**13.70.3.51 textfont()** [1/2]

```
Fl_Font Fl_Input_::textfont () const [inline]
```

Gets the font of the text in the input field.

**Returns**

the current [Fl\\_Font](#) index

**13.70.3.52 textfont() [2/2]**

```
void Fl_Input_::textfont (
 Fl_Font s) [inline]
```

Sets the font of the text in the input field.

The text font defaults to FL\_HELVETICA.

**Parameters**

in	s	the new text font
----	---	-------------------

**13.70.3.53 textsize() [1/2]**

```
Fl_Fontsize Fl_Input_::textsize () const [inline]
```

Gets the size of the text in the input field.

**Returns**

the text height in pixels

**13.70.3.54 textsize() [2/2]**

```
void Fl_Input_::textsize (
 Fl_Fontsize s) [inline]
```

Sets the size of the text in the input field.

The text height defaults to FL\_NORMAL\_SIZE.

**Parameters**

in	s	the new font height in pixel units
----	---	------------------------------------

**13.70.3.55 undo()**

```
int Fl_Input_::undo ()
```

Undoes previous changes to the text buffer.

This call undoes a number of previous calls to [replace\(\)](#).

**Returns**

non-zero if any change was made.

**13.70.3.56 up\_down\_position()**

```
int Fl_Input_::up_down_position (
 int i,
 int keepmark = 0) [protected]
```

Moves the cursor to the column given by up\_down\_pos.

This function is helpful when implementing up and down cursor movement. It moves the cursor from the beginning of a line to the column indicated by the global variable up\_down\_pos in pixel units.

**Parameters**

in	i	index into the beginning of a line of text
in	keepmark	if set, move only the cursor, but not the mark

**Returns**

index to new cursor position

**13.70.3.57 value() [1/5]**

```
const char * Fl_Input_::value () const [inline]
```

Returns the text displayed in the widget.

This function returns the current value, which is a pointer to the internal buffer and is valid only until the next event is handled.

**Returns**

pointer to an internal buffer - do not free() this

**See also**

[Fl\\_Input\\_::value\(const char\\*\)](#)

**13.70.3.58 value() [2/5]**

```
int Fl_Input_::value (
 const char * str)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing `NULL` is the same as `" "`.

**Parameters**

in	<i>str</i>	the new text
----	------------	--------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str, int len\)](#), [Fl\\_Input\\_::value\(\)](#)

**13.70.3.59 value() [3/5]**

```
int Fl_Input_::value (
 const char * str,
 int len)
```

Changes the widget text.

This function changes the text and sets the mark and the point to the end of it. The string is copied to the internal buffer. Passing `NULL` is the same as `""`.

You can use the `length` parameter to directly set the length if you know it already or want to put `nul` characters in the text.

**Parameters**

in	<i>str</i>	the new text
in	<i>len</i>	the length of the new text

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::value\(\)](#)

**13.70.3.60 value() [4/5]**

```
int Fl_Input_::value (
 double v)
```

Changes the widget text to a floating point number ("%g").

**Parameters**

<code>in</code>	<code>v</code>	the new value
-----------------	----------------	---------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::ivalue\(\)](#)

**13.70.3.61 value() [5/5]**

```
int Fl_Input_::value (
 int v)
```

Changes the widget text to a signed integer number.

**Parameters**

<code>in</code>	<code>v</code>	the new value
-----------------	----------------	---------------

**Returns**

non-zero if the new value is different than the current one

**See also**

[Fl\\_Input\\_::value\(const char\\* str\)](#), [Fl\\_Input\\_::ivalue\(\)](#)

**13.70.3.62 word\_end()**

```
int Fl_Input_::word_end (
 int i) const [protected]
```

Finds the end of a word.

Returns the index after the last byte of a word. If the index is already at the end of a word, it will find the end of the following word, so if you call it repeatedly you will move forwards to the end of the text.

Note that this is inconsistent with [line\\_end\(\)](#).

**Parameters**

<code>in</code>	<code>i</code>	starting index for the search
-----------------	----------------	-------------------------------

**Returns**

end of the word

**13.70.3.63 word\_start()**

```
int Fl_Input_::word_start (
 int i) const [protected]
```

Finds the start of a word.

Returns the index of the first byte of a word. If the index is already at the beginning of a word, it will find the beginning of the previous word, so if you call it repeatedly you will move backwards to the beginning of the text.

Note that this is inconsistent with [line\\_start\(\)](#).

**Parameters**

in	i	starting index for the search
----	---	-------------------------------

**Returns**

start of the word, or previous word

**13.70.3.64 wrap() [1/2]**

```
int Fl_Input_::wrap () const [inline]
```

Gets the word wrapping state of the input field.

Word wrap is only functional with multi-line input fields.

**13.70.3.65 wrap() [2/2]**

```
void Fl_Input_::wrap (
 int b) [inline]
```

Sets the word wrapping state of the input field.

Word wrap is only functional with multi-line input fields.

The documentation for this class was generated from the following files:

- `Fl_Input_.H`
- `Fl_Input_.cxx`

**13.71 Fl\_Input\_Choice Class Reference**

A combination of the input widget and a menu button.

Inheritance diagram for `Fl_Input_Choice`:

**Public Member Functions**

- void [add](#) (const char \*s)  
*Adds an item to the menu.*
- int **changed** () const

- Returns the combined [changed\(\)](#) state of the input and menu button widget.*

  - void **clear** ()
 

*Removes all items from the menu.*
  - void **clear\_changed** ()
 

*Clears the [changed\(\)](#) state of both input and menu button widgets.*
  - [FL\\_Boxtype](#) **down\_box** () const
 

*Gets the box type of the menu button.*
  - void **down\_box** ([FL\\_Boxtype](#) b)
 

*Sets the box type of the menu button.*
  - [FL\\_Input\\_Choice](#) (int X, int Y, int W, int H, const char \*L=0)
 

*Creates a new [FL\\_Input\\_Choice](#) widget using the given position, size, and label string.*
  - [FL\\_Input](#) \* **input** () const
 

*Returns a pointer to the internal [FL\\_Input](#) widget.*
  - const [FL\\_Menu\\_Item](#) \* **menu** ()
 

*Gets the [FL\\_Menu\\_Item](#) array used for the menu.*
  - void **menu** (const [FL\\_Menu\\_Item](#) \*m)
 

*Sets the [FL\\_Menu\\_Item](#) array used for the menu.*
  - [FL\\_Menu\\_Button](#) \* **menubutton** () const
 

*Returns a pointer to the internal [FL\\_Menu\\_Button](#) widget.*
  - void **resize** (int X, int Y, int W, int H) override
 

*Resizes the [FL\\_Input\\_Choice](#) widget.*
  - void **set\_changed** ()
 

*Sets the [changed\(\)](#) state of both input and menu button widgets to the specified value.*
  - [FL\\_Color](#) **textcolor** () const
 

*Gets the [FL\\_Input](#) text field's text color.*
  - void **textcolor** ([FL\\_Color](#) c)
 

*Sets the [FL\\_Input](#) text field's text color to *c*.*
  - [FL\\_Font](#) **textfont** () const
 

*Gets the [FL\\_Input](#) text field's font style.*
  - void **textfont** ([FL\\_Font](#) f)
 

*Sets the [FL\\_Input](#) text field's font style to *f*.*
  - [FL\\_Fonsize](#) **textsize** () const
 

*Gets the [FL\\_Input](#) text field's font size.*
  - void **textsize** ([FL\\_Fonsize](#) s)
 

*Sets the [FL\\_Input](#) text field's font size to *s*.*
  - int **update\_menubutton** ()
 

*Updates the menubutton with the string value in [FL\\_Input](#).*
  - const char \* **value** () const
 

*Returns the [FL\\_Input](#) text field's current contents.*
  - void **value** (const char \*val)
 

*Sets the [FL\\_Input](#) text field's contents to *val*.*
  - void **value** (int val)
 

*Chooses item# *val* in the menu, and sets the [FL\\_Input](#) text field to that value.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- int **handle** (int) override  
*Handles the specified event.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*

- void **remove** (int index)  
*Removes the widget at `index` from the group but does not delete it.*
- **FI\_Widget** \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (**FI\_Widget** &o)  
*Sets the group's resizable widget.*
- void **resizable** (**FI\_Widget** \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual ~**FI\_Group** ()  
*The destructor also deletes all the children.*

### Public Member Functions inherited from **FI\_Widget**

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align** **align** () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an **FI\_Gl\_Window** pointer if this widget is an **FI\_Gl\_Window**.*
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FI\_Window** \* **as\_window** ()  
*Returns an **FI\_Window** pointer if this widget is an **FI\_Window**.*
- virtual **FI\_Window** const \* **as\_window** () const
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI\_Boxtype** **box** () const  
*Gets the box type of the widget.*
- void **box** (**FI\_Boxtype** new\_box)  
*Sets the box type for the widget.*
- **FI\_Callback\_p** **callback** () const  
*Gets the current callback function for the widget.*
- void **callback** (**FI\_Callback** \*cb)  
*Sets the current callback function for the widget.*

- void `callback` (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FI_Color` color () const  
*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- uchar `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)  
*Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FI_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` \*img)

- Sets the image to use as part of the widget label when in the inactive state.*

  - `int deimage_bound () const`

*Returns whether the inactive image is managed by the widget.*
- `void do_callback (FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

*Calls the widget callback function with default arguments.*
- `void do_callback (FI_Widget *widget, long arg, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

*Calls the widget callback function with arbitrary arguments.*
- `void do_callback (FI_Widget *widget, void *arg=0, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

*Calls the widget callback function with arbitrary arguments.*
- `void draw_label (int, int, int, int, FI_Align) const`

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- `int h () const`

*Gets the widget height.*
- `virtual void hide ()`

*Makes a widget invisible.*
- `int horizontal_label_margin ()`

*Get the spacing between the label and the horizontal edge of the widget.*
- `void horizontal_label_margin (int px)`

*Set the spacing between the label and the horizontal edge of the widget.*
- `FI_Image * image ()`

*Gets the image that is used as part of the widget label when in the active state.*
- `const FI_Image * image () const`

*Gets the image that is used as part of the widget label when in the active state.*
- `void image (FI_Image &img)`

*Sets the image to use as part of the widget label when in the active state.*
- `void image (FI_Image *img)`

*Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`

*Returns whether the image is managed by the widget.*
- `int inside (const FI_Widget *wgt) const`

*Checks if this widget is a child of wgt.*
- `int is_label_copied () const`

*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`

*Gets the current label text.*
- `void label (const char *text)`

*Sets the current label pointer.*
- `void label (FI_Labeltype a, const char *b)`

*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`

*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`

*Set the gap between the label and the image in pixels.*
- `FI_Color labelcolor () const`

*Gets the label color.*
- `void labelcolor (FI_Color c)`

*Sets the label color.*
- `FI_Font labelfont () const`

*Gets the font to use.*
- `void labelfont (FI_Font f)`

*Sets the font to use.*

- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [FL\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()

- Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- uchar [type](#) () const  
*Gets the widget type.*
- void [type](#) (uchar t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()  
*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*
- virtual int **inp\_h** () const  
*See [inp\\_x\(\)](#) for info.*
- virtual int **inp\_w** () const  
*See [inp\\_x\(\)](#) for info.*
- virtual int **inp\_x** () const  
*The methods [inp\\_x\(\)](#), [inp\\_y\(\)](#), [inp\\_w\(\)](#) and [inp\\_h\(\)](#) return the desired position and size of the internal [FI\\_Input](#) widget.*
- virtual int **inp\_y** () const  
*See [inp\\_x\(\)](#) for info.*
- virtual int **menu\_h** () const  
*See [menu\\_x\(\)](#) for info.*
- virtual int **menu\_w** () const  
*See [menu\\_x\(\)](#) for info.*
- virtual int **menu\_x** () const  
*The methods [menu\\_x\(\)](#), [menu\\_y\(\)](#), [menu\\_w\(\)](#) and [menu\\_h\(\)](#) return the desired position and size of the internal [FI\\_Menu\\_Button](#) widget.*
- virtual int **menu\_y** () const  
*See [menu\\_x\(\)](#) for info.*

### Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* **bounds** ()  
*Returns the internal array of widget sizes and positions.*
- void **draw\_child** ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void **draw\_children** ()  
*Draws all children of the group.*
- void **draw\_outside\_label** (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int **on\_insert** ([FI\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int **on\_move** (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void **on\_remove** (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* **sizes** ()  
*Returns the internal array of widget sizes and positions.*
- void **update\_child** ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If [FL\\_ALIGN\\_IMAGE\\_BACKDROP](#) is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const

- Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const
- Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const
- Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const
- Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)
- Creates a widget at the given position and size.*
- unsigned int **flags** () const
- Gets the widget flags mask.*
- void **h** (int v)
- Internal use only.*
- void **set\_flag** (unsigned int c)
- Sets a flag in the flags mask.*
- void **w** (int v)
- Internal use only.*
- void **x** (int v)
- Internal use only.*
- void **y** (int v)
- Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Group

- static FI\_Group \* **current** ()
- Returns the currently active group.*
- static void **current** (FI\_Group \*g)
- Sets the current group.*

### Static Public Member Functions inherited from FI\_Widget

- static void **default\_callback** (FI\_Widget \*widget, void \*data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from [Fl\\_Widget](#)

*flags possible values enumeration.*

### 13.71.1 Detailed Description

A combination of the input widget and a menu button.

Figure 13.26 [Fl\\_Input\\_Choice](#) widget

The user can either type into the input area, or use the menu button chooser on the right to choose an item which loads the input area with the selected text.

The application can directly access both the internal [Fl\\_Input](#) and [Fl\\_Menu\\_Button](#) widgets respectively using the [input\(\)](#) and [menubutton\(\)](#) accessor methods.

The default behavior is to invoke the [Fl\\_Input\\_Choice::callback\(\)](#) if the user changes the input field's contents, either by typing, pasting, or clicking a different item in the choice menu.

The callback can determine if an item was picked vs. typing into the input field by checking the value of [menubutton\(\)->changed\(\)](#), which will be:

- 1: the user picked a different item in the choice menu
- 0: the user typed or pasted directly into the input field

FLTK triggers an [FL\\_BEFORE\\_MENU](#) event for this widget right before displaying the menu. This event provides an opportunity to update menu item states and activation.

#### Example Use of [Fl\\_Input\\_Choice](#)

```
#include <stdio.h>
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Input_Choice.H>
// Fl_Input_Choice callback()
void choice_cb(Fl_Widget *w, void *userdata) {
 // Show info about the picked item
 Fl_Input_Choice *choice = (Fl_Input_Choice*)w;
 printf("*** Choice Callback:\n");
 printf(" widget's text value='%s'\n", choice->value()); // normally all you need
 // Access the menu via menubutton()..
 const Fl_Menu_Item *item = choice->menubutton()->mvalue();
 printf(" item label()=' %s'\n", item ? item->label() : "(No item)");
 printf(" item value()=%d\n", choice->menubutton()->value());
 printf(" input value()=' %s'\n", choice->input()->value());
 printf(" The user %s\n", choice->menubutton()->changed()
 ? "picked a menu item"
 : "typed text");
}
```

```

}
int main() {
 Fl_Double_Window win(200,100,"Input Choice");
 win.begin();
 Fl_Input_Choice choice(10,10,100,30);
 choice.callback(choice_cb, 0);
 choice.add("Red");
 choice.add("Orange");
 choice.add("Yellow");
 //choice.value("Red"); // uncomment to make "Red" default
 win.end();
 win.show();
 return Fl::run();
}

```

### Subclassing Example

One can subclass `Fl_Input_Choice` to override the virtual methods `inp_x/y/w/h()` and `menu_x/y/w/h()` to take control of the internal `Fl_Input` and `Fl_Menu_Button` widget positioning. In this example, input and menubutton's positions are swapped:

```

#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Input_Choice.H>

class MyInputChoice : public Fl_Input_Choice {
protected:
 virtual int inp_x() const { return x() + Fl::box_dx(box()) + menu_w(); } // override to reposition
 virtual int menu_x() const { return x() + Fl::box_dx(box()); } // override to reposition
public:
 MyInputChoice(int X,int Y,int W,int H,const char*L=0) : Fl_Input_Choice(X,Y,W,H,L) {
 resize(X,Y,W,H); // necessary for ctor to trigger our overrides
 }
};

int main(int argc, char **argv) {
 Fl_Window *win = new Fl_Window(400,300);
 MyInputChoice *mychoice = new MyInputChoice(150,40,150,25,"Right Align Input");
 mychoice->add("Aaa");
 mychoice->add("Bbb");
 mychoice->add("Ccc");
 win->end();
 win->resizable(win);
 win->show();
 return Fl::run();
}

```

## 13.71.2 Constructor & Destructor Documentation

### 13.71.2.1 Fl\_Input\_Choice()

```

Fl_Input_Choice::Fl_Input_Choice (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)

```

Creates a new `Fl_Input_Choice` widget using the given position, size, and label string. Inherited destructor destroys the widget and any values associated with it.

## 13.71.3 Member Function Documentation

### 13.71.3.1 add()

```

void Fl_Input_Choice::add (
 const char * s) [inline]

```

Adds an item to the menu.

When any item is selected, the `Fl_Input_Choice callback()` is invoked, which can do something with the selected item.

You can access the more complex `Fl_Menu_Button::add()` methods (setting item-specific callbacks, userdata, etc), via `menubutton()`. Example:

```

Fl_Input_Choice *choice = new Fl_Input_Choice(100,10,120,25,"Fonts");
Fl_Menu_Button *mb = choice->menubutton(); // use Fl_Input_Choice's Fl_Menu_Button
mb->add("Helvetica", 0, MyFont_CB, (void*)mydata); // use Fl_Menu_Button's add() methods

```

```
mb->add("Courier", 0, MyFont_CB, (void*)mydata);
mb->add("More..", 0, FontDialog_CB, (void*)mydata);
```

### 13.71.3.2 draw()

```
void Fl_Input_Choice::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

### 13.71.3.3 inp\_x()

```
virtual int Fl_Input_Choice::inp_x () const [inline], [protected], [virtual]
```

The methods [inp\\_x\(\)](#), [inp\\_y\(\)](#), [inp\\_w\(\)](#) and [inp\\_h\(\)](#) return the desired position and size of the internal [Fl\\_Input](#) widget. These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

### 13.71.3.4 input()

```
Fl_Input * Fl_Input_Choice::input () const [inline]
```

Returns a pointer to the internal [Fl\\_Input](#) widget.

This can be used to directly access all of the [Fl\\_Input](#) widget's methods.

### 13.71.3.5 menu\_x()

```
virtual int Fl_Input_Choice::menu_x () const [inline], [protected], [virtual]
```

The methods [menu\\_x\(\)](#), [menu\\_y\(\)](#), [menu\\_w\(\)](#) and [menu\\_h\(\)](#) return the desired position and size of the internal [Fl\\_Menu\\_Button](#) widget.

These can be overridden by a subclass to redefine positioning. See code example in the Description for subclassing details.

### 13.71.3.6 menubutton()

```
Fl_Menu_Button * Fl_Input_Choice::menubutton () const [inline]
```

Returns a pointer to the internal [Fl\\_Menu\\_Button](#) widget.

This can be used to access any of the methods of the menu button, e.g.

```
Fl_Input_Choice *choice = new Fl_Input_Choice(100,10,120,25,"Choice:");
[...]
```

```
// Print all the items in the choice menu
for (int t=0; t<choice->menubutton()->size(); t++) {
 const Fl_Menu_Item &item = choice->menubutton()->menu()[t];
 printf("item %d -- label=%s\n", t, item.label() ? item.label() : "(Null)");
}
```

### 13.71.3.7 resize()

```
void Fl_Input_Choice::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Input\\_Choice](#) widget.

Reimplemented from [Fl\\_Group](#).

### 13.71.3.8 update\_menubutton()

```
int Fl_Input_Choice::update_menubutton ()
```

Updates the menubutton with the string value in [Fl\\_Input](#).

If the string value currently in [Fl\\_Input](#) matches one of the menu items in [menubutton\(\)](#), that menu item will become the current item selected.

Call this method after setting [value\(const char\\*\)](#) if you need the [menubutton\(\)](#) to be synchronized with the [Fl\\_Input](#) field.

```
// Add items
choice->add(".25");
choice->add(".50");
choice->add("1.0");
choice->add("2.0");
choice->add("4.0");

choice->value("1.0"); // sets Fl_Input to "1.0"
choice->update_menubutton(); // cause menubutton to reflect this value too
 // (returns 1 if match was found, 0 if not)

// Verify menubutton()'s value.
printf("menu button choice index=%d, value=%s\n",
 choice->menubutton()->value(), // would be -1 if update not done
 choice->menubutton()->text()); // would be NULL if update not done
```

#### Returns

1 if a matching menuitem was found and value set, 0 if not.

#### Version

1.4.0

### 13.71.3.9 value() [1/2]

```
void Fl_Input_Choice::value (
 const char * val) [inline]
```

Sets the [Fl\\_Input](#) text field's contents to `val`.

Note it is possible to set the [value\(\)](#) to one that is not in the menubutton's list of choices.

Setting the [value\(\)](#) does NOT affect the menubutton's selection. If that's needed, call [update\\_menubutton\(\)](#) after setting [value\(\)](#).

#### See also

[void value\(int val\)](#), [update\\_menubutton\(\)](#)

### 13.71.3.10 value() [2/2]

```
void Fl_Input_Choice::value (
 int val)
```

Chooses item# `val` in the menu, and sets the [Fl\\_Input](#) text field to that value.

Any previous text is cleared.

#### See also

[void value\(const char \\*val\)](#)

The documentation for this class was generated from the following files:

- [Fl\\_Input\\_Choice.H](#)
- [Fl\\_Input\\_Choice.cxx](#)

## 13.72 Fl\_Int\_Input Class Reference

The [Fl\\_Int\\_Input](#) class is a subclass of [Fl\\_Input](#) that only allows the user to type decimal digits (or hex numbers of the form 0xae).

```
#include <Fl_Int_Input.H>
```

Inheritance diagram for `Fl_Int_Input`:

### Public Member Functions

- `Fl_Int_Input` (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new `Fl_Int_Input` widget using the given position, size, and label string.*

### Public Member Functions inherited from `Fl_Input`

- `Fl_Input` (int, int, int, int, const char \*l=0)  
*Creates a new `Fl_Input` widget using the given position, size, and label string.*
- int `handle` (int) override  
*Handles the specified event.*

### Public Member Functions inherited from `Fl_Input_`

- int `append` (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool `can_redo` () const  
*Check if there is a redo action available.*
- bool `can_undo` () const  
*Check if the last operation can be undone.*
- int `copy` (int clipboard)  
*Put the current selection into the clipboard.*
- int `copy_cuts` ()  
*Copies the yank buffer to the clipboard.*
- `Fl_Color` `cursor_color` () const  
*Gets the color of the cursor.*
- void `cursor_color` (`Fl_Color` n)  
*Sets the color of the cursor.*
- int `cut` ()  
*Deletes the current selection.*
- int `cut` (int a, int b)  
*Deletes all characters between index a and b.*
- int `cut` (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double `dvalue` () const  
*Returns the widget text interpreted as a floating point number.*
- `Fl_Input_` (int, int, int, int, const char \*l=0)  
*Creates a new `Fl_Input_` widget.*
- unsigned int `index` (int i) const  
*Returns the character at index i.*

- int [input\\_type](#) () const  
*Gets the input field type.*
- void [input\\_type](#) (int t)  
*Sets the input field type.*
- int [insert](#) (const char \*t, int l=0)  
*Inserts text at the cursor position.*
- int [insert\\_position](#) () const  
*Gets the position of the text cursor.*
- int [insert\\_position](#) (int p)  
*Sets the cursor position and mark.*
- int [insert\\_position](#) (int p, int m)  
*Sets the index for the cursor and mark.*
- int [ivalue](#) () const  
*Returns the widget text interpreted as a signed integer.*
- int [mark](#) () const  
*Gets the current selection mark.*
- int [mark](#) (int m)  
*Sets the current selection mark.*
- int [maximum\\_size](#) () const  
*Gets the maximum length of the input field in characters.*
- void [maximum\\_size](#) (int m)  
*Sets the maximum length of the input field in characters.*
- const char \* [placeholder](#) () const  
*Get the placeholder text.*
- void [placeholder](#) (const char \*text)  
*Set the placeholder text.*
- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const  
*Gets the read-only state of the input field.*
- void [readonly](#) (int b)  
*Sets the read-only state of the input field.*
- int [redo](#) ()  
*Redo previous undo operation.*
- int [replace](#) (int b, int e, const char \*text, int llen=0)  
*Deletes text from b to e and inserts the new string text.*
- void [resize](#) (int, int, int, int) override  
*Changes the size of the widget.*
- int [shortcut](#) () const  
*Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)  
*Sets the shortcut key associated with this widget.*
- int [size](#) () const  
*Returns the number of bytes in value().*
- void [size](#) (int W, int H)  
*Sets the width and height of this widget.*
- int [static\\_value](#) (const char \*)  
*Changes the widget text.*
- int [static\\_value](#) (const char \*, int)  
*Changes the widget text.*

- int [tab\\_nav](#) () const  
*Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)  
*Sets whether the Tab key does focus navigation, or inserts tab characters into [Fl\\_Multiline\\_Input](#).*
- [Fl\\_Color](#) [textcolor](#) () const  
*Gets the color of the text in the input field.*
- void [textcolor](#) ([Fl\\_Color](#) n)  
*Sets the color of the text in the input field.*
- [Fl\\_Font](#) [textfont](#) () const  
*Gets the font of the text in the input field.*
- void [textfont](#) ([Fl\\_Font](#) s)  
*Sets the font of the text in the input field.*
- [Fl\\_Fontsize](#) [textsize](#) () const  
*Gets the size of the text in the input field.*
- void [textsize](#) ([Fl\\_Fontsize](#) s)  
*Sets the size of the text in the input field.*
- int [undo](#) ()  
*Undoes previous changes to the text buffer.*
- const char \* [value](#) () const  
*Returns the text displayed in the widget.*
- int [value](#) (const char \*)  
*Changes the widget text.*
- int [value](#) (const char \*, int)  
*Changes the widget text.*
- int [value](#) (double value)  
*Changes the widget text to a floating point number ("%g").*
- int [value](#) (int value)  
*Changes the widget text to a signed integer number.*
- int [wrap](#) () const  
*Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)  
*Sets the word wrapping state of the input field.*
- [~Fl\\_Input](#) ()  
*Destroys the widget.*

## Public Member Functions inherited from [Fl\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [Fl\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([Fl\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*

- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*

- void `color` (`FL_Color` bg)
 

*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)
 

*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const
 

*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)
 

*Sets the current label.*
- void `copy_tooltip` (const char \*text)
 

*Sets the current tooltip text.*
- `uchar` `damage` () const
 

*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)
 

*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)
 

*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
 

*Internal use only.*
- void `deactivate` ()
 

*Deactivates the widget.*
- `FL_Image` \* `deimage` ()
 

*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const
 

*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)
 

*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)
 

*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
 

*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
 

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
 

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
 

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const
 

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const
 

*Gets the widget height.*
- virtual void `hide` ()
 

*Makes a widget invisible.*
- int `horizontal_label_margin` ()
 

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)
 

*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()
 

*Gets the image that is used as part of the widget label when in the active state.*
- const `FL_Image` \* `image` () const
 

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FL_Image` &img)

- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([FI\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [FI\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([FI\\_Color](#) c)
- Sets the label color.*

  - [FI\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([FI\\_Font](#) f)
- Sets the font to use.*

  - [FI\\_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([FI\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [FI\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([FI\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [FI\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

- Sets the user data for this widget.*

    - int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const
- Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const
- Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)
- Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const
- Returns whether a widget and all its parents are visible.*
- int [w](#) () const
- Gets the widget width.*
- [Fl\\_When](#) [when](#) () const
- Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)
- Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const
- Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const
- Gets the widget position in its window.*
- int [y](#) () const
- Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()
- Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

### Static Public Attributes inherited from [Fl\\_Input](#)

- static const char \* [copy\\_menu\\_text](#) = "Copy"
- [this text may be customized at run-time]*
- static const char \* [cut\\_menu\\_text](#) = "Cut"
- [this text may be customized at run-time]*
- static const char \* [paste\\_menu\\_text](#) = "Paste"
- [this text may be customized at run-time]*

## Protected Member Functions inherited from [FI\\_Input](#)

- void [draw](#) () override  
*Draws the widget.*
- int [handle\\_key](#) ()  
*Handles a keystroke.*
- int [handle\\_rmb](#) ()  
*Handle right mouse button down events.*

## Protected Member Functions inherited from [FI\\_Input\\_](#)

- int [apply\\_undo](#) ()  
*Apply the current undo/redo operation.*
- void [drawtext](#) (int, int, int, int)  
*Draws the text in the passed bounding box.*
- void [drawtext](#) (int, int, int, int, bool draw\_active)  
*Draws the text in the passed bounding box.*
- void [handle\\_mouse](#) (int, int, int, int, int keepmark=0)  
*Handles mouse clicks and mouse moves.*
- int [handletext](#) (int e, int, int, int, int)  
*Handles all kinds of text field related events.*
- int [line\\_end](#) (int i) const  
*Finds the end of a line.*
- int [line\\_start](#) (int i) const  
*Finds the start of a line.*
- int [linesPerPage](#) ()
- void [maybe\\_do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- int [up\\_down\\_position](#) (int, int keepmark=0)  
*Moves the cursor to the column given by up\_down\_pos.*
- int [word\\_end](#) (int i) const  
*Finds the end of a word.*
- int [word\\_start](#) (int i) const  
*Finds the start of a word.*
- int [xscroll](#) () const
- int [yscroll](#) () const
- void [yscroll](#) (int yOffset)

## Protected Member Functions inherited from [Fl\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.72.1 Detailed Description

The [Fl\\_Int\\_Input](#) class is a subclass of [Fl\\_Input](#) that only allows the user to type decimal digits (or hex numbers of the form 0xae).

### 13.72.2 Constructor & Destructor Documentation

#### 13.72.2.1 [Fl\\_Int\\_Input](#)()

```
Fl_Int_Input::Fl_Int_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Int\\_Input](#) widget using the given position, size, and label string.

The default boxttype is FL\_DOWN\_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [Fl\\_Int\\_Input.H](#)
- [Fl\\_Input.cxx](#)

### 13.73 [Fl\\_JPEG\\_Image](#) Class Reference

The [Fl\\_JPEG\\_Image](#) class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

```
#include <Fl_JPEG_Image.H>
```

Inheritance diagram for [Fl\\_JPEG\\_Image](#):

#### Public Member Functions

- [Fl\\_JPEG\\_Image](#) (const char \*filename)  
*The constructor loads the JPEG image from the given jpeg filename.*
- [Fl\\_JPEG\\_Image](#) (const char \*name, const unsigned char \*data, int data\_length=-1)  
*The constructor loads the JPEG image from memory.*

#### Public Member Functions inherited from [Fl\\_RGB\\_Image](#)

- virtual [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) ()  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- virtual const [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) () const  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- int **cache\_h** () const
- int **cache\_w** () const
- void [color\\_average](#) ([Fl\\_Color](#) c, float i) override  
*The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.*
- [Fl\\_Image](#) \* **copy** () const
- [Fl\\_Image](#) \* [copy](#) (int W, int H) const override  
*Creates a resized copy of the image.*
- void [desaturate](#) () override  
*The [desaturate\(\)](#) method converts an image to grayscale.*
- void **draw** (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draws the image to the current drawing surface with a bounding box.*
- [Fl\\_RGB\\_Image](#) (const [Fl\\_Pixmap](#) \*pxm, [Fl\\_Color](#) bg=FL\_GRAY)  
*The constructor creates a new RGBA image from the specified [Fl\\_Pixmap](#).*
- [Fl\\_RGB\\_Image](#) (const uchar \*bits, int bits\_length, int W, int H, int D, int LD)  
*The constructor creates a new image from the specified data.*
- [Fl\\_RGB\\_Image](#) (const uchar \*bits, int W, int H, int D=3, int LD=0)  
*The constructor creates a new image from the specified data.*
- void [label](#) ([Fl\\_Menu\\_Item](#) \*m) override  
*This method is an obsolete way to set the image attribute of a menu item.*
- void [label](#) ([Fl\\_Widget](#) \*w) override

- *This method is an obsolete way to set the image attribute of a widget or menu item.*
- virtual void **normalize** ()  
*Makes sure the object is fully initialized.*
- void **uncache** () override  
*If the image has been cached for display, delete the cache data.*
- **~FI\_RGB\_Image** () override  
*The destructor frees all memory and server resources that are used by the image.*

## Public Member Functions inherited from FI\_Image

- virtual class **FI\_Shared\_Image** \* **as\_shared\_image** ()  
*Returns whether an image is an FI\_Shared\_Image or not.*
- **FI\_Image** \* **copy** () const  
*Creates a copy of the image in the same size.*
- int **count** () const  
*Returns the number of data values associated with the image.*
- int **d** () const  
*Returns the image depth.*
- const char \*const \* **data** () const  
*Returns a pointer to the current image data array.*
- int **data\_h** () const  
*Returns the height of the image data.*
- int **data\_w** () const  
*Returns the width of the image data.*
- void **draw** (int X, int Y)  
*Draws the image to the current drawing surface.*
- int **fail** () const  
*Returns a value that is not 0 if there is currently no image available.*
- **FI\_Image** (int W, int H, int D)  
*The constructor creates an empty image with the specified width, height, and depth.*
- int **h** () const  
*Returns the current image drawing height in FLTK units.*
- void **inactive** ()  
*The inactive() method calls color\_average(FL\_BACKGROUND\_COLOR, 0.33f) to produce an image that appears grayed out.*
- int **ld** () const  
*Returns the current line data size in bytes.*
- virtual void **release** ()  
*Releases an FI\_Image - the same as 'delete this'.*
- virtual void **scale** (int width, int height, int proportional=1, int can\_expand=0)  
*Sets the drawing size of the image.*
- int **w** () const  
*Returns the current image drawing width in FLTK units.*
- virtual **~FI\_Image** ()  
*The destructor is a virtual method that frees all memory used by the image.*

## Protected Member Functions

- void **load\_jpg\_** (const char \*filename, const char \*sharename, const unsigned char \*data, int data\_length=-1)

## Protected Member Functions inherited from [FI\\_Image](#)

- void **d** (int D)  
*Sets the current image depth.*
- void **data** (const char \*const \*p, int c)  
*Sets the current data pointer and count of pointers in the array.*
- void **draw\_empty** (int X, int Y)  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int **draw\_scaled** (int X, int Y, int W, int H)  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void **h** (int H)  
*Sets the height of the image data.*
- void **ld** (int LD)  
*Sets the current line data size in bytes.*
- void **w** (int W)  
*Sets the width of the image data.*

## Additional Inherited Members

## Static Public Member Functions inherited from [FI\\_RGB\\_Image](#)

- static size\_t **max\_size** ()  
*Returns the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*
- static void **max\_size** (size\_t size)  
*Sets the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*

## Static Public Member Functions inherited from [FI\\_Image](#)

- static [FI\\_Labeltype](#) **define\_FL\_IMAGE\_LABEL** ()
- static [FI\\_RGB\\_Scaling](#) **RGB\_scaling** ()  
*Returns the currently used RGB image scaling method.*
- static void **RGB\_scaling** ([FI\\_RGB\\_Scaling](#))  
*Sets the RGB image scaling method used for copy(int, int).*
- static [FI\\_RGB\\_Scaling](#) **scaling\_algorithm** ()  
*Gets what algorithm is used when resizing a source image to draw it.*
- static void **scaling\_algorithm** ([FI\\_RGB\\_Scaling](#) algorithm)  
*Sets what algorithm is used when resizing a source image to draw it.*

## Public Attributes inherited from [FI\\_RGB\\_Image](#)

- int **alloc\_array**  
*If non-zero, the object's data array is delete[]'d when deleting the object.*
- const uchar \* **array**  
*Points to the start of the object's data array.*

## Static Public Attributes inherited from [FI\\_Image](#)

- static const int **ERR\_FILE\_ACCESS** = -2
- static const int **ERR\_FORMAT** = -3
- static const int **ERR\_MEMORY\_ACCESS** = -4
- static const int **ERR\_NO\_IMAGE** = -1
- static bool **register\_images\_done** = false  
*True after [fl\\_register\\_images\(\)](#) was called, false before.*

## Static Protected Member Functions inherited from FI\_Image

- static void **labeltype** (const FI\_Label \*lo, int lx, int ly, int lw, int lh, FI\_Align la)
- static void **measure** (const FI\_Label \*lo, int &lw, int &lh)

### 13.73.1 Detailed Description

The FI\_JPEG\_Image class supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images.

The class supports grayscale and color (RGB) JPEG image files.

### 13.73.2 Constructor & Destructor Documentation

#### 13.73.2.1 FI\_JPEG\_Image() [1/2]

```
FI_JPEG_Image::FI_JPEG_Image (
 const char * filename)
```

The constructor loads the JPEG image from the given jpeg filename.

The inherited destructor frees all memory and server resources that are used by the image.

Use FI\_Image::fail() to check if FI\_JPEG\_Image failed to load. fail() returns ERR\_FILE\_ACCESS if the file could not be opened or read, ERR\_FORMAT if the JPEG format could not be decoded, and ERR\_NO\_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

#### Parameters

in	filename	a full path and name pointing to a valid jpeg file.
----	----------	-----------------------------------------------------

#### See also

FI\_JPEG\_Image::FI\_JPEG\_Image(const char \*imagename, const unsigned char \*data)

#### 13.73.2.2 FI\_JPEG\_Image() [2/2]

```
FI_JPEG_Image::FI_JPEG_Image (
 const char * name,
 const unsigned char * data,
 int data_length = -1)
```

The constructor loads the JPEG image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. name\_png can be NULL. If a name is given, the image is added to the list of shared images (see: FI\_Shared\_Image) and will be available by that name.

The inherited destructor frees all memory and server resources that are used by the image.

Use FI\_Image::fail() to check if FI\_JPEG\_Image failed to load. fail() returns ERR\_FILE\_ACCESS if the file could not be opened or read, ERR\_FORMAT if the JPEG format could not be decoded, and ERR\_NO\_IMAGE if the image could not be loaded for another reason. If the image has loaded correctly, w(), h(), and d() should return values greater than zero.

#### Parameters

name	A unique name or NULL
data	A pointer to the memory location of the JPEG image
data_length	optional length of data. This will protect memory outside of the data array from illegal read operations

## 13.74 FI\_Label Struct Reference

This struct stores all information for a text or mixed graphics label.

```
#include <FI_Widget.H>
```

### Public Member Functions

- void [draw](#) (int, int, int, int, [FI\\_Align](#)) const  
*Draws the label aligned to the given box.*
- void [measure](#) (int &w, int &h) const  
*Measures the size of the label.*

### Public Attributes

- [FI\\_Align](#) **align\_**  
*alignment of label*
- [FI\\_Color](#) **color**  
*text color*
- [FI\\_Image](#) \* **deimage**  
*optional image for a deactivated label*
- [FI\\_Font](#) **font**  
*label font used in text*
- signed char **h\_margin\_**  
*Spacing between label and the horizontally aligned side of the widget.*
- [FI\\_Image](#) \* **image**  
*optional image for an active label*
- [FI\\_Fonsize](#) **size**  
*size of label font*
- [uchar](#) **spacing**  
*Spacing between an image and the label text.*
- [uchar](#) **type**  
*type of label.*
- signed char **v\_margin\_**  
*Spacing between label and the vertically aligned side of the widget.*
- const char \* **value**  
*label text*

### 13.74.1 Detailed Description

This struct stores all information for a text or mixed graphics label.

**Todo** There is an aspiration that the [FI\\_Label](#) type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

## 13.74.2 Member Function Documentation

### 13.74.2.1 draw()

```
void Fl_Label::draw (
 int X,
 int Y,
 int W,
 int H,
 Fl_Align align) const
```

Draws the label aligned to the given box.

Draws a label with arbitrary alignment in an arbitrary box.

### 13.74.2.2 measure()

```
void Fl_Label::measure (
 int & W,
 int & H) const
```

Measures the size of the label.

#### Parameters

in, out	W,H	: this is the requested size for the label text plus image; on return, this will contain the size needed to fit the label
---------	-----	---------------------------------------------------------------------------------------------------------------------------

## 13.74.3 Member Data Documentation

### 13.74.3.1 type

```
uchar Fl_Label::type
```

type of label.

The documentation for this struct was generated from the following files:

- [Fl\\_Widget.H](#)
- [fl\\_labeltype.cxx](#)

## 13.75 Fl\_Light\_Button Class Reference

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

```
#include <Fl_Light_Button.H>
```

Inheritance diagram for Fl\_Light\_Button:

## Public Member Functions

- [FL\\_Light\\_Button](#) (int x, int y, int w, int h, const char \*l=0)  
*Creates a new [FL\\_Light\\_Button](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

## Public Member Functions inherited from [FL\\_Button](#)

- int [clear](#) ()  
*Same as `value(0)`.*
- [uchar compact](#) () const  
*Return true if buttons are rendered as compact buttons.*
- void [compact](#) (uchar v)  
*Decide if buttons should be rendered in compact mode.*
- [FL\\_Boxtype down\\_box](#) () const  
*Returns the current down box type, which is drawn when `value()` is non-zero.*
- void [down\\_box](#) (FL\_Boxtype b)  
*Sets the down box type.*
- [FL\\_Color down\\_color](#) () const  
*(for backwards compatibility)*
- void [down\\_color](#) (unsigned c)  
*(for backwards compatibility)*
- [FL\\_Button](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*
- int [set](#) ()  
*Same as `value(1)`.*
- void [setonly](#) ()  
*Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*
- int [shortcut](#) () const  
*Returns the current shortcut key for the button.*
- void [shortcut](#) (const char \*s)  
*(for backwards compatibility)*
- void [shortcut](#) (int s)  
*Sets the shortcut key to `s`.*
- char [value](#) () const  
*Returns the current value of the button (0 or 1).*
- int [value](#) (int v)  
*Sets the current value of the button.*

## Public Member Functions inherited from [FL\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align align](#) () const  
*Gets the label alignment.*

- void [align](#) ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FL\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- virtual [FL\\_Group](#) const \* [as\\_group](#) () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*

- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()

- Gets the image that is used as part of the widget label when in the active state.*

  - const [FI\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([FI\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [FI\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([FI\\_Color](#) c)
- Sets the label color.*

  - [FI\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([FI\\_Font](#) f)
- Sets the font to use.*

  - [FI\\_Fonsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([FI\\_Fonsize](#) pix)
- Sets the font size in pixels.*

  - [FI\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([FI\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [FI\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)
- Internal use only - "for hacks only".*

- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* **user\_data** () const  
*Gets the user data for this widget.*
  - void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
  - void **user\_data** (void \*v)  
*Sets the user data for this widget.*
  - int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
  - void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
  - unsigned int **visible** () const  
*Returns whether a widget is visible.*
  - unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
  - void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
  - int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
  - int **w** () const  
*Gets the widget width.*
  - FI\_When **when** () const  
*Returns the conditions under which the callback is called.*
  - void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
  - FI\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
  - int **x** () const  
*Gets the widget position in its window.*
  - int **y** () const  
*Gets the widget position in its window.*
  - virtual ~FI\_Widget ()  
*Destroys the widget.*

#### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

#### Protected Member Functions inherited from FI\_Button

- void **simulate\_key\_action** ()

#### Protected Member Functions inherited from FI\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const

- Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void **default\_callback** ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Static Protected Member Functions inherited from Fl\_Button

- static void `key_release_timeout` (void \*)

## Static Protected Attributes inherited from Fl\_Button

- static `Fl_Widget_Tracker` \* `key_release_tracker` = 0

### 13.75.1 Detailed Description

This subclass displays the "on" state by turning on a light, rather than drawing pushed in.

The shape of the "light" is initially set to `FL_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_YELLOW`.

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for `type()` and `when()`.

Figure 13.27 Fl\_Light\_Button

### 13.75.2 Constructor & Destructor Documentation

#### 13.75.2.1 Fl\_Light\_Button()

```
Fl_Light_Button::Fl_Light_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Light_Button` widget using the given position, size, and label string.

The default box type is `FL_UP_BOX` and the default down box type `down_box()` is `FL_NO_BOX` (0).

The `selection_color()` sets the color of the "light". Default is `FL_YELLOW`.

The default label alignment is `'FL_ALIGN_LEFT|FL_ALIGN_INSIDE'` so the label is drawn inside the button area right of the "light".

#### Note

Do not change the default box types of `Fl_Light_Button`. The box types determine how the button is drawn. If you change the `down_box()` type the drawing behavior is undefined.

### 13.75.3 Member Function Documentation

#### 13.75.3.1 draw()

```
void Fl_Light_Button::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from `Fl_Button`.

#### 13.75.3.2 handle()

```
int Fl_Light_Button::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Button](#).

## 13.76 Fl\_Line\_Dial Class Reference

Inheritance diagram for Fl\_Line\_Dial:

#### Public Member Functions

- **Fl\_Line\_Dial** (int X, int Y, int W, int H, const char \*L=0)

#### Public Member Functions inherited from [Fl\\_Dial](#)

- short [angle1](#) () const  
*Sets Or gets the angles used for the minimum and maximum values.*
- void **angle1** (short a)

- See short [angle1\(\)](#) const.
- short **angle2** () const
  - See short [angle1\(\)](#) const.
- void **angle2** (short a)
  - See short [angle1\(\)](#) const.
- void **angles** (short a, short b)
  - See short [angle1\(\)](#) const.
- [FI\\_Dial](#) (int x, int y, int w, int h, const char \*l=0)
  - Creates a new [FI\\_Dial](#) widget using the given position, size, and label string.
- int [handle](#) (int) override
  - Allow subclasses to handle event based on current position and size.

## Public Member Functions inherited from [FI\\_Valuator](#)

- void **bounds** (double a, double b)
  - Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
  - Clamps the passed value to the valuator range.
- virtual int [format](#) (char \*)
  - Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- virtual std::string [format\\_str](#) ()
  - C++11 API for [FI\\_Valuator::format\(char\\* buffer\)](#).
- double [increment](#) (double, int)
  - Adds n times the step value to the passed value.
- double [maximum](#) () const
  - Gets the maximum value for the valuator.
- void [maximum](#) (double a)
  - Sets the maximum value for the valuator.
- double [minimum](#) () const
  - Gets the minimum value for the valuator.
- void [minimum](#) (double a)
  - Sets the minimum value for the valuator.
- void [precision](#) (int digits)
  - Sets the step value to  $1.0 / 10^{\text{digits}}$ .
- void [range](#) (double a, double b)
  - Sets the minimum and maximum values for the valuator.
- double [round](#) (double)
  - Round the passed value to the nearest step increment.
- double [step](#) () const
  - Gets or sets the step value.
- void **step** (double a, int b)
  - See double [FI\\_Valuator::step\(\)](#) const
- void **step** (double s)
  - See double [FI\\_Valuator::step\(\)](#) const.
- void **step** (int a)
  - See double [FI\\_Valuator::step\(\)](#) const
- double [value](#) () const
  - Gets the floating point(double) value.
- int [value](#) (double)
  - Sets the current value.
- [~FI\\_Valuator](#) () override
  - Destructor is accessible despite protected constructor.

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

  - void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*

  - void `clear_changed` ()

*Marks the value of the widget as unchanged.*

  - void `clear_damage` (uchar c=0)

*Clears or sets the damage flags.*

  - void `clear_output` ()

*Sets a widget to accept input.*

  - void `clear_visible` ()

*Hides the widget.*

  - void `clear_visible_focus` ()

*Disables keyboard focus navigation with this widget.*

  - `Fl_Color` `color` () const

*Gets the background color of the widget.*

  - void `color` (`Fl_Color` bg)

*Sets the background color of the widget.*

  - void `color` (`Fl_Color` bg, `Fl_Color` sel)

*Sets the background and selection color of the widget.*

  - int `contains` (const `Fl_Widget` \*w) const

*Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)

*Sets the current label.*

  - void `copy_tooltip` (const char \*text)

*Sets the current tooltip text.*

  - `uchar` `damage` () const

*Returns non-zero if `draw()` needs to be called.*

  - void `damage` (uchar c)

*Sets the damage bits for the widget.*

  - void `damage` (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)

*Internal use only.*

  - void `deactivate` ()

*Deactivates the widget.*

  - `Fl_Image` \* `deimage` ()

*Gets the image that is used as part of the widget label when in the inactive state.*

  - const `Fl_Image` \* `deimage` () const

*Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`Fl_Image` &img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`Fl_Image` \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const

*Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*

  - void `do_callback` (`Fl_Widget` \*widget, long arg, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`Fl_Widget` \*widget, void \*arg=0, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*

- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

- Sets width ww and height hh accordingly with the label size.*

  - bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FI_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FI_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- `FI_Color` `selection_color` () const

*Gets the selection color.*
- void `selection_color` (`FI_Color` a)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*

- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window** \* **top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window** \* **top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const  
*Gets the widget type.*
- void **type** (**uchar** t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (**Fl\_Callback\_User\_Data** \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (**uchar** i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual **~Fl\_Widget** ()  
*Destroys the widget.*

## Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void **default\_callback** (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from FI\_Widget

- enum {  
**INACTIVE** = 1<<0 , **INVISIBLE** = 1<<1 , **OUTPUT** = 1<<2 , **NOBORDER** = 1<<3 ,

**USERFLAG1** = 1<<31 }  
*flags possible values enumeration.*

### Protected Member Functions inherited from FI\_Dial

- void **draw** () override  
*Draws dial at current position and size.*
- void **draw** (int X, int Y, int W, int H)  
*Draws dial at given position and size.*
- int **handle** (int event, int X, int Y, int W, int H)  
*Allows subclasses to handle event based on given position and size.*

### Protected Member Functions inherited from FI\_Valuator

- **FI\_Valuator** (int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Valuator widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)

*Clamps the value, but accepts v if the previous value is not already out of range.*

- virtual void [value\\_damage](#) ()

*Asks for partial redraw.*

## Protected Member Functions inherited from [Fl\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

- [Fl\\_Dial.cxx](#)

## 13.77 [Fl\\_Mac\\_App\\_Menu](#) Class Reference

### Static Public Member Functions

- static void [custom\\_application\\_menu\\_items](#) (const [Fl\\_Menu\\_Item](#) \*m)  
*Adds custom menu item(s) to the application menu of the system menu bar.*

## Static Public Attributes

- static const char \* **about**  
*Localizable text for the "About xxx" application menu item.*
- static const char \* **hide**  
*Localizable text for the "Hide xxx" application menu item.*
- static const char \* **hide\_others**  
*Localizable text for the "Hide Others" application menu item.*
- static const char \* **print**  
*Localizable text for the "Print Front Window" application menu item.*
- static const char \* **print\_no\_titlebar**  
*Localizable text for the "Print Front Window" application menu item.*
- static const char \* **quit**  
*Localizable text for the "Quit xxx" application menu item.*
- static const char \* **services**  
*Localizable text for the "Services" application menu item.*
- static const char \* **show**  
*Localizable text for the "Show All" application menu item.*
- static const char \* **toggle\_print\_titlebar**  
*Localizable text for the "Toggle print titlebar" application menu item.*

## 13.77.1 Member Function Documentation

### 13.77.1.1 custom\_application\_menu\_items()

```
static void Fl_Mac_App_Menu::custom_application_menu_items (
 const Fl_Menu_Item * m) [static]
```

Adds custom menu item(s) to the application menu of the system menu bar.

They are positioned after the "Print Front Window / Toggle printing of titlebar" items, or at their place if they were removed with `Fl_Mac_App_Menu::print = ""`.

#### Parameters

<i>m</i>	zero-ending array of <code>Fl_Menu_Item</code> 's.
----------	----------------------------------------------------

## 13.77.2 Member Data Documentation

### 13.77.2.1 print

```
const char* Fl_Mac_App_Menu::print [static]
```

Localizable text for the "Print Front Window" application menu item.

This menu item and next one won't be displayed if `Fl_Mac_App_Menu::print` is set to an empty string.

The documentation for this class was generated from the following file:

- `mac.H`

## 13.78 Fl\_Menu\_ Class Reference

Base class of all widgets that have a menu in FLTK.

```
#include <Fl_Menu_.H>
```

Inheritance diagram for `Fl_Menu_`:

## Public Member Functions

- `int add (const char *)`  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- `int add (const char *, int shortcut, FL_Callback *, void *=0, int=0)`  
*Adds a new menu item.*
- `int add (const char *a, const char *b, FL_Callback *c, void *d=0, int e=0)`  
*See int FL\_Menu\_::add(const char\* label, int shortcut, FL\_Callback\*, void \*user\_data=0, int flags=0)*
- `void clear ()`  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- `int clear_submenu (int index)`  
*Clears the specified submenu pointed to by index of all menu items.*
- `void copy (const FL_Menu_Item *m, void *user_data=0)`  
*Sets the menu array pointer with a copy of m that will be automatically deleted.*
- `FL_Boxtype down_box () const`  
*This box type is used to surround the currently-selected items in the menus.*
- `void down_box (FL_Boxtype b)`  
*Sets the box type used to surround the currently-selected items in the menus.*
- `FL_Color down_color () const`  
*For back compatibility, same as selection\_color()*
- `void down_color (unsigned c)`  
*For back compatibility, same as selection\_color()*
- `int find_index (const char *name) const`  
*Find the menu item index for a given menu pathname, such as "Edit/Copy".*
- `int find_index (const FL_Menu_Item *item) const`  
*Find the index into the menu array for a given item.*
- `int find_index (FL_Callback *cb) const`  
*Find the index into the menu array for a given callback cb.*
- `const FL_Menu_Item * find_item (const char *name)`  
*Find the menu item for a given menu pathname, such as "Edit/Copy".*
- `const FL_Menu_Item * find_item (FL_Callback *)`  
*Find the menu item for the given callback cb.*
- `const FL_Menu_Item * find_item_with_argument (long)`  
*Find the menu item for the given user argument v.*
- `const FL_Menu_Item * find_item_with_user_data (void *)`  
*Find the menu item for the given user data v.*
- `FL_Menu_ (int, int, int, int, const char *=0)`  
*Creates a new FL\_Menu\_ widget using the given position, size, and label string.*
- `void global ()`  
*Make the shortcuts for this menu work no matter what window has the focus when you type it.*

- int **insert** (int index, const char \*, int **shortcut**, **FL\_Callback** \*, void \*=0, int=0)  
*Inserts a new menu item at the specified `index` position.*
- int **insert** (int index, const char \*a, const char \*b, **FL\_Callback** \*c, void \*d=0, int e=0)  
*See int `FL_Menu_::insert(const char* label, int shortcut, FL_Callback*, void *user_data=0, int flags=0)`*
- int **item\_pathname** (char \*name, int namelen, const **FL\_Menu\_Item** \*finditem=0) const  
*Get the menu 'pathname' for the specified menuitem.*
- const **FL\_Menu\_Item** \* **menu** () const  
*Returns a pointer to the array of `FL_Menu_Items`.*
- void **menu** (const **FL\_Menu\_Item** \*m)  
*Sets the menu array pointer directly.*
- **FL\_Boxtype** **menu\_box** () const  
*Get the box type for the menu popup windows.*
- void **menu\_box** (**FL\_Boxtype** b)  
*Set the box type for the menu popup windows.*
- const **FL\_Menu\_Item** \* **menu\_end** ()  
*Finishes menu modifications and returns `menu()`.*
- int **mode** (int i) const  
*Get the flags of item `i`.*
- void **mode** (int i, int fl)  
*Set the flags of item `i`.*
- const **FL\_Menu\_Item** \* **mvalue** () const  
*Return a pointer to the last menu item that was picked.*
- const **FL\_Menu\_Item** \* **picked** (const **FL\_Menu\_Item** \*)  
*When user picks a menu item, call this.*
- const **FL\_Menu\_Item** \* **prev\_mvalue** () const  
*Return a pointer to the menu item that was picked before the current one was picked.*
- void **remove** (int)  
*Deletes item `i` from the menu.*
- void **replace** (int, const char \*)  
*Changes the text of item `i`.*
- void **setonly** (**FL\_Menu\_Item** \*item)  
*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void **shortcut** (int i, int s)  
*Change the shortcut of item `i` to `s`.*
- int **size** () const  
*This returns the number of `FL_Menu_Item` structures that make up the menu, correctly counting submenus.*
- void **size** (int W, int H)
- const **FL\_Menu\_Item** \* **test\_shortcut** ()  
*Returns the menu item with the entered shortcut (key value).*
- const char \* **text** () const  
*Returns the title of the last item chosen.*
- const char \* **text** (int i) const  
*Returns the title of item `i`.*
- **FL\_Color** **textcolor** () const  
*Get the current color of menu item labels.*
- void **textcolor** (**FL\_Color** c)  
*Sets the current color of menu item labels.*
- **FL\_Font** **textfont** () const  
*Gets the current font of menu item labels.*
- void **textfont** (**FL\_Font** c)  
*Sets the current font of menu item labels.*

- [FI\\_Fonsize](#) [textsize](#) () const  
*Gets the font size of menu item labels.*
- void [textsize](#) ([FI\\_Fonsize](#) c)  
*Sets the font size of menu item labels.*
- int [value](#) () const  
*Return the index into the menu() of the last item chosen by the user.*
- int [value](#) (const [FI\\_Menu\\_Item](#) \*)  
*Set the value of a menu to the menu item m.*
- int [value](#) (int i)  
*Set the value of the menu to index i.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const

- Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)
- Clears or sets the damage flags.*
- void [clear\\_output](#) ()
- Sets a widget to accept input.*
- void [clear\\_visible](#) ()
- Hides the widget.*
- void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const
- Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)
- Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)
- Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*
- [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*
- void [deactivate](#) ()
- Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

- void [deimage](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- virtual void [draw](#) ()=0  
*Draws the widget.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual int [handle](#) (int event)  
*Handles the specified event.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const

- Gets the label color.*

  - void [labelcolor](#) ([Fl\\_Color](#) c)
- Sets the label color.*

  - [Fl\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([Fl\\_Font](#) f)
- Sets the font to use.*

  - [Fl\\_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([Fl\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [Fl\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([Fl\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [Fl\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([Fl\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()
- Schedules the drawing of the label.*

  - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

  - [Fl\\_Color](#) [selection\\_color](#) () const
- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

- Sets the flags used to decide when a callback is called.*
- `FL_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FL_Widget ()`  
*Destroys the widget.*

### Protected Member Functions

- `int item_pathname_ (char *name, int namelen, const FL_Menu_Item *finditem, const FL_Menu_Item *menu=0) const`

### Protected Member Functions inherited from FL\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FL_Boxtype t, FL_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*
- `void h (int v)`  
*Internal use only.*
- `void set_flag (unsigned int c)`  
*Sets a flag in the flags mask.*
- `void w (int v)`  
*Internal use only.*
- `void x (int v)`  
*Internal use only.*
- `void y (int v)`  
*Internal use only.*

### Protected Attributes

- [uchar](#) `alloc`
- [uchar](#) `down_box_`
- [Fl\\_Boxtype](#) `menu_box_`
- [Fl\\_Color](#) `textcolor_`
- [Fl\\_Font](#) `textfont_`
- [Fl\\_Fontsize](#) `textsize_`

### Additional Inherited Members

### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

*flags possible values enumeration.*

## 13.78.1 Detailed Description

Base class of all widgets that have a menu in FLTK.

Currently FLTK provides you with [Fl\\_Menu\\_Button](#), [Fl\\_Menu\\_Bar](#), and [Fl\\_Choice](#).

The class contains a pointer to an array of structures of type [Fl\\_Menu\\_Item](#). The array may either be supplied directly by the user program, or it may be "private": a dynamically allocated array managed by the [Fl\\_Menu\\_](#).

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- If the [Fl\\_Menu\\_Item](#) has a callback set, that callback is invoked with any userdata configured for it. (The [Fl\\_Menu\\_](#) widget's callback is NOT invoked.)
- For any [Fl\\_Menu\\_Items](#) that **don't** have a callback set, the [Fl\\_Menu\\_](#) widget's callback is invoked with any userdata configured for it. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

The line spacing between menu items can be controlled with the global setting [Fl::menu\\_linespacing\(\)](#).

See also

[Fl\\_Widget::shortcut\\_label\(int\)](#)

## 13.78.2 Constructor & Destructor Documentation

### 13.78.2.1 Fl\_Menu\_()

```
Fl_Menu_::Fl_Menu_ (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Menu\\_](#) widget using the given position, size, and label string. menu() is initialized to null.

## 13.78.3 Member Function Documentation

### 13.78.3.1 add() [1/2]

```
int Fl_Menu_::add (
 const char * str)
```

This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.

The passed string is split at any '|' characters and then add(s,0,0,0,0) is done with each section. This is often useful if you are just using the value, and is compatible with Forms and other GL programs. The section strings use the same special characters as described for the long version of [add\(\)](#).

No items must be added to a menu during a callback to the same menu.

#### Parameters

<i>str</i>	string containing multiple menu labels as described above
------------	-----------------------------------------------------------

#### Returns

the index into the menu() array, where the entry was added

### 13.78.3.2 add() [2/2]

```
int Fl_Menu_::add (
 const char * label,
 int shortcut,
 Fl_Callback * callback,
 void * userdata = 0,
 int flags = 0)
```

Adds a new menu item.

#### Parameters

in	<i>label</i>	The text label for the menu item.
in	<i>shortcut</i>	Optional keyboard shortcut that can be an int or string: (FL_CTRL+'a') or "^a". Default 0 if none.
in	<i>callback</i>	Optional callback invoked when user clicks the item. Default 0 if none.
in	<i>userdata</i>	Optional user data passed as an argument to the callback. Default 0 if none.
in	<i>flags</i>	Optional flags that control the type of menu item; see below. Default is 0 for none.

#### Returns

The index into the menu() array, where the entry was added.

### Description

If the menu array was directly set with `menu(x)`, then `copy()` is done to make a private array.

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

A menu item's callback must not `add()` items to its parent menu during the callback.

Due to backwards compatibility and historical restrictions we recommend to use either

- static menu arrays that are not extended during runtime or
- dynamic, extendable menu item arrays that are entirely created by using `add()` or `insert()`.

This ensures that all menu arrays and strings are copied to internal storage and released when required.

### Note

If you create menus from static `Fl_Menu_Item` arrays and `add()` or `insert()` more menu items later, then the menu array is copied to local storage but some local (static) strings may appear to "leak memory". This is a known issue and discouraged usage (see description above) but the impact on memory usage should typically be small.

### Detailed Description of Parameters

#### label

The menu item's label. This argument is required and must not be NULL.

The characters "&", "/", "\", and "\_" are treated as special characters in the label string. The "&" character specifies that the following character is an accelerator and will be underlined. The "" character is used to escape the next character in the string. Labels starting with the "\_" character cause a divider to be placed after that menu item.

A label of the form "File/Quit" will create the submenu "File" with a menu item called "Quit".

The label string is copied to new memory and can be freed. The other arguments (including the shortcut) are copied into the menu item unchanged.

If an item exists already with that name then it is replaced with this new one. Otherwise this new one is added to the end of the correct menu or submenu. The return value is the offset into the array that the new entry was placed at.

#### shortcut

The keyboard shortcut for this menu item.

This parameter is optional, and defaults to 0 to indicate no shortcut.

The shortcut can either be a raw integer value (eg. `FL_CTRL+'A'`) or a string (eg. `"^c"` or `"^97"`).

Raw integer shortcuts can be a combination of keyboard chars (eg. 'A') and optional keyboard modifiers (see [Fl::event\\_state\(\)](#), e.g. FL\_SHIFT, etc). In addition, FL\_COMMAND can be used to denote FL\_META under Mac OS X and FL\_CTRL under other platforms.

String shortcuts can be specified in one of two ways:

```
[#+^]<ascii_value> e.g. "97", "^97", "+97", "#97"
[#+^]<ascii_char> e.g. "a", "^a", "+a", "#a"
```

..where <ascii\_value> is a decimal value representing an ASCII character (eg. 97 is the ascii code for 'a'), and the optional prefixes enhance the value that follows. Multiple prefixes must appear in the order below.

```
- Alt
+ - Shift
^ - Control
```

Internally, the text shortcuts are converted to integer values using [fl\\_old\\_shortcut\(const char\\*\)](#).

#### callback

The callback to invoke when this menu item is selected.

This parameter is optional, and defaults to 0 for no callback.

#### userdata

The callback's 'user data' that is passed to the callback.

This parameter is optional, and defaults to 0.

#### flags

These are bit flags to define what kind of menu item this is.

This parameter is optional, and defaults to 0 to define a 'regular' menu item.

These flags can be 'OR'ed together:

```
FL_MENU_INACTIVE // Deactivate menu item (gray out)
FL_MENU_TOGGLE // Item is a checkbox toggle (shows checkbox for on/off state)
FL_MENU_VALUE // The on/off state for checkbox/radio buttons (if set, state is 'on')
FL_MENU_RADIO // Item is a radio button (one checkbox of many can be on)
FL_MENU_INVISIBLE // Item will not show up (shortcut will work)
FL_SUBMENU_POINTER // Indicates user_data() is a pointer to another menu array
FL_SUBMENU // This item is a submenu to other items
FL_MENU_DIVIDER // Creates divider line below this item. Also ends a group of radio buttons.
```

**All other bits in 'flags' are reserved and must not be used.**

If FL\_SUBMENU is set in an item's flags, then actually two items are added:

- the first item is the menu item (submenu title), as expected, and
- the second item is the submenu terminating item with the label and all other members set to 0.

If you add submenus with the 'path' technique, then the corresponding submenu terminators (maybe more than one) are added as well.

**Todo** Raw integer shortcut needs examples. Dependent on responses to <https://www.fltk.org/newsgroups.php?gfltk.coredev+v:10086> and results of STR#2344

### 13.78.3.3 clear()

```
void Fl_Menu_::clear ()
```

Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.

Menus must not be cleared during a callback to the same menu.

### 13.78.3.4 clear\_submenu()

```
int Fl_Menu_::clear_submenu (
 int index)
```

Clears the specified submenu pointed to by `index` of all menu items.

This method is useful for clearing a submenu so that it can be re-populated with new items. Example: a "File/Recent Files/..." submenu that shows the last few files that have been opened.

The specified `index` must point to a submenu.

The submenu is cleared with [remove\(\)](#). If the menu array was directly set with menu(x), then [copy\(\)](#) is done to make a private array.

#### Warning

Since this method can change the internal menu array, any menu item pointers or indices the application may have cached can become stale, and should be recalculated/refreshed.

#### Example:

```
int index = menubar->find_index("File/Recent"); // get index of "File/Recent" submenu
if (index != -1) menubar->clear_submenu(index); // clear the submenu
menubar->add("File/Recent/Aaa");
menubar->add("File/Recent/Bbb");
[...]
```

#### Parameters

<i>index</i>	The index of the submenu to be cleared
--------------	----------------------------------------

#### Returns

0 on success, -1 if the index is out of range or not a submenu

#### See also

[remove\(int\)](#)

### 13.78.3.5 copy()

```
void Fl_Menu_::copy (
 const Fl_Menu_Item * m,
 void * ud = 0)
```

Sets the menu array pointer with a copy of `m` that will be automatically deleted.

If userdata `ud` is not NULL, then all user data pointers are changed in the menus as well. See [void Fl\\_Menu\\_::menu\(const Fl\\_Menu\\_Item\\* m\)](#).

### 13.78.3.6 down\_box()

```
void Fl_Menu_::down_box (
 Fl_Boxtype b) [inline]
```

Sets the box type used to surround the currently-selected items in the menus.

### 13.78.3.7 find\_index() [1/3]

```
int Fl_Menu_::find_index (
 const char * pathname) const
```

Find the menu item index for a given menu `pathname`, such as "Edit/Copy".

This method finds a menu item's index position for the given menu `pathname`, also traversing submenus, but **not** submenu pointers (FL\_SUBMENU\_POINTER).

To get the menu item pointer for a `pathname`, use [find\\_item\(\)](#)

#### Parameters

<code>in</code>	<code>pathname</code>	The path and name of the menu item to find
-----------------	-----------------------	--------------------------------------------

#### Returns

The index of the matching item, or -1 if not found.

#### See also

[item\\_pathname\(\)](#)

### 13.78.3.8 find\_index() [2/3]

```
int Fl_Menu_::find_index (
 const Fl_Menu_Item * item) const
```

Find the index into the menu array for a given `item`.

A way to convert a menu item pointer into an index.

Does **not** handle items that are in submenu pointers (FL\_SUBMENU\_POINTER).

-1 is returned if the item is not in this menu or is part of an FL\_SUBMENU\_POINTER submenu.

Current implementation is fast and not expensive.

```
// Convert an index-to-item
int index = 12;
const Fl_Menu_Item *item = mymenu->menu() + index;

// Convert an item-to-index
int index = mymenu->find_index(item);
if (index == -1) { ..error.. }
```

#### Parameters

<code>in</code>	<code>item</code>	The item to be found
-----------------	-------------------	----------------------

#### Returns

The index of the item, or -1 if not found.

#### See also

[menu\(\)](#)

### 13.78.3.9 find\_index() [3/3]

```
int Fl_Menu_::find_index (
 Fl_Callback * cb) const
```

Find the index into the menu array for a given callback `cb`.

This method finds a menu item's index position, also traversing submenus, but **not** submenu pointers (FL\_SUBMENU\_POINTER). This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

#### Parameters

<code>cb</code>	Find the first item with this callback
-----------------	----------------------------------------

**Returns**

The index of the item with the specific callback, or -1 if not found

**See also**

[find\\_index\(const char\\*\)](#)

**13.78.3.10 find\_item() [1/2]**

```
const Fl_Menu_Item * Fl_Menu_::find_item (
 const char * pathname)
```

Find the menu item for a given menu pathname, such as "Edit/Copy".

This method finds a menu item in the menu array, also traversing submenus, but not submenu pointers (FL\_↔SUBMENU\_POINTER).

To get the menu item's index, use [find\\_index\(const char\\*\)](#)

**Example:**

```
Fl_Menu_Bar *menubar = new Fl_Menu_Bar(..);
menubar->add("File/&Open");
menubar->add("File/&Save");
menubar->add("Edit/&Copy");
// [...]
Fl_Menu_Item *item;
if ((item = (Fl_Menu_Item*)menubar->find_item("File/&Open")) != NULL) {
 item->labelcolor(FL_RED);
}
if ((item = (Fl_Menu_Item*)menubar->find_item("Edit/&Copy")) != NULL) {
 item->labelcolor(FL_GREEN);
}
```

**Parameters**

<i>pathname</i>	The path and name of the menu item
-----------------	------------------------------------

**Returns**

The item found, or NULL if not found

**See also**

[find\\_index\(const char\\*\)](#), [find\\_item\(Fl\\_Callback\\*\)](#), [item\\_pathname\(\)](#)

**13.78.3.11 find\_item() [2/2]**

```
const Fl_Menu_Item * Fl_Menu_::find_item (
 Fl_Callback * cb)
```

Find the menu item for the given callback *cb*.

This method finds a menu item in a menu array, also traversing submenus, but not submenu pointers. This is useful if an application uses internationalisation and a menu item can not be found using its label. This search is also much faster.

**Parameters**

<i>in</i>	<i>cb</i>	find the first item with this callback
-----------	-----------	----------------------------------------

**Returns**

The item found, or NULL if not found

**See also**

[find\\_item\(const char\\*\)](#)

**13.78.3.12 find\_item\_with\_argument()**

```
const Fl_Menu_Item * Fl_Menu_::find_item_with_argument (
 long v)
```

Find the menu item for the given user argument *v*.

**Parameters**

in	v	find the first item with this user argument
----	---	---------------------------------------------

**Returns**

The item found, or NULL if not found

**See also**

[find\\_item\(const char\\*\)](#)

**13.78.3.13 find\_item\_with\_user\_data()**

```
const Fl_Menu_Item * Fl_Menu_::find_item_with_user_data (
 void * v)
```

Find the menu item for the given user data *v*.

**Parameters**

in	v	find the first item with this user data
----	---	-----------------------------------------

**Returns**

The item found, or NULL if not found

**See also**

[find\\_item\(const char\\*\)](#)

**13.78.3.14 global()**

```
void Fl_Menu_::global ()
```

Make the shortcuts for this menu work no matter what window has the focus when you type it.

This is done by using [Fl::add\\_handler\(\)](#). This [Fl\\_Menu\\_](#) widget does not have to be visible (ie the window it is in can be hidden, or it does not have to be put in a window at all).

Currently there can be only one [global\(\)](#) menu. Setting a new one will replace the old one. There is no way to remove the [global\(\)](#) setting (so don't destroy the widget!)

**13.78.3.15 insert()**

```
int Fl_Menu_::insert (
 int index,
 const char * label,
 int shortcut,
 Fl_Callback * callback,
 void * userdata = 0,
 int flags = 0)
```

Inserts a new menu item at the specified *index* position.

If *index* is -1, the menu item is appended; same behavior as [add\(\)](#).

To properly insert a menu item, `label` must be the name of the item (eg. "Quit"), and not a 'menu pathname' (eg. "File/Quit"). If a menu pathname is specified, the value of `index` is *ignored*, the new item's position defined by the pathname.

For more details, see [add\(\)](#). Except for the `index` parameter, [add\(\)](#) has more detailed information on parameters and behavior, and is functionally equivalent.

#### Parameters

in	<i>index</i>	The menu array's index position where the new item is inserted. If -1, behavior is the same as <a href="#">add()</a> .
in	<i>label</i>	The text label for the menu item. If the label is a menu pathname, <code>index</code> is ignored, and the pathname indicates the position of the new item.
in	<i>shortcut</i>	Optional keyboard shortcut. Can be an int (FL_CTRL+'a') or a string ("^a"). Default is 0.
in	<i>callback</i>	Optional callback invoked when user clicks the item. Default 0 if none.
in	<i>userdata</i>	Optional user data passed as an argument to the callback. Default 0 if none.
in	<i>flags</i>	Optional flags that control the type of menu item; see <a href="#">add()</a> for more info. Default is 0 for none.

#### Returns

The index into the `menu()` array, where the entry was added.

#### See also

[add\(\)](#)

### 13.78.3.16 item\_pathname()

```
int Fl_Menu_::item_pathname (
 char * name,
 int namelen,
 const Fl_Menu_Item * finditem = 0) const
```

Get the menu 'pathname' for the specified menuitem.

If `finditem==NULL`, [mvalue\(\)](#) is used (the most recently picked menuitem).

#### Example:

```
Fl_Menu_Bar *menubar = 0;
void my_menu_callback(Fl_Widget*, void*) {
 char name[80];
 if (menubar->item_pathname(name, sizeof(name)-1) == 0) { // recently picked item
 if (strcmp(name, "File/&Open") == 0) { .. } // open invoked
 if (strcmp(name, "File/&Save") == 0) { .. } // save invoked
 if (strcmp(name, "Edit/&Copy") == 0) { .. } // copy invoked
 }
}
int main() {
 [...]
 menubar = new Fl_Menu_Bar(..);
 menubar->add("File/&Open", 0, my_menu_callback);
 menubar->add("File/&Save", 0, my_menu_callback);
 menubar->add("Edit/&Copy", 0, my_menu_callback);
 [...]
}
```

#### Returns

- 0 : OK (name has menuitem's pathname)
- -1 : item not found (name=="")
- -2 : 'name' not large enough (name=="")

#### See also

[find\\_item\(\)](#)

**13.78.3.17 menu()** [1/2]

```
const Fl_Menu_Item * Fl_Menu_::menu () const [inline]
```

Returns a pointer to the array of `Fl_Menu_Items`.

This will either be the value passed to `menu(value)` or the private copy or an internal (temporary) location (see note below).

**Note**

**Implementation details - may be changed in the future.** All modifications of the menu array are done by copying the entire menu array to an internal storage for optimization of memory allocations, for instance when using `add()` or `insert()`. While this is done, `menu()` returns the pointer to this internal location. The entire menu will be copied back to private storage when needed, i.e. when **another** `Fl_Menu_` is modified. You can force this reallocation after you're done with all menu modifications by calling `Fl_Menu_::menu_end()` to make sure `menu()` returns a permanent pointer to private storage (until the menu is modified again). Note also that some menu methods (e.g. `Fl_Menu_Button::popup()`) call `menu_end()` internally to ensure a consistent menu array while the menu is open.

**See also**

`size()` – returns the `size` of the `Fl_Menu_Item` array.

`menu_end()` – finish menu modifications (optional)

**Example: How to walk the array:**

```
for (int t=0; t<menubar->size(); t++) { // walk array of items
 const Fl_Menu_Item &item = menubar->menu()[t]; // get each item
 fprintf(stderr, "item #d -- label=%s, value=%s type=%s\n",
 t,
 item.label() ? item.label() : "(Null)", // menu terminators have NULL labels
 (item.flags & FL_MENU_VALUE) ? "set" : "clear", // value of toggle or radio items
 (item.flags & FL_SUBMENU) ? "Submenu" : "Item"); // see if item is a submenu or actual item
}
```

**13.78.3.18 menu()** [2/2]

```
void Fl_Menu_::menu (
 const Fl_Menu_Item * m)
```

Sets the menu array pointer directly.

If the old menu is private it is deleted. NULL is allowed and acts the same as a zero-length menu. If you try to modify the array (with `add()`, `replace()`, or `remove()`) a private copy is automatically done.

**13.78.3.19 menu\_box()** [1/2]

```
Fl_Boxtype Fl_Menu_::menu_box () const [inline]
```

Get the box type for the menu popup windows.

**Returns**

the box type, or `FL_NO_BOX` if `Fl_Menu_::box()` is to be used instead

**13.78.3.20 menu\_box()** [2/2]

```
void Fl_Menu_::menu_box (
 Fl_Boxtype b) [inline]
```

Set the box type for the menu popup windows.

If `menu_box` set to `FL_NO_BOX`, the menu window will use `Fl_Menu_::box()` instead.

**Parameters**

in	<i>b</i>	new box type or <code>FL_NO_BOX</code>
----	----------	----------------------------------------

**13.78.3.21 menu\_end()**

```
const Fl_Menu_Item * Fl_Menu_::menu_end ()
```

Finishes menu modifications and returns menu().

Call [menu\\_end\(\)](#) after using [add\(\)](#), [insert\(\)](#), [remove\(\)](#), or any other methods that may change the menu array if you want to access the menu array anytime later with menu(). This should be called only once after the **last** menu modification for performance reasons.

Does nothing if the menu array is already in a private location.

Some methods like [Fl\\_Menu\\_Button::popup\(\)](#) call this method before their menu is opened.

**Note**

After menu changes like [add\(\)](#), [insert\(\)](#), etc. menu() would return a pointer to a temporary internal menu array that may be relocated at unexpected times. This is due to performance considerations and may be changed w/o further notice.

**Since**

1.4.0

**Returns**

New [Fl\\_Menu\\_Item](#) array pointer.

**See also**

[Fl\\_Menu\\_::menu\(\)](#)

**13.78.3.22 mode() [1/2]**

```
int Fl_Menu_::mode (
 int i) const [inline]
```

Get the flags of item i.

For a list of the flags, see [Fl\\_Menu\\_Item](#).

**13.78.3.23 mode() [2/2]**

```
void Fl_Menu_::mode (
 int i,
 int fl) [inline]
```

Set the flags of item i.

For a list of the flags, see [Fl\\_Menu\\_Item](#).

**13.78.3.24 mvalue()**

```
const Fl_Menu_Item * Fl_Menu_::mvalue () const [inline]
```

Return a pointer to the last menu item that was picked.

**13.78.3.25 picked()**

```
const Fl_Menu_Item * Fl_Menu_::picked (
 const Fl_Menu_Item * v)
```

When user picks a menu item, call this.

It will do the callback.

Unfortunately this also casts away const for the checkboxes, but this was necessary so non-checkbox menus can really be declared 'const'.

## Parameters

<code>in</code>	<code>v</code>	The menu item that was picked by the user.
-----------------	----------------	--------------------------------------------

## Returns

The same `Fl_Menu_Item*` that was set (`v`).

**13.78.3.26 prev\_mvalue()**

```
const Fl_Menu_Item * Fl_Menu_::prev_mvalue () const [inline]
```

Return a pointer to the menu item that was picked before the current one was picked.

This call gives developers additional details how a user changed a choice in the [Fl\\_Choice](#) widget.

**13.78.3.27 remove()**

```
void Fl_Menu_::remove (
 int i)
```

Deletes item `i` from the menu.

If the menu array was directly set with `menu(x)` then [copy\(\)](#) is done to make a private array.

No items must be removed from a menu during a callback to the same menu.

## Parameters

<code>i</code>	index into menu array
----------------	-----------------------

**13.78.3.28 replace()**

```
void Fl_Menu_::replace (
 int i,
 const char * str)
```

Changes the text of item `i`.

This is the only way to get slash into an [add\(\)](#)'ed menu item. If the menu array was directly set with `menu(x)` then [copy\(\)](#) is done to make a private array.

## Parameters

<code>i</code>	index into menu array
<code>str</code>	new label for menu item at index <code>i</code>

**13.78.3.29 size()**

```
int Fl_Menu_::size () const
```

This returns the number of [Fl\\_Menu\\_Item](#) structures that make up the menu, correctly counting submenus.

This includes the "terminator" item at the end. To copy a menu array you need to copy `size()*sizeof(Fl_Menu_Item)` bytes. If the menu is NULL this returns zero (an empty menu will return 1).

**13.78.3.30 test\_shortcut()**

```
const Fl_Menu_Item * Fl_Menu_::test_shortcut () [inline]
```

Returns the menu item with the entered shortcut (key value).

This searches the complete `menu()` for a shortcut that matches the entered key value. It must be called for a `FL_KEYBOARD` or `FL_SHORTCUT` event.

If a match is found, the menu's callback will be called.

**Returns**

matched [Fl\\_Menu\\_Item](#) or NULL.

**13.78.3.31 text() [1/2]**

```
const char * Fl_Menu_::text () const [inline]
```

Returns the title of the last item chosen.

**13.78.3.32 text() [2/2]**

```
const char * Fl_Menu_::text (
 int i) const [inline]
```

Returns the title of item i.

**13.78.3.33 textcolor()**

```
Fl_Color Fl_Menu_::textcolor () const [inline]
```

Get the current color of menu item labels.

**13.78.3.34 textfont() [1/2]**

```
Fl_Font Fl_Menu_::textfont () const [inline]
```

Gets the current font of menu item labels.

**13.78.3.35 textfont() [2/2]**

```
void Fl_Menu_::textfont (
 Fl_Font c) [inline]
```

Sets the current font of menu item labels.

**13.78.3.36 textsize() [1/2]**

```
Fl_Fontsize Fl_Menu_::textsize () const [inline]
```

Gets the font size of menu item labels.

**13.78.3.37 textsize() [2/2]**

```
void Fl_Menu_::textsize (
 Fl_Fontsize c) [inline]
```

Sets the font size of menu item labels.

**13.78.3.38 value()** [1/3]

```
int Fl_Menu_::value () const
```

Return the index into the menu() of the last item chosen by the user.

The *value* of the menu is the index into the menu() of the last item chosen by the user or -1.

It is -1 initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an FL\_SUBMENU\_POINTER.

**Note**

All menu items are located in a contiguous array of [Fl\\_Menu\\_Item](#)'s unless an item has the FL\_SUBMENU\_POINTER flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the [size\(\)](#) of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return -1 when [value\(\)](#) is called. This may be changed in a future version.

You can use [mvalue\(\)](#) instead to retrieve the last picked menu item directly.

**Returns**

Index of the last chosen menu item or -1 (see description).

**See also**

const [Fl\\_Menu\\_Item](#) \*[mvalue\(\)](#)

**13.78.3.39 value()** [2/3]

```
int Fl_Menu_::value (
 const Fl_Menu_Item * m)
```

Set the value of a menu to the menu item *m*.

The *value* of the menu is the index into the menu() of the last item chosen by the user or -1.

It is -1 initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an FL\_SUBMENU\_POINTER.

**Note**

All menu items are located in a contiguous array of [Fl\\_Menu\\_Item](#)'s unless an item has the FL\_SUBMENU\_POINTER flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the [size\(\)](#) of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return -1 when [value\(\)](#) is called. This may be changed in a future version.

The menu item can be any menu item, even one in a detached submenu (see note about FL\_SUBMENU\_POINTER above).

**Parameters**

<i>in</i>	<i>m</i>	Pointer to any menu item.
-----------	----------	---------------------------

**Returns**

Whether the new value is different than the old one.

**Return values**

0	The value didn't change.
1	The value was changed.

## See also

```
int value(int)
int value()
const Fl_Menu_Item *mvalue()
```

**13.78.3.40 value()** [3/3]

```
int Fl_Menu_::value (
 int i) [inline]
```

Set the value of the menu to index *i*.

The *value* of the menu is the index into the menu() of the last item chosen by the user or -1.

It is -1 initially (if no item has been chosen) or if the chosen menu item is part of a submenu addressed by an FL\_SUBMENU\_POINTER.

## Note

All menu items are located in a contiguous array of [Fl\\_Menu\\_Item](#)'s unless an item has the FL\_SUBMENU\_POINTER flag which redirects the submenu to an independent submenu array. This submenu array is not counted in the [size\(\)](#) of the menu, and menu items in this submenu can't return a valid index into the **main** menu. Therefore menu items that are located in such a submenu return -1 when [value\(\)](#) is called. This may be changed in a future version.

You can set the value as an integer or with a pointer to a menu item. The integer value is restricted to the main menu array (0..[size\(\)](#)-1) whereas the menu item can be any menu item, even one in a detached submenu (see note about FL\_SUBMENU\_POINTER above).

## Parameters

in	<i>i</i>	Index of the menu item in the main menu array. Values outside 0.. <a href="#">size()</a> -1 are ignored (return 0).
----	----------	---------------------------------------------------------------------------------------------------------------------

## Returns

Whether the new value is different than the old one.

## Return values

0	The value didn't change.
1	The value was changed.

**13.79 Fl\_Menu\_Bar Class Reference**

This widget provides a standard menubar interface.

```
#include <Fl_Menu_Bar.H>
```

Inheritance diagram for Fl\_Menu\_Bar:

### Public Member Functions

- [Fl\\_Menu\\_Bar](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Menu\\_Bar](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- virtual void [play\\_menu](#) (const [Fl\\_Menu\\_Item](#) \*item)  
*Opens the 1st level submenu of the menubar corresponding to *item*.*
- virtual void [update](#) ()  
*Updates the menu bar after any change to its items.*

### Public Member Functions inherited from [Fl\\_Menu\\_](#)

- int [add](#) (const char \*)  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- int [add](#) (const char \*, int [shortcut](#), [Fl\\_Callback](#) \*, void \*=0, int=0)  
*Adds a new menu item.*
- int [add](#) (const char \*a, const char \*b, [Fl\\_Callback](#) \*c, void \*d=0, int e=0)  
*See int [Fl\\_Menu\\_::add](#)(const char\* label, int shortcut, [Fl\\_Callback](#)\*, void \*user\_data=0, int flags=0)*
- void [clear](#) ()  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- int [clear\\_submenu](#) (int index)  
*Clears the specified submenu pointed to by *index* of all menu items.*
- void [copy](#) (const [Fl\\_Menu\\_Item](#) \*m, void \*user\_data=0)  
*Sets the menu array pointer with a copy of *m* that will be automatically deleted.*
- [Fl\\_Boxtype](#) [down\\_box](#) () const  
*This box type is used to surround the currently-selected items in the menus.*
- void [down\\_box](#) ([Fl\\_Boxtype](#) b)  
*Sets the box type used to surround the currently-selected items in the menus.*
- [Fl\\_Color](#) [down\\_color](#) () const  
*For back compatibility, same as [selection\\_color](#)()*
- void [down\\_color](#) (unsigned c)  
*For back compatibility, same as [selection\\_color](#)()*
- int [find\\_index](#) (const char \*name) const  
*Find the menu item index for a given menu *pathname*, such as "Edit/Copy".*
- int [find\\_index](#) (const [Fl\\_Menu\\_Item](#) \*item) const  
*Find the index into the menu array for a given *item*.*
- int [find\\_index](#) ([Fl\\_Callback](#) \*cb) const

- Find the index into the menu array for a given callback `cb`.*

  - const `FI_Menu_Item * find_item` (const char \*name)

*Find the menu item for a given menu `pathname`, such as "Edit/Copy".*

  - const `FI_Menu_Item * find_item` (FI\_Callback \*)

*Find the menu item for the given callback `cb`.*

  - const `FI_Menu_Item * find_item_with_argument` (long)

*Find the menu item for the given user argument `v`.*

  - const `FI_Menu_Item * find_item_with_user_data` (void \*)

*Find the menu item for the given user data `v`.*

  - `FI_Menu_` (int, int, int, int, const char \*\*=0)

*Creates a new `FI_Menu_` widget using the given position, size, and label string.*

  - void `global` ()

*Make the shortcuts for this menu work no matter what window has the focus when you type it.*

  - int `insert` (int index, const char \*, int `shortcut`, FI\_Callback \*, void \*\*=0, int=0)

*Inserts a new menu item at the specified `index` position.*

  - int `insert` (int index, const char \*a, const char \*b, FI\_Callback \*c, void \*d=0, int e=0)

*See int `FI_Menu_::insert`(const char\* label, int shortcut, FI\_Callback\*, void \*user\_data=0, int flags=0)*

  - int `item_pathname` (char \*name, int namelen, const `FI_Menu_Item *finditem`=0) const

*Get the menu 'pathname' for the specified menuitem.*

  - const `FI_Menu_Item * menu` () const

*Returns a pointer to the array of `FI_Menu_Items`.*

  - void `menu` (const `FI_Menu_Item *m`)

*Sets the menu array pointer directly.*

  - `FI_Boxtype menu_box` () const

*Get the box type for the menu popup windows.*

  - void `menu_box` (FI\_Boxtype b)

*Set the box type for the menu popup windows.*

  - const `FI_Menu_Item * menu_end` ()

*Finishes menu modifications and returns `menu()`.*

  - int `mode` (int i) const

*Get the flags of item `i`.*

  - void `mode` (int i, int fl)

*Set the flags of item `i`.*

  - const `FI_Menu_Item * mvalue` () const

*Return a pointer to the last menu item that was picked.*

  - const `FI_Menu_Item * picked` (const `FI_Menu_Item *`)

*When user picks a menu item, call this.*

  - const `FI_Menu_Item * prev_mvalue` () const

*Return a pointer to the menu item that was picked before the current one was picked.*

  - void `remove` (int)

*Deletes item `i` from the menu.*

  - void `replace` (int, const char \*)

*Changes the text of item `i`.*

  - void `setonly` (FI\_Menu\_Item \*item)

*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*

  - void `shortcut` (int i, int s)

*Change the shortcut of item `i` to `s`.*

  - int `size` () const

*This returns the number of `FI_Menu_Item` structures that make up the menu, correctly counting submenus.*

  - void `size` (int W, int H)
  - const `FI_Menu_Item * test_shortcut` ()

- Returns the menu item with the entered shortcut (key value).*

  - `const char * text () const`

*Returns the title of the last item chosen.*

  - `const char * text (int i) const`

*Returns the title of item i.*

  - `FI_Color textcolor () const`

*Get the current color of menu item labels.*

  - `void textcolor (FI_Color c)`

*Sets the current color of menu item labels.*

  - `FI_Font textfont () const`

*Gets the current font of menu item labels.*

  - `void textfont (FI_Font c)`

*Sets the current font of menu item labels.*

  - `FI_Fonsize textsize () const`

*Gets the font size of menu item labels.*

  - `void textsize (FI_Fonsize c)`

*Sets the font size of menu item labels.*

  - `int value () const`

*Return the index into the menu() of the last item chosen by the user.*

  - `int value (const FI_Menu_Item *)`

*Set the value of a menu to the menu item m.*

  - `int value (int i)`

*Set the value of the menu to index i.*

## Public Member Functions inherited from FI\_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
- Activates the widget.*
- `unsigned int active () const`
- Returns whether the widget is active.*
- `int active_r () const`
- Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`
- Gets the label alignment.*
- `void align (FI_Align alignment)`
- Sets the label alignment.*
- `long argument () const`
- Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`
- Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_Gl_Window * as_gl_window ()`
- Returns an FI\_Gl\_Window pointer if this widget is an FI\_Gl\_Window.*
- `virtual class FI_Gl_Window const * as_gl_window () const`
- `virtual FI_Group * as_group ()`
- Returns an FI\_Group pointer if this widget is an FI\_Group.*
- `virtual FI_Group const * as_group () const`
- `virtual FI_Window * as_window ()`
- Returns an FI\_Window pointer if this widget is an FI\_Window.*
- `virtual FI_Window const * as_window () const`

- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const

- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
  - Sets the damage bits for the widget.*
  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
  - Sets the damage bits for an area inside the widget.*
  - int [damage\\_resize](#) (int, int, int, int)
  - Internal use only.*
  - void [deactivate](#) ()
  - Deactivates the widget.*
  - [FI\\_Image](#) \* [deimage](#) ()
  - Gets the image that is used as part of the widget label when in the inactive state.*
  - const [FI\\_Image](#) \* [deimage](#) () const
  - Gets the image that is used as part of the widget label when in the inactive state.*
  - void [deimage](#) ([FI\\_Image](#) &img)
  - Sets the image to use as part of the widget label when in the inactive state.*
  - void [deimage](#) ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
  - int [deimage\\_bound](#) () const
  - Returns whether the inactive image is managed by the widget.*
  - void [do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with default arguments.*
  - void [do\\_callback](#) ([FI\\_Widget](#) \*widget, long arg, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with arbitrary arguments.*
  - void [do\\_callback](#) ([FI\\_Widget](#) \*widget, void \*arg=0, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
  - Calls the widget callback function with arbitrary arguments.*
  - void [draw\\_label](#) (int, int, int, int, [FI\\_Align](#)) const
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
  - int [h](#) () const
  - Gets the widget height.*
  - virtual void [hide](#) ()
  - Makes a widget invisible.*
  - int [horizontal\\_label\\_margin](#) ()
  - Get the spacing between the label and the horizontal edge of the widget.*
  - void [horizontal\\_label\\_margin](#) (int px)
  - Set the spacing between the label and the horizontal edge of the widget.*
  - [FI\\_Image](#) \* [image](#) ()
  - Gets the image that is used as part of the widget label when in the active state.*
  - const [FI\\_Image](#) \* [image](#) () const
  - Gets the image that is used as part of the widget label when in the active state.*
  - void [image](#) ([FI\\_Image](#) &img)
  - Sets the image to use as part of the widget label when in the active state.*
  - void [image](#) ([FI\\_Image](#) \*img)
  - Sets the image to use as part of the widget label when in the active state.*
  - int [image\\_bound](#) () const
  - Returns whether the image is managed by the widget.*
  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const
  - Checks if this widget is a child of wgt.*
  - int [is\\_label\\_copied](#) () const
  - Returns whether the current label was assigned with [copy\\_label\(\)](#).*
  - const char \* [label](#) () const
  - Gets the current label text.*

- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) (FI\_Labeltype a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FI\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FI\\_Color](#) c)  
*Sets the label color.*
- [FI\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FI\\_Font](#) f)  
*Sets the font to use.*
- [FI\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FI\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FI\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FI\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FI\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FI\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [FI\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()

- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [FI\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*

  - unsigned int [visible](#) () const
- Returns whether a widget is visible.*

  - unsigned int [visible\\_focus](#) () const
- Checks whether this widget has a visible focus.*

- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `FL_When` when () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `FL_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~FL_Widget` ()  
*Destroys the widget.*

### Protected Member Functions

- void `draw` () override  
*Draws the widget.*

### Protected Member Functions inherited from `FL_Menu_`

- int `item_pathname`\_ (char \*name, int namelen, const `FL_Menu_Item` \*finditem, const `FL_Menu_Item` \*menu=0) const

### Protected Member Functions inherited from `FL_Widget`

- void `clear_flag` (unsigned int c)  
*Clears a flag in the flags mask.*
- void `draw_backdrop` () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void `draw_box` () const  
*Draws the widget box according to its box style.*
- void `draw_box` (`FL_Boxtype` t, `FL_Color` c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void `draw_box` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void `draw_focus` () const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` bg) const  
*Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `FL_Widget` (int x, int y, int w, int h, const char \*label=0L)

*Creates a widget at the given position and size.*

- unsigned int **flags** () const

*Gets the widget flags mask.*

- void **h** (int v)

*Internal use only.*

- void **set\_flag** (unsigned int c)

*Sets a flag in the flags mask.*

- void **w** (int v)

*Internal use only.*

- void **x** (int v)

*Internal use only.*

- void **y** (int v)

*Internal use only.*

### 13.79.1 Detailed Description

This widget provides a standard menubar interface.

Usually you will put this widget along the top edge of your window. The height of the widget should be 30 for the menu titles to draw correctly with the default font.

The items on the bar and the menus they bring up are defined by a single [Fl\\_Menu\\_Item](#) array. Because a [Fl\\_Menu\\_Item](#) array defines a hierarchy, the top level menu defines the items in the menubar, while the submenus define the pull-down menus. Sub-sub menus and lower pop up to the right of the submenus.

Figure 13.28 menubar

If there is an item in the top menu that is not a title of a submenu, then it acts like a "button" in the menubar. Clicking on it will pick it.

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- The item's callback is done if one has been set; the [Fl\\_Menu\\_Bar](#) is passed as the `Fl_Widget*` argument, along with any userdata configured for the callback.
- If the item does not have a callback, the [Fl\\_Menu\\_Bar](#)'s callback is done instead, along with any userdata configured for the callback. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

Submenus will also pop up in response to shortcuts indicated by putting a '&' character in the name field of the menu item. If you put a '&' character in a top-level "button" then the shortcut picks it. The '&' character in submenus is ignored until the menu is popped up.

Typing the [shortcut\(\)](#) of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse.

FLTK triggers an `FL_BEFORE_MENU` event for this widget right before displaying the menu. This event provides an opportunity to update menu item states and activation.

### 13.79.2 Constructor & Destructor Documentation

#### 13.79.2.1 Fl\_Menu\_Bar()

```
Fl_Menu_Bar::Fl_Menu_Bar (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Menu\\_Bar](#) widget using the given position, size, and label string.

The default boxtype is `FL_UP_BOX`.

The constructor sets [menu\(\)](#) to `NULL`. See [Fl\\_Menu\\_](#) for the methods to set or change the menu.

[labelsize\(\)](#), [labelfont\(\)](#), and [labelcolor\(\)](#) are used to control how the menubar items are drawn. They are initialized from the `Fl_Menu` static variables, but you can change them if desired.

[label\(\)](#) is ignored unless you change [align\(\)](#) to put it outside the menubar.

The destructor removes the [Fl\\_Menu\\_Bar](#) widget and all of its menu items.

### 13.79.3 Member Function Documentation

#### 13.79.3.1 draw()

```
void Fl_Menu_Bar::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

### 13.79.3.2 handle()

```
int Fl_Menu_Bar::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

### 13.79.3.3 play\_menu()

```
void Fl_Menu_Bar::play_menu (
 const Fl_Menu_Item * item) [virtual]
```

Opens the 1st level submenu of the menubar corresponding to `item`.

#### Since

1.4.0

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

### 13.79.3.4 update()

```
virtual void Fl_Menu_Bar::update () [inline], [virtual]
```

Updates the menu bar after any change to its items.

This is useful when the menu bar can be an [Fl\\_Sys\\_Menu\\_Bar](#) object.

Reimplemented in [Fl\\_Sys\\_Menu\\_Bar](#).

The documentation for this class was generated from the following files:

- [Fl\\_Menu\\_Bar.H](#)
- [Fl\\_Menu\\_Bar.cxx](#)

## 13.80 FI\_Menu\_Button Class Reference

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of [FI\\_Menu\\_Item](#) objects.

```
#include <Fl_Menu_Button.H>
```

Inheritance diagram for `FI_Menu_Button`:

### Public Types

- enum `popup_buttons` {  
`POPUP1` = 1, `POPUP2`, `POPUP12`, `POPUP3`,  
`POPUP13`, `POPUP23`, `POPUP123`}

*indicate what mouse buttons pop up the menu.*

### Public Member Functions

- `FI_Menu_Button` (int, int, int, int, const char \* = 0)  
*Creates a new [FI\\_Menu\\_Button](#) widget using the given position, size, and label string.*
- int `handle` (int) override  
*Handles the specified event.*
- const `FI_Menu_Item` \* `popup` ()  
*Act exactly as though the user clicked the button or typed the shortcut key.*

### Public Member Functions inherited from [FI\\_Menu\\_](#)

- int `add` (const char \*)  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- int `add` (const char \*, int `shortcut`, `FI_Callback` \*, void \* = 0, int = 0)  
*Adds a new menu item.*
- int `add` (const char \*a, const char \*b, `FI_Callback` \*c, void \*d = 0, int e = 0)  
*See int [FI\\_Menu\\_::add](#)(const char\* label, int shortcut, FI\_Callback\*, void \*user\_data=0, int flags=0)*
- void `clear` ()  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- int `clear_submenu` (int index)  
*Clears the specified submenu pointed to by index of all menu items.*
- void `copy` (const `FI_Menu_Item` \*m, void \*user\_data = 0)  
*Sets the menu array pointer with a copy of m that will be automatically deleted.*
- `FI_Boxtype` `down_box` () const  
*This box type is used to surround the currently-selected items in the menus.*
- void `down_box` (`FI_Boxtype` b)  
*Sets the box type used to surround the currently-selected items in the menus.*
- `FI_Color` `down_color` () const  
*For back compatibility, same as [selection\\_color\(\)](#)*
- void `down_color` (unsigned c)

- For back compatibility, same as [selection\\_color\(\)](#)
- int [find\\_index](#) (const char \*name) const

Find the menu item index for a given menu *pathname*, such as "Edit/Copy".
- int [find\\_index](#) (const FI\_Menu\_Item \*item) const

Find the index into the menu array for a given *item*.
- int [find\\_index](#) (FI\_Callback \*cb) const

Find the index into the menu array for a given callback *cb*.
- const FI\_Menu\_Item \* [find\\_item](#) (const char \*name)

Find the menu item for a given menu *pathname*, such as "Edit/Copy".
- const FI\_Menu\_Item \* [find\\_item](#) (FI\_Callback \*)

Find the menu item for the given callback *cb*.
- const FI\_Menu\_Item \* [find\\_item\\_with\\_argument](#) (long)

Find the menu item for the given user argument *v*.
- const FI\_Menu\_Item \* [find\\_item\\_with\\_user\\_data](#) (void \*)

Find the menu item for the given user data *v*.
- FI\_Menu\_ (int, int, int, int, const char \*=0)

Creates a new [FI\\_Menu\\_](#) widget using the given position, size, and label string.
- void [global](#) ()

Make the shortcuts for this menu work no matter what window has the focus when you type it.
- int [insert](#) (int index, const char \*, int [shortcut](#), FI\_Callback \*, void \*=0, int=0)

Inserts a new menu item at the specified *index* position.
- int [insert](#) (int index, const char \*a, const char \*b, FI\_Callback \*c, void \*d=0, int e=0)

See int [FI\\_Menu\\_::insert](#)(const char\* label, int shortcut, FI\_Callback\*, void \*user\_data=0, int flags=0)
- int [item\\_pathname](#) (char \*name, int namelen, const FI\_Menu\_Item \*finditem=0) const

Get the menu 'pathname' for the specified menuitem.
- const FI\_Menu\_Item \* [menu](#) () const

Returns a pointer to the array of FI\_Menu\_Items.
- void [menu](#) (const FI\_Menu\_Item \*m)

Sets the menu array pointer directly.
- FI\_Boxtype [menu\\_box](#) () const

Get the box type for the menu popup windows.
- void [menu\\_box](#) (FI\_Boxtype b)

Set the box type for the menu popup windows.
- const FI\_Menu\_Item \* [menu\\_end](#) ()

Finishes menu modifications and returns [menu\(\)](#).
- int [mode](#) (int i) const

Get the flags of item *i*.
- void [mode](#) (int i, int fl)

Set the flags of item *i*.
- const FI\_Menu\_Item \* [mvalue](#) () const

Return a pointer to the last menu item that was picked.
- const FI\_Menu\_Item \* [picked](#) (const FI\_Menu\_Item \*)

When user picks a menu item, call this.
- const FI\_Menu\_Item \* [prev\\_mvalue](#) () const

Return a pointer to the menu item that was picked before the current one was picked.
- void [remove](#) (int)

Deletes item *i* from the menu.
- void [replace](#) (int, const char \*)

Changes the text of item *i*.
- void [setonly](#) (FI\_Menu\_Item \*item)

Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.

- void **shortcut** (int i, int s)  
*Change the shortcut of item i to s.*
- int **size** () const  
*This returns the number of [FI\\_Menu\\_Item](#) structures that make up the menu, correctly counting submenus.*
- void **size** (int W, int H)
- const [FI\\_Menu\\_Item](#) \* **test\_shortcut** ()  
*Returns the menu item with the entered shortcut (key value).*
- const char \* **text** () const  
*Returns the title of the last item chosen.*
- const char \* **text** (int i) const  
*Returns the title of item i.*
- [FI\\_Color](#) **textcolor** () const  
*Get the current color of menu item labels.*
- void **textcolor** ([FI\\_Color](#) c)  
*Sets the current color of menu item labels.*
- [FI\\_Font](#) **textfont** () const  
*Gets the current font of menu item labels.*
- void **textfont** ([FI\\_Font](#) c)  
*Sets the current font of menu item labels.*
- [FI\\_Fonsize](#) **textsize** () const  
*Gets the font size of menu item labels.*
- void **textsize** ([FI\\_Fonsize](#) c)  
*Sets the font size of menu item labels.*
- int **value** () const  
*Return the index into the menu() of the last item chosen by the user.*
- int **value** (const [FI\\_Menu\\_Item](#) \*)  
*Set the value of a menu to the menu item m.*
- int **value** (int i)  
*Set the value of the menu to index i.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) **align** () const  
*Gets the label alignment.*
- void **align** ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* **as\_gl\_window** ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* **as\_gl\_window** () const

- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const

- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- [uchar damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*
- void [deactivate](#) ()

*Deactivates the widget.*
- [FL\\_Image \\* deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image \\* deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const

*Gets the widget height.*
- virtual void [hide](#) ()

*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image \\* image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image \\* image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*

- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [FL\\_Color](#) [selection\\_color](#) () const

- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [Fl\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

- void `vertical_label_margin` (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const  
*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const  
*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `FL_When` `when` () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `FL_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~FL_Widget` ()  
*Destroys the widget.*

### Protected Member Functions

- void `draw` () override  
*Draws the widget.*

### Protected Member Functions inherited from `FL_Menu_`

- int `item_pathname`\_ (char \*name, int namelen, const `FL_Menu_Item` \*finditem, const `FL_Menu_Item` \*menu=0) const

### Protected Member Functions inherited from `FL_Widget`

- void `clear_flag` (unsigned int c)  
*Clears a flag in the flags mask.*
- void `draw_backdrop` () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void `draw_box` () const  
*Draws the widget box according to its box style.*
- void `draw_box` (`FL_Boxtype` t, `FL_Color` c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void `draw_box` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void `draw_focus` () const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` bg) const

- *Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int `x`, int `y`, int `w`, int `h`, const char \*`label`=0L)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int `v`)  
*Internal use only.*
- void `set_flag` (unsigned int `c`)  
*Sets a flag in the flags mask.*
- void `w` (int `v`)  
*Internal use only.*
- void `x` (int `v`)  
*Internal use only.*
- void `y` (int `v`)  
*Internal use only.*

### Static Protected Attributes

- static `FI_Menu_Button` \* `pressed_menu_button_` = NULL

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*`widget`, void \*`data`)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*`t`)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool `require_alt`=false)  
*Returns true if the given text `t` contains the entered '&x' shortcut.*

### 13.80.1 Detailed Description

This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of [Fl\\_Menu\\_Item](#) objects.

Figure 13.29 menu\_button

Normally any mouse button will pop up a menu and it is lined up below the button as shown in the picture. However an [Fl\\_Menu\\_Button](#) may also control a pop-up menu. This is done by setting the [type\(\)](#). If [type\(\)](#) is zero a normal menu button is produced. If it is nonzero then this is a pop-up menu. The bits in [type\(\)](#) indicate what mouse buttons pop up the menu (see [Fl\\_Menu\\_Button::popup\\_buttons](#)).

The menu will also pop up in response to shortcuts indicated by putting a '&' character in the [label\(\)](#).

Typing the [shortcut\(\)](#) of any of the menu items will cause callbacks exactly the same as when you pick the item with the mouse. The '&' character in menu item names are only looked at when the menu is popped up, however.

When the user clicks a menu item, [value\(\)](#) is set to that item and then:

- The item's callback is done if one has been set; the [Fl\\_Menu\\_Button](#) is passed as the `Fl_Widget*` argument, along with any userdata configured for the callback.
- If the item does not have a callback, the [Fl\\_Menu\\_Button](#)'s callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using [value\(\)](#), [mvalue\(\)](#), [item\\_pathname\(\)](#), etc.

FLTK triggers an `FL_BEFORE_MENU` event for this widget right before displaying the menu. This event provides an opportunity to update menu item states and activation.

### 13.80.2 Member Enumeration Documentation

#### 13.80.2.1 popup\_buttons

enum [Fl\\_Menu\\_Button::popup\\_buttons](#)

indicate what mouse buttons pop up the menu.

Values for [type\(\)](#) used to indicate what mouse buttons pop up the menu. [Fl\\_Menu\\_Button::POPUP3](#) is usually what you want.

## Enumerator

POPUP1	pops up with the mouse 1st button.
POPUP2	pops up with the mouse 2nd button.
POPUP12	pops up with the mouse 1st or 2nd buttons.
POPUP3	pops up with the mouse 3rd button.
POPUP13	pops up with the mouse 1st or 3rd buttons.
POPUP23	pops up with the mouse 2nd or 3rd buttons.
POPUP123	pops up with any mouse button.

## 13.80.3 Constructor & Destructor Documentation

### 13.80.3.1 Fl\_Menu\_Button()

```
Fl_Menu_Button::Fl_Menu_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Menu\\_Button](#) widget using the given position, size, and label string.

The default boxtype is FL\_UP\_BOX.

The constructor sets menu() to NULL. See [Fl\\_Menu\\_](#) for the methods to set or change the menu.

## 13.80.4 Member Function Documentation

### 13.80.4.1 draw()

```
void Fl_Menu_Button::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 13.80.4.2 handle()

```
int Fl_Menu_Button::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

## Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

## 13.80.4.3 popup()

```
const Fl_Menu_Item * Fl_Menu_Button::popup ()
```

Act exactly as though the user clicked the button or typed the shortcut key.

The menu appears, it waits for the user to pick an item, and if they pick one it sets [value\(\)](#) and does the callback or sets [changed\(\)](#) as described above. The menu item is returned or NULL if the user dismisses the menu.

## Note

Since FLTK 1.4.0 [Fl\\_Menu\\_::menu\\_end\(\)](#) is called before the menu pops up to make sure the menu array is located in private storage.

## See also

## 13.81 Fl\_Menu\_Item Struct Reference

The [Fl\\_Menu\\_Item](#) structure defines a single menu item that is used by the [Fl\\_Menu\\_](#) class.

```
#include <Fl_Menu_Item.H>
```

## Public Member Functions

- void **activate** ()  
*Allows a menu item to be picked.*
- int **active** () const  
*Gets whether or not the item can be picked.*
- int **activevisible** () const  
*Returns non 0 if FL\_INACTIVE and FL\_INVISIBLE are cleared, 0 otherwise.*
- int **add** (const char \*, int [shortcut](#), [Fl\\_Callback](#) \*, void \*=0, int=0)  
*Adds a menu item.*
- int **add** (const char \*a, const char \*b, [Fl\\_Callback](#) \*c, void \*d=0, int e=0)  
*See int add(const char\*, int shortcut, Fl\_Callback\*, void\*, int)*
- long **argument** () const  
*Gets the [user\\_data\(\)](#) argument that is sent to the callback function.*
- void **argument** (long v)

- Sets the [user\\_data\(\)](#) argument that is sent to the callback function.*

  - [FL\\_Callback\\_p](#) [callback](#) () const

*Returns the callback function that is set for the menu item.*
- void [callback](#) ([FL\\_Callback](#) \*c)

*Sets the menu item's callback function.*
- void [callback](#) ([FL\\_Callback](#) \*c, void \*p)

*Sets the menu item's callback function and userdata() argument.*
- void [callback](#) ([FL\\_Callback0](#) \*c)

*Sets the menu item's callback function.*
- void [callback](#) ([FL\\_Callback1](#) \*c, long p=0)

*Sets the menu item's callback function and userdata() argument.*
- int [checkbox](#) () const

*Returns true if a checkbox will be drawn next to this item.*
- void **clear** ()

*Turns the check or radio item "off" for the menu item.*
- void [deactivate](#) ()

*Prevents a menu item from being picked.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*o, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#)) const

*Calls the [FL\\_Menu\\_Item](#) item's callback, and provides the [FL\\_Widget](#) argument.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*o, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#)) const

*Calls the [FL\\_Menu\\_Item](#) item's callback, and provides the [FL\\_Widget](#) argument.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*o, void \*arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#)) const

*Calls the [FL\\_Menu\\_Item](#) item's callback, and provides the [FL\\_Widget](#) argument.*
- void [draw](#) (int x, int y, int w, int h, const [FL\\_Menu\\_\\*](#), int t=0) const

*Draws the menu item in the bounding box selected or unselected.*
- const [FL\\_Menu\\_Item](#) \* [find\\_shortcut](#) (int \*ip=0, const bool require\_alt=false) const

*Search only the top level menu for a shortcut.*
- [FL\\_Menu\\_Item](#) \* **first** ()

*Returns the first menu item, same as [next\(0\)](#).*
- const [FL\\_Menu\\_Item](#) \* **first** () const

*Returns the first menu item, same as [next\(0\)](#).*
- **FL\_DEPRECATED** ("since 1.3 - use [setonly](#)([FL\\_Menu\\_Item](#) const\* [first](#)) instead", void [setonly](#)())
- int **headline** () const

*Return non 0 if this menu item is used as a headline.*
- void [headline](#) (bool yes)

*Set menu item as a headline.*
- void **hide** ()

*Hides an item in the menu.*
- void [image](#) ([FL\\_Image](#) &image)

*Compatibility API for FLUID, same as [image.label\(this\)](#).*
- void [image](#) ([FL\\_Image](#) \*image)

*Compatibility API for FLUID, same as [image->label\(this\)](#).*
- void [image\\_label](#) (const [FL\\_Image](#) \*image)

*Sets the title ([label\(\)](#)) to an icon or image.*
- int [insert](#) (int, const char \*, int, [FL\\_Callback](#) \*, void \*==0, int=0)

*Inserts an item at position [index](#).*
- const char \* [label](#) () const

*Returns the title (label) of the menu item.*
- void [label](#) (const char \*a)

*Sets the title (label) of the menu item.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)

- Sets the title (label) and the label type of the menu item.*
- [FI\\_Color labelcolor](#) () const  
*Gets the menu item's label color.*
- void [labelcolor](#) ([FI\\_Color](#) a)  
*Sets the menu item's label color.*
- [FI\\_Font labelfont](#) () const  
*Gets the menu item's label font.*
- void [labelfont](#) ([FI\\_Font](#) a)  
*Sets the menu item's label font.*
- [FI\\_Fonsize labelsiz](#)e () const  
*Gets the label font pixel size/height.*
- void [labelsiz](#)e ([FI\\_Fonsize](#) a)  
*Sets the label font pixel size/height.*
- [FI\\_Labeltype labeltype](#) () const  
*Returns the menu item's labeltype.*
- void [labeltype](#) ([FI\\_Labeltype](#) a)  
*Sets the menu item's labeltype.*
- int [measure](#) (int \*h, const [FI\\_Menu\\_\\*](#)) const  
*Measures width of label, including effect of & characters.*
- void [multi\\_label](#) (const [FI\\_Multi\\_Label](#) \*ml)  
*Sets the title (label()) and labeltype() to an FI\_Multi\_Label.*
- [FI\\_Menu\\_Item \\* next](#) (int i=1)  
*Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.*
- const [FI\\_Menu\\_Item \\* next](#) (int=1) const  
*Advance a pointer by n items through a menu array.*
- const [FI\\_Menu\\_Item \\* popup](#) (int X, int Y, const char \*title=0, const [FI\\_Menu\\_Item](#) \*picked=0, const [FI\\_Menu\\_\\*](#)=0) const  
*This method is called by widgets that want to display menus.*
- const [FI\\_Menu\\_Item \\* pulldown](#) (int X, int Y, int W, int H, const [FI\\_Menu\\_Item](#) \*picked=0, const [FI\\_Menu\\_\\*](#)=0, const [FI\\_Menu\\_Item](#) \*title=0, int menubar=0) const  
*Pulldown() is similar to popup(), but a rectangle is provided to position the menu.*
- int [radio](#) () const  
*Returns true if this item is a radio item.*
- int [selectable](#) () const  
*Returns non-0 if the menu item can be selected.*
- void [set](#) ()  
*Turns the check or radio item "on" for the menu item.*
- void [setonly](#) ([FI\\_Menu\\_Item](#) const \*first)  
*Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.*
- int [shortcut](#) () const  
*Gets what key combination shortcut will trigger the menu item.*
- void [shortcut](#) (int s)  
*Sets exactly what key combination will trigger the menu item.*
- void [show](#) ()  
*Makes an item visible in the menu.*
- int [size](#) () const  
*Size of the menu starting from this menu item.*
- int [submenu](#) () const  
*Returns true if either FL\_SUBMENU or FL\_SUBMENU\_POINTER is on in the flags.*
- const [FI\\_Menu\\_Item \\* test\\_shortcut](#) () const  
*This is designed to be called by a widgets handle() method in response to a FL\_SHORTCUT event.*

- void \* **user\_data** () const  
*Gets the [user\\_data\(\)](#) argument that is sent to the callback function.*
- void **user\_data** (void \*v)  
*Sets the [user\\_data\(\)](#) argument that is sent to the callback function.*
- int **value** () const  
*Returns the current value of the check or radio item.*
- void **value** (int v)  
*Sets the current value of the check or radio item.*
- int **visible** () const  
*Gets the visibility of an item.*

## Public Attributes

- [Fl\\_Callback](#) \* **callback\_**  
*menu item callback*
- int **flags**  
*menu item flags like `FL_MENU_TOGGLE`, `FL_MENU_RADIO`*
- [Fl\\_Color](#) **labelcolor\_**  
*menu item text color*
- [Fl\\_Font](#) **labelfont\_**  
*which font for this menu item text*
- [Fl\\_Fontsize](#) **labelsize\_**  
*size of menu item text*
- [uchar](#) **labeltype\_**  
*how the menu item text looks like*
- int **shortcut\_**  
*menu item shortcut*
- const char \* **text**  
*menu item text, returned by [label\(\)](#)*
- void \* **user\_data\_**  
*menu item user\_data for the menu's callback*

## 13.81.1 Detailed Description

The [Fl\\_Menu\\_Item](#) structure defines a single menu item that is used by the [Fl\\_Menu\\_](#) class.

```
struct Fl_Menu_Item {
 const char* text; // label()
 int shortcut_;
 Fl_Callback* callback_;
 void* user_data_;
 int flags;
 uchar labeltype_;
 uchar labelfont_;
 uchar labelsize_;
 uchar labelcolor_;
};

enum { // values for flags:
 FL_MENU_INACTIVE = 1, // Deactivate menu item (gray out)
 FL_MENU_TOGGLE = 2, // Item is a checkbox toggle (shows checkbox for on/off state)
 FL_MENU_VALUE = 4, // The on/off state for checkbox/radio buttons (if set, state is 'on')
 FL_MENU_RADIO = 8, // Item is a radio button (one checkbox of many can be on)
 FL_MENU_INVISIBLE = 0x10, // Item will not show up (shortcut will work)
 FL_SUBMENU_POINTER = 0x20, // Indicates user_data() is a pointer to another menu array
 FL_SUBMENU = 0x40, // This item is a submenu to other items
 FL_MENU_DIVIDER = 0x80, // Creates divider line below this item. Also ends a group of radio buttons.
 FL_MENU_HORIZONTAL = 0x100, // reserved, do not use
 FL_MENU_CHATTY = 0x200
};
```

## Note

All other bits in `flags` are reserved for FLTK usage, do not use any bits of the `flags` variable for your own purposes. Even **undocumented** bits can be used for internal purposes in this or any future FLTK version.

Some `flags` bits may be changed during runtime by user code, particularly if you need to change the value of a menu item (ON/OFF) or make it active or inactive. Such changes must be done with caution so they don't affect other (maybe undocumented) bits, i.e. you need to make proper bit operations to set or clear only these particular bits.

Typically menu items are statically defined; for example:

```
Fl_Menu_Item popup[] = {
 {"&alpha", FL_ALT+'a', the_cb, (void*)1},
 {"&beta", FL_ALT+'b', the_cb, (void*)2},
 {"gamma", FL_ALT+'c', the_cb, (void*)3, FL_MENU_DIVIDER},
 {"&strange", 0, strange_cb},
 {"&charm", 0, charm_cb},
 {"&truth", 0, truth_cb},
 {"b&eauty", 0, beauty_cb},
 {"sub&menu", 0, 0, 0, FL_SUBMENU},
 {"one"},
 {"two"},
 {"three"},
 {0},
 {"inactive", FL_ALT+'i', 0, 0, FL_MENU_INACTIVE|FL_MENU_DIVIDER},
 {"invisible", FL_ALT+'i', 0, 0, FL_MENU_INVISIBLE},
 {"check", FL_ALT+'i', 0, 0, FL_MENU_TOGGLE|FL_MENU_VALUE},
 {"box", FL_ALT+'i', 0, 0, FL_MENU_TOGGLE},
 {0}};
```

produces:

Figure 13.30 menu

A submenu title is identified by the bit `FL_SUBMENU` in the `flags` field, and ends with a `label()` that is `NULL`. You can nest menus to any depth. A pointer to the first item in the submenu can be treated as an `Fl_Menu` array itself. It is also possible to make separate submenu arrays with `FL_SUBMENU_POINTER` flags.

You should use the method functions to access structure members and not access them directly to avoid compatibility problems with future releases of FLTK.

**Note**

Adding menu items with `insert()`, `add()`, or any of its overloaded variants copies the entire menu to internal storage. Using the memory of a static menu array after that would access unused (but not released) memory and thus have no effect.

When a menu item is selected by the user and a callback is set, the callback will be called with `FL_REASON_SELECTED`. The `Fl_Widget` pointer is set to the widget that opened the menu, a copy of the menu item's user data. If no menu item callback is set, the callback of the managing widget is called instead.

If the `FL_MENU_CHATTY` flag is set, the menu item callback may be called for additional reasons. When a menu item is highlighted, the callback is called with `FL_REASON_GOT_FOCUS`. If it is no longer highlighted, `FL_REASON_LOST_FOCUS` is sent.

**13.81.2 Member Function Documentation****13.81.2.1 `add()`**

```
int Fl_Menu_Item::add (
 const char * mytext,
 int sc,
 Fl_Callback * cb,
 void * data = 0,
 int myflags = 0)
```

Adds a menu item.

The text is split at '/' characters to automatically produce submenus (actually a totally unnecessary feature as you can now add submenu titles directly by setting `FL_SUBMENU` in the flags).

**Returns**

the index into the `menu()` array, where the entry was added

**See also**

`Fl_Menu_Item::insert(int, const char*, int, Fl_Callback*, void*, int)`

**13.81.2.2 `argument()` [1/2]**

```
long Fl_Menu_Item::argument () const [inline]
```

Gets the `user_data()` argument that is sent to the callback function.

For convenience you can also define the callback as taking a long argument. This method casts the stored `user_data()` argument to long and returns it as a *long* value.

**13.81.2.3 `argument()` [2/2]**

```
void Fl_Menu_Item::argument (
 long v) [inline]
```

Sets the `user_data()` argument that is sent to the callback function.

For convenience you can also define the callback as taking a long argument. This method casts the given argument `v` to `void*` and stores it in the menu item's `userdata()` member. This may not be portable to some machines.

**13.81.2.4 `callback()` [1/5]**

```
Fl_Callback_p Fl_Menu_Item::callback () const [inline]
```

Returns the callback function that is set for the menu item.

Each item has space for a callback function and an argument for that function. Due to back compatibility, the `Fl_Menu_Item` itself is not passed to the callback, instead you have to get it by calling `((Fl_Menu_*)w)->mvalue()` where `w` is the widget argument.

**13.81.2.5 callback()** [2/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback * c) [inline]
```

Sets the menu item's callback function.

This method does not set the userdata() argument.

See also

[Fl\\_Callback\\_p](#) Fl\_Menultem::callback() const

**13.81.2.6 callback()** [3/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback * c,
 void * p) [inline]
```

Sets the menu item's callback function and userdata() argument.

See also

[Fl\\_Callback\\_p](#) Fl\_Menultem::callback() const

**13.81.2.7 callback()** [4/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback0 * c) [inline]
```

Sets the menu item's callback function.

This method does not set the userdata() argument.

See also

[Fl\\_Callback\\_p](#) Fl\_Menultem::callback() const

**13.81.2.8 callback()** [5/5]

```
void Fl_Menu_Item::callback (
 Fl_Callback1 * c,
 long p = 0) [inline]
```

Sets the menu item's callback function and userdata() argument.

The argument `is` cast to `void*` and stored as the userdata() for the menu item's callback function.

See also

[Fl\\_Callback\\_p](#) Fl\_Menultem::callback() const

**13.81.2.9 checkbox()**

```
int Fl_Menu_Item::checkbox () const [inline]
```

Returns true if a checkbox will be drawn next to this item.

This is true if `FL_MENU_TOGGLE` or `FL_MENU_RADIO` is set in the flags.

**13.81.2.10 deactivate()**

```
void Fl_Menu_Item::deactivate () [inline]
```

Prevents a menu item from being picked.

Note that this will also cause the menu item to appear grayed-out.

**13.81.2.11 do\_callback()** [1/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

The callback is called with the stored [user\\_data\(\)](#) as its second argument. You must first check that [callback\(\)](#) is non-zero before calling this.

**13.81.2.12 do\_callback()** [2/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o,
 long arg,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

This call overrides the callback's second argument with the given value `arg`. `long arg` is cast to `void*` when calling the callback. You must first check that [callback\(\)](#) is non-zero before calling this.

**13.81.2.13 do\_callback()** [3/3]

```
void Fl_Menu_Item::do_callback (
 Fl_Widget * o,
 void * arg,
 Fl_Callback_Reason reason = FL_REASON_UNKNOWN) const [inline]
```

Calls the [Fl\\_Menu\\_Item](#) item's callback, and provides the [Fl\\_Widget](#) argument.

This call overrides the callback's second argument with the given value `arg`. You must first check that [callback\(\)](#) is non-zero before calling this.

**13.81.2.14 draw()**

```
void Fl_Menu_Item::draw (
 int x,
 int y,
 int w,
 int h,
 const Fl_Menu_ * m,
 int draw_mode = 0) const
```

Draws the menu item in the bounding box selected or unselected.

This does not draw the shortcut: see `menuwindow::drawentry()`.

**Parameters**

in	<i>x,y,w,h</i>	bounding box for the menu item
in	<i>m</i>	draw the background, label, and checkbox of this item
in	<i>draw_mode</i>	0 = draw unselected, 1 = draw selected, 2 = draw menu title

**13.81.2.15 find\_shortcut()**

```
const Fl_Menu_Item * Fl_Menu_Item::find_shortcut (
 int * ip = 0,
 const bool require_alt = false) const
```

Search only the top level menu for a shortcut.

Either `&x` in the label or the shortcut fields are used.

This tests the current event, which must be an `FL_KEYBOARD` or `FL_SHORTCUT`, against a shortcut value.

## Parameters

<i>ip</i>	returns the index of the item, if <i>ip</i> is not NULL.
<i>require_alt</i>	if true: match only if Alt key is pressed.

## Returns

found [Fl\\_Menu\\_Item](#) or NULL

**13.81.2.16 headline()**

```
void Fl_Menu_Item::headline (
 bool yes) [inline]
```

Set menu item as a headline.

A menu item can be designated as a headline. Headline items are not selectable, but they are also not grayed out. To visually distinguish them, add indentation and apply bold or italic styling.

**13.81.2.17 image() [1/2]**

```
void Fl_Menu_Item::image (
 Fl_Image & image) [inline]
```

Compatibility API for FLUID, same as `image.label(this)`.

## Note

This method is intended for internal use by fluid and may not do what you expect.

**13.81.2.18 image() [2/2]**

```
void Fl_Menu_Item::image (
 Fl_Image * image) [inline]
```

Compatibility API for FLUID, same as `image->label(this)`.

## Note

This method is intended for internal use by fluid and may not do what you expect.

**13.81.2.19 image\_label()**

```
void Fl_Menu_Item::image_label (
 const Fl_Image * image) [inline]
```

Sets the title (`label()`) to an icon or image.

This sets the `labeltype()` to `_FL_IMAGE_LABEL` (note the leading underscore).

## See also

`const char* Fl\_Menu\_Item::label\(\) const`

## Since

1.4.0

**13.81.2.20 insert()**

```
int Fl_Menu_Item::insert (
 int index,
 const char * mytext,
 int sc,
 Fl_Callback * cb,
```

```
void * data = 0,
int myflags = 0)
```

Inserts an item at position `index`.

If `index` is -1, the item is added the same way as [FI\\_Menu\\_Item::add\(\)](#).

If 'mytext' contains any un-escaped front slashes (/), it's assumed a menu pathname is being specified, and the value of `index` will be ignored.

In all other aspects, the behavior of [insert\(\)](#) is the same as [add\(\)](#).

#### Parameters

in	<i>index</i>	insert new items here
in	<i>mytext</i>	new label string, details see above
in	<i>sc</i>	keyboard shortcut for new item
in	<i>cb</i>	callback function for new item
in	<i>data</i>	user data for new item
in	<i>myflags</i>	menu flags as described in <a href="#">FI_Menu_Item</a>

#### Returns

the index into the menu() array, where the entry was added

#### 13.81.2.21 label() [1/3]

```
const char * FI_Menu_Item::label () const [inline]
```

Returns the title (label) of the menu item.

A NULL here indicates the end of the menu (or of a submenu). A '&' in the item will print an underscore under the next letter, and if the menu is popped up that letter will be a "shortcut" to pick that item. To get a real '&' put two in a row.

The returned value depends on the [labeltype\(\)](#) that has been used to store the label.

#### Returns

A pointer to the label cast to (const char \*)

#### Return values

(a)	A pointer to text (const char *)
(b)	A pointer to an image ( <a href="#">FI_Image</a> *)
(c)	A pointer to a "multi label" ( <a href="#">FI_Multi_Label</a> *)
NULL	End of menu or submenu

#### See also

[FI\\_Menu\\_Item::label\(const char \\*\)](#)

[FI\\_Menu\\_Item::label\(FI\\_Labeltype, const char \\*\)](#)

[FI\\_Menu\\_Item::image\\_label\(const FI\\_Image \\*\)](#)

[FI\\_Menu\\_Item::multi\\_label\(const FI\\_Multi\\_Label \\*\)](#)

[FI\\_Multi\\_Label::label\(FI\\_Menu\\_Item \\*\)](#)

#### 13.81.2.22 label() [2/3]

```
void FI_Menu_Item::label (
 const char * a) [inline]
```

Sets the title (label) of the menu item.

## Note

This does **not** change the [labeltype\(\)](#) for backwards compatibility. Take care to assign the correct [labeltype\(\)](#) if you assign different label types to the same menu item sequentially.

The default [labeltype\(\)](#) is FL\_NORMAL\_LABEL.

## See also

[label\(Fl\\_Labeltype, const char\\*\)](#)  
 const char\* [Fl\\_Menu\\_Item::label\(\)](#) const

**13.81.2.23 label()** [3/3]

```
void Fl_Menu_Item::label (
 Fl_Labeltype a,
 const char * b) [inline]
```

Sets the title (label) and the label type of the menu item.

The default Fl\_Labeltype when using [Fl\\_Menu\\_Item::label\(const char\\* a\)](#) is FL\_NORMAL\_LABEL but you can set any other label type, for instance FL\_EMBOSSED\_LABEL.

Special labeltypes are:

- FL\_ICON\_LABEL: draws the icon ([Fl\\_Image](#)) associated with the text
- FL\_IMAGE\_LABEL: draws the image ([Fl\\_Image](#)) associated with the text
- FL\_MULTI\_LABEL: draws multiple parts side by side, see [Fl\\_Multi\\_Label](#)

## See also

const char\* [Fl\\_Menu\\_Item::label\(\)](#) const

**13.81.2.24 labelcolor()** [1/2]

```
Fl_Color Fl_Menu_Item::labelcolor () const [inline]
```

Gets the menu item's label color.

This color is passed to the labeltype routine, and is typically the color of the label text. This defaults to FL\_BLACK. If this color is not black fltk will **not** use overlay bitplanes to draw the menu - this is so that images put in the menu draw correctly.

**13.81.2.25 labelcolor()** [2/2]

```
void Fl_Menu_Item::labelcolor (
 Fl_Color a) [inline]
```

Sets the menu item's label color.

## See also

Fl\_Color [Fl\\_Menu\\_Item::labelcolor\(\)](#) const

**13.81.2.26 labelfont()** [1/2]

```
Fl_Font Fl_Menu_Item::labelfont () const [inline]
```

Gets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function [Fl::set\\_font\(\)](#) can define new fonts.

**13.81.2.27 labelfont()** [2/2]

```
void Fl_Menu_Item::labelfont (
 Fl_Font a) [inline]
```

Sets the menu item's label font.

Fonts are identified by small 8-bit indexes into a table. See the enumeration list for predefined fonts. The default value is a Helvetica font. The function [Fl::set\\_font\(\)](#) can define new fonts.

**13.81.2.28 labeltype() [1/2]**

```
Fl_Labeltype Fl_Menu_Item::labeltype () const [inline]
```

Returns the menu item's labeltype.

A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the [label\(\)](#) pointer as another form of data such as a bitmap. The value FL\_NORMAL\_LABEL prints the label as text.

**13.81.2.29 labeltype() [2/2]**

```
void Fl_Menu_Item::labeltype (
 Fl_Labeltype a) [inline]
```

Sets the menu item's labeltype.

A labeltype identifies a routine that draws the label of the widget. This can be used for special effects such as emboss, or to use the [label\(\)](#) pointer as another form of data such as a bitmap. The value FL\_NORMAL\_LABEL prints the label as text.

**13.81.2.30 measure()**

```
int Fl_Menu_Item::measure (
 int * hp,
 const Fl_Menu_ * m) const
```

Measures width of label, including effect of & characters.

Optionally, can get height if hp is not NULL.

**Parameters**

out	<i>hp</i>	return the height of the label
in	<i>m</i>	for this menu item

**Returns**

width of the label without shortcut text, but including checkbox for radio and check items.

**13.81.2.31 multi\_label()**

```
void Fl_Menu_Item::multi_label (
 const Fl_Multi_Label * ml) [inline]
```

Sets the title ([label\(\)](#)) and [labeltype\(\)](#) to an [Fl\\_Multi\\_Label](#).

This sets the [labeltype\(\)](#) to FL\_MULTI\_LABEL (note the leading underscore).

**See also**

const char\* [Fl\\_Menu\\_Item::label\(\)](#) const

**Since**

1.4.0

**13.81.2.32 next() [1/2]**

```
Fl_Menu_Item * Fl_Menu_Item::next (
 int i = 1) [inline]
```

Advances a pointer by n items through a menu array, skipping the contents of submenus and invisible items.

There are two calls so that you can advance through const and non-const data.

**13.81.2.33 next()** [2/2]

```
const Fl_Menu_Item * Fl_Menu_Item::next (
 int n = 1) const
```

Advance a pointer by n items through a menu array.

This function skips the contents of submenus, and also invisible items. There are two calls so that you can advance through const and non-const data.

**Parameters**

in	<i>n</i>	advance by n items
----	----------	--------------------

**Returns**

a pointer to the next menu item. If the [label\(\)](#) of the returned item is nullptr, the function reached the end of the array and no next item was found.

**13.81.2.34 popup()**

```
const Fl_Menu_Item * Fl_Menu_Item::popup (
 int X,
 int Y,
 const char * title = 0,
 const Fl_Menu_Item * picked = 0,
 const Fl_Menu_ * menu_button = 0) const
```

This method is called by widgets that want to display menus.

The menu stays up until the user picks an item or dismisses it. The selected item (or NULL if none) is returned. *This does not do the callbacks or change the state of check or radio items.*

The menu is positioned so the cursor is centered over the item picked. This will work even if `picked` is in a submenu. If `picked` is zero or not in the menu item table the menu is positioned with the cursor in the top-left corner.

**Parameters**

in	<i>X,Y</i>	the position of the mouse cursor, relative to the window that got the most recent event (usually you can pass <a href="#">Fl::event_x()</a> and <a href="#">Fl::event_y()</a> unchanged here).
in	<i>title</i>	a character string title for the menu. If non-zero a small box appears above the menu with the title in it.
in	<i>picked</i>	if this pointer is not NULL, the popup menu will appear so that the picked menu is under the mouse pointer.
in	<i>menu_button</i>	is a pointer to an <a href="#">Fl_Menu_</a> from which the color and boxtypes for the menu are pulled. If NULL then defaults are used.

**Returns**

a pointer to the menu item selected by the user, or NULL

**13.81.2.35 pulldown()**

```
const Fl_Menu_Item * Fl_Menu_Item::pulldown (
 int X,
 int Y,
 int W,
 int H,
 const Fl_Menu_Item * initial_item = 0,
 const Fl_Menu_ * pbutton = 0,
```

```
const Fl_Menu_Item * title = 0,
int menubar = 0) const
```

Pulldown() is similar to [popup\(\)](#), but a rectangle is provided to position the menu.

The menu is made at least W wide, and the picked item `initial_item` is centered over the rectangle (like [Fl\\_Choice](#) uses).

If `initial_item` is NULL or not found, the menu is aligned just below the rectangle (like a pulldown menu).

The `title` and `menubar` arguments are used internally by the [Fl\\_Menu\\_Bar](#) widget.

### 13.81.2.36 radio()

```
int Fl_Menu_Item::radio () const [inline]
```

Returns true if this item is a radio item.

When a radio button is selected all "adjacent" radio buttons are turned off. A set of radio items is delimited by an item that has [radio\(\)](#) false, or by an item with FL\_MENU\_DIVIDER turned on.

### 13.81.2.37 selectable()

```
int Fl_Menu_Item::selectable () const [inline]
```

Returns non-0 if the menu item can be selected.

Return 0 if the menu is hidden, inactive, or a headline.

### 13.81.2.38 set()

```
void Fl_Menu_Item::set () [inline]
```

Turns the check or radio item "on" for the menu item.

Note that this does not turn off any adjacent radio items like [setonly\(\)](#) does.

### 13.81.2.39 setonly()

```
void Fl_Menu_Item::setonly (
 Fl_Menu_Item const * first)
```

Turns the radio item "on" for the menu item and turns "off" adjacent radio items set.

**Deprecated** Please use [Fl\\_Menu\\_Item::setonly\(Fl\\_Menu\\_Item const\\* first\)](#) instead.

#### Note

This method is dangerous if radio items are first in the menu. Make sure that `first` is set correctly or use [Fl\\_Menu\\_::setonly\(Fl\\_Menu\\_Item\\*\)](#) instead.

#### Parameters

<code>in</code>	<code>first</code>	start of menu array or NULL (default) if the radio group is not the first item
-----------------	--------------------	--------------------------------------------------------------------------------

### 13.81.2.40 shortcut()

```
void Fl_Menu_Item::shortcut (
 int s) [inline]
```

Sets exactly what key combination will trigger the menu item.

The value is a logical 'or' of a key and a set of shift flags, for instance FL\_ALT+'a' or FL\_ALT+FL\_F+10 or just 'a'. A value of zero disables the shortcut.

The key can be any value returned by [Fl::event\\_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event\\_state\(\)](#). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

**13.81.2.41 size()**

```
int Fl_Menu_Item::size () const
```

Size of the menu starting from this menu item.

This method counts all menu items starting with `this` menu item, including all menu items in the same (sub)menu level, all nested submenus, **and** the terminating empty (0) menu item.

It does **not** count menu items referred to by FL\_SUBMENU\_POINTER menu items (except the single menu item with FL\_SUBMENU\_POINTER).

All menu items counted are consecutive in memory (one array).

Example:

```
schemechoice = new Fl_Choice(X+125,Y,140,25,"FLTK Scheme");
schemechoice->add("none");
schemechoice->add("plastic");
schemechoice->add("gtk+");
schemechoice->add("gleam");
printf("schemechoice->menu()->size() = %d\n", schemechoice->menu()->size());
```

Output:

```
schemechoice->menu()->size() = 5
```

**13.81.2.42 submenu()**

```
int Fl_Menu_Item::submenu () const [inline]
```

Returns true if either FL\_SUBMENU or FL\_SUBMENU\_POINTER is on in the flags.

FL\_SUBMENU indicates an embedded submenu that goes from the next item through the next one with a NULL [label\(\)](#). FL\_SUBMENU\_POINTER indicates that [user\\_data\(\)](#) is a pointer to another menu array.

**13.81.2.43 test\_shortcut()**

```
const Fl_Menu_Item * Fl_Menu_Item::test_shortcut () const
```

This is designed to be called by a widgets `handle()` method in response to a FL\_SHORTCUT event.

If the current event matches one of the items shortcut, that item is returned. If the keystroke does not match any shortcuts then NULL is returned. This only matches the [shortcut\(\)](#) fields, not the letters in the title preceeded by ' '

**13.81.2.44 value()**

```
int Fl_Menu_Item::value () const [inline]
```

Returns the current value of the check or radio item.

This is zero (0) if the menu item is not checked and non-zero otherwise.

Since

1.4.0 this method returns 1 if the item is checked but you should not rely on a particular value, only zero or non-zero.

Note

The returned value for a checked menu item was FL\_MENU\_VALUE (4) before FLTK 1.4.0.

The documentation for this struct was generated from the following files:

- [Fl\\_Menu\\_Item.H](#)
- [Fl\\_Menu.cxx](#)
- [Fl\\_Menu\\_.cxx](#)
- [Fl\\_Menu\\_add.cxx](#)

**13.82 Fl\_Menu\_Window Class Reference**

The [Fl\\_Menu\\_Window](#) widget is a window type originally used for menus.

```
#include <Fl_Menu_Window.H>
```

Inheritance diagram for Fl\_Menu\_Window:

### Public Member Functions

- **Fl\_Menu\_Window** (int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Menu\\_Window](#) widget using the given size, and label string.*
- **Fl\_Menu\_Window** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Menu\\_Window](#) widget using the given position, size, and label string.*
- **~Fl\_Menu\_Window** ()  
*Destroys the window and all of its children.*

### Public Member Functions inherited from [Fl\\_Single\\_Window](#)

- **Fl\_Single\_Window** (int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Single\\_Window](#) widget using the given size, and label (title) string.*
- **Fl\_Single\_Window** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Single\\_Window](#) widget using the given position, size, and label (title) string.*
- void **flush** () *override*  
*Same as [Fl\\_Window::flush\(\)](#)*
- void **make\_current** ()  
*Same as [Fl\\_Window::make\\_current\(\)](#)*
- void **show** () *override*  
*Makes a widget visible.*
- void **show** (int argc, char \*\*argv)  
*Same as [Fl\\_Window::show\(int argc, char \\*\\*argv\)](#)*

### Public Member Functions inherited from [Fl\\_Window](#)

- void **allow\_expand\_outside\_parent** ()  
*Allow this subwindow to expand outside the area of its parent window.*
- virtual class [Fl\\_Double\\_Window](#) \* **as\_double\_window** ()  
*Return non-null if this is an [Fl\\_Double\\_Window](#) object.*
- virtual class [Fl\\_Overlay\\_Window](#) \* **as\_overlay\_window** ()  
*Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.*
- [Fl\\_Window](#) const \* **as\_window** () *const override*
- [Fl\\_Window](#) \* **as\_window** () *override*  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- unsigned int **border** () *const*  
*Returns whether the window possesses a border.*
- void **border** (int b)  
*Sets whether or not the window manager border is around the window.*
- void **clear\_border** ()

- Fast inline function to turn the window manager border off.*

  - void `clear_modal_states` ()

*Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*
- void `copy_label` (const char \*a)

*Sets the window titlebar label to a copy of a character string.*
- void `cursor` (const FI\_RGB\_Image \*, int, int)

*Changes the cursor for this window using the provided image as cursor's shape.*
- void `cursor` (FI\_Cursor c, FI\_Color, FI\_Color=FL\_WHITE)

*For back compatibility only.*
- void `cursor` (FI\_Cursor)

*Changes the cursor for this window.*
- int `decorated_h` () const

*Returns the window height including any window title bar and any frame added by the window manager.*
- int `decorated_w` () const

*Returns the window width including any frame added by the window manager.*
- void `default_cursor` (FI\_Cursor c, FI\_Color, FI\_Color=FL\_WHITE)

*For back compatibility only.*
- void `default_cursor` (FI\_Cursor)

*Sets the default window cursor.*
- void `draw_backdrop` ()

*Draw the background image if one is set and is aligned inside.*
- FI\_Window (int w, int h, const char \*title=0)

*Creates a window from the given width w, height h, and title.*
- FI\_Window (int x, int y, int w, int h, const char \*title=0)

*Creates a window from the given position (x, y), size (w, h) and title.*
- void `free_position` ()

*Undoes the effect of a previous `resize()` or `show()` so that the next time `show()` is called the window manager is free to position the window.*
- void `fullscreen` ()

*Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int `fullscreen_active` () const

*Returns non zero if FULLSCREEN flag is set, 0 otherwise.*
- void `fullscreen_off` ()

*Turns off any side effects of `fullscreen()`*
- void `fullscreen_off` (int X, int Y, int W, int H)

*Turns off any side effects of `fullscreen()` and does `resize(X,Y,W,H)`.*
- void `fullscreen_screens` (int top, int bottom, int left, int right)

*Sets which screens should be used when this window is in fullscreen mode.*
- uchar `get_size_range` (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL) const

*Gets the allowable range to which the user can resize this window.*
- int `handle` (int) `override`

*Handles the specified event.*
- void `hide` () `override`

*Removes the window from the screen.*
- void `hotspot` (const FI\_Widget &p, int offscreen=0)

*See void FI\_Window::hotspot(int x, int y, int offscreen = 0)*
- void `hotspot` (const FI\_Widget \*, int offscreen=0)

*See void FI\_Window::hotspot(int x, int y, int offscreen = 0)*
- void `hotspot` (int x, int y, int offscreen=0)

*Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*

- `const void * icon () const`  
*Gets the current icon window target dependent data.*
- `void icon (const FL_RGB_Image *)`  
*Sets or resets a single window icon.*
- `void icon (const void *ic)`  
*Platform-specific method to set the window icon usable on Windows and X11 only.*
- `void iconize ()`  
*Iconifies the window.*
- `const char * iconlabel () const`  
*See void [FL\\_Window::iconlabel\(const char\\*\)](#)*
- `void iconlabel (const char *)`  
*Sets the icon label.*
- `void icons (const FL_RGB_Image *[], int)`  
*Sets the window icons.*
- `void icons (HICON big_icon, HICON small_icon)`  
*Sets the window icons using HICON handles (Windows platform only).*
- `const char * label () const`  
*See void [FL\\_Window::label\(const char\\*\)](#)*
- `void label (const char *)`  
*Sets the window title bar label.*
- `void label (const char *label, const char *iconlabel)`  
*Sets the icon label.*
- `void make_current ()`  
*Sets things up so that the drawing functions in [<FL/fl\\_draw.H>](#) will go into this window.*
- `void maximize ()`  
*Maximizes a top-level window to its current screen.*
- `unsigned int maximize_active () const`  
*Returns whether the window is currently maximized.*
- `unsigned int menu_window () const`  
*Returns true if this window is a menu window.*
- `unsigned int modal () const`  
*Returns true if this window is modal.*
- `unsigned int non_modal () const`  
*Returns true if this window is modal or non-modal.*
- `fl_uintptr_t os_id () const`  
*Returns a platform-specific identification of a shown window, or 0 if not shown.*
- `unsigned int override () const`  
*Returns non zero if OVERRIDE flag is set, 0 otherwise.*
- `void resize (int X, int Y, int W, int H) override`  
*Changes the size and position of the window.*
- `int screen_num () const`  
*The number of the screen containing the mapped window.*
- `void screen_num (int screen_num)`  
*Set the number of the screen where to map the window.*
- `void set_menu_window ()`  
*Marks the window as a menu window.*
- `void set_modal ()`

A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

- void [set\\_non\\_modal](#) ()

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.

- void [set\\_override](#) ()

Activates the flags `NOBORDER|OVERRIDE`.

- void [set\\_tooltip\\_window](#) ()

Marks the window as a tooltip window.

- const [Fl\\_Image](#) \* [shape](#) () const

Returns the image controlling the window shape or `NULL`.

- void [shape](#) (const [Fl\\_Image](#) &b)

Set the window's shape with an [Fl\\_Image](#).

- void [shape](#) (const [Fl\\_Image](#) \*img)

Assigns a non-rectangular shape to the window.

- void [show](#) () [override](#)

Puts the window on the screen.

- void [show](#) (int argc, char \*\*argv)

Puts the window on the screen with [show\(\)](#) and parses command-line arguments.

- int [shown](#) () const

Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).

- void [size\\_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)

Sets the allowable range to which the user can resize this window.

- unsigned int [tooltip\\_window](#) () const

Returns true if this window is a tooltip window.

- void [un\\_maximize](#) ()

Returns a previously maximized top-level window to its previous size.

- void [wait\\_for\\_expose](#) ()

Waits for the window to be displayed after calling [show\(\)](#).

- int [x\\_root](#) () const

Gets the x position of the window on the screen.

- const char \* [xclass](#) () const

Returns the xclass for this window, or a default.

- void [xclass](#) (const char \*c)

Sets the xclass for this window.

- int [y\\_root](#) () const

Gets the y position of the window on the screen.

- virtual [~Fl\\_Window](#) ()

The destructor also deletes all the children.

## Public Member Functions inherited from [Fl\\_Group](#)

- [Fl\\_Widget](#) \*& [\\_ddfdesign\\_kludge](#) ()

This is for forms compatibility only.

- void [add](#) ([Fl\\_Widget](#) &)

The widget is removed from its current group (if any) and then added to the end of this group.

- void [add](#) ([Fl\\_Widget](#) \*o)

See void [Fl\\_Group::add\(Fl\\_Widget &w\)](#)

- void [add\\_resizable](#) ([Fl\\_Widget](#) &o)

Adds a widget to the group and makes it the resizable widget.

- [Fl\\_Widget](#) \*const \* [array](#) () const

- Returns a pointer to the internal array of children.*

  - `FL_Group` const \* `as_group` () const override
  - `FL_Group` \* `as_group` () override

*Returns an `FL_Group` pointer if this widget is an `FL_Group`.*
- void `begin` ()
 

*Sets the current group so you can build the widget tree by just constructing the widgets.*
- `FL_Widget` \* `child` (int n) const
 

*Returns the n'th child.*
- int `children` () const
 

*Returns how many child widgets the group has.*
- void `clear` ()
 

*Deletes all child widgets from memory recursively.*
- unsigned int `clip_children` () const
 

*Returns the current clipping mode.*
- void `clip_children` (int c)
 

*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int `delete_child` (int n)
 

*Removes the widget at `index` from the group and deletes it.*
- void `end` ()
 

*Exactly the same as `current(this->parent())`.*
- int `find` (const `FL_Widget` &o) const
 

*See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` \*) const
 

*Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \*s=0)
 

*Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()
 

*This is for forms compatibility only.*
- void `init_sizes` ()
 

*Resets the internal array of widget sizes and positions.*
- void `insert` (`FL_Widget` &, int i)
 

*The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)
 

*This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)
 

*Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)
 

*Removes the widget o from the group.*
- void `remove` (int index)
 

*Removes the widget at `index` from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const
 

*Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)
 

*Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)
 

*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual `~FL_Group` ()
 

*The destructor also deletes all the children.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align align** () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an FI\_Gl\_Window pointer if this widget is an FI\_Gl\_Window.*
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI\_Boxtype box** () const  
*Gets the box type of the widget.*
- void **box** (**FI\_Boxtype** new\_box)  
*Sets the box type for the widget.*
- **FI\_Callback\_p callback** () const  
*Gets the current callback function for the widget.*
- void **callback** (**FI\_Callback** \*cb)  
*Sets the current callback function for the widget.*
- void **callback** (**FI\_Callback** \*cb, **FI\_Callback\_User\_Data** \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void **callback** (**FI\_Callback** \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void **callback** (**FI\_Callback0** \*cb)  
*Sets the current callback function for the widget.*
- void **callback** (**FI\_Callback1** \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int **changed** () const  
*Checks if the widget value changed since the last callback.*
- void **clear\_active** ()  
*Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()  
*Marks the value of the widget as unchanged.*

- void `clear_damage` (`uchar` c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- int `horizontal_label_margin` ()

- Get the spacing between the label and the horizontal edge of the widget.*

  - void [horizontal\\_label\\_margin](#) (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const

*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const

*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const

*Gets the current label text.*
- void [label](#) (const char \*text)

*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()

*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const

*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)

*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const

*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)

*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const

*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)

*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const

*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)

*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const

*Returns if a widget is used for output only.*

- `Fl_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (Fl_Group *p)`  
*Internal use only - "for hacks only".*
- `void position (int X, int Y)`  
*Repositions the window or widget.*
- `void redraw ()`  
*Schedules the drawing of the widget.*
- `void redraw_label ()`  
*Schedules the drawing of the label.*
- `Fl_Color selection_color () const`  
*Gets the selection color.*
- `void selection_color (Fl_Color a)`  
*Sets the selection color.*
- `int send (int event)`  
*Sends the specified event to the widget.*
- `void set_active ()`  
*Marks the widget as active without sending events or changing focus.*
- `void set_changed ()`  
*Marks the value of the widget as changed.*
- `void set_output ()`  
*Sets a widget to output only.*
- `void set_visible ()`  
*Makes the widget visible.*
- `void set_visible_focus ()`  
*Enables keyboard focus navigation with this widget.*
- `int shortcut_label () const`  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- `void shortcut_label (int value)`  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- `void size (int W, int H)`  
*Changes the size of the widget.*
- `int take_focus ()`  
*Gives the widget the keyboard focus.*
- `unsigned int takeevents () const`  
*Returns if the widget is able to take events.*
- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip () const`  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window () const`  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type () const`  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`

- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
  - Gets the user data for this widget.*
  - void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
  - Sets the user data for this widget.*
  - void [user\\_data](#) (void \*v)
  - Sets the user data for this widget.*
  - int [vertical\\_label\\_margin](#) ()
  - Get the spacing between the label and the vertical edge of the widget.*
  - void [vertical\\_label\\_margin](#) (int px)
  - Set the spacing between the label and the vertical edge of the widget.*
  - unsigned int [visible](#) () const
  - Returns whether a widget is visible.*
  - unsigned int [visible\\_focus](#) () const
  - Checks whether this widget has a visible focus.*
  - void [visible\\_focus](#) (int v)
  - Modifies keyboard focus navigation.*
  - int [visible\\_r](#) () const
  - Returns whether a widget and all its parents are visible.*
  - int [w](#) () const
  - Gets the widget width.*
  - [FI\\_When](#) [when](#) () const
  - Returns the conditions under which the callback is called.*
  - void [when](#) (uchar i)
  - Sets the flags used to decide when a callback is called.*
  - [FI\\_Window](#) \* [window](#) () const
  - Returns a pointer to the nearest parent window up the widget hierarchy.*
  - int [x](#) () const
  - Gets the widget position in its window.*
  - int [y](#) () const
  - Gets the widget position in its window.*
  - virtual [~FI\\_Widget](#) ()
  - Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from [FI\\_Window](#)

- typedef struct HICON\_\_ \* [HICON](#)

### Static Public Member Functions inherited from [FI\\_Window](#)

- static [FI\\_Window](#) \* [current](#) ()
- Returns the last window that was made current.*
- static void [default\\_callback](#) ([FI\\_Window](#) \*, void \*v)
- Back compatibility: Sets the default callback v for win to call on close event.*
- static void [default\\_icon](#) (const [FI\\_RGB\\_Image](#) \*)
- Sets a single default window icon.*
- static void [default\\_icons](#) (const [FI\\_RGB\\_Image](#) \*[], int)
- Sets the default window icons.*
- static void [default\\_icons](#) (HICON big\_icon, HICON small\_icon)
- Sets the default window icons (Windows platform only).*

- static const char \* [default\\_xclass](#) ()  
*Returns the default xclass.*
- static void [default\\_xclass](#) (const char \*)  
*Sets the default window xclass.*
- static bool [is\\_a\\_rescale](#) ()  
*Returns true when a window is being rescaled.*
- static char [show\\_next\\_window\\_iconic](#) ()  
*Returns the static flag whether the next window should be opened iconified.*
- static void [show\\_next\\_window\\_iconic](#) (char stat)  
*Sets a static flag whether the next window should be opened iconified.*

### Static Public Member Functions inherited from [FI\\_Group](#)

- static [FI\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*
- static void [current](#) ([FI\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from [FI\\_Widget](#)

- enum {  
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,  
[FORCE\\_POSITION](#) = 1<<4 , [NON\\_MODAL](#) = 1<<5 , [SHORTCUT\\_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7  
, [OVERRIDE](#) = 1<<8 , [VISIBLE\\_FOCUS](#) = 1<<9 , [COPIED\\_LABEL](#) = 1<<10 , [CLIP\\_CHILDREN](#) = 1<<11

[USERFLAG1](#) = 1<<31 }  
*flags possible values enumeration.*

### Protected Member Functions inherited from [FI\\_Window](#)

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [override](#)  
*Draws the widget.*
- int [force\\_position](#) () const  
*Returns the internal state of the window's `FORCE_POSITION` flag.*
- void [force\\_position](#) (int force)

*Sets an internal flag that tells FLTK and the window manager to honor position requests.*

- void [free\\_icons](#) ()

*Deletes all icons previously attached to the window.*

- int [is\\_resizable](#) ()

*Protected method to determine whether a window is resizable.*

## Protected Member Functions inherited from [FL\\_Group](#)

- [FL\\_Rect](#) \* [bounds](#) ()

*Returns the internal array of widget sizes and positions.*

- void [draw\\_child](#) ([FL\\_Widget](#) &widget) const

*Forces a child to redraw.*

- void [draw\\_children](#) ()

*Draws all children of the group.*

- void [draw\\_outside\\_label](#) (const [FL\\_Widget](#) &widget) const

*Parents normally call this to draw outside labels of child widgets.*

- virtual int [on\\_insert](#) ([FL\\_Widget](#) \*, int)

*Allow derived groups to act when a widget is added as a child.*

- virtual int [on\\_move](#) (int, int)

*Allow derived groups to act when a widget is moved within the group.*

- virtual void [on\\_remove](#) (int)

*Allow derived groups to act when a child widget is removed from the group.*

- int \* [sizes](#) ()

*Returns the internal array of widget sizes and positions.*

- void [update\\_child](#) ([FL\\_Widget](#) &widget) const

*Draws a child only if it needs it.*

## Protected Member Functions inherited from [FL\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)

*Clears a flag in the flags mask.*

- void [draw\\_backdrop](#) () const

*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*

- void [draw\\_box](#) () const

*Draws the widget box according to its box style.*

- void [draw\\_box](#) ([FL\\_Boxtype](#) t, [FL\\_Color](#) c) const

*Draws a box of type t, of color c at the widget's position and size.*

- void [draw\\_box](#) ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) c) const

*Draws a box of type t, of color c at the position X,Y and size W,H.*

- void [draw\\_focus](#) () const

*Draws a focus rectangle around the widget.*

- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int X, int Y, int W, int H) const

*Draws a focus rectangle around the widget.*

- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) bg) const

*Draws a focus box for the widget at the given position and size.*

- void [draw\\_label](#) () const

*Draws the widget's label at the defined label position.*

- void [draw\\_label](#) (int, int, int, int) const

*Draws the label in an arbitrary bounding box.*

- [FL\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)

*Creates a widget at the given position and size.*

- unsigned int [flags](#) () const

*Gets the widget flags mask.*

- void **h** (int v)

*Internal use only.*

- void **set\_flag** (unsigned int c)

*Sets a flag in the flags mask.*

- void **w** (int v)

*Internal use only.*

- void **x** (int v)

*Internal use only.*

- void **y** (int v)

*Internal use only.*

## Static Protected Attributes inherited from [Fl\\_Window](#)

- static [Fl\\_Window](#) \* **current\_**

*Stores the last window that was made current.*

### 13.82.1 Detailed Description

The [Fl\\_Menu\\_Window](#) widget is a window type originally used for menus.

Historically this window is drawn in hardware overlay layers of the graphics card if they are available so that the menu doesn't force the rest of the window to redraw (older SGI machines running under IRIX and X11).

With improved hardware and operating systems handling layered windows and defaulting to double buffering, overlay support was no longer useful and was removed from FLTK in version 1.4.

[Fl\\_Menu\\_Window](#) has currently no special behavior over [Fl\\_Single\\_Window](#). In `Fl_Menu.cxx`, the local classes `Menu_Window_Basetype` and `Menu_Title_Window` are derived from [Fl\\_Menu\\_Window](#), implementing additional popup functionality.

The documentation for this class was generated from the following files:

- `Fl_Menu_Window.H`
- `Fl_Menu_Window.cxx`

## 13.83 [Fl\\_Multi\\_Browser](#) Class Reference

The [Fl\\_Multi\\_Browser](#) class is a subclass of [Fl\\_Browser](#) which lets the user select any set of the lines.

```
#include <Fl_Multi_Browser.H>
```

Inheritance diagram for [Fl\\_Multi\\_Browser](#):

### Public Member Functions

- [Fl\\_Multi\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)

*Creates a new [Fl\\_Multi\\_Browser](#) widget using the given position, size, and label string.*

## Public Member Functions inherited from FI\_Browser

- void [add](#) (const char \*newtext, void \*d=0)  
*Adds a new line to the end of the browser.*
- void [bottomline](#) (int line)  
*Scrolls the browser so the bottom item in the browser is showing the specified line.*
- void [clear](#) ()  
*Removes all the lines in the browser.*
- char [column\\_char](#) () const  
*Gets the current column separator character.*
- void [column\\_char](#) (char c)  
*Sets the column separator to c.*
- const int \* [column\\_widths](#) () const  
*Gets the current column width array.*
- void [column\\_widths](#) (const int \*arr)  
*Sets the current array to arr.*
- void \* [data](#) (int line) const  
*Returns the user data() for specified line.*
- void [data](#) (int line, void \*d)  
*Sets the user data for specified line to d.*
- void [display](#) (int line, int val=1)  
*For back compatibility.*
- int [displayed](#) (int line) const  
*Returns non-zero if line has been scrolled to a position where it is being displayed.*
- [FI\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor makes an empty browser.*
- char [format\\_char](#) () const  
*Gets the current format code prefix character, which by default is '@'.*
- void [format\\_char](#) (char c)  
*Sets the current format code prefix character to c.*
- void [hide](#) () override  
*Hides the entire FI\_Browser widget – opposite of show().*
- void [hide](#) (int line)  
*Makes line invisible, preventing selection by the user.*
- [FI\\_Image](#) \* [icon](#) (int line) const  
*Returns the icon currently defined for line.*
- void [icon](#) (int line, [FI\\_Image](#) \*icon)  
*Set the image icon for line to the value icon.*
- void [insert](#) (int line, const char \*newtext, void \*d=0)  
*Insert a new entry whose label is newtext above given line, optional data d.*
- void [lineposition](#) (int line, [FI\\_Line\\_Position](#) pos)  
*Updates the browser so that line is shown at position pos.*
- int [load](#) (const char \*filename)  
*Clears the browser and reads the file, adding each line from the file to the browser.*
- void [make\\_visible](#) (int line)  
*Make the item at the specified line visible().*
- void [middleline](#) (int line)  
*Scrolls the browser so the middle item in the browser is showing the specified line.*
- void [move](#) (int to, int from)  
*Line from is removed and reinserted at to.*
- void [remove](#) (int line)

- Remove entry for given `line` number, making the browser one line shorter.*

  - void `remove_icon` (int `line`)

*Removes the icon for `line`.*
- void `replace` (int `a`, const char \*`b`)

*For back compatibility only.*
- int `select` (int `line`, int `val`=1)

*Sets the selection state of the item at `line` to the value `val`.*
- int `selected` (int `line`) const

*Returns 1 if specified `line` is selected, 0 if not.*
- void `show` () override

*Shows the entire `FL_Browser` widget – opposite of `hide()`.*
- void `show` (int `line`)

*Makes `line` visible, and available for selection by user.*
- int `size` () const

*Returns how many lines are in the browser.*
- void `size` (int `W`, int `H`)
- void `swap` (int `a`, int `b`)

*Swaps two browser lines `a` and `b`.*
- const char \* `text` (int `line`) const

*Returns the label text for the specified `line`.*
- void `text` (int `line`, const char \*`newtext`)

*Sets the text for the specified `line` to `newtext`.*
- `FL_Fontsize` `textsize` () const

*Gets the default text size (in pixels) for the lines in the browser.*
- void `textsize` (`FL_Fontsize` `newSize`)

*Sets the default text size (in pixels) for the lines in the browser to `newSize`.*
- int `topline` () const

*Returns the line that is currently visible at the top of the browser.*
- void `topline` (int `line`)

*Scrolls the browser so the top item in the browser is showing the specified `line`.*
- int `value` () const

*Returns the line number of the currently selected line, or 0 if none selected.*
- void `value` (int `line`)

*Sets the browser's `value()`, which selects the specified `line`.*
- int `visible` (int `line`) const

*Returns non-zero if the specified `line` is visible, 0 if hidden.*
- ~`FL_Browser` ()

*The destructor deletes all list items and destroys the browser.*

## Public Member Functions inherited from `FL_Browser_`

- int `deselect` (int `docallbacks`=0)

*Deselects all items in the list and returns 1 if the state changed or 0 if it did not.*
- void `display` (void \*`item`)

*Displays the `item`, scrolling the list as necessary.*
- int `handle` (int `event`) override

*Handles the `event` within the normal widget bounding box.*
- `uchar` `has_scrollbar` () const

*Returns the current scrollbar mode, see `FL_Browser_::has_scrollbar(uchar)`*
- void `has_scrollbar` (`uchar` `mode`)

*Sets whether the widget should have scrollbars or not (default `FL_Browser_::BOTH`).*

- `int hposition () const`  
*Gets the horizontal scroll position of the list as a pixel position `pos`.*
- `void hposition (int)`  
*Sets the horizontal scroll position of the list to pixel position `pos`.*
- `int linespacing () const`  
*Return the height of additional spacing between browser lines.*
- `void linespacing (int pixels)`  
*Add some space between browser lines.*
- `int position () const`
- `void position (int pos)`
- `void position (int x, int y)`
- `void resize (int X, int Y, int W, int H) override`  
*Repositions and/or resizes the browser.*
- `void scrollbar_left ()`  
*Moves the vertical scrollbar to the lefthand side of the list.*
- `void scrollbar_right ()`  
*Moves the vertical scrollbar to the righthand side of the list.*
- `int scrollbar_size () const`  
*Gets the current size of the scrollbars' troughs, in pixels.*
- `void scrollbar_size (int newSize)`  
*Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.*
- `int select (void *item, int val=1, int docallbacks=0)`  
*Sets the selection state of `item` to `val`, and returns 1 if the state changed or 0 if it did not.*
- `int select_only (void *item, int docallbacks=0)`  
*Selects `item` and returns 1 if the state changed or 0 if it did not.*
- `void sort (int flags=0)`  
*Sort the items in the browser based on `flags`.*
- `FI_Color textcolor () const`  
*Gets the default text color for the lines in the browser.*
- `void textcolor (FI_Color col)`  
*Sets the default text color for the lines in the browser to color `col`.*
- `FI_Font textfont () const`  
*Gets the default text font for the lines in the browser.*
- `void textfont (FI_Font font)`  
*Sets the default text font for the lines in the browser to `font`.*
- `FI_Fontsize textsize () const`  
*Gets the default text size (in pixels) for the lines in the browser.*
- `void textsize (FI_Fontsize newSize)`  
*Sets the default text size (in pixels) for the lines in the browser to `size`.*
- `int vposition () const`  
*Gets the vertical scroll position of the list as a pixel position `pos`.*
- `void vposition (int pos)`  
*Sets the vertical scroll position of the list to pixel position `pos`.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- int **handle** (int) override  
*Handles the specified event.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*

- void **remove** (int index)  
*Removes the widget at `index` from the group but does not delete it.*
- **FI\_Widget** \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (**FI\_Widget** &o)  
*Sets the group's resizable widget.*
- void **resizable** (**FI\_Widget** \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- void **resize** (int, int, int, int) override  
*Resizes the **FI\_Group** widget and all of its children.*
- virtual ~**FI\_Group** ()  
*The destructor also deletes all the children.*

### Public Member Functions inherited from **FI\_Widget**

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align** **align** () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an **FI\_Gl\_Window** pointer if this widget is an **FI\_Gl\_Window**.*
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FI\_Window** \* **as\_window** ()  
*Returns an **FI\_Window** pointer if this widget is an **FI\_Window**.*
- virtual **FI\_Window** const \* **as\_window** () const
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI\_Boxtype** **box** () const  
*Gets the box type of the widget.*
- void **box** (**FI\_Boxtype** new\_box)  
*Sets the box type for the widget.*
- **FI\_Callback\_p** **callback** () const  
*Gets the current callback function for the widget.*

- void `callback` (`FI_Callback` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- uchar `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)  
*Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FI_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)

- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

  - void `horizontal_label_margin` (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

  - `FL_Image` \* `image` ()
- Gets the image that is used as part of the widget label when in the active state.*

  - const `FL_Image` \* `image` () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void `image` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void `image` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int `image_bound` () const
- Returns whether the image is managed by the widget.*

  - int `inside` (const `FL_Widget` \*wgt) const
- Checks if this widget is a child of wgt.*

  - int `is_label_copied` () const
- Returns whether the current label was assigned with `copy_label()`.*

  - const char \* `label` () const
- Gets the current label text.*

  - void `label` (const char \*text)
- Sets the current label pointer.*

  - void `label` (`FL_Labeltype` a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int `label_image_spacing` ()
- Return the gap size between the label and the image.*

  - void `label_image_spacing` (int gap)
- Set the gap between the label and the image in pixels.*

  - `FL_Color` `labelcolor` () const
- Gets the label color.*

  - void `labelcolor` (`FL_Color` c)
- Sets the label color.*

  - `FL_Font` `labelfont` () const
- Gets the font to use.*

  - void `labelfont` (`FL_Font` f)
- Sets the font to use.*

- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [FL\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

- Returns if the widget is able to take events.*

  - int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const

*Gets the widget type.*
- void `type` (`uchar` t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (`uchar` i)

*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()

*Destroys the widget.*

## Additional Inherited Members

### Public Types inherited from [FI\\_Browser](#)

- enum [FI\\_Line\\_Position](#) { [TOP](#) , [BOTTOM](#) , [MIDDLE](#) }
- For internal use only?*

### Public Types inherited from [FI\\_Browser\\_](#)

- enum {  
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS\\_ON](#) = 4 ,

## Protected Member Functions inherited from FI\_Browser

- `FL_BLINE * _remove` (int line)  
*Removes the item at the specified line.*
- `const void * bline_data` (const FL\_BLINE \*b) const  
*Get FL\_BLINE data.*
- `void *& bline_data` (FL\_BLINE \*b) const  
*Get writable reference to FL\_BLINE data.*
- `char bline_flags` (const FL\_BLINE \*b) const  
*Get FL\_BLINE flags.*
- `char & bline_flags` (FL\_BLINE \*b) const  
*Get writable reference to FL\_BLINE flags.*
- `const FI_Image * bline_icon` (const FL\_BLINE \*b) const  
*Get FL\_BLINE icon.*
- `FI_Image *& bline_icon` (FL\_BLINE \*b) const  
*Get writable reference to FL\_BLINE icon.*
- `short bline_length` (const FL\_BLINE \*b) const  
*Get FL\_BLINE allocated text buffer size (excl.*
- `const char * bline_txt` (const FL\_BLINE \*b) const  
*Get FL\_BLINE text.*
- `char * bline_txt` (FL\_BLINE \*b) const  
*Get writable reference to FL\_BLINE text.*
- `FL_BLINE * find_line` (int line) const  
*Returns the item for specified line.*
- `int full_height` () const override  
*The height of the entire list of all visible() items in pixels.*
- `int incr_height` () const override  
*The default 'average' item height (including inter-item spacing) in pixels.*
- `void insert` (int line, FL\_BLINE \*item)  
*Insert specified item above line.*
- `void * item_at` (int line) const override  
*Return the item at specified line.*
- `void item_draw` (void \*item, int X, int Y, int W, int H) const override  
*Draws item at the position specified by X Y W H.*
- `void * item_first` () const override  
*Returns the very first item in the list.*
- `int item_height` (void \*item) const override  
*Returns height of item in pixels.*
- `void * item_last` () const override  
*Returns the very last item in the list.*
- `void * item_next` (void \*item) const override  
*Returns the next item after item.*
- `void * item_prev` (void \*item) const override  
*Returns the previous item before item.*
- `void item_select` (void \*item, int val) override  
*Change the selection state of item to the value val.*
- `int item_selected` (void \*item) const override  
*See if item is selected.*
- `void item_swap` (void \*a, void \*b) override  
*Swap the items a and b.*
- `const char * item_text` (void \*item) const override

- *Returns the label text for `item`.*
- `int item_width (void *item) const` override  
*Returns width of `item` in pixels.*
- `int lineno (void *item) const`  
*Returns line number corresponding to `item`, or zero if not found.*
- `void swap (FL_BLINE *a, FL_BLINE *b)`  
*Swap the two items `a` and `b`.*

## Protected Member Functions inherited from `FI_Browser_`

- `void bbox (int &X, int &Y, int &W, int &H) const`  
*Returns the bounding box for the interior of the list's display window, inside the scrollbars.*
- `void deleting (void *item)`  
*This method should be used when `item` is being deleted from the list.*
- `int displayed (void *item) const`  
*Returns non-zero if `item` has been scrolled to a position where it is being displayed.*
- `void draw ()` override  
*Draws the list within the normal widget bounding box.*
- `void * find_item (int ypos)`  
*This method returns the item under mouse `y` position `ypos`.*
- `FI_Browser_ (int X, int Y, int W, int H, const char *L=0)`  
*The constructor makes an empty browser.*
- `virtual int full_width () const`  
*This method may be provided by the subclass to indicate the full width of the item list, in pixels.*
- `void inserting (void *a, void *b)`  
*This method should be used when an item is in the process of being inserted into the list.*
- `virtual int item_quick_height (void *item) const`  
*This method may be provided by the subclass to return the height of the `item`, in pixels.*
- `int leftedge () const`  
*This method returns the `X` position of the left edge of the list area after adjusting for the scrollbar and border, if any.*
- `void new_list ()`  
*This method should be called when the list data is completely replaced or cleared.*
- `void redraw_line (void *item)`  
*This method should be called when the contents of `item` has changed, but not its height.*
- `void redraw_lines ()`  
*This method will cause the entire list to be redrawn.*
- `void replacing (void *a, void *b)`  
*This method should be used when item `a` is being replaced by item `b`.*
- `void * selection () const`  
*Returns the item currently selected, or `NULL` if there is no selection.*
- `void swapping (void *a, void *b)`  
*This method should be used when two items `a` and `b` are being swapped.*
- `void * top () const`  
*Returns the item that appears at the top of the list.*

## Protected Member Functions inherited from FI\_Group

- `FI_Rect * bounds ()`  
*Returns the internal array of widget sizes and positions.*
- `void draw ()` override  
*Draws the widget.*
- `void draw_child (FI_Widget &widget) const`  
*Forces a child to redraw.*
- `void draw_children ()`  
*Draws all children of the group.*
- `void draw_outside_label (const FI_Widget &widget) const`  
*Parents normally call this to draw outside labels of child widgets.*
- `virtual int on_insert (FI_Widget *, int)`  
*Allow derived groups to act when a widget is added as a child.*
- `virtual int on_move (int, int)`  
*Allow derived groups to act when a widget is moved within the group.*
- `virtual void on_remove (int)`  
*Allow derived groups to act when a child widget is removed from the group.*
- `int * sizes ()`  
*Returns the internal array of widget sizes and positions.*
- `void update_child (FI_Widget &widget) const`  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from FI\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FI_Boxtype t, FI_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FI_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*

### Static Protected Attributes inherited from [FI\\_Browser](#)

- static constexpr char **BLINE\_NOTDISPLAYED** = 2
- static constexpr char **BLINE\_SELECTED** = 1

### 13.83.1 Detailed Description

The [FI\\_Multi\\_Browser](#) class is a subclass of [FI\\_Browser](#) which lets the user select any set of the lines.

Figure 13.31 [FI\\_Multi\\_Browser](#)

The user interface is Macintosh style: clicking an item turns off all the others and selects that one, dragging selects all the items the mouse moves over, and ctrl + click (Cmd+click on the Mac OS platform) toggles the items. Shift + click extends the selection until the clicked item. This is different from how forms did it. Normally the callback is done when the user releases the mouse, but you can change this with [when\(\)](#). See [FI\\_Browser](#) for methods to add and remove lines from the browser.

### 13.83.2 Constructor & Destructor Documentation

#### 13.83.2.1 [FI\\_Multi\\_Browser](#)()

```
FI_Multi_Browser::FI_Multi_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [FI\\_Multi\\_Browser](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX. The constructor specializes [FI\\_Browser\(\)](#) by setting the type to FL\_↔MULTI\_BROWSER. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- [FI\\_Multi\\_Browser.H](#)
- [FI\\_Browser.cxx](#)

## 13.84 [FI\\_Multi\\_Label](#) Struct Reference

Allows a mixed text and/or graphics label to be applied to an [FI\\_Menu\\_Item](#) or [FI\\_Widget](#).

```
#include <FI_Multi_Label.H>
```

### Public Member Functions

- void [label](#) ([FI\\_Menu\\_Item](#) \*)  
*Associate an [FI\\_Multi\\_Label](#) with an [FI\\_Menu\\_Item](#).*
- void [label](#) ([FI\\_Widget](#) \*)  
*Associate an [FI\\_Multi\\_Label](#) with an [FI\\_Widget](#).*

## Public Attributes

- `const char * labela`  
*Holds the "leftmost" of the two elements in the composite label.*
- `const char * labelb`  
*Holds the "rightmost" of the two elements in the composite label.*
- `uchar typea`  
*Holds the "type" of [labela](#).*
- `uchar typeb`  
*Holds the "type" of [labelb](#).*

### 13.84.1 Detailed Description

Allows a mixed text and/or graphics label to be applied to an [Fl\\_Menu\\_Item](#) or [Fl\\_Widget](#).

Most regular FLTK widgets now support the ability to associate both images and text with a label but some special cases, notably the non-widget [Fl\\_Menu\\_Item](#) objects, do not. [Fl\\_Multi\\_Label](#) may be used to create menu items that have an icon and text, which would not normally be possible for an [Fl\\_Menu\\_Item](#). For example, [Fl\\_Multi\\_Label](#) is used in the New->Code submenu in fluid, and others.

Figure 13.32 Menu items with icons using [Fl\\_Multi\\_Label](#)

Each [Fl\\_Multi\\_Label](#) holds two elements, [labela](#) and [labelb](#); each may hold either a text label (`const char*`) or an image (`Fl_Image*`). When displayed, [labela](#) is drawn first and [labelb](#) is drawn immediately to its right. More complex labels can be constructed by setting [labelb](#) as another [Fl\\_Multi\\_Label](#) and thus chaining up a series of label elements.

When assigning a label element to one of [labela](#) or [labelb](#), they should be explicitly cast to (`const char*`) if they are not of that type already.

#### Note

An [Fl\\_Multi\\_Label](#) object and all its components (label text, images, chained [Fl\\_Multi\\_Label](#)'s and their linked objects) must exist during the lifetime of the widget or menu item they are assigned to. It is the responsibility of the user's code to release these linked objects if necessary after the widget or menu is deleted.

#### Example Use: [Fl\\_Menu\\_Bar](#)

```
Fl_Pixmap *image = new Fl_Pixmap(..); // image for menu item; any Fl_Image based widget
Fl_Menu_Bar *menu = new Fl_Menu_Bar(..); // can be any Fl_Menu_ oriented widget (Fl_Choice,
 Fl_Menu_Button..)

// Create a menu item
int i = menu->add("File/New", ..);
Fl_Menu_Item *item = (Fl_Menu_Item*)&(menu->menu()[i]);

// Create a multi label, assign it an image + text
Fl_Multi_Label *ml = new Fl_Multi_Label;

// Left side of label is an image
ml->typea = FL_IMAGE_LABEL;
ml->labela = (const char*)image; // any Fl_Image widget: Fl_Pixmap, Fl_PNG_Image, etc..

// Right side of label is label text
ml->typeb = FL_NORMAL_LABEL;
ml->labelb = item->label();

// Assign the multilabel to the menu item
// ml->label(item); // deprecated since 1.4.0; backwards compatible with 1.3.x
item->label(ml); // new method since 1.4.0
```

## 13.84.2 Member Function Documentation

### 13.84.2.1 `label()` [1/2]

```
void Fl_Multi_Label::label (
 Fl_Menu_Item * o)
```

Associate an [Fl\\_Multi\\_Label](#) with an [Fl\\_Menu\\_Item](#).

This uses [Fl\\_Menu\\_Item::label\(Fl\\_Labeltype a, const char \\*b\)](#) internally to set the *label* and the label type of the menu item, i.e. it stores a *pointer* to the [Fl\\_Multi\\_Label](#) object (*this*). An existing label (pointer) will be overwritten.

This sets the type of the menu item's label to `_FL_MULTI_LABEL` - note the leading underscore ('\_').

There is no way to use a method like [Fl\\_Widget::copy\\_label\(\)](#) that transfers ownership of the [Fl\\_Multi\\_Label](#) and its linked objects (images, text, and chained [Fl\\_Multi\\_Label](#)'s) to the menu item.

The [Fl\\_Multi\\_Label](#) and all linked images, text labels, or chained [Fl\\_Multi\\_Label](#) objects must exist during the lifetime of the menu and will not be released when the menu item is destroyed.

Note

The user's code is responsible for releasing the [Fl\\_Multi\\_Label](#) and all linked objects (images, text, chained [Fl\\_Multi\\_Label](#)'s) after the menu has been deleted. This may cause memory leaks if [Fl\\_Multi\\_Label](#) is used and reassigned w/o releasing the objects assigned to it.

**Deprecated** since 1.4.0: please use [Fl\\_Menu\\_Item::label\(Fl\\_Multi\\_Label \\*\)](#)

See also

[Fl\\_Menu\\_Item::label\(Fl\\_Multi\\_Label \\*\)](#)

### 13.84.2.2 `label()` [2/2]

```
void Fl_Multi_Label::label (
 Fl_Widget * o)
```

Associate an [Fl\\_Multi\\_Label](#) with an [Fl\\_Widget](#).

This method uses [Fl\\_Widget::label\(Fl\\_Labeltype, const char \\*\)](#) internally to set the *label* of the widget, i.e. it stores a *pointer* to the [Fl\\_Multi\\_Label](#) object (*this*). An existing label that has been set using [Fl\\_Widget::copy\\_label\(\)](#) will be released prior to the assignment of the new label.

This sets the type of the widget's label to `_FL_MULTI_LABEL` - note the leading underscore ('\_').

There is no way to use a method like [Fl\\_Widget::copy\\_label\(\)](#) that transfers ownership of the [Fl\\_Multi\\_Label](#) and its linked objects (images, text, and chained [Fl\\_Multi\\_Label](#)'s) to the widget.

The [Fl\\_Multi\\_Label](#) and all linked images, text labels, or chained [Fl\\_Multi\\_Label](#) objects must exist during the lifetime of the widget and will not be released when the widget is destroyed.

Note

The user's code is responsible for releasing the [Fl\\_Multi\\_Label](#) and all linked objects (images, text, chained [Fl\\_Multi\\_Label](#)'s) after the widget has been deleted. This may cause memory leaks if [Fl\\_Multi\\_Label](#) is used and reassigned w/o releasing the objects assigned to it.

## 13.84.3 Member Data Documentation

### 13.84.3.1 `labela`

```
const char* Fl_Multi_Label::labela
```

Holds the "leftmost" of the two elements in the composite label.

Typically this would be assigned either a text string (const char\*), a ([Fl\\_Image\\*](#)) or a ([Fl\\_Multi\\_Label\\*](#)).

### 13.84.3.2 `labelb`

```
const char* Fl_Multi_Label::labelb
```

Holds the "rightmost" of the two elements in the composite label.

Typically this would be assigned either a text string (const char\*), a ([Fl\\_Image\\*](#)) or a ([Fl\\_Multi\\_Label\\*](#)).

### 13.84.3.3 typea

`uchar Fl_Multi_Label::typea`

Holds the "type" of labela.

Typically this is set to FL\_NORMAL\_LABEL for a text label, FL\_IMAGE\_LABEL for an image (based on `Fl_image`) or FL\_MULTI\_LABEL if "chaining" multiple [Fl\\_Multi\\_Label](#) elements together.

### 13.84.3.4 typeb

`uchar Fl_Multi_Label::typeb`

Holds the "type" of labelb.

Typically this is set to FL\_NORMAL\_LABEL for a text label, FL\_IMAGE\_LABEL for an image (based on `Fl_image`) or FL\_MULTI\_LABEL if "chaining" multiple [Fl\\_Multi\\_Label](#) elements together.

The documentation for this struct was generated from the following files:

- `Fl_Multi_Label.H`
- `Fl_Multi_Label.cxx`

## 13.85 Fl\_Multiline\_Input Class Reference

This input field displays '\n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

```
#include <Fl_Multiline_Input.H>
```

Inheritance diagram for `Fl_Multiline_Input`:

### Public Member Functions

- [Fl\\_Multiline\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Multiline\\_Input](#) widget using the given position, size, and label string.*

### Public Member Functions inherited from [Fl\\_Input](#)

- [Fl\\_Input](#) (int, int, int, int, const char \*l=0)  
*Creates a new [Fl\\_Input](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

### Public Member Functions inherited from [Fl\\_Input\\_](#)

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool [can\\_redo](#) () const  
*Check if there is a redo action available.*
- bool [can\\_undo](#) () const  
*Check if the last operation can be undone.*

- int `copy` (int clipboard)  
*Put the current selection into the clipboard.*
- int `copy_cuts` ()  
*Copies the yank buffer to the clipboard.*
- `Fl_Color cursor_color` () const  
*Gets the color of the cursor.*
- void `cursor_color` (Fl\_Color n)  
*Sets the color of the cursor.*
- int `cut` ()  
*Deletes the current selection.*
- int `cut` (int a, int b)  
*Deletes all characters between index a and b.*
- int `cut` (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double `dvalue` () const  
*Returns the widget text interpreted as a floating point number.*
- `Fl_Input_` (int, int, int, const char \*=0)  
*Creates a new Fl\_Input\_ widget.*
- unsigned int `index` (int i) const  
*Returns the character at index i.*
- int `input_type` () const  
*Gets the input field type.*
- void `input_type` (int t)  
*Sets the input field type.*
- int `insert` (const char \*t, int l=0)  
*Inserts text at the cursor position.*
- int `insert_position` () const  
*Gets the position of the text cursor.*
- int `insert_position` (int p)  
*Sets the cursor position and mark.*
- int `insert_position` (int p, int m)  
*Sets the index for the cursor and mark.*
- int `ivalue` () const  
*Returns the widget text interpreted as a signed integer.*
- int `mark` () const  
*Gets the current selection mark.*
- int `mark` (int m)  
*Sets the current selection mark.*
- int `maximum_size` () const  
*Gets the maximum length of the input field in characters.*
- void `maximum_size` (int m)  
*Sets the maximum length of the input field in characters.*
- const char \* `placeholder` () const  
*Get the placeholder text.*
- void `placeholder` (const char \*text)  
*Set the placeholder text.*
- int `position` () const
- int `position` (int p)
- int `position` (int p, int m)
- int `readonly` () const  
*Gets the read-only state of the input field.*

- void `readonly` (int b)  
*Sets the read-only state of the input field.*
- int `redo` ()  
*Redo previous undo operation.*
- int `replace` (int b, int e, const char \*text, int len=0)  
*Deletes text from b to e and inserts the new string text.*
- void `resize` (int, int, int, int) override  
*Changes the size of the widget.*
- int `shortcut` () const  
*Return the shortcut key associated with this widget.*
- void `shortcut` (int s)  
*Sets the shortcut key associated with this widget.*
- int `size` () const  
*Returns the number of bytes in value().*
- void `size` (int W, int H)  
*Sets the width and height of this widget.*
- int `static_value` (const char \*)  
*Changes the widget text.*
- int `static_value` (const char \*, int)  
*Changes the widget text.*
- int `tab_nav` () const  
*Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void `tab_nav` (int val)  
*Sets whether the Tab key does focus navigation, or inserts tab characters into FL\_Multiline\_Input.*
- `FL_Color` `textcolor` () const  
*Gets the color of the text in the input field.*
- void `textcolor` (`FL_Color` n)  
*Sets the color of the text in the input field.*
- `FL_Font` `textfont` () const  
*Gets the font of the text in the input field.*
- void `textfont` (`FL_Font` s)  
*Sets the font of the text in the input field.*
- `FL_Fontsize` `textsize` () const  
*Gets the size of the text in the input field.*
- void `textsize` (`FL_Fontsize` s)  
*Sets the size of the text in the input field.*
- int `undo` ()  
*Undoes previous changes to the text buffer.*
- const char \* `value` () const  
*Returns the text displayed in the widget.*
- int `value` (const char \*)  
*Changes the widget text.*
- int `value` (const char \*, int)  
*Changes the widget text.*
- int `value` (double value)  
*Changes the widget text to a floating point number ("%g").*
- int `value` (int value)  
*Changes the widget text to a signed integer number.*
- int `wrap` () const  
*Gets the word wrapping state of the input field.*
- void `wrap` (int b)  
*Sets the word wrapping state of the input field.*
- `~FL_Input_` ()  
*Destroys the widget.*

*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

    - void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*

  - void `clear_changed` ()
- Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const
- Gets the background color of the widget.*
- void `color` (`FL_Color` bg)
- Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)
- Sets the current label.*
- void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*
- `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)
- Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- `FI_Color` `selection_color` () const

*Gets the selection color.*
- void `selection_color` (`FI_Color` a)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*

- `Fl_Window * top_window ()` const  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type ()` const  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data ()` const  
*Gets the user data for this widget.*
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`  
*Sets the user data for this widget.*
- `void user_data (void *v)`  
*Sets the user data for this widget.*
- `int vertical_label_margin ()`  
*Get the spacing between the label and the vertical edge of the widget.*
- `void vertical_label_margin (int px)`  
*Set the spacing between the label and the vertical edge of the widget.*
- `unsigned int visible ()` const  
*Returns whether a widget is visible.*
- `unsigned int visible_focus ()` const  
*Checks whether this widget has a visible focus.*
- `void visible_focus (int v)`  
*Modifies keyboard focus navigation.*
- `int visible_r ()` const  
*Returns whether a widget and all its parents are visible.*
- `int w ()` const  
*Gets the widget width.*
- `Fl_When when ()` const  
*Returns the conditions under which the callback is called.*
- `void when (uchar i)`  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window * window ()` const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x ()` const  
*Gets the widget position in its window.*
- `int y ()` const  
*Gets the widget position in its window.*
- `virtual ~Fl_Widget ()`  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback (Fl_Widget *widget, void *data)`  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut (const char *t)`  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut (const char *, const bool require_alt=false)`  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Static Public Attributes inherited from FI\_Input

- static const char \* **copy\_menu\_text** = "Copy"  
*[this text may be customized at run-time]*
- static const char \* **cut\_menu\_text** = "Cut"  
*[this text may be customized at run-time]*
- static const char \* **paste\_menu\_text** = "Paste"  
*[this text may be customized at run-time]*

## Protected Member Functions inherited from FI\_Input

- void **draw** () override  
*Draws the widget.*
- int **handle\_key** ()  
*Handles a keystroke.*
- int **handle\_rmb** ()  
*Handle right mouse button down events.*

## Protected Member Functions inherited from FI\_Input\_

- int **apply\_undo** ()  
*Apply the current undo/redo operation.*
- void **drawtext** (int, int, int, int)  
*Draws the text in the passed bounding box.*
- void **drawtext** (int, int, int, int, bool draw\_active)  
*Draws the text in the passed bounding box.*
- void **handle\_mouse** (int, int, int, int, int keepmark=0)  
*Handles mouse clicks and mouse moves.*
- int **handletext** (int e, int, int, int, int)  
*Handles all kinds of text field related events.*
- int **line\_end** (int i) const  
*Finds the end of a line.*
- int **line\_start** (int i) const  
*Finds the start of a line.*
- int **linesPerPage** ()
- void **maybe\_do\_callback** (FI\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)

- int [up\\_down\\_position](#) (int, int keepmark=0)  
*Moves the cursor to the column given by `up_down_pos`.*
- int [word\\_end](#) (int i) const  
*Finds the end of a word.*
- int [word\\_start](#) (int i) const  
*Finds the start of a word.*
- int [xscroll](#) () const
- int [yscroll](#) () const
- void [yscroll](#) (int yOffset)

### Protected Member Functions inherited from [Fl\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int [flags](#) () const  
*Gets the widget flags mask.*
- void [h](#) (int v)  
*Internal use only.*
- void [set\\_flag](#) (unsigned int c)  
*Sets a flag in the flags mask.*
- void [w](#) (int v)  
*Internal use only.*
- void [x](#) (int v)  
*Internal use only.*
- void [y](#) (int v)  
*Internal use only.*

### 13.85.1 Detailed Description

This input field displays '\n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys.

This is for editing multiline text.

This is far from the nirvana of text editors, and is probably only good for small bits of text, 10 lines at most. Note that this widget does not support scrollbars or per-character color control.

If you are presenting large amounts of text and need scrollbars or full color control of characters, you probably want [Fl\\_Text\\_Editor](#) instead.

In FLTK 1.3.x, the default behavior of the 'Tab' key was changed to support consistent focus navigation. To get the older FLTK 1.1.x behavior, set [Fl\\_Input\\_::tab\\_nav\(\)](#) to 0. Newer programs should consider using [Fl\\_Text\\_Editor](#).

### 13.85.2 Constructor & Destructor Documentation

#### 13.85.2.1 Fl\_Multiline\_Input()

```
Fl_Multiline_Input::Fl_Multiline_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Multiline\\_Input](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [Fl\\_Multiline\\_Input.H](#)
- [Fl\\_Input.cxx](#)

## 13.86 Fl\_Multiline\_Output Class Reference

This widget is a subclass of [Fl\\_Output](#) that displays multiple lines of text.

```
#include <Fl_Multiline_Output.H>
```

Inheritance diagram for Fl\_Multiline\_Output:

#### Public Member Functions

- [Fl\\_Multiline\\_Output](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Multiline\\_Output](#) widget using the given position, size, and label string.*

#### Public Member Functions inherited from [Fl\\_Output](#)

- [Fl\\_Output](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Output](#) widget using the given position, size, and label string.*

## Public Member Functions inherited from [FL\\_Input](#)

- [FL\\_Input](#) (int, int, int, int, const char \*=0)  
*Creates a new [FL\\_Input](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

## Public Member Functions inherited from [FL\\_Input\\_](#)

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool [can\\_redo](#) () const  
*Check if there is a redo action available.*
- bool [can\\_undo](#) () const  
*Check if the last operation can be undone.*
- int [copy](#) (int clipboard)  
*Put the current selection into the clipboard.*
- int [copy\\_cuts](#) ()  
*Copies the yank buffer to the clipboard.*
- [FL\\_Color](#) [cursor\\_color](#) () const  
*Gets the color of the cursor.*
- void [cursor\\_color](#) ([FL\\_Color](#) n)  
*Sets the color of the cursor.*
- int [cut](#) ()  
*Deletes the current selection.*
- int [cut](#) (int a, int b)  
*Deletes all characters between index a and b.*
- int [cut](#) (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double [dvalue](#) () const  
*Returns the widget text interpreted as a floating point number.*
- [FL\\_Input\\_](#) (int, int, int, int, const char \*=0)  
*Creates a new [FL\\_Input\\_](#) widget.*
- unsigned int [index](#) (int i) const  
*Returns the character at index i.*
- int [input\\_type](#) () const  
*Gets the input field type.*
- void [input\\_type](#) (int t)  
*Sets the input field type.*
- int [insert](#) (const char \*t, int l=0)  
*Inserts text at the cursor position.*
- int [insert\\_position](#) () const  
*Gets the position of the text cursor.*
- int [insert\\_position](#) (int p)  
*Sets the cursor position and mark.*
- int [insert\\_position](#) (int p, int m)  
*Sets the index for the cursor and mark.*
- int [ivalue](#) () const  
*Returns the widget text interpreted as a signed integer.*
- int [mark](#) () const  
*Gets the current selection mark.*
- int [mark](#) (int m)

- Sets the current selection mark.*
- int [maximum\\_size](#) () const
  - Gets the maximum length of the input field in characters.*
- void [maximum\\_size](#) (int m)
  - Sets the maximum length of the input field in characters.*
- const char \* [placeholder](#) () const
  - Get the placeholder text.*
- void [placeholder](#) (const char \*text)
  - Set the placeholder text.*
- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const
  - Gets the read-only state of the input field.*
- void [readonly](#) (int b)
  - Sets the read-only state of the input field.*
- int [redo](#) ()
  - Redo previous undo operation.*
- int [replace](#) (int b, int e, const char \*text, int llen=0)
  - Deletes text from *b* to *e* and inserts the new string *text*.*
- void [resize](#) (int, int, int, int) override
  - Changes the size of the widget.*
- int [shortcut](#) () const
  - Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)
  - Sets the shortcut key associated with this widget.*
- int [size](#) () const
  - Returns the number of bytes in [value\(\)](#).*
- void [size](#) (int W, int H)
  - Sets the width and height of this widget.*
- int [static\\_value](#) (const char \*)
  - Changes the widget text.*
- int [static\\_value](#) (const char \*, int)
  - Changes the widget text.*
- int [tab\\_nav](#) () const
  - Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)
  - Sets whether the Tab key does focus navigation, or inserts tab characters into [FI\\_Multiline\\_Input](#).*
- [FI\\_Color](#) [textcolor](#) () const
  - Gets the color of the text in the input field.*
- void [textcolor](#) ([FI\\_Color](#) n)
  - Sets the color of the text in the input field.*
- [FI\\_Font](#) [textfont](#) () const
  - Gets the font of the text in the input field.*
- void [textfont](#) ([FI\\_Font](#) s)
  - Sets the font of the text in the input field.*
- [FI\\_Fontsize](#) [textsize](#) () const
  - Gets the size of the text in the input field.*
- void [textsize](#) ([FI\\_Fontsize](#) s)
  - Sets the size of the text in the input field.*
- int [undo](#) ()

- Undoes previous changes to the text buffer.*
- `const char * value () const`  
  - Returns the text displayed in the widget.*
- `int value (const char *)`  
  - Changes the widget text.*
- `int value (const char *, int)`  
  - Changes the widget text.*
- `int value (double value)`  
  - Changes the widget text to a floating point number ("%g").*
- `int value (int value)`  
  - Changes the widget text to a signed integer number.*
- `int wrap () const`  
  - Gets the word wrapping state of the input field.*
- `void wrap (int b)`  
  - Sets the word wrapping state of the input field.*
- `~FI_Input ()`  
  - Destroys the widget.*

## Public Member Functions inherited from `FI_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
  - Activates the widget.*
- `unsigned int active () const`  
  - Returns whether the widget is active.*
- `int active_r () const`  
  - Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`  
  - Gets the label alignment.*
- `void align (FI_Align alignment)`  
  - Sets the label alignment.*
- `long argument () const`  
  - Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
  - Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_Gl_Window * as_gl_window ()`  
  - Returns an `FI_Gl_Window` pointer if this widget is an `FI_Gl_Window`.*
- `virtual class FI_Gl_Window const * as_gl_window () const`
- `virtual FI_Group * as_group ()`  
  - Returns an `FI_Group` pointer if this widget is an `FI_Group`.*
- `virtual FI_Group const * as_group () const`
- `virtual FI_Window * as_window ()`  
  - Returns an `FI_Window` pointer if this widget is an `FI_Window`.*
- `virtual FI_Window const * as_window () const`
- `void bind_deimage (FI_Image *img)`  
  - Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FI_Image *img)`  
  - Sets the image to use as part of the widget label when in the active state.*

- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)  
*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

- Internal use only.*

  - void `deactivate` ()
  - Deactivates the widget.*
  - `FI_Image * deimage` ()
  - Gets the image that is used as part of the widget label when in the inactive state.*
  - const `FI_Image * deimage` () const
  - Gets the image that is used as part of the widget label when in the inactive state.*
  - void `deimage` (`FI_Image &img`)
  - Sets the image to use as part of the widget label when in the inactive state.*
  - void `deimage` (`FI_Image *img`)
  - Sets the image to use as part of the widget label when in the inactive state.*
  - int `deimage_bound` () const
  - Returns whether the inactive image is managed by the widget.*
  - void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
  - Calls the widget callback function with default arguments.*
  - void `do_callback` (`FI_Widget *widget`, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
  - Calls the widget callback function with arbitrary arguments.*
  - void `do_callback` (`FI_Widget *widget`, void \*arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
  - Calls the widget callback function with arbitrary arguments.*
  - void `draw_label` (int, int, int, int, `FI_Align`) const
  - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
  - int `h` () const
  - Gets the widget height.*
  - virtual void `hide` ()
  - Makes a widget invisible.*
  - int `horizontal_label_margin` ()
  - Get the spacing between the label and the horizontal edge of the widget.*
  - void `horizontal_label_margin` (int px)
  - Set the spacing between the label and the horizontal edge of the widget.*
  - `FI_Image * image` ()
  - Gets the image that is used as part of the widget label when in the active state.*
  - const `FI_Image * image` () const
  - Gets the image that is used as part of the widget label when in the active state.*
  - void `image` (`FI_Image &img`)
  - Sets the image to use as part of the widget label when in the active state.*
  - void `image` (`FI_Image *img`)
  - Sets the image to use as part of the widget label when in the active state.*
  - int `image_bound` () const
  - Returns whether the image is managed by the widget.*
  - int `inside` (const `FI_Widget *wgt`) const
  - Checks if this widget is a child of wgt.*
  - int `is_label_copied` () const
  - Returns whether the current label was assigned with `copy_label()`.*
  - const char \* `label` () const
  - Gets the current label text.*
  - void `label` (const char \*text)
  - Sets the current label pointer.*
  - void `label` (`FI_Labeltype` a, const char \*b)
  - Shortcut to set the label text and type in one call.*
  - int `label_image_spacing` ()
  - Return the gap size between the label and the image.*

- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsiz](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group \\* parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [FL\\_Color selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

- Enables keyboard focus navigation with this widget.*

  - int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const

*Gets the widget type.*
- void `type` (`uchar` t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*

- void `when` (`uchar` i)  
*Sets the flags used to decide when a callback is called.*
- `FI_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~FI_Widget` ()  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Static Public Attributes inherited from `FI_Input`

- static const char \* `copy_menu_text` = "Copy"  
*[this text may be customized at run-time]*
- static const char \* `cut_menu_text` = "Cut"  
*[this text may be customized at run-time]*
- static const char \* `paste_menu_text` = "Paste"  
*[this text may be customized at run-time]*

### Protected Member Functions inherited from `FI_Input`

- void `draw` () override  
*Draws the widget.*
- int `handle_key` ()  
*Handles a keystroke.*

- int [handle\\_rmb](#) ()  
*Handle right mouse button down events.*

## Protected Member Functions inherited from [FI\\_Input\\_](#)

- int [apply\\_undo](#) ()  
*Apply the current undo/redo operation.*
- void [drawtext](#) (int, int, int, int)  
*Draws the text in the passed bounding box.*
- void [drawtext](#) (int, int, int, int, bool draw\_active)  
*Draws the text in the passed bounding box.*
- void [handle\\_mouse](#) (int, int, int, int, int keepmark=0)  
*Handles mouse clicks and mouse moves.*
- int [handletext](#) (int e, int, int, int, int)  
*Handles all kinds of text field related events.*
- int [line\\_end](#) (int i) const  
*Finds the end of a line.*
- int [line\\_start](#) (int i) const  
*Finds the start of a line.*
- int [linesPerPage](#) ()
- void [maybe\\_do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- int [up\\_down\\_position](#) (int, int keepmark=0)  
*Moves the cursor to the column given by up\_down\_pos.*
- int [word\\_end](#) (int i) const  
*Finds the end of a word.*
- int [word\\_start](#) (int i) const  
*Finds the start of a word.*
- int [xscroll](#) () const
- int [yscroll](#) () const
- void [yscroll](#) (int yOffset)

## Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const

- Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int *x*, int *y*, int *w*, int *h*, const char \**label*=0L)
- Creates a widget at the given position and size.*
- unsigned int **flags** () const
- Gets the widget flags mask.*
- void *h* (int *v*)
- Internal use only.*
- void **set\_flag** (unsigned int *c*)
- Sets a flag in the flags mask.*
- void *w* (int *v*)
- Internal use only.*
- void *x* (int *v*)
- Internal use only.*
- void *y* (int *v*)
- Internal use only.*

### 13.86.1 Detailed Description

This widget is a subclass of [Fl\\_Output](#) that displays multiple lines of text.

It also displays tab characters as whitespace to the next column.

Note that this widget does not support scrollbars, or per-character color control.

If you are presenting large amounts of read-only text and need scrollbars, or full color control of characters, then use [Fl\\_Text\\_Display](#). If you want to display HTML text, use [Fl\\_Help\\_View](#).

A caret cursor (^) shows the keyboard navigation mark for keyboard selection of the output text, e.g. Arrow Keys to move the cursor, Shift + Arrow Keys to create a text selection, and '^C' to copy the selected text to the paste buffer. The caret cursor can be disabled by disabling the widget's "visible focus" using [clear\\_visible\\_focus\(\)](#), inherited from the [Fl\\_Widget](#) base class. Doing this also disables the widget's keyboard navigation.

### 13.86.2 Constructor & Destructor Documentation

#### 13.86.2.1 Fl\_Multiline\_Output()

```
Fl_Multiline_Output::Fl_Multiline_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Multiline\\_Output](#) widget using the given position, size, and label string.

The default boxtype is FL\_DOWN\_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [Fl\\_Multiline\\_Output.H](#)
- [Fl\\_Input.cxx](#)

## 13.87 Fl\_Native\_File\_Chooser Class Reference

This class lets an FLTK application easily and consistently access the operating system's native file chooser.

```
#include <Fl_Native_File_Chooser.H>
```

### Public Types

- enum [Option](#) {  
[NO\\_OPTIONS](#) = 0x0000 , [SAVEAS\\_CONFIRM](#) = 0x0001 , [NEW\\_FOLDER](#) = 0x0002 , [PREVIEW](#) = 0x0004 ,  
[USE\\_FILTER\\_EXT](#) = 0x0008 }

- enum `Type` {  
`BROWSE_FILE` = 0 , `BROWSE_DIRECTORY` , `BROWSE_MULTI_FILE` , `BROWSE_MULTI_DIRECTORY` ,  
`BROWSE_SAVE_FILE` , `BROWSE_SAVE_DIRECTORY` }

## Public Member Functions

- int `count` () const  
*Returns the number of filenames (or directory names) the user selected.*
- const char \* `directory` () const  
*Returns the current preset `directory()` value.*
- void `directory` (const char \*val)  
*Preset the directory the browser will show when opened.*
- const char \* `errmsg` () const  
*Returns a system dependent error message for the last method that failed.*
- const char \* `filename` () const  
*Return the filename the user chose.*
- const char \* `filename` (int i) const  
*Return one of the filenames the user selected.*
- const char \* `filter` () const  
*Returns the filter string last set.*
- void `filter` (const char \*f)  
*Sets the filename filters used for browsing.*
- int `filter_value` () const  
*Returns which filter value was last selected by the user.*
- void `filter_value` (int i)  
*Sets which filter will be initially selected.*
- int `filters` () const  
*Gets how many filters were available, not including "All Files".*
- `FI_Native_File_Chooser` (int val=`BROWSE_FILE`)  
*The constructor.*
- int `options` () const  
*Gets the platform specific `FI_Native_File_Chooser::Option` flags.*
- void `options` (int o)  
*Sets the platform specific chooser options to `val`.*
- const char \* `preset_file` () const  
*Get the preset filename.*
- void `preset_file` (const char \*f)  
*Sets the default filename for the chooser.*
- int `show` ()  
*Post the chooser's dialog.*
- const char \* `title` () const  
*Get the title of the file chooser's dialog window.*
- void `title` (const char \*t)  
*Set the title of the file chooser's dialog window.*
- int `type` () const  
*Gets the current `FI_Native_File_Chooser::Type` of browser.*
- void `type` (int t)  
*Sets the current `FI_Native_File_Chooser::Type` of browser.*
- `~FI_Native_File_Chooser` ()  
*Destructor.*

## Static Public Attributes

- static const char \* **file\_exists\_message** = "File exists. Are you sure you want to overwrite?"

*Localizable message.*

### 13.87.1 Detailed Description

This class lets an FLTK application easily and consistently access the operating system's native file chooser.

Some operating systems have very complex and specific file choosers that many users want access to specifically, instead of FLTK's default file chooser(s).

In cases where there is no native file browser, FLTK's own file browser is used instead.

To use this widget, use the following include in your code:

```
#include <FL/Fl_Native_File_Chooser.H>
```

The following example shows how to pick a single file:

```
// Create and post the local native file chooser
#include <FL/Fl_Native_File_Chooser.H>
[...
Fl_Native_File_Chooser fnfc;
fnfc.title("Pick a file");
fnfc.type(Fl_Native_File_Chooser::BROWSE_FILE);
fnfc.filter("Text\t*.txt\n"
 "C Files\t*.{cxx,h,c}");
fnfc.directory("/var/tmp"); // default directory to use
// Show native chooser
switch (fnfc.show()) {
 case -1: printf("ERROR: %s\n", fnfc.errmsg()); break; // ERROR
 case 1: printf("CANCEL\n"); break; // CANCEL
 default: printf("PICKED: %s\n", fnfc.filename()); break; // FILE CHOSEN
}
```

The [Fl\\_Native\\_File\\_Chooser](#) widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the [fl\\_fopen\(\)](#) or [fl\\_open\(\)](#) utility functions that handle these names in a cross-platform way (whereas the standard [fopen\(\)](#)/[open\(\)](#) functions fail on the Windows platform to open files with a non-ASCII name).

## Platform Specific Caveats

- Under X11/Wayland the dialog is chosen as follows:

1. If command `zenity` is available at run-time and if `Fl::option(OPTION_FNFC_USES_ZENITY)` is turned on, the `zenity`-based dialog opens. This is expected to be more appropriate than other dialog forms for sandboxed apps, but member function [filter\\_value\(\)](#) is not effective.
2. Else if the app runs under the KDE desktop and if `Fl::option(OPTION_FNFC_USES_KDIALOG)` is turned on, and if command `kdiallog` is available at run-time, the `kdiallog`-based dialog opens. Member function [filter\\_value\(\)](#) is not effective with this dialog.
3. Else if the GTK library is available at run-time on the computer and if `Fl::option(OPTION_FNFC_USES_GTK)` is not turned off, the GTK-styled dialog opens. Call [fl\\_register\\_images\(\)](#) to add a "Preview" button to this dialog. Use the static public attributes of class [Fl\\_File\\_Chooser](#) to localize the browser.
4. Otherwise, FLTK's own dialog produced by the [Fl\\_File\\_Chooser](#) class opens. Call [fl\\_register\\_images\(\)](#) to add a "Preview" button to it. It's best if you also call [Fl\\_File\\_Icon::load\\_system\\_icons\(\)](#) at the start of `main()`, to enable the nicer looking file browser widgets. Use the static public attributes of class [Fl\\_File\\_Chooser](#) to localize the browser.

- Some operating systems support certain OS specific options; see [Fl\\_Native\\_File\\_Chooser::options\(\)](#) for a list.

Figure 13.33 The Fl\_Native\_File\_Chooser on different platforms

## 13.87.2 Member Enumeration Documentation

### 13.87.2.1 Option

```
enum Fl_Native_File_Chooser::Option
```

#### Enumerator

NO_OPTIONS	no options enabled
SAVEAS_CONFIRM	Show native 'Save As' overwrite confirm dialog.
NEW_FOLDER	Show 'New Folder' icon (if supported)
PREVIEW	enable preview mode (if supported)
USE_FILTER_EXT	Chooser filter presets the output file extension (if supported)

### 13.87.2.2 Type

```
enum Fl_Native_File_Chooser::Type
```

#### Enumerator

BROWSE_FILE	browse files (lets user choose one file)
BROWSE_DIRECTORY	browse directories (lets user choose one directory)
BROWSE_MULTI_FILE	browse files (lets user choose multiple files)
BROWSE_MULTI_DIRECTORY	browse directories (lets user choose multiple directories)
BROWSE_SAVE_FILE	browse to save a file
BROWSE_SAVE_DIRECTORY	browse to save a directory

### 13.87.3 Constructor & Destructor Documentation

#### 13.87.3.1 Fl\_Native\_File\_Chooser()

```
Fl_Native_File_Chooser::Fl_Native_File_Chooser (
 int val = BROWSE_FILE)
```

The constructor.

Internally allocates the native widgets. Optional `val` presets the type of browser this will be, which can also be changed with [type\(\)](#).

#### 13.87.3.2 ~Fl\_Native\_File\_Chooser()

```
Fl_Native_File_Chooser::~Fl_Native_File_Chooser ()
```

Destructor.

Deallocates any resources allocated to this widget.

### 13.87.4 Member Function Documentation

#### 13.87.4.1 count()

```
int Fl_Native_File_Chooser::count () const
```

Returns the number of filenames (or directory names) the user selected.

**Example:**

```
if (fnfc->show() == 0) {
 // Print all filenames user selected
 for (int n=0; n<fnfc->count(); n++) {
 printf("%d) '%s'\n", n, fnfc->filename(n));
 }
}
```

#### 13.87.4.2 directory()

```
void Fl_Native_File_Chooser::directory (
 const char * val)
```

Preset the directory the browser will show when opened.

If `val` is NULL, or no directory is specified, the chooser will attempt to use the last non-cancelled folder.

#### 13.87.4.3 errmsg()

```
const char * Fl_Native_File_Chooser::errmsg () const
```

Returns a system dependent error message for the last method that failed.

This message should at least be flagged to the user in a dialog box, or to some kind of error log. Contents will be valid only for methods that document [errmsg\(\)](#) will have info on failures.

#### 13.87.4.4 filename() [1/2]

```
const char * Fl_Native_File_Chooser::filename () const
```

Return the filename the user chose.

Use this if only expecting a single filename. If more than one filename is expected, use [filename\(int\)](#) instead. Return value may be "" if no filename was chosen (eg. user cancelled).

#### 13.87.4.5 filename() [2/2]

```
const char * Fl_Native_File_Chooser::filename (
 int i) const
```

Return one of the filenames the user selected.

Use [count\(\)](#) to determine how many filenames the user selected.

**Example:**

```
if (fnfc->show() == 0) {
 // Print all filenames user selected
 for (int n=0; n<fnfc->count(); n++) {
 printf("%d) '%s'\n", n, fnfc->filename(n));
 }
}
```

**13.87.4.6 filter()** [1/2]

```
const char * Fl_Native_File_Chooser::filter () const
```

Returns the filter string last set.

Can be NULL if no filter was set.

**13.87.4.7 filter()** [2/2]

```
void Fl_Native_File_Chooser::filter (
 const char * f)
```

Sets the filename filters used for browsing.

The default is NULL, which browses all files.

The filter string can be any of:

- A single wildcard (eg. "\*.txt")
- Multiple wildcards (eg. ".\*{cxx,h,H}")
- A descriptive name followed by a "\t" and a wildcard (eg. "Text Files\t\*.txt")
- A list of separate wildcards with a "\n" between each (eg. ".\*{cxx,H}\n\*.txt")
- A list of descriptive names and wildcards (eg. "C++ Files\t\*.{cxx,H}\nTxt Files\t\*.txt")

The format of each filter is a wildcard, or an optional user description followed by '\t' and the wildcard.

On most platforms, each filter is available to the user via a pulldown menu in the file chooser. The 'All Files' option is always available to the user.

**13.87.4.8 filter\_value()** [1/2]

```
int Fl_Native_File_Chooser::filter_value () const
```

Returns which filter value was last selected by the user.

This is only valid if the chooser returns success and if the particular file chooser supports it. Otherwise the value is not changed.

Some "native" file choosers don't support returning the filter selection by the user, particularly the system dialog based browsers:

- kdialog (KDE system dialog)
- zenity (another system dialog based chooser).

Note: this list may not be complete.

These system file chooser dialogs don't return the filter value chosen by the user.

See also

[filter\(const char \\*f\)](#)

**13.87.4.9 filter\_value()** [2/2]

```
void Fl_Native_File_Chooser::filter_value (
 int i)
```

Sets which filter will be initially selected.

The first filter is indexed as 0. If [filter\\_value\(\)](#) == [filters\(\)](#), then "All Files" was chosen. If [filter\\_value\(\)](#) > [filters\(\)](#), then a custom filter was set.

Some "native" file choosers don't support this way to set the initial filter type, particularly the system dialog based browsers:

- kdialog (KDE system dialog)
- zenity (another system dialog based chooser).

Note: this list may not be complete.

As far as we know these dialogs use the **first** item in the list of filter values as the initial filter presented to the user.

See also

[filter\(const char \\*f\)](#)

#### 13.87.4.10 options()

```
void Fl_Native_File_Chooser::options (
 int o)
```

Sets the platform specific chooser options to `val`.

`val` is expected to be one or more [Fl\\_Native\\_File\\_Chooser::Option](#) flags ORed together. Some platforms have OS-specific functions that can be enabled/disabled via this method.

Flag	Description	Win	Mac	Other
-----	-----	-----	-----	-----
<a href="#">NEW_FOLDER</a>	Shows the 'New Folder' button.	Ignored	Used	Used
<a href="#">PREVIEW</a>	Enables the 'Preview' mode by <a href="#">default</a> .	Ignored	Ignored	Used
<a href="#">SAVEAS_CONFIRM</a>	Confirm dialog <a href="#">if</a> <a href="#">BROWSE_SAVE_FILE</a> file exists.	Used	Used	Used
<a href="#">USE_FILTER_EXT</a>	Chooser <a href="#">filter</a> presets the output file extension.	Ignored	Used	Used (GTK)

#### 13.87.4.11 preset\_file()

```
void Fl_Native_File_Chooser::preset_file (
 const char * f)
```

Sets the default filename for the chooser.

Use [directory\(\)](#) to set the default directory. Mainly used to preset the filename for save dialogs, and on most platforms can be used for opening files as well.

#### 13.87.4.12 show()

```
int Fl_Native_File_Chooser::show ()
```

Post the chooser's dialog.

Blocks until dialog has been completed or cancelled.

Returns

- 0 – user picked a file
- 1 – user cancelled
- -1 – failed; [errmsg\(\)](#) has reason

#### 13.87.4.13 title() [1/2]

```
const char * Fl_Native_File_Chooser::title () const
```

Get the title of the file chooser's dialog window.

Return value may be NULL if no title was set.

#### 13.87.4.14 title() [2/2]

```
void Fl_Native_File_Chooser::title (
 const char * t)
```

Set the title of the file chooser's dialog window.

Can be NULL if no title desired. The default title varies according to the platform, so you are advised to set the title explicitly.

The documentation for this class was generated from the following files:

- [Fl\\_Native\\_File\\_Chooser.H](#)
- [Fl\\_Native\\_File\\_Chooser.cxx](#)

## 13.88 FI\_Nice\_Slider Class Reference

Inheritance diagram for FI\_Nice\_Slider:

### Public Member Functions

- **FI\_Nice\_Slider** (int X, int Y, int W, int H, const char \*L=0)

### Public Member Functions inherited from FI\_Slider

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- **FI\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new FI\_Slider widget using the given position, size, and label string.*
- **FI\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Slider widget using the given type, position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*
- uchar **num\_ticks** () const  
*Gets the number of tick marks.*
- **Scale\_Type scale** () const  
*Gets the scale type.*
- void **scale** (Scale\_Type s)  
*Sets the scale type.*
- int **scrollvalue** (int pos, int size, int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- **FI\_Boxtype slider** () const  
*Gets the slider box type.*
- void **slider** (FI\_Boxtype c)  
*Sets the slider box type.*
- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void **slider\_size** (double v)  
*Set the dimensions of the moving piece of slider.*
- uchar **ticks** () const  
*Gets the tick mark position.*
- void **ticks** (uchar t, uchar num\_ticks=11)  
*Sets the tick mark position for FI\_Nice\_Slider.*

## Public Member Functions inherited from FI\_Valuator

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for FI\_Valuator::format(char\* buffer).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double FI\_Valuator::step() const*
- void **step** (double s)  
*See double FI\_Valuator::step() const.*
- void **step** (int a)  
*See double FI\_Valuator::step() const*
- double **value** () const  
*Gets the floating point(double) value.*

- virtual [Fl\\_Window](#) const \* as\_window () const
- void bind\_deimage ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void bind\_deimage (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void bind\_image ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void bind\_image (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype](#) box () const  
*Gets the box type of the widget.*
- void box ([Fl\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [Fl\\_Callback\\_p](#) callback () const  
*Gets the current callback function for the widget.*
- void callback ([Fl\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void callback ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void callback ([Fl\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void callback ([Fl\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void callback ([Fl\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int changed () const  
*Checks if the widget value changed since the last callback.*
- void clear\_active ()  
*Marks the widget as inactive without sending events or changing focus.*
- void clear\_changed ()  
*Marks the value of the widget as unchanged.*
- void clear\_damage (uchar c=0)  
*Clears or sets the damage flags.*
- void clear\_output ()

- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()
- Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

  - [FL\\_Color](#) [color](#) () const
- Gets the background color of the widget.*

  - void [color](#) ([FL\\_Color](#) bg)
- Sets the background color of the widget.*

  - void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)
- Sets the background and selection color of the widget.*

  - int [contains](#) (const [FL\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*

  - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*

  - void [deactivate](#) ()
- Deactivates the widget.*

  - [FL\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const [FL\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

  - void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

  - void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int [h](#) () const
- Gets the widget height.*

  - virtual void [hide](#) ()
- Makes a widget invisible.*

  - int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*

- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const

- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [FI\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*
- void [set\\_visible](#) ()

*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

*Makes a widget visible.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*

- void **type** (uchar t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- FI\_When **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- FI\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~FI\_Widget ()  
*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from FI\_Slider

- enum **Scale\_Type** : uchar { **LINEAR\_SCALE** = 0 , **LOG\_SCALE** }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*
- enum **Tick\_Position** : uchar {  
**TICKS\_NONE** = 0x00 , **TICKS\_BELOW** = 0x01 , **TICKS\_ABOVE** = 0x02 , **TICKS\_LEFT** = 0x01 ,  
**TICKS\_RIGHT** = 0x02 }  
*Bitset for tick mark positions for FI\_Nice\_Slider.*

## Static Public Member Functions inherited from FI\_Widget

- static void `default_callback` (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from FI\_Widget

- enum {  
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,  
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7  
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11  
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15  
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`  
= 1<<19 ,  
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,  
`AUTO_DELETE_USER_DATA` = 1<<23 ,  
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,  
`USERFLAG1` = 1<<31 }  
*flags possible values enumeration.*

## Protected Member Functions inherited from FI\_Slider

- void `draw` () override  
*Draws the widget.*
- void `draw` (int, int, int, int)
- void `draw_ticks` (const FI\_Rect &r, int S)  
*Draw tick marks.*
- int `handle` (int, int, int, int, int)
- double `increment_lin_log` (double v, int n, int range)  
*Adds a sensible step value to the passed value.*
- double `position_to_value` (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double `value_to_position` (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from FI\_Valuator

- FI\_Valuator (int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Valuator widget using the given position, size, and label string.*
- void `handle_drag` (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void `handle_push` ()  
*Stores the current value in the previous value.*
- void `handle_release` ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int `horizontal` () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*

- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value\_damage** ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from **FI\_Widget**

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FI\_Boxtype t, FI\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **FI\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

The documentation for this class was generated from the following files:

- FI\_Nice\_Slider.H
- FI\_Slider.cxx

## 13.89 Fl\_Output Class Reference

This widget displays a piece of text.

```
#include <Fl_Output.H>
```

Inheritance diagram for Fl\_Output:

### Public Member Functions

- [Fl\\_Output](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Output](#) widget using the given position, size, and label string.*

### Public Member Functions inherited from [Fl\\_Input](#)

- [Fl\\_Input](#) (int, int, int, int, const char \*l=0)  
*Creates a new [Fl\\_Input](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

### Public Member Functions inherited from [Fl\\_Input\\_](#)

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool [can\\_redo](#) () const  
*Check if there is a redo action available.*
- bool [can\\_undo](#) () const  
*Check if the last operation can be undone.*
- int [copy](#) (int clipboard)  
*Put the current selection into the clipboard.*
- int [copy\\_cuts](#) ()  
*Copies the yank buffer to the clipboard.*
- [Fl\\_Color](#) [cursor\\_color](#) () const  
*Gets the color of the cursor.*
- void [cursor\\_color](#) ([Fl\\_Color](#) n)  
*Sets the color of the cursor.*
- int [cut](#) ()  
*Deletes the current selection.*
- int [cut](#) (int a, int b)  
*Deletes all characters between index a and b.*
- int [cut](#) (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double [dvalue](#) () const

- Returns the widget text interpreted as a floating point number.*

  - `Fl_Input_` (int, int, int, int, const char \* = 0)

*Creates a new `Fl_Input_` widget.*
- unsigned int `index` (int i) const

*Returns the character at index `i`.*
- int `input_type` () const

*Gets the input field type.*
- void `input_type` (int t)

*Sets the input field type.*
- int `insert` (const char \*t, int l = 0)

*Inserts text at the cursor position.*
- int `insert_position` () const

*Gets the position of the text cursor.*
- int `insert_position` (int p)

*Sets the cursor position and mark.*
- int `insert_position` (int p, int m)

*Sets the index for the cursor and mark.*
- int `ivalue` () const

*Returns the widget text interpreted as a signed integer.*
- int `mark` () const

*Gets the current selection mark.*
- int `mark` (int m)

*Sets the current selection mark.*
- int `maximum_size` () const

*Gets the maximum length of the input field in characters.*
- void `maximum_size` (int m)

*Sets the maximum length of the input field in characters.*
- const char \* `placeholder` () const

*Get the placeholder text.*
- void `placeholder` (const char \*text)

*Set the placeholder text.*
- int `position` () const
- int `position` (int p)
- int `position` (int p, int m)
- int `readonly` () const

*Gets the read-only state of the input field.*
- void `readonly` (int b)

*Sets the read-only state of the input field.*
- int `redo` ()

*Redo previous undo operation.*
- int `replace` (int b, int e, const char \*text, int llen = 0)

*Deletes text from `b` to `e` and inserts the new string `text`.*
- void `resize` (int, int, int, int) override

*Changes the size of the widget.*
- int `shortcut` () const

*Return the shortcut key associated with this widget.*
- void `shortcut` (int s)

*Sets the shortcut key associated with this widget.*
- int `size` () const

*Returns the number of bytes in `value()`.*
- void `size` (int W, int H)

- Sets the width and height of this widget.*

  - int [static\\_value](#) (const char \*)

*Changes the widget text.*

  - int [static\\_value](#) (const char \*, int)

*Changes the widget text.*

  - int [tab\\_nav](#) () const

*Gets whether the Tab key causes focus navigation in multiline input fields or not.*

  - void [tab\\_nav](#) (int val)

*Sets whether the Tab key does focus navigation, or inserts tab characters into [FI\\_Multiline\\_Input](#).*

  - [FI\\_Color](#) [textcolor](#) () const

*Gets the color of the text in the input field.*

  - void [textcolor](#) ([FI\\_Color](#) n)

*Sets the color of the text in the input field.*

  - [FI\\_Font](#) [textfont](#) () const

*Gets the font of the text in the input field.*

  - void [textfont](#) ([FI\\_Font](#) s)

*Sets the font of the text in the input field.*

  - [FI\\_Fonsize](#) [textsize](#) () const

*Gets the size of the text in the input field.*

  - void [textsize](#) ([FI\\_Fonsize](#) s)

*Sets the size of the text in the input field.*

  - int [undo](#) ()

*Undoes previous changes to the text buffer.*

  - const char \* [value](#) () const

*Returns the text displayed in the widget.*

  - int [value](#) (const char \*)

*Changes the widget text.*

  - int [value](#) (const char \*, int)

*Changes the widget text.*

  - int [value](#) (double value)

*Changes the widget text to a floating point number ("%g").*

  - int [value](#) (int value)

*Changes the widget text to a signed integer number.*

  - int [wrap](#) () const

*Gets the word wrapping state of the input field.*

  - void [wrap](#) (int b)

*Sets the word wrapping state of the input field.*

  - [~FI\\_Input\\_](#) ()

*Destroys the widget.*

### Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
  - void [\\_set\\_fullscreen](#) ()
  - void [activate](#) ()
- Activates the widget.*
- unsigned int [active](#) () const
- Returns whether the widget is active.*
- int [active\\_r](#) () const
- Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const

- Gets the label alignment.*

  - void [align](#) ([FI\\_Align](#) alignment)
- Sets the label alignment.*

  - long [argument](#) () const
- Gets the current user data (long) argument that is passed to the callback function.*

  - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

  - virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()
- Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

  - virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*

  - virtual [FI\\_Group](#) \* [as\\_group](#) ()
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Window](#) \* [as\\_window](#) ()
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [bind\\_deimage](#) ([FI\\_Image](#) \*img)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_deimage](#) (int f)
- Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) ([FI\\_Image](#) \*img)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_image](#) (int f)
- Gets the box type of the widget.*

  - [FI\\_Boxtype](#) [box](#) () const
- Sets the box type for the widget.*

  - void [box](#) ([FI\\_Boxtype](#) new\_box)
- Gets the current callback function for the widget.*

  - [FI\\_Callback\\_p](#) [callback](#) () const
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Checks if the widget value changed since the last callback.*

  - unsigned int [changed](#) () const
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_active](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_changed](#) ()
- Clears or sets the damage flags.*

  - void [clear\\_damage](#) (uchar c=0)
- Sets a widget to accept input.*

  - void [clear\\_output](#) ()
- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()

- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const
- Gets the background color of the widget.*
- void `color` (`FL_Color` bg)
- Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)
- Sets the current label.*
- void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*
- `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)
- Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const
- Gets the widget height.*
- virtual void `hide` ()
- Makes a widget invisible.*
- int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

- `FL_Image * image ()`  
*Gets the image that is used as part of the widget label when in the active state.*
- `const FL_Image * image () const`  
*Gets the image that is used as part of the widget label when in the active state.*
- `void image (FL_Image &img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void image (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`  
*Returns whether the image is managed by the widget.*
- `int inside (const FL_Widget *wgt) const`  
*Checks if this widget is a child of wgt.*
- `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`  
*Gets the current label text.*
- `void label (const char *text)`  
*Sets the current label pointer.*
- `void label (FL_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*
- `FL_Color labelcolor () const`  
*Gets the label color.*
- `void labelcolor (FL_Color c)`  
*Sets the label color.*
- `FL_Font labelfont () const`  
*Gets the font to use.*
- `void labelfont (FL_Font f)`  
*Sets the font to use.*
- `FL_Fonsize labelsiz () const`  
*Gets the font size in pixels.*
- `void labelsiz (FL_Fonsize pix)`  
*Sets the font size in pixels.*
- `FL_Labeltype labeltype () const`  
*Gets the label type.*
- `void labeltype (FL_Labeltype a)`  
*Sets the label type.*
- `void measure_label (int &ww, int &hh) const`  
*Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`  
*Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`  
*Sets whether this widget needs a keyboard.*
- `unsigned int output () const`  
*Returns if a widget is used for output only.*
- `FL_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (FL_Group *p)`

- Internal use only - "for hacks only".*

  - void **position** (int X, int Y)  
*Repositions the window or widget.*
  - void **redraw** ()  
*Schedules the drawing of the widget.*
  - void **redraw\_label** ()  
*Schedules the drawing of the label.*
  - **FI\_Color selection\_color** () const  
*Gets the selection color.*
  - void **selection\_color** (**FI\_Color** a)  
*Sets the selection color.*
  - int **send** (int event)  
*Sends the specified event to the widget.*
  - void **set\_active** ()  
*Marks the widget as active without sending events or changing focus.*
  - void **set\_changed** ()  
*Marks the value of the widget as changed.*
  - void **set\_output** ()  
*Sets a widget to output only.*
  - void **set\_visible** ()  
*Makes the widget visible.*
  - void **set\_visible\_focus** ()  
*Enables keyboard focus navigation with this widget.*
  - int **shortcut\_label** () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
  - void **shortcut\_label** (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
  - virtual void **show** ()  
*Makes a widget visible.*
  - void **size** (int W, int H)  
*Changes the size of the widget.*
  - int **take\_focus** ()  
*Gives the widget the keyboard focus.*
  - unsigned int **takeevents** () const  
*Returns if the widget is able to take events.*
  - int **test\_shortcut** ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
  - const char \* **tooltip** () const  
*Gets the current tooltip text.*
  - void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
  - **FI\_Window \* top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
  - **FI\_Window \* top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
  - **uchar type** () const  
*Gets the widget type.*
  - void **type** (**uchar** t)  
*Sets the widget type.*
  - int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- FI\_When **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- FI\_Window \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~FI\_Widget ()  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void **default\_callback** (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Static Public Attributes inherited from FI\_Input

- static const char \* **copy\_menu\_text** = "Copy"  
*[this text may be customized at run-time]*
- static const char \* **cut\_menu\_text** = "Cut"  
*[this text may be customized at run-time]*
- static const char \* **paste\_menu\_text** = "Paste"  
*[this text may be customized at run-time]*

## Protected Member Functions inherited from FI\_Input

- void `draw` () override  
*Draws the widget.*
- int `handle_key` ()  
*Handles a keystroke.*
- int `handle_rmb` ()  
*Handle right mouse button down events.*

## Protected Member Functions inherited from FI\_Input\_

- int `apply_undo` ()  
*Apply the current undo/redo operation.*
- void `drawtext` (int, int, int, int)  
*Draws the text in the passed bounding box.*
- void `drawtext` (int, int, int, int, bool draw\_active)  
*Draws the text in the passed bounding box.*
- void `handle_mouse` (int, int, int, int, int keepmark=0)  
*Handles mouse clicks and mouse moves.*
- int `handletext` (int e, int, int, int, int)  
*Handles all kinds of text field related events.*
- int `line_end` (int i) const  
*Finds the end of a line.*
- int `line_start` (int i) const  
*Finds the start of a line.*
- int `linesPerPage` ()
- void `maybe_do_callback` (FI\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
- int `up_down_position` (int, int keepmark=0)  
*Moves the cursor to the column given by up\_down\_pos.*
- int `word_end` (int i) const  
*Finds the end of a word.*
- int `word_start` (int i) const  
*Finds the start of a word.*
- int `xscroll` () const
- int `yscroll` () const
- void `yscroll` (int yOffset)

## Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.89.1 Detailed Description

This widget displays a piece of text.

When you set the [value\(\)](#) , [FI\\_Output](#) does a strcpy() to its own storage, which is useful for program-generated values. The user may select portions of the text using the mouse and paste the contents into other fields or programs.

Figure 13.34 FI\_Output

There is a single subclass, [FI\\_Multiline\\_Output](#), which allows you to display multiple lines of text. [FI\\_Multiline\\_Output](#) does not provide scroll bars. If a more complete text editing widget is needed, use [FI\\_Text\\_Display](#) instead. The text may contain any characters except `\0`, and will correctly display anything, using `^X` notation for unprintable control characters and `\nnn` notation for unprintable characters with the high bit set. It assumes the font can draw any characters in the ISO-Latin1 character set.

## 13.89.2 Constructor & Destructor Documentation

### 13.89.2.1 FI\_Output()

```
FI_Output::FI_Output (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [FI\\_Output](#) widget using the given position, size, and label string.

The default boxtype is `FL_DOWN_BOX`.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- [FI\\_Output.H](#)
- [FI\\_Input.cxx](#)

## 13.90 FI\_Overlay\_Window Class Reference

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

```
#include <FI_Overlay_Window.H>
```

Inheritance diagram for [FI\\_Overlay\\_Window](#):

### Public Member Functions

- [FL\\_Overlay\\_Window \\* as\\_overlay\\_window \(\)](#) **override**  
Return non-null if this is an [FL\\_Overlay\\_Window](#) object.
- **int can\_do\_overlay ()**  
Returns non-zero if there's hardware overlay support.
- **virtual void draw\_overlay ()=0**  
You must subclass [FL\\_Overlay\\_Window](#) and provide this method.
- **void flush ()** **override**  
Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).
- **void hide ()** **override**  
Makes a widget invisible.
- **void redraw\_overlay ()**  
Call this to indicate that the overlay data has changed and needs to be redrawn.
- **void resize (int, int, int, int)** **override**  
Changes the size or position of the widget.
- **void show ()** **override**  
Makes a widget visible.
- **void show (int a, char \*\*b)**  
Same as [FL\\_Window::show\(int a, char \\*\\*b\)](#)
- **~FL\_Overlay\_Window ()**  
Destroys the window and all child widgets.

### Public Member Functions inherited from [FL\\_Double\\_Window](#)

- [FL\\_Double\\_Window \\* as\\_double\\_window \(\)](#) **override**  
Return non-null if this is an [FL\\_Double\\_Window](#) object.
- **FL\_Double\_Window (int W, int H, const char \*l=0)**  
Creates a new [FL\\_Double\\_Window](#) widget using the given position, size, and label (title) string.
- **FL\_Double\_Window (int X, int Y, int W, int H, const char \*l=0)**  
See [FL\\_Double\\_Window::FL\\_Double\\_Window\(int w, int h, const char \\*label = 0\)](#)
- **void show (int a, char \*\*b)**  
Same as [FL\\_Window::show\(int a, char \\*\\*b\)](#)
- [~FL\\_Double\\_Window \(\)](#)  
The destructor also deletes all the children.

## Public Member Functions inherited from FI\_Window

- void [allow\\_expand\\_outside\\_parent](#) ()  
*Allow this subwindow to expand outside the area of its parent window.*
- [FI\\_Window](#) const \* [as\\_window](#) () const [override](#)
- [FI\\_Window](#) \* [as\\_window](#) () [override](#)  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- unsigned int **border** () const  
*Returns whether the window possesses a border.*
- void [border](#) (int b)  
*Sets whether or not the window manager border is around the window.*
- void [clear\\_border](#) ()  
*Fast inline function to turn the window manager border off.*
- void [clear\\_modal\\_states](#) ()  
*Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*
- void **copy\_label** (const char \*a)  
*Sets the window titlebar label to a copy of a character string.*
- void [cursor](#) (const [FI\\_RGB\\_Image](#) \*, int, int)  
*Changes the cursor for this window using the provided image as cursor's shape.*
- void [cursor](#) ([FI\\_Cursor](#) c, [FI\\_Color](#), [FI\\_Color](#)=[FL\\_WHITE](#))  
*For back compatibility only.*
- void [cursor](#) ([FI\\_Cursor](#))  
*Changes the cursor for this window.*
- int [decorated\\_h](#) () const  
*Returns the window height including any window title bar and any frame added by the window manager.*
- int [decorated\\_w](#) () const  
*Returns the window width including any frame added by the window manager.*
- void [default\\_cursor](#) ([FI\\_Cursor](#) c, [FI\\_Color](#), [FI\\_Color](#)=[FL\\_WHITE](#))  
*For back compatibility only.*
- void [default\\_cursor](#) ([FI\\_Cursor](#))  
*Sets the default window cursor.*
- void **draw\_backdrop** ()  
*Draw the background image if one is set and is aligned inside.*
- [FI\\_Window](#) (int w, int h, const char \*title=0)  
*Creates a window from the given width w, height h, and title.*
- [FI\\_Window](#) (int x, int y, int w, int h, const char \*title=0)  
*Creates a window from the given position (x, y), size (w, h) and title.*
- void [free\\_position](#) ()  
*Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.*
- void [fullscreen](#) ()  
*Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int **fullscreen\_active** () const  
*Returns non zero if FULLSCREEN flag is set, 0 otherwise.*
- void **fullscreen\_off** ()  
*Turns off any side effects of [fullscreen\(\)](#)*
- void **fullscreen\_off** (int X, int Y, int W, int H)  
*Turns off any side effects of [fullscreen\(\)](#) and does [resize\(X,Y,W,H\)](#).*
- void [fullscreen\\_screens](#) (int top, int bottom, int left, int right)  
*Sets which screens should be used when this window is in fullscreen mode.*
- [uchar](#) [get\\_size\\_range](#) (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL) const

- Gets the allowable range to which the user can resize this window.*

  - int **handle** (int) **override**

*Handles the specified event.*
- void **hide** () **override**

*Removes the window from the screen.*
- void **hotspot** (const **FL\_Widget** &p, int offscreen=0)

*See void **FL\_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (const **FL\_Widget** \*, int offscreen=0)

*See void **FL\_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (int x, int y, int offscreen=0)

*Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*
- const void \* **icon** () const

*Gets the current icon window target dependent data.*
- void **icon** (const **FL\_RGB\_Image** \*)

*Sets or resets a single window icon.*
- void **icon** (const void \*ic)

*Platform-specific method to set the window icon usable on Windows and X11 only.*
- void **iconize** ()

*Iconifies the window.*
- const char \* **iconlabel** () const

*See void **FL\_Window::iconlabel**(const char\*)*
- void **iconlabel** (const char \*)

*Sets the icon label.*
- void **icons** (const **FL\_RGB\_Image** \*[], int)

*Sets the window icons.*
- void **icons** (HICON big\_icon, HICON small\_icon)

*Sets the window icons using HICON handles (Windows platform only).*
- const char \* **label** () const

*See void **FL\_Window::label**(const char\*)*
- void **label** (const char \*)

*Sets the window title bar label.*
- void **label** (const char \*label, const char \***iconlabel**)

*Sets the icon label.*
- void **make\_current** ()

*Sets things up so that the drawing functions in <**FL/fl\_draw.H**> will go into this window.*
- void **maximize** ()

*Maximizes a top-level window to its current screen.*
- unsigned int **maximize\_active** () const

*Returns whether the window is currently maximized.*
- unsigned int **menu\_window** () const

*Returns true if this window is a menu window.*
- unsigned int **modal** () const

*Returns true if this window is modal.*
- unsigned int **non\_modal** () const

*Returns true if this window is modal or non-modal.*
- **fl\_uintptr\_t** **os\_id** () const

*Returns a platform-specific identification of a shown window, or 0 if not shown.*
- unsigned int **override** () const

- Returns non zero if OVERRIDE flag is set, 0 otherwise.*

  - void [resize](#) (int X, int Y, int W, int H) [override](#)

*Changes the size and position of the window.*
- int [screen\\_num](#) () const

*The number of the screen containing the mapped window.*
- void [screen\\_num](#) (int screen\_num)

*Set the number of the screen where to map the window.*
- void [set\\_menu\\_window](#) ()

*Marks the window as a menu window.*
- void [set\\_modal](#) ()

*A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void [set\\_non\\_modal](#) ()

*A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.*
- void [set\\_override](#) ()

*Activates the flags NOBORDER|OVERRIDE.*
- void [set\\_tooltip\\_window](#) ()

*Marks the window as a tooltip window.*
- const [FI\\_Image](#) \* [shape](#) () const

*Returns the image controlling the window shape or NULL.*
- void [shape](#) (const [FI\\_Image](#) &b)

*Set the window's shape with an [FI\\_Image](#).*
- void [shape](#) (const [FI\\_Image](#) \*img)

*Assigns a non-rectangular shape to the window.*
- void [show](#) () [override](#)

*Puts the window on the screen.*
- void [show](#) (int argc, char \*\*argv)

*Puts the window on the screen with [show\(\)](#) and parses command-line arguments.*
- int [shown](#) () const

*Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).*
- void [size\\_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)

*Sets the allowable range to which the user can resize this window.*
- unsigned int [tooltip\\_window](#) () const

*Returns true if this window is a tooltip window.*
- void [un\\_maximize](#) ()

*Returns a previously maximized top-level window to its previous size.*
- void [wait\\_for\\_expose](#) ()

*Waits for the window to be displayed after calling [show\(\)](#).*
- int [x\\_root](#) () const

*Gets the x position of the window on the screen.*
- const char \* [xclass](#) () const

*Returns the xclass for this window, or a default.*
- void [xclass](#) (const char \*c)

*Sets the xclass for this window.*
- int [y\\_root](#) () const

*Gets the y position of the window on the screen.*
- virtual [~FI\\_Window](#) ()

*The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* [array](#) () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* [as\\_group](#) () const override
- [FL\\_Group](#) \* [as\\_group](#) () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*

- `FI_Widget * resizable () const`  
*Returns the group's resizable widget.*
- `void resizable (FI_Widget &o)`  
*Sets the group's resizable widget.*
- `void resizable (FI_Widget *o)`  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- `virtual ~FI_Group ()`  
*The destructor also deletes all the children.*

## Public Member Functions inherited from FI\_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
*Activates the widget.*
- `unsigned int active () const`  
*Returns whether the widget is active.*
- `int active_r () const`  
*Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`  
*Gets the label alignment.*
- `void align (FI_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_GL_Window * as_gl_window ()`  
*Returns an FI\_GL\_Window pointer if this widget is an FI\_GL\_Window.*
- `virtual class FI_GL_Window const * as_gl_window () const`
- `void bind_deimage (FI_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FI_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FI_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (FI_Boxtype new_box)`  
*Sets the box type for the widget.*
- `FI_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (FI_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*
- `void callback (FI_Callback *cb, void *p)`  
*Sets the current callback function and data for the widget.*
- `void callback (FI_Callback0 *cb)`

- Sets the current callback function for the widget.*

  - void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

*Sets a widget to accept input.*
- void [clear\\_visible](#) ()

*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) [color](#) () const

*Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)

*Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)

*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const

*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*
- void [deactivate](#) ()

*Deactivates the widget.*
- [FL\\_Image](#) \* [deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with default arguments.*

- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const `FL_Image` \* `image` () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const  
*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FL_Color` c)  
*Sets the label color.*
- `FL_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FL_Font` f)  
*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)  
*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const  
*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)

- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const

*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const

*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*
- void [set\\_visible](#) ()

*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*

- [FI\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [FI\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)  
*Sets the flags used to decide when a callback is called.*
- [FI\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual ~[FI\\_Widget](#) ()  
*Destroys the widget.*

### Protected Member Functions

- [FI\\_Overlay\\_Window](#) (int W, int H, const char \*l=0)  
*See [FI\\_Overlay\\_Window::FI\\_Overlay\\_Window](#)(int X, int Y, int W, int H, const char \*l=0)*
- [FI\\_Overlay\\_Window](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [FI\\_Overlay\\_Window](#) widget using the given position, size, and label (title) string.*

## Protected Member Functions inherited from [FI\\_Window](#)

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [override](#)  
*Draws the widget.*
- int [force\\_position](#) () const  
*Returns the internal state of the window's `FORCE_POSITION` flag.*
- void [force\\_position](#) (int force)  
*Sets an internal flag that tells FLTK and the window manager to honor position requests.*
- void [free\\_icons](#) ()  
*Deletes all icons previously attached to the window.*
- int [is\\_resizable](#) ()  
*Protected method to determine whether a window is resizable.*

## Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([FI\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*

- void `draw_focus` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` bg) const  
*Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int v)  
*Internal use only.*
- void `set_flag` (unsigned int c)  
*Sets a flag in the flags mask.*
- void `w` (int v)  
*Internal use only.*
- void `x` (int v)  
*Internal use only.*
- void `y` (int v)  
*Internal use only.*

#### Additional Inherited Members

#### Public Types inherited from `FI_Window`

- typedef struct HICON\_\_ \* `HICON`

#### Static Public Member Functions inherited from `FI_Window`

- static `FI_Window` \* `current` ()  
*Returns the last window that was made current.*
- static void `default_callback` (`FI_Window` \*, void \*v)  
*Back compatibility: Sets the default callback v for win to call on close event.*
- static void `default_icon` (const `FI_RGB_Image` \*)  
*Sets a single default window icon.*
- static void `default_icons` (const `FI_RGB_Image` \*[], int)  
*Sets the default window icons.*
- static void `default_icons` (HICON big\_icon, HICON small\_icon)  
*Sets the default window icons (Windows platform only).*
- static const char \* `default_xclass` ()  
*Returns the default xclass.*
- static void `default_xclass` (const char \*)  
*Sets the default window xclass.*
- static bool `is_a_rescale` ()  
*Returns true when a window is being rescaled.*
- static char `show_next_window_iconic` ()  
*Returns the static flag whether the next window should be opened iconified.*
- static void `show_next_window_iconic` (char stat)  
*Sets a static flag whether the next window should be opened iconified.*

## Static Public Member Functions inherited from [Fl\\_Group](#)

- static [Fl\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*
- static void [current](#) ([Fl\\_Group](#) \*g)  
*Sets the current group.*

## Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Static Protected Attributes inherited from [Fl\\_Window](#)

- static [Fl\\_Window](#) \* [current\\_](#)  
*Stores the last window that was made current.*

### 13.90.1 Detailed Description

This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image.

The overlay is designed to be a rapidly-changing but simple graphic such as a mouse selection box. [Fl\\_Overlay\\_Window](#) uses the overlay planes provided by your graphics hardware if they are available.

If no hardware support is found the overlay is simulated by drawing directly into the on-screen copy of the double-buffered window, and "erased" by copying the backbuffer over it again. This means the overlay will blink if you change the image in the window.

### 13.90.2 Constructor & Destructor Documentation

#### 13.90.2.1 [Fl\\_Overlay\\_Window](#)()

```
Fl_Overlay_Window::Fl_Overlay_Window (
 int X,
 int Y,
 int W,
```

```
int H,
const char * l = 0) [protected]
```

Creates a new [Fl\\_Overlay\\_Window](#) widget using the given position, size, and label (title) string.  
If the positions (x,y) are not given, then the window manager will choose them.

### 13.90.3 Member Function Documentation

#### 13.90.3.1 as\_overlay\_window()

```
Fl_Overlay_Window * Fl_Overlay_Window::as_overlay_window () [inline], [override], [virtual]
```

Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.

Reimplemented from [Fl\\_Window](#).

#### 13.90.3.2 draw\_overlay()

```
virtual void Fl_Overlay_Window::draw_overlay () [pure virtual]
```

You must subclass [Fl\\_Overlay\\_Window](#) and provide this method.

It is just like a [draw\(\)](#) method, except it draws the overlay. The overlay will have already been "cleared" when this is called. You can use any of the routines described in [<FL/fl\\_draw.H>](#).

#### 13.90.3.3 flush()

```
void Fl_Overlay_Window::flush () [override], [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl\\_Double\\_Window](#).

#### 13.90.3.4 hide()

```
void Fl_Overlay_Window::hide () [override], [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

#### 13.90.3.5 redraw\_overlay()

```
void Fl_Overlay_Window::redraw_overlay ()
```

Call this to indicate that the overlay data has changed and needs to be redrawn.

The overlay will be clear until the first time this is called, so if you want an initial display you must call this after calling [show\(\)](#).

#### 13.90.3.6 resize()

```
void Fl_Overlay_Window::resize (
 int x,
 int y,
 int w,
 int h) [override], [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and size(W, H) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

## Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

## See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

**13.90.3.7 show()**

```
void Fl_Overlay_Window::show () [override], [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL\_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL\_SHOW or FL\_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL\_SHOW or FL\_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

## See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Double\\_Window](#).

The documentation for this class was generated from the following files:

- Fl\_Overlay\_Window.H
- Fl\_Overlay\_Window.cxx

**13.91 Fl\_Pack Class Reference**

This widget was designed to add the functionality of compressing and aligning widgets.

```
#include <Fl_Pack.H>
```

Inheritance diagram for Fl\_Pack:

**Public Types**

- enum { **VERTICAL** = 0 , **HORIZONTAL** = 1 }

**Public Member Functions**

- void [clear](#) ()  
*Deletes all child widgets with [Fl\\_Group::clear\(\)](#).*
- [Fl\\_Pack](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Pack](#) widget using the given position, size, and label string.*
- [uchar horizontal](#) () const

- Returns non-zero if [FL\\_Pack](#) alignment is horizontal.
- void [resize](#) (int X, int Y, int W, int H) override  
Override [FL\\_Group](#) resize behavior.
- int [spacing](#) () const  
Gets the number of extra pixels of blank space that are added between the children.
- void [spacing](#) (int i)  
Sets the number of extra pixels of blank space that are added between the children.

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*& [\\_ddfdesign\\_kludge](#) ()  
This is for forms compatibility only.
- void [add](#) ([FL\\_Widget](#) &)  
The widget is removed from its current group (if any) and then added to the end of this group.
- void [add](#) ([FL\\_Widget](#) \*o)  
See void [FL\\_Group::add\(FL\\_Widget &w\)](#)
- void [add\\_resizable](#) ([FL\\_Widget](#) &o)  
Adds a widget to the group and makes it the resizable widget.
- [FL\\_Widget](#) \*const \* [array](#) () const  
Returns a pointer to the internal array of children.
- [FL\\_Group](#) const \* [as\\_group](#) () const override
- [FL\\_Group](#) \* [as\\_group](#) () override  
Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).
- void [begin](#) ()  
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL\\_Widget](#) \* [child](#) (int n) const  
Returns the n'th child.
- int [children](#) () const  
Returns how many child widgets the group has.
- void [clear](#) ()  
Deletes all child widgets from memory recursively.
- unsigned int [clip\\_children](#) () const  
Returns the current clipping mode.
- void [clip\\_children](#) (int c)  
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int [delete\\_child](#) (int n)  
Removes the widget at *index* from the group and deletes it.
- void [end](#) ()  
Exactly the same as `current(this->parent())`.
- int [find](#) (const [FL\\_Widget](#) &o) const  
See int [FL\\_Group::find\(const FL\\_Widget \\*w\) const](#).
- int [find](#) (const [FL\\_Widget](#) \*) const  
Searches the children for the widget and returns the index.
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
Creates a new [FL\\_Group](#) widget using the given position, size, and label string.
- void [forms\\_end](#) ()  
This is for forms compatibility only.
- int [handle](#) (int) override  
Handles the specified event.
- void [init\\_sizes](#) ()  
Resets the internal array of widget sizes and positions.

- void `insert` (`FL_Widget` &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)  
*This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)  
*Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)  
*Removes the widget o from the group.*
- void `remove` (int index)  
*Removes the widget at index from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const  
*Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)  
*Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual `~FL_Group` ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()  
*Activates the widget.*
- unsigned int `active` () const  
*Returns whether the widget is active.*
- int `active_r` () const  
*Returns whether the widget and all of its parents are active.*
- `FL_Align` `align` () const  
*Gets the label alignment.*
- void `align` (`FL_Align` alignment)  
*Sets the label alignment.*
- long `argument` () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void `argument` (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `FL_Gl_Window` \* `as_gl_window` ()  
*Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.*
- virtual class `FL_Gl_Window` const \* `as_gl_window` () const
- virtual `FL_Window` \* `as_window` ()  
*Returns an `FL_Window` pointer if this widget is an `FL_Window`.*
- virtual `FL_Window` const \* `as_window` () const
- void `bind_deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `bind_deimage` (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void `bind_image` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void `bind_image` (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

- [FI\\_Boxtype box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()

- Deactivates the widget.*

  - `FL_Image * deimage ()`  
*Gets the image that is used as part of the widget label when in the inactive state.*
  - `const FL_Image * deimage () const`  
*Gets the image that is used as part of the widget label when in the inactive state.*
  - `void deimage (FL_Image &img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
  - `void deimage (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
  - `int deimage_bound () const`  
*Returns whether the inactive image is managed by the widget.*
  - `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with default arguments.*
  - `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with arbitrary arguments.*
  - `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with arbitrary arguments.*
  - `void draw_label (int, int, int, int, FL_Align) const`  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
  - `int h () const`  
*Gets the widget height.*
  - `virtual void hide ()`  
*Makes a widget invisible.*
  - `int horizontal_label_margin ()`  
*Get the spacing between the label and the horizontal edge of the widget.*
  - `void horizontal_label_margin (int px)`  
*Set the spacing between the label and the horizontal edge of the widget.*
  - `FL_Image * image ()`  
*Gets the image that is used as part of the widget label when in the active state.*
  - `const FL_Image * image () const`  
*Gets the image that is used as part of the widget label when in the active state.*
  - `void image (FL_Image &img)`  
*Sets the image to use as part of the widget label when in the active state.*
  - `void image (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
  - `int image_bound () const`  
*Returns whether the image is managed by the widget.*
  - `int inside (const FL_Widget *wgt) const`  
*Checks if this widget is a child of wgt.*
  - `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
  - `const char * label () const`  
*Gets the current label text.*
  - `void label (const char *text)`  
*Sets the current label pointer.*
  - `void label (FL_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
  - `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
  - `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*

- [FL\\_Color labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize labelsiz](#)e () const  
*Gets the font size in pixels.*
- void [labelsiz](#)e ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group \\* parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [FL\\_Color selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

*Makes a widget visible.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

*Sets the flags used to decide when a callback is called.*

- [FL\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~FL\\_Widget](#) ()  
*Destroys the widget.*

### Protected Member Functions

- void [draw](#) () override  
*Draws the widget.*
- void [draw\\_filler](#) (const [FL\\_Rect](#) &rect)  
*Draw a rectangular area as a background filler.*

### Protected Member Functions inherited from [FL\\_Group](#)

- [FL\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([FL\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FL\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int [on\\_insert](#) ([FL\\_Widget](#) \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int [on\\_move](#) (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void [on\\_remove](#) (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FL\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [FL\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FL\\_Boxtype](#) t, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int X, int Y, int W, int H) const

- Draws a focus rectangle around the widget.*
- void `draw_focus` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` bg) const  
*Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int v)  
*Internal use only.*
- void `set_flag` (unsigned int c)  
*Sets a flag in the flags mask.*
- void `w` (int v)  
*Internal use only.*
- void `x` (int v)  
*Internal use only.*
- void `y` (int v)  
*Internal use only.*

#### Additional Inherited Members

#### Static Public Member Functions inherited from `FI_Group`

- static `FI_Group` \* `current` ()  
*Returns the currently active group.*
- static void `current` (`FI_Group` \*g)  
*Sets the current group.*

#### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

#### Protected Types inherited from `FI_Widget`

### 13.91.1 Detailed Description

This widget was designed to add the functionality of compressing and aligning widgets.

If `type()` is `FI_Pack::HORIZONTAL` all the children are resized to the height of the `FI_Pack`, and are moved next to each other horizontally. If `type()` is not `FI_Pack::HORIZONTAL` then the children are resized to the width and are stacked below each other. Then the `FI_Pack` resizes itself to surround the child widgets.

You may want to put the `FI_Pack` inside an `FI_Scroll`.

The '`resizable()`' for `FI_Pack` is set to `NULL` by default. Its behavior is slightly different than in a normal `FI_Group` widget: only if the `resizable()` widget is the last widget in the group it is extended to take the full available width or height, respectively, of the `FI_Pack` group.

#### Note

`FI_Pack` is optimized to use a frame-only (`..._FRAME`) box type. Box types with background graphics (`..._BOX`) generally work, but can be slower with a large number of children. Not all box types work well with `FI_Pack`. Avoid irregular graphics like `FL_DIAMOND_BOX` and background images.

You can nest `FI_Pack` widgets or put them inside `FI_Scroll` widgets or inside other group widgets but their behavior can sometimes be "surprising". This is partly due to the fact that `FI_Pack` widgets resize themselves during their `draw()` operation, trying to react on their child widgets resizing themselves during **their** `draw()` operations which can be confusing. If you want to achieve special resize behavior of nested group widgets it can sometimes be easier to derive your own specialized group widget than to try to make nested `FI_Pack` widgets behave as expected.

#### See also

[FI\\_Group::resizable\(\)](#)

### 13.91.2 Constructor & Destructor Documentation

#### 13.91.2.1 FI\_Pack()

```
FI_Pack::FI_Pack (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `FI_Pack` widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`.

The default `type()` is `FI_Pack::VERTICAL`.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `FI_Pack` and all of its children can be automatic (local) variables, but you must declare the `FI_Pack` *first*, so that it is destroyed last.

#### Parameters

in	<i>X,Y</i>	X and Y coordinates (position)
in	<i>W,H</i>	width and height, respectively
in	<i>L</i>	label (optional)

### 13.91.3 Member Function Documentation

#### 13.91.3.1 clear()

```
void FI_Pack::clear () [inline]
```

Deletes all child widgets with `FI_Group::clear()`.

And sets to NULL the [resizable\(\)](#) widget.

### 13.91.3.2 draw()

```
void Fl_Pack::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

### 13.91.3.3 draw\_filler\_()

```
void Fl_Pack::draw_filler_ (
 const Fl_Rect & rect) [protected]
```

Draw a rectangular area as a background filler.

If the box type has a background (is not a frame), this will clip to the rectangular area and draw the box. Otherwise, it will draw a rectangle in widget color.

#### Parameters

in	<i>rect</i>	fill this rectangle inside the widget bounds
----	-------------	----------------------------------------------

### 13.91.3.4 horizontal()

```
uchar Fl_Pack::horizontal () const [inline]
```

Returns non-zero if [Fl\\_Pack](#) alignment is horizontal.

#### Returns

non-zero if [Fl\\_Pack](#) alignment is horizontal ([Fl\\_Pack::HORIZONTAL](#))

#### Note

Currently the return value is the same as [Fl\\_Group::type\(\)](#), but this may change in the future. Do not set any other values than the following with [Fl\\_Pack::type\(\)](#):

- [Fl\\_Pack::VERTICAL](#) (Default)
- [Fl\\_Pack::HORIZONTAL](#)

See class [Fl\\_Pack](#) documentation for details.

### 13.91.3.5 resize()

```
void Fl_Pack::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Override [Fl\\_Group](#) resize behavior.

Resizing an [Fl\\_Pack](#) will not resize any of its children, but trigger a redraw, which in turn recalculates the dimensions of all children.

#### Parameters

in	<i>X,Y,W,H</i>	new position and size of the <a href="#">Fl_Pack</a> widget
----	----------------	-------------------------------------------------------------

Reimplemented from [Fl\\_Group](#).

The documentation for this class was generated from the following files:

- [Fl\\_Pack.H](#)
- [Fl\\_Pack.cxx](#)

## 13.92 Fl\_Paged\_Device Class Reference

Represents page-structured drawing surfaces.

```
#include <Fl_Paged_Device.H>
```

Inheritance diagram for Fl\_Paged\_Device:

### Classes

- struct [page\\_format](#)  
*width, height and name of a page format*

### Public Types

- enum [Page\\_Format](#) {  
[A0](#) = 0 , [A1](#) , [A2](#) , [A3](#) ,  
[A4](#) , [A5](#) , [A6](#) , [A7](#) ,

*The current drawing surface.*

**Protected Attributes inherited from FI\_Widget\_Surface**

- int **x\_offset**  
*horizontal offset to the origin of graphics coordinates*
- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

**13.92.1 Detailed Description**

Represents page-structured drawing surfaces.

This class has no public constructor: don't instantiate it; use [FI\\_Printer](#) or [FI\\_PostScript\\_File\\_Device](#) instead.

**13.92.2 Member Enumeration Documentation****13.92.2.1 Page\_Format**

```
enum FI_Paged_Device::Page_Format
```

Possible page formats.

All paper formats with pre-defined width and height. The [FI\\_Paged\\_Device::page\\_formats](#) array gives these widths and heights.

**Enumerator**

A0	A0 format.
A1	A1 format.
A2	A2 format.
A3	A3 format.

## Enumerator

A4	A4 format.
A5	A5 format.
A6	A6 format.
A7	A7 format.
A8	A8 format.
A9	A9 format.
B0	B0 format.
B1	B1 format.
B2	B2 format.
B3	B3 format.
B4	B4 format.
B5	B5 format.
B6	B6 format.
B7	B7 format.
B8	B8 format.
B9	B9 format.
B10	B10 format.
EXECUTIVE	Executive format.
FOLIO	Folio format.
LEDGER	Ledger format.
LEGAL	Legal format.
LETTER	Letter format.
TABLOID	Tabloid format.

**13.92.2.2 Page\_Layout**

enum `Fl_Paged_Device::Page_Layout`

Possible page layouts.

## Enumerator

PORTRAIT	Portrait orientation.
LANDSCAPE	Landscape orientation.
REVERSED	Reversed orientation.
ORIENTATION	orientation

**13.92.3 Member Function Documentation****13.92.3.1 begin\_job()**

```
int Fl_Paged_Device::begin_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [virtual]
```

Begins a print job.

## Parameters

in	<i>pagecount</i>	the total number of pages of the job (or 0 if you don't know the number of pages)
out	<i>frompage</i>	if non-null, *frompage is set to the first page the user wants printed

## Parameters

out	<i>topage</i>	if non-null, *topage is set to the last page the user wants printed
out	<i>perr_message</i>	if non-null and if the returned value is 2, *perr_message is set to a string describing the error. That string can be deleted after use.

## Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented in [Fl\\_PostScript\\_File\\_Device](#), [Fl\\_Printer](#), and [Fl\\_PDF\\_File\\_Surface](#).

**13.92.3.2 begin\_page()**

```
int Fl_Paged_Device::begin_page (
 void) [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

## Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

## Returns

0 if OK, non-zero if any error

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

**13.92.3.3 end\_job()**

```
void Fl_Paged_Device::end_job (
 void) [virtual]
```

To be called at the end of a print job.

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

**13.92.3.4 end\_page()**

```
int Fl_Paged_Device::end_page (
 void) [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

## Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

## Returns

0 if OK, non-zero if any error.

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 13.92.3.5 margins()

```
void Fl_Paged_Device::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

#### Parameters

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 13.92.3.6 rotate()

```
void Fl_Paged_Device::rotate (
 float angle) [virtual]
```

Rotates the graphics operations relatively to paper. The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

#### Parameters

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 13.92.3.7 scale()

```
void Fl_Paged_Device::scale (
 float scale_x,
 float scale_y = 0.) [virtual]
```

Changes the scaling of page coordinates. This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

#### Parameters

<i>scale_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code>

Reimplemented in [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 13.92.3.8 start\_job()

```
int Fl_Paged_Device::start_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [inline]
```

Synonym of [begin\\_job\(int pagecount, int \\*frompage, int \\*topage, char \\*\\*perr\\_message\)](#).  
For API compatibility with FLTK 1.3.x

### 13.92.3.9 start\_page()

```
int Fl_Paged_Device::start_page () [inline]
```

Synonym of [begin\\_page\(\)](#).

For API compatibility with FLTK 1.3.x

The documentation for this class was generated from the following files:

- [Fl\\_Paged\\_Device.H](#)
- [Fl\\_Paged\\_Device.cxx](#)

## 13.93 FI\_PDF\_File\_Surface Class Reference

To send graphical output to a PDF file.

```
#include <Fl_PDF_File_Surface.H>
```

Inheritance diagram for Fl\_PDF\_File\_Surface:

### Public Member Functions

- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

### 13.93.1 Detailed Description

To send graphical output to a PDF file.

Class `Fl_PDF_File_Surface` is used exactly as the `Fl_Printer` class except for its 2 member functions `begin_job()` and `begin_document()`.

**Platform notes:**

- Windows: requires "Microsoft Print to PDF" available in Windows 10 and later.
- Wayland/X11: requires the FLTK library was built with `FLTK_USE_PANGO=1`.
- macOS: requires macOS 10.9 or later.

If the running platform doesn't fulfill the requirement above, the program runs but doesn't output any PDF.

### 13.93.2 Member Function Documentation

#### 13.93.2.1 `begin_document()`

```
int Fl_PDF_File_Surface::begin_document (
 const char * pathname,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT,
 char ** perr = NULL)
```

Prepare to draw to a PDF document identified by its pathname.

**Parameters**

<i>pathname</i>	Path name for the PDF document
<i>format</i>	The paper format for the PDF document
<i>layout</i>	The orientation for the PDF document
<i>perr</i>	NULL or address of a string that receives a message in case of error. To be deleted[] after use.

**Returns**

0 for success, 2 when an error occurred.

#### 13.93.2.2 `begin_job()` [1/2]

```
int Fl_PDF_File_Surface::begin_job (
 const char * defaultfilename,
 char ** perr = NULL)
```

Prepare to draw to a PDF document identified with a file chooser.

A dialog opens to select the location and name of the output PDF document as well as its page format and orientation.

**Parameters**

<i>defaultfilename</i>	Default name for the PDF document
<i>perr</i>	NULL or address of a string that receives a message in case of error. To be deleted[] after use.

**Returns**

0 for success, 1 when the user cancelled the operation, 2 when an error occurred.

#### 13.93.2.3 `begin_job()` [2/2]

```
int Fl_PDF_File_Surface::begin_job (
 int ,
```

```

 int * ,
 int * ,
 char **) [inline], [override], [virtual]

```

Don't use for this class.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.93.2.4 begin\_page()

```

int Fl_PDF_File_Surface::begin_page (
 void) [inline], [override], [virtual]

```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area.

This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

##### Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

##### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.93.2.5 end\_job()

```

void Fl_PDF_File_Surface::end_job (
 void) [inline], [override], [virtual]

```

To be called at the end of a print job.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.93.2.6 end\_page()

```

int Fl_PDF_File_Surface::end_page (
 void) [inline], [override], [virtual]

```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

##### Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

##### Returns

0 if OK, non-zero if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.93.2.7 is\_current()

```

bool Fl_PDF_File_Surface::is_current () [inline], [override], [virtual]

```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

**13.93.2.8 margins()**

```
void Fl_PDF_File_Surface::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [inline], [override], [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

**Parameters**

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.93.2.9 origin() [1/2]**

```
void Fl_PDF_File_Surface::origin (
 int * x,
 int * y) [inline], [override], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.93.2.10 origin() [2/2]**

```
void Fl_PDF_File_Surface::origin (
 int x,
 int y) [inline], [override], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.93.2.11 printable\_rect()**

```
int Fl_PDF_File_Surface::printable_rect (
 int * w,
 int * h) [inline], [override], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.93.2.12 rotate()**

```
void Fl_PDF_File_Surface::rotate (
 float angle) [inline], [override], [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

**Parameters**

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.93.2.13 scale()**

```
void Fl_PDF_File_Surface::scale (
 float scale_x,
 float scale_y = 0) [inline], [override], [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

**Parameters**

<i>scale_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor)</code> ; is equivalent to <code>scale(factor, factor)</code> ;

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.93.2.14 set\_current()**

```
void Fl_PDF_File_Surface::set_current (
 void) [inline], [override], [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

**Note**

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#);  
don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) and [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

### 13.93.2.15 translate()

```
void Fl_PDF_File_Surface::translate (
 int x,
 int y) [inline], [override], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 13.93.2.16 untranslate()

```
void Fl_PDF_File_Surface::untranslate (
 void) [inline], [override], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following files:

- [Fl\\_PDF\\_File\\_Surface.H](#)
- [Fl\\_Device.cxx](#)

## 13.94 Fl\_Pixmap Class Reference

The [Fl\\_Pixmap](#) class supports caching and drawing of colormap (pixmap) images, including transparency.

```
#include <Fl_Pixmap.H>
```

Inheritance diagram for [Fl\\_Pixmap](#):

## 13.94.1 Detailed Description

The [FI\\_Pixmap](#) class supports caching and drawing of colormap (pixmap) images, including transparency.

## 13.94.2 Constructor & Destructor Documentation

### 13.94.2.1 Fl\_Pixmap() [1/4]

```
Fl_Pixmap::Fl_Pixmap (
 char *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

### 13.94.2.2 Fl\_Pixmap() [2/4]

```
Fl_Pixmap::Fl_Pixmap (
 uchar *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

### 13.94.2.3 Fl\_Pixmap() [3/4]

```
Fl_Pixmap::Fl_Pixmap (
 const char *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

### 13.94.2.4 Fl\_Pixmap() [4/4]

```
Fl_Pixmap::Fl_Pixmap (
 const uchar *const * D) [inline], [explicit]
```

The constructors create a new pixmap from the specified XPM data.

## 13.94.3 Member Function Documentation

### 13.94.3.1 color\_average()

```
void Fl_Pixmap::color_average (
 Fl_Color c,
 float i) [override], [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

### 13.94.3.2 copy()

```
Fl_Image * Fl_Pixmap::copy (
 int W,
 int H) const [override], [virtual]
```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl\\_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- $w() == \text{data\_w}() == W$
- $h() == \text{data\_h}() == H$

#### Parameters

in	$W, H$	Requested width and height of the new image
----	--------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

#### 13.94.3.3 desaturate()

```
void Fl_Pixmap::desaturate () [override], [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

#### 13.94.3.4 draw()

```
void Fl_Pixmap::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [override], [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments  $X$ ,  $Y$ ,  $W$ ,  $H$  specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the  $cx$  and  $cy$  arguments.

Another way to see what part of the image gets drawn and where, is to consider this alternative writing producing the same output:

```
fl_push_clip(X,Y,W,H);
this->draw(X - cx, Y - cy);
fl_pop_clip();
```

Repeated calls to this member function with the same image but varying  $W$ ,  $H$ ,  $cx$ , or  $cy$  arguments can be more efficiently processed using the above alternative writing.

Reimplemented from [Fl\\_Image](#).

**13.94.3.5 label()** [1/2]

```
void Fl_Pixmap::label (
 Fl_Menu_Item * m) [override], [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

**13.94.3.6 label()** [2/2]

```
void Fl_Pixmap::label (
 Fl_Widget * widget) [override], [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

**13.94.3.7 uncache()**

```
void Fl_Pixmap::uncache () [override], [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [Fl\\_Image](#).

The documentation for this class was generated from the following files:

- [Fl\\_Pixmap.H](#)
- [Fl\\_Pixmap.cxx](#)

**13.95 Fl\_Plugin Class Reference**

[Fl\\_Plugin](#) allows link-time and run-time integration of binary modules.

```
#include <Fl_Plugin.H>
```

Inheritance diagram for [Fl\\_Plugin](#):

**Public Member Functions**

- [Fl\\_Plugin](#) (const char \*klass, const char \*name)  
*Create a plugin.*
- virtual [~Fl\\_Plugin](#) ()  
*Clear the plugin and remove it from the database.*

**13.95.1 Detailed Description**

[Fl\\_Plugin](#) allows link-time and run-time integration of binary modules.

[Fl\\_Plugin](#) and [Fl\\_Plugin\\_Manager](#) provide a small and simple solution for linking C++ classes at run-time, or optionally linking modules at compile time without the need to change the main application.

[Fl\\_Plugin\\_Manager](#) uses static initialization to create the plugin interface early during startup. Plugins are stored in a temporary database, organized in classes.

Plugins should derive a new class from [Fl\\_Plugin](#) as a base:

```
class My_Plugin : public Fl_Plugin {
```

```

public:
 My_Plugin() : Fl_Plugin("effects", "blur") { }
 void do_something(...);
};
My_Plugin blur_plugin();

```

Plugins can be put into modules and either linked before distribution, or loaded from dynamically linkable files. An [Fl\\_Plugin\\_Manager](#) is used to list and access all currently loaded plugins.

```

Fl_Plugin_Manager mgr("effects");
int i, n = mgr.plugins();
for (i=0; i<n; i++) {
 My_Plugin *pin = (My_Plugin*)mgr.plugin(i);
 pin->do_something();
}

```

## 13.95.2 Constructor & Destructor Documentation

### 13.95.2.1 Fl\_Plugin()

```

Fl_Plugin::Fl_Plugin (
 const char * klass,
 const char * name)

```

Create a plugin.

#### Parameters

in	<i>klass</i>	plugins are grouped in classes
in	<i>name</i>	every plugin should have a unique name

The documentation for this class was generated from the following files:

- [Fl\\_Plugin.H](#)
- [Fl\\_Preferences.cxx](#)

## 13.96 Fl\_Plugin\_Manager Class Reference

[Fl\\_Plugin\\_Manager](#) manages link-time and run-time plugin binaries.

```
#include <Fl_Plugin.H>
```

Inheritance diagram for [Fl\\_Plugin\\_Manager](#):

## Protected Attributes inherited from [Fl\\_Preferences](#)

- [Node](#) \* **node**
- [RootNode](#) \* **rootNode**

### 13.96.1 Detailed Description

[Fl\\_Plugin\\_Manager](#) manages link-time and run-time plugin binaries.

See also

[Fl\\_Plugin](#)

### 13.96.2 Constructor & Destructor Documentation

#### 13.96.2.1 ~Fl\_Plugin\_Manager()

```
Fl_Plugin_Manager::~Fl_Plugin_Manager ()
```

Remove the plugin manager.

Calling this does not remove the database itself or any plugins. It just removes the reference to the database.

### 13.96.3 Member Function Documentation

#### 13.96.3.1 addPlugin()

```
Fl_Preferences::ID Fl_Plugin_Manager::addPlugin (
 const char * name,
 Fl_Plugin * plugin)
```

This function adds a new plugin to the database.

There is no need to call this function explicitly. Every [Fl\\_Plugin](#) constructor will call this function at initialization time.

#### 13.96.3.2 klass\_list()

```
std::vector< std::string > Fl_Plugin_Manager::klass_list () [static]
```

Return a list of all plugin classes that have been registered so far.

The returned strings can be used to crate a manager for the klass of plugins, which in turn can be used to list plugins for that klass.

```
auto k1 = Fl_Plugin_Manager::klass_list();
for (auto &k: k1) {
 Fl_Plugin_Manager m { k.c_str() };
 std::cout << m.plugins() << "plugins have registered for klass" << k << std::endl;
}
```

#### Returns

a copy of a vector of strings

#### 13.96.3.3 load()

```
int Fl_Plugin_Manager::load (
 const char * filename) [static]
```

Load a module from disk.

A module must be a dynamically linkable file for the given operating system. When loading a module, its +init function will be called which in turn calls the constructor of all statically initialized [Fl\\_Plugin](#) classes and adds them to the database.

### 13.96.3.4 loadAll()

```
int Fl_Plugin_Manager::loadAll (
 const char * dirpath,
 const char * pattern = 0) [static]
```

Use this function to load a whole directory full of modules.

#### Parameters

<i>dirpath</i>	Pathname of a directory. It <b>must</b> end with the platform's directory separator character (i.e., '\' under Windows, '/' otherwise).
<i>pattern</i>	A filename pattern to catch all modules of interest in the targeted directory (e.g., "{*.so,*.dll,*.dylib}"), or NULL to catch all files in the directory.

### 13.96.3.5 removePlugin()

```
void Fl_Plugin_Manager::removePlugin (
 Fl_Preferences::ID id) [static]
```

Remove any plugin.

There is no need to call this function explicitly. Every [Fl\\_Plugin](#) destructor will call this function at destruction time. The documentation for this class was generated from the following files:

- [Fl\\_Plugin.H](#)
- [Fl\\_Preferences.cxx](#)

## 13.97 FI\_PNG\_Image Class Reference

The [Fl\\_PNG\\_Image](#) class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files.

```
#include <Fl_PNG_Image.H>
```

Inheritance diagram for [Fl\\_PNG\\_Image](#):

### Public Member Functions

- [Fl\\_PNG\\_Image](#) (const char \*filename)  
*The constructor loads the named PNG image from the given png filename.*
- [Fl\\_PNG\\_Image](#) (const char \*name\_png, const unsigned char \*buffer, int datasize)  
*Constructor that reads a PNG image from memory.*

### Public Member Functions inherited from [Fl\\_RGB\\_Image](#)

- virtual [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) ()  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- virtual const [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) () const  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- int [cache\\_h](#) () const
- int [cache\\_w](#) () const
- void [color\\_average](#) ([Fl\\_Color](#) c, float i) override

- The `color_average()` method averages the colors in the image with the provided FLTK color value.
- `FI_Image * copy ()` const
- `FI_Image * copy (int W, int H)` const override
  - Creates a resized copy of the image.*
- void `desaturate ()` override
  - The `desaturate()` method converts an image to grayscale.*
- void `draw (int X, int Y)`
- void `draw (int X, int Y, int W, int H, int cx=0, int cy=0)` override
  - Draws the image to the current drawing surface with a bounding box.*
- `FI_RGB_Image (const FI_Pixmap *pixmap, FI_Color bg=FL_GRAY)`
  - The constructor creates a new RGBA image from the specified `FI_Pixmap`.*
- `FI_RGB_Image (const uchar *bits, int bits_length, int W, int H, int D, int LD)`
  - The constructor creates a new image from the specified data.*
- `FI_RGB_Image (const uchar *bits, int W, int H, int D=3, int LD=0)`
  - The constructor creates a new image from the specified data.*
- void `label (FI_Menu_Item *m)` override
  - This method is an obsolete way to set the image attribute of a menu item.*
- void `label (FI_Widget *w)` override
  - This method is an obsolete way to set the image attribute of a widget or menu item.*
- virtual void `normalize ()`
  - Makes sure the object is fully initialized.*
- void `uncache ()` override
  - If the image has been cached for display, delete the cache data.*
- `~FI_RGB_Image ()` override
  - The destructor frees all memory and server resources that are used by the image.*

## Public Member Functions inherited from `FI_Image`

- virtual class `FI_Shared_Image * as_shared_image ()`
  - Returns whether an image is an `FI_Shared_Image` or not.*
- `FI_Image * copy ()` const
  - Creates a copy of the image in the same size.*
- int `count ()` const
  - Returns the number of data values associated with the image.*
- int `d ()` const
  - Returns the image depth.*
- const char \*const \* `data ()` const
  - Returns a pointer to the current image data array.*
- int `data_h ()` const
  - Returns the height of the image data.*
- int `data_w ()` const
  - Returns the width of the image data.*
- void `draw (int X, int Y)`
  - Draws the image to the current drawing surface.*
- int `fail ()` const
  - Returns a value that is not 0 if there is currently no image available.*
- `FI_Image (int W, int H, int D)`
  - The constructor creates an empty image with the specified width, height, and depth.*
- int `h ()` const
  - Returns the current image drawing height in FLTK units.*
- void `inactive ()`

The *inactive()* method calls *color\_average*(*FL\_BACKGROUND\_COLOR*, 0.33f) to produce an image that appears grayed out.

- int *ld* () const  
Returns the current line data size in bytes.
- virtual void *release* ()  
Releases an *FI\_Image* - the same as 'delete this'.
- virtual void *scale* (int width, int height, int proportional=1, int can\_expand=0)  
Sets the drawing size of the image.
- int *w* () const  
Returns the current image drawing width in FLTK units.
- virtual ~*FI\_Image* ()  
The destructor is a virtual method that frees all memory used by the image.

## Friends

- class *FI\_ICO\_Image*

## Additional Inherited Members

### Static Public Member Functions inherited from *FI\_RGB\_Image*

- static size\_t *max\_size* ()  
Returns the maximum allowed image size in bytes when creating an *FI\_RGB\_Image* object.
- static void *max\_size* (size\_t size)  
Sets the maximum allowed image size in bytes when creating an *FI\_RGB\_Image* object.

### Static Public Member Functions inherited from *FI\_Image*

- static *FI\_Labeltype* *define\_FL\_IMAGE\_LABEL* ()
- static *FI\_RGB\_Scaling* *RGB\_scaling* ()  
Returns the currently used RGB image scaling method.
- static void *RGB\_scaling* (*FI\_RGB\_Scaling*)  
Sets the RGB image scaling method used for copy(int, int).
- static *FI\_RGB\_Scaling* *scaling\_algorithm* ()  
Gets what algorithm is used when resizing a source image to draw it.
- static void *scaling\_algorithm* (*FI\_RGB\_Scaling* algorithm)  
Sets what algorithm is used when resizing a source image to draw it.

### Public Attributes inherited from *FI\_RGB\_Image*

- int *alloc\_array*  
If non-zero, the object's data array is delete[]'d when deleting the object.
- const uchar \* *array*  
Points to the start of the object's data array.

### Static Public Attributes inherited from *FI\_Image*

- static const int *ERR\_FILE\_ACCESS* = -2
- static const int *ERR\_FORMAT* = -3
- static const int *ERR\_MEMORY\_ACCESS* = -4
- static const int *ERR\_NO\_IMAGE* = -1
- static bool *register\_images\_done* = false  
True after *fl\_register\_images()* was called, false before.

## Protected Member Functions inherited from [FI\\_Image](#)

- void **d** (int D)  
*Sets the current image depth.*
- void **data** (const char \*const \*p, int c)  
*Sets the current data pointer and count of pointers in the array.*
- void **draw\_empty** (int X, int Y)  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int **draw\_scaled** (int X, int Y, int W, int H)  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void **h** (int H)  
*Sets the height of the image data.*
- void **ld** (int LD)  
*Sets the current line data size in bytes.*
- void **w** (int W)  
*Sets the width of the image data.*

## Static Protected Member Functions inherited from [FI\\_Image](#)

- static void **labeltype** (const [FI\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [FI\\_Align](#) la)
- static void **measure** (const [FI\\_Label](#) \*lo, int &lw, int &lh)

### 13.97.1 Detailed Description

The [FI\\_PNG\\_Image](#) class supports loading, caching, and drawing of Portable Network Graphics (PNG) image files. The class loads color-mapped and full-color images and handles color- and alpha-based transparency.

### 13.97.2 Constructor & Destructor Documentation

#### 13.97.2.1 [FI\\_PNG\\_Image\(\)](#) [1/2]

```
FI_PNG_Image::FI_PNG_Image (
 const char * filename)
```

The constructor loads the named PNG image from the given png filename.

The destructor frees all memory and server resources that are used by the image.

Use [FI\\_Image::fail\(\)](#) to check if [FI\\_PNG\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the PNG format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

<code>in</code>	<code>filename</code>	Name of PNG file to read
-----------------	-----------------------	--------------------------

#### 13.97.2.2 [FI\\_PNG\\_Image\(\)](#) [2/2]

```
FI_PNG_Image::FI_PNG_Image (
 const char * name_png,
 const unsigned char * buffer,
 int maxsize)
```

Constructor that reads a PNG image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary Data" chunks as a great way to add image data into the C++ source code. `name_png` can be `NULL`. If a name is given, the image is added to the list of shared images (see: [FI\\_Shared\\_Image](#)) and will be available by that name.

#### Parameters

<code>name_png</code>	A name given to this image or <code>NULL</code>
-----------------------	-------------------------------------------------

## Parameters

<i>buffer</i>	Pointer to the start of the PNG image in memory
<i>maxsize</i>	Size in bytes of the memory buffer containing the PNG image

The documentation for this class was generated from the following files:

- FI\_PNG\_Image.H
- FI\_PNG\_Image.cxx

## 13.98 FI\_PNM\_Image Class Reference

The [FI\\_PNM\\_Image](#) class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

```
#include <FI_PNM_Image.H>
```

Inheritance diagram for FI\_PNM\_Image:

### Public Member Functions

- [FI\\_PNM\\_Image](#) (const char \*filename)  
*The constructor loads the named PNM image.*

### Public Member Functions inherited from [FI\\_RGB\\_Image](#)

### 13.98.1 Detailed Description

The [Fl\\_PNM\\_Image](#) class supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files.

The class loads bitmap, grayscale, and full-color images in both ASCII and binary formats.

### 13.98.2 Constructor & Destructor Documentation

#### 13.98.2.1 [Fl\\_PNM\\_Image](#)()

```
Fl_PNM_Image::Fl_PNM_Image (
 const char * filename)
```

The constructor loads the named PNM image.

The destructor frees all memory and server resources that are used by the image.

Use [Fl\\_Image::fail\(\)](#) to check if [Fl\\_PNM\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the PNM format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

#### Parameters

in	<i>filename</i>	a full path and name pointing to a valid jpeg file.
----	-----------------	-----------------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_PNM\\_Image.H](#)
- [Fl\\_PNM\\_Image.cxx](#)

## 13.99 [Fl\\_Positioner](#) Class Reference

This class is provided for Forms compatibility.

```
#include <Fl_Positioner.H>
```

Inheritance diagram for [Fl\\_Positioner](#):

### Public Member Functions

- [Fl\\_Positioner](#) (int *x*, int *y*, int *w*, int *h*, const char \*l=0)  
*Creates a new [Fl\\_Positioner](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- int **value** (double, double)  
*Returns the current position in x and y.*
- void **xbounds** (double, double)  
*Sets the X axis bounds.*
- double **xmaximum** () const  
*Gets the X axis maximum.*

- void **xmaximum** (double a)  
*Same as xbounds(xminimum(), a)*
- double **xminimum** () const  
*Gets the X axis minimum.*
- void **xminimum** (double a)  
*Same as xbounds(a, xmaximum())*
- void **xstep** (double a)  
*Sets the stepping value for the X axis.*
- double **xvalue** () const  
*Gets the X axis coordinate.*
- int **xvalue** (double)  
*Sets the X axis coordinate.*
- void **ybounds** (double, double)  
*Sets the Y axis bounds.*
- double **ymaximum** () const  
*Gets the Y axis maximum.*
- void **ymaximum** (double a)  
*Same as ybounds(yminimum(), a)*
- double **yminimum** () const  
*Gets the Y axis minimum.*
- void **yminimum** (double a)  
*Same as ybounds(a, ymaximum())*
- void **ystep** (double a)  
*Sets the stepping value for the Y axis.*
- double **yvalue** () const  
*Gets the Y axis coordinate.*
- int **yvalue** (double)  
*Sets the Y axis coordinate.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()

- Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*

  - virtual [FL\\_Group](#) const \* **as\_group** () const
  - virtual [FL\\_Window](#) \* **as\_window** ()
- Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*

  - virtual [FL\\_Window](#) const \* **as\_window** () const
  - void **bind\_deimage** ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void **bind\_deimage** (int f)

*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void **bind\_image** ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*

  - void **bind\_image** (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) **box** () const
- Gets the box type of the widget.*

  - void **box** ([FL\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) **callback** () const
- Gets the current callback function for the widget.*

  - void **callback** ([FL\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*

  - void **callback** ([FL\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void **callback** ([FL\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void **callback** ([FL\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int **changed** () const
- Checks if the widget value changed since the last callback.*

  - void **clear\_active** ()

*Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()
- Marks the value of the widget as unchanged.*

  - void **clear\_damage** (uchar c=0)

*Clears or sets the damage flags.*
- void **clear\_output** ()
- Sets a widget to accept input.*

  - void **clear\_visible** ()

*Hides the widget.*
- void **clear\_visible\_focus** ()
- Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) **color** () const
- Gets the background color of the widget.*

  - void **color** ([FL\\_Color](#) bg)

*Sets the background color of the widget.*
- void **color** ([FL\\_Color](#) bg, [FL\\_Color](#) sel)
- Sets the background and selection color of the widget.*
- int **contains** (const [FL\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FL\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const

- Checks if this widget is a child of wgt.*

  - int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (FL\_Labeltype a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- FL\_Color `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (FL\_Color c)

*Sets the label color.*
- FL\_Font `labelfont` () const

*Gets the font to use.*
- void `labelfont` (FL\_Font f)

*Sets the font to use.*
- FL\_Fonsize `labelsize` () const

*Gets the font size in pixels.*
- void `labelsize` (FL\_Fonsize pix)

*Sets the font size in pixels.*
- FL\_Labeltype `labeltype` () const

*Gets the label type.*
- void `labeltype` (FL\_Labeltype a)

*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- FL\_Group \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (FL\_Group \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- FL\_Color `selection_color` () const

*Gets the selection color.*

- void [selection\\_color](#) ([FI\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) type () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

- Set the spacing between the label and the vertical edge of the widget.*

  - unsigned int **visible** () const

*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const

*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)

*Modifies keyboard focus navigation.*
- int **visible\_r** () const

*Returns whether a widget and all its parents are visible.*
- int **w** () const

*Gets the widget width.*
- **FL\_When** **when** () const

*Returns the conditions under which the callback is called.*
- void **when** (uchar i)

*Sets the flags used to decide when a callback is called.*
- **FL\_Window** \* **window** () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const

*Gets the widget position in its window.*
- int **y** () const

*Gets the widget position in its window.*
- virtual **~FL\_Widget** ()

*Destroys the widget.*

### Protected Member Functions

- void **draw** () override
- Draws the widget.*
- void **draw** (int, int, int, int)
  - int **handle** (int, int, int, int, int)

### Protected Member Functions inherited from **FL\_Widget**

- void **clear\_flag** (unsigned int c)
- Clears a flag in the flags mask.*
- void **draw\_backdrop** () const
- If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const
- Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const
- Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const
- Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const
- Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const
- Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const

- Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int `x`, int `y`, int `w`, int `h`, const char \*`label`=0L)
- Creates a widget at the given position and size.*
- unsigned int `flags` () const
- Gets the widget flags mask.*
- void `h` (int `v`)
- Internal use only.*
- void `set_flag` (unsigned int `c`)
- Sets a flag in the flags mask.*
- void `w` (int `v`)
- Internal use only.*
- void `x` (int `v`)
- Internal use only.*
- void `y` (int `v`)
- Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*`widget`, void \*`data`)
- The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*`t`)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*`t`, const bool `require_alt`=false)
- Returns true if the given text `t` contains the entered '&x' shortcut.*

### Protected Types inherited from `FI_Widget`

*flags possible values enumeration.*

### 13.99.1 Detailed Description

This class is provided for Forms compatibility.

It provides 2D input. It would be useful if this could be put atop another widget so that the crosshairs are on top, but this is not implemented. The color of the crosshairs is `selection_color()`.

Figure 13.35 Fl\_Positioner

## 13.99.2 Constructor & Destructor Documentation

### 13.99.2.1 Fl\_Positioner()

```
Fl_Positioner::Fl_Positioner (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Positioner](#) widget using the given position, size, and label string. The default boxtype is FL\_NO\_BOX.

## 13.99.3 Member Function Documentation

### 13.99.3.1 draw()

```
void Fl_Positioner::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 13.99.3.2 handle()

```
int Fl_Positioner::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	event	the kind of event received
----	-------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[FI\\_Event](#)

Reimplemented from [FI\\_Widget](#).

The documentation for this class was generated from the following files:

- FI\_Positioner.H
- FI\_Positioner.cxx

## 13.100 FI\_PostScript\_File\_Device Class Reference

To send graphical output to a PostScript file.

```
#include <FI_PostScript.H>
```

Inheritance diagram for FI\_PostScript\_File\_Device:

### Public Member Functions

- int [begin\\_job](#) (FILE \*ps\_output, int pagecount=0, enum [FI\\_Paged\\_Device::Page\\_Format](#) format=[FI\\_Paged\\_Device::A4](#), enum [FI\\_Paged\\_Device::Page\\_Layout](#) layout=[FI\\_Paged\\_Device::PORTRAIT](#))  
*Begins the session where all graphics requests will go to FILE pointer.*
- int [begin\\_job](#) (int pagecount, int \*from, int \*to, char \*\*perr\_message) override  
*Don't use with this class.*
- int [begin\\_job](#) (int pagecount=0, enum [FI\\_Paged\\_Device::Page\\_Format](#) format=[FI\\_Paged\\_Device::A4](#), enum [FI\\_Paged\\_Device::Page\\_Layout](#) layout=[FI\\_Paged\\_Device::PORTRAIT](#))  
*Begins the session where all graphics requests will go to a local PostScript file.*
- int [begin\\_page](#) (void) override  
*Begins a new printed page.*
- void [close\\_command](#) ([FI\\_PostScript\\_Close\\_Command](#) cmd)  
*Sets the function [end\\_job\(\)](#) calls to close the [file\(\)](#)*
- void [end\\_current](#) () override  
*FLTK calls this each time a surface ceases to be the current drawing surface.*
- void [end\\_job](#) (void) override  
*Completes all PostScript output.*
- int [end\\_page](#) (void) override  
*To be called at the end of each page.*
- FILE \* [file](#) ()  
*Returns the underlying FILE\* receiving all PostScript data.*
- [FI\\_PostScript\\_File\\_Device](#) ()

*The constructor.*

- void **margins** (int \*left, int \*top, int \*right, int \*bottom) override  
*Computes the dimensions of margins that lie between the printable page area and the full page.*
- void **origin** (int \*x, int \*y) override  
*Computes the coordinates of the current origin of graphics functions.*
- void **origin** (int x, int y) override  
*Sets the position of the origin of graphics in the drawable part of the drawing surface.*
- int **printable\_rect** (int \*w, int \*h) override  
*Computes the width and height of the drawable area of the drawing surface.*
- void **rotate** (float angle) override  
*Rotates the graphics operations relatively to paper.*
- void **scale** (float scale\_x, float scale\_y=0.) override  
*Changes the scaling of page coordinates.*
- void **set\_current** () override  
*Make this surface the current drawing surface.*
- int **start\_job** (FILE \*ps\_output, int pagecount=0, enum **FI\_Paged\_Device::Page\_Format** format=**FI\_Paged\_Device::A4**, enum **FI\_Paged\_Device::Page\_Layout** layout=**FI\_Paged\_Device::PORTRAIT**)  
*Synonym of **begin\_job()**.*
- int **start\_job** (int pagecount=0, enum **FI\_Paged\_Device::Page\_Format** format=**FI\_Paged\_Device::A4**, enum **FI\_Paged\_Device::Page\_Layout** layout=**FI\_Paged\_Device::PORTRAIT**)  
*Synonym of **begin\_job()**.*
- void **translate** (int x, int y) override  
*Translates the current graphics origin accounting for the current rotation.*
- void **untranslate** (void) override  
*Undoes the effect of a previous **translate()** call.*
- ~**FI\_PostScript\_File\_Device** ()  
*The destructor.*

## Public Member Functions inherited from **FI\_Paged\_Device**

- void **print\_widget** (**FI\_Widget** \*widget, int delta\_x=0, int delta\_y=0)  
*Synonym of **draw(FI\_Widget\*, int, int)***

*Synonym of **draw\_decorated\_window(FI\_Window\*, int, int)***
- int **start\_job** (int pagecount=0, int \*frompage=NULL, int \*topage=NULL, char \*\*perr\_message=NULL)  
*Synonym of **begin\_job(int pagecount, int \*frompage, int \*topage, char \*\*perr\_message)**.*
- int **start\_page** ()  
*Synonym of **begin\_page()**.*
- virtual ~**FI\_Paged\_Device** ()  
*The destructor.*

## Public Member Functions inherited from **FI\_Widget\_Surface**

- void **draw** (**FI\_Widget** \*widget, int delta\_x=0, int delta\_y=0)  
*Draws the widget on the drawing surface.*
- void **draw\_decorated\_window** (**FI\_Window** \*win, int x\_offset=0, int y\_offset=0)  
*Draws a window with its title bar and frame if any.*
- void **print\_window\_part** (**FI\_Window** \*win, int x, int y, int w, int h, int delta\_x=0, int delta\_y=0)  
*Draws a rectangular part of an on-screen window.*

## Public Member Functions inherited from FI\_Surface\_Device

- FI\_Graphics\_Driver \* **driver** ()  
*Returns the graphics driver of this drawing surface.*
- virtual bool **is\_current** ()  
*Is this surface the current drawing surface?*
- virtual ~**FI\_Surface\_Device** ()  
*The destructor.*

## Static Public Attributes

- static const char \* **file\_chooser\_title**  
*Label of the PostScript file chooser window.*

## Static Public Attributes inherited from FI\_Paged\_Device

- static const [page\\_format](#) **page\_formats** [[NO\\_PAGE\\_FORMATS](#)]  
*width, height and name of all elements of the enum [Page\\_Format](#).*

## Protected Member Functions

- FI\_PostScript\_Graphics\_Driver \* **driver** ()  
*Returns the PostScript driver of this drawing surface.*

## Protected Member Functions inherited from FI\_Paged\_Device

- **FI\_Paged\_Device** ()  
*The constructor.*

## Protected Member Functions inherited from FI\_Widget\_Surface

- **FI\_Widget\_Surface** (FI\_Graphics\_Driver \*d)  
*The constructor.*

## Protected Member Functions inherited from FI\_Surface\_Device

- void **driver** (FI\_Graphics\_Driver \*graphics\_driver)  
*Sets the graphics driver of this drawing surface.*
- **FI\_Surface\_Device** (FI\_Graphics\_Driver \*graphics\_driver)  
*Constructor that sets the graphics driver to use for the created surface.*

## Additional Inherited Members

## Public Types inherited from FI\_Paged\_Device

- enum [Page\\_Format](#) {  
A0 = 0 , A1 , A2 , A3 ,  
A4 , A5 , A6 , A7 ,  
A8 , A9 , B0 , B1 ,  
B2 , B3 , B4 , B5 ,  
B6 , B7 , B8 , B9 ,  
B10 , C5E , DLE , EXECUTIVE ,  
FOLIO , LEDGER , LEGAL , LETTER ,  
TABLOID , ENVELOPE , MEDIA = 0x1000 }  
*Possible page formats.*
- enum [Page\\_Layout](#) { [PORTRAIT](#) = 0 , [LANDSCAPE](#) = 0x100 , [REVERSED](#) = 0x200 , [ORIENTATION](#) = 0x300 }  
*Possible page layouts.*

## Static Public Member Functions inherited from [FI\\_Surface\\_Device](#)

- static [FI\\_Surface\\_Device](#) \* [pop\\_current](#) ()  
*Removes the top element from the current drawing surface stack, and makes the new top element current.*
- static void [push\\_current](#) ([FI\\_Surface\\_Device](#) \*new\_current)  
*Pushes new\_current on top of the stack of current drawing surfaces, and makes it current.*
- static [FI\\_Surface\\_Device](#) \* [surface](#) ()  
*The current drawing surface.*

## Protected Attributes inherited from [FI\\_Widget\\_Surface](#)

- int [x\\_offset](#)  
*horizontal offset to the origin of graphics coordinates*
- int [y\\_offset](#)  
*vertical offset to the origin of graphics coordinates*

### 13.100.1 Detailed Description

To send graphical output to a PostScript file.

This class is used exactly as the [FI\\_Printer](#) class except for the [begin\\_job\(\)](#) call, two variants of which are usable and allow to specify what page format and layout are desired.

**Processing of text:** Text uses vectorial fonts under the X11 + Pango and the Wayland platforms. With other platforms, only text restricted to the Latin alphabet (and a few other characters listed in the table below) and to FLTK standard fonts is vectorized. All other unicode characters or all other fonts ([FL\\_FREE\\_FONT](#) and above) are output as a bitmap. FLTK standard fonts are output using the corresponding PostScript standard fonts. The latin alphabet means all unicode characters between U+0020 and U+017F, or, in other words, the ASCII, Latin-1 Supplement and Latin Extended-A charts.

Char	Codepoint	Name	Char	Codepoint	Name	Char	Codepoint	Name

Figure 13.36 Extra characters supported by standard PostScript fonts

**Processing of transparent [FI\\_RGB\\_Image](#) objects:** Under the X11 + Pango and the Wayland platforms, these objects are output with their exact transparency. With other platforms, these objects are drawn blended to white color. Class [FI\\_EPS\\_File\\_Surface](#) 's constructor allows to set another background color for blending.

## 13.100.2 Member Function Documentation

### 13.100.2.1 begin\_job() [1/3]

```
int Fl_PostScript_File_Device::begin_job (
 FILE * ps_output,
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT)
```

Begins the session where all graphics requests will go to FILE pointer.

This member function prevents [end\\_job\(\)](#) from closing `ps_output`, so the user can check with `ferror(ps_output)` for output errors.

#### Parameters

<i>ps_output</i>	A writable FILE pointer that will receive PostScript output and that should not be closed until after <a href="#">end_job()</a> has been called.
<i>pagecount</i>	The total number of pages to be created. Use 0 if this number is unknown when this function is called.
<i>format</i>	Desired page format.
<i>layout</i>	Desired page layout.

#### Returns

always 0.

### 13.100.2.2 begin\_job() [2/3]

```
int Fl_PostScript_File_Device::begin_job (
 int pagecount,
 int * from,
 int * to,
 char ** perr_message) [override], [virtual]
```

Don't use with this class.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.100.2.3 begin\_job() [3/3]

```
int Fl_PostScript_File_Device::begin_job (
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT)
```

Begins the session where all graphics requests will go to a local PostScript file.

Opens a file dialog to select an output PostScript file. This member function makes [end\\_job\(\)](#) close the resulting PostScript file and display an alert message with `fl_alert()` in case of any output error.

#### Parameters

<i>pagecount</i>	The total number of pages to be created. Use 0 if this number is unknown when this function is called.
<i>format</i>	Desired page format.
<i>layout</i>	Desired page layout.

#### Returns

0 if OK, 1 if user cancelled the file dialog, 2 if fopen failed on user-selected output file.

### 13.100.2.4 begin\_page()

```
int Fl_PostScript_File_Device::begin_page (
 void) [override], [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.100.2.5 end\_current()

```
void Fl_PostScript_File_Device::end_current () [override], [virtual]
```

FLTK calls this each time a surface ceases to be the current drawing surface.

This member function is mostly of interest to developers of new [Fl\\_Surface\\_Device](#) derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to [Fl\\_Surface\\_Device::end\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

### 13.100.2.6 end\_job()

```
void Fl_PostScript_File_Device::end_job (
 void) [override], [virtual]
```

Completes all PostScript output.

This also closes with `fclose()` the underlying [file\(\)](#) unless [close\\_command\(\)](#) was used to set another function.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.100.2.7 end\_page()

```
int Fl_PostScript_File_Device::end_page (
 void) [override], [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Returns

0 if OK, non-zero if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.100.2.8 margins()**

```
void Fl_PostScript_File_Device::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [override], [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page. Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

**Parameters**

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
out	<i>right</i>	If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.100.2.9 origin() [1/2]**

```
void Fl_PostScript_File_Device::origin (
 int * x,
 int * y) [override], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	<i>x,y</i>	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	------------	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.100.2.10 origin() [2/2]**

```
void Fl_PostScript_File_Device::origin (
 int x,
 int y) [override], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	------------	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.100.2.11 printable\_rect()**

```
int Fl_PostScript_File_Device::printable_rect (
 int * w,
 int * h) [override], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.100.2.12 rotate()**

```
void Fl_PostScript_File_Device::rotate (
 float angle) [override], [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

**Parameters**

<i>angle</i>	Rotation angle in counter-clockwise degrees.
--------------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.100.2.13 scale()**

```
void Fl_PostScript_File_Device::scale (
 float scale_x,
 float scale_y = 0.) [override], [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

**Parameters**

<i>scale_x</i>	Horizontal dimensions of plot are multiplied by this quantity.
<i>scale_y</i>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor)</code> ; is equivalent to <code>scale(factor, factor)</code> ;

Reimplemented from [Fl\\_Paged\\_Device](#).

**13.100.2.14 set\_current()**

```
void Fl_PostScript_File_Device::set_current (
 void) [override], [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

**Note**

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#);  
don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) and [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

**13.100.2.15 start\_job() [1/2]**

```
int Fl_PostScript_File_Device::start_job (
 FILE * ps_output,
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT) [inline]
```

Synonym of [begin\\_job\(\)](#).

For API compatibility with FLTK 1.3.x

**13.100.2.16 start\_job() [2/2]**

```
int Fl_PostScript_File_Device::start_job (
 int pagecount = 0,
 enum Fl_Paged_Device::Page_Format format = Fl_Paged_Device::A4,
 enum Fl_Paged_Device::Page_Layout layout = Fl_Paged_Device::PORTRAIT) [inline]
```

Synonym of [begin\\_job\(\)](#).

For API compatibility with FLTK 1.3.x

**13.100.2.17 translate()**

```
void Fl_PostScript_File_Device::translate (
 int x,
 int y) [override], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.100.2.18 untranslate()**

```
void Fl_PostScript_File_Device::untranslate (
 void) [override], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following file:

- [Fl\\_PostScript.H](#)

**13.101 Fl\_Preferences Class Reference**

### 13.101.1 Detailed Description

[Fl\\_Preferences](#) store user settings between application starts.

FLTK Preferences are similar to the Registry on Windows and Preferences on MacOS, providing a simple method to store customizable user settings between application launches. A typical use is storing the last window position or a history of previously used documents.

Preferences are organized in a hierarchy of groups. Every group can contain more groups and any number of key/value pairs. Keys can be text strings containing ASCII letters, digits, periods, and underscores. Forward slashes in a key name are treated as subgroups, i.e. the key 'window/width' would actually refer to the key 'width' inside the group 'window'.

Keys have a unique name within their group. A value can be any string including control characters 0x00 to 0x1f, 0x7f, and UTF-8 octets.

Several methods allow setting and getting numerical values and binary data.

Preferences files are the same across platforms. User comments in preference files are preserved. Filenames are unique for each application by using a vendor/application naming scheme. The developer app must provide default values for all entries to ensure proper operation should preferences be corrupted or not yet exist.

#### Note

The format of preferences files is not part of the FLTK specification and intentionally undocumented. The only valid way to read or write prefs files is via the API from your app. The fact that the current implementation looks like human-readable text is purely coincidental and may change at any time. Preferences files are not meant to be created or edited "by hand."

FLTK preferences are not meant to replace a fully featured database. No merging of data takes place. If several instances of an app access the same database at the same time, only the most recent changes will persist.

Preferences should not be used to store document data. The .prefs file should be kept small for performance reasons. One application can have multiple preferences files. Extensive binary data however should be stored in separate files: see [Fl\\_Preferences::get\\_userdata\\_path\(\)](#).

[Fl\\_Preferences](#) are not thread-safe. They can temporarily change the locale on some platforms during read and write access, which also changes it temporarily in other threads of the same app.

Typically a preferences database is read at startup, and then reopened and written at app shutdown:

```
int appWindowWidth, appWindowHeight;

void launch() {
 Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
 // 'app' constructor will be called, reading data from .prefs file
 Fl_Preferences window(app, "window");
 window.get("width", appWindowWidth, 800);
 window.get("height", appWindowHeight, 600);
 // 'app' destructor will be called. This will write data to the
 // .prefs file if any preferences were changed or added
}

void quit() {
 Fl_Preferences app(Fl_Preferences::USER_L, "matthiasm.com", "hello");
 Fl_Preferences window(app, "window");
 window.set("width", appWindowWidth);
 window.set("height", appWindowHeight);
}
```

#### See also

[Fl\\_Preferences::Fl\\_Preferences\(Root root, const char \\*vendor, const char \\*application\)](#)

As a special case, [Fl\\_Preferences](#) can be memory mapped and not be associated with a file on disk. See [Fl\\_Preferences::Fl\\_Preferences\(Fl\\_Preferences \\*parent, const char \\*group\)](#) and [Fl\\_Preferences::MEMORY](#) for more details on memory mapped preferences.

#### Note

Starting with FLTK 1.3, preferences databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see [Fl\\_Preferences::Fl\\_Preferences\(Root, const char\\*, const char\\*\)](#) for details.

Starting with FLTK 1.4, preference files should be created with `SYSTEM_L` or `USER_L` to be interchangeable between computers with differing locale settings. The legacy modes, `LOCAL` and `SYSTEM`, will read and

write floating point values using the decimal point of the current locale. As a result, a fp-value would be written '3,1415' on a German machine, and would be read back as '3.0' on a US machine because the comma would not be recognized as an alternative decimal point.

### 13.101.2 Member Typedef Documentation

#### 13.101.2.1 ID

```
typedef void* Fl_Preferences::ID
```

Every Fl\_Preferences-Group has a unique ID.

ID's can be retrieved from an Fl\_Preferences-Group and can then be used to create more Fl\_Preference references to the same data set, as long as the database remains open.

### 13.101.3 Member Enumeration Documentation

#### 13.101.3.1 Root

```
enum Fl_Preferences::Root
```

Define the scope of the preferences.

##### Enumerator

UNKNOWN_ROOT_TYPE	Returned if storage could not be determined.
SYSTEM	Preferences are used system-wide. Deprecated, see SYSTEM_L.
USER	Preferences apply only to the current user. Deprecated, see USER_L.
MEMORY	Returned if querying memory mapped preferences.
ROOT_MASK	Mask for the values above.
CORE	OR'd by FLTK to read and write core library preferences and options.
C_LOCALE	This flag should always be set to ensure that floating point values are written and read correctly independently of the current locale.
CLEAR	Don't read a possibly existing database. Instead, start with an empty set of preferences.
SYSTEM_L	Preferences are used system-wide, locale independent.
USER_L	Preferences apply only to the current user, locale independent.
CORE_SYSTEM_L	Same as CORE   SYSTEM   C_LOCALE.
CORE_USER_L	Same as CORE   USER   C_LOCALE.
CORE_SYSTEM	Deprecated, same as CORE   SYSTEM. Use CORE_SYSTEM_L instead.
CORE_USER	Deprecated, same as CORE   USER. Use CORE_USER_L instead.

### 13.101.4 Constructor & Destructor Documentation

#### 13.101.4.1 Fl\_Preferences() [1/8]

```
Fl_Preferences::Fl_Preferences (
 Root root,
 const char * vendor,
 const char * application)
```

The constructor creates a group that manages key/value pairs and child groups.

Preferences can be stored per user using the root type `Fl_Preferences::USER_L`, or stored system-wide using `Fl_Preferences::SYSTEM_L`.

Groups and key/value pairs can be read and written randomly. Reading undefined values will return the default value. Writing undefined values will create all required groups and key/value pairs.

This constructor creates the *base* instance for all following entries and reads the database from disk into memory if it exists. The vendor argument is a unique text string identifying the development team or vendor of an application. A domain name or an EMail address (replacing the '@' with a '.') are great unique names, e.g. "research.matthiasm.↵

com" or "fluid.fltk.org". The application argument can be the working title or final name of your application. Both vendor and application must be valid UNIX path segments as they become parts of the preference file path and may contain forward slashes to create deeper file structures.

#### Note

On **Windows**, the directory is constructed by querying the *Common AppData* or *AppData* key of the Software\Microsoft\Windows\CurrentVersion\Explorer\Shell Folders registry entry. The filename and path is then constructed as `$(query)/$(vendor)/$(application).prefs`. If the query call fails, data will be stored in RAM only. It will be lost when the app exits.

In FLTK versions before 1.4.0, if querying the registry failed,

preferences would be written to `C:\FLTK\$(vendor)\$(application).prefs`.

#### Note

On **Linux**, the USER directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, FLTK will check the path member of the passwd struct returned by `getpwuid(getuid())`. If all attempts fail, data will be stored in RAM only and be lost when the app exits.

The SYSTEM preference filename is hardcoded as `/etc/fltk/$(vendor)/$(application).prefs`.

For backward compatibility, the old USER .prefs file naming scheme `$(directory)/.fltk/$(vendor)/$(application).prefs` is checked first. If that file does not exist, the environment variable `$XDG_CONFIG_HOME` is read as a base directory. If `$XDG_CONFIG_HOME` is not set, the base directory defaults to `$HOME/.config/`.

The user preferences will be stored in `$(directory)/$(vendor)/$(application).prefs`. The user data path will be `$(directory)/$(vendor)/$(application)/`.

In FLTK versions before 1.4.0, if `$HOME` was not set, the USER path would be empty, generating `$(vendor)/$(application).prefs`, which was used relative to the current working directory.

#### Note

On **macOS**, the USER directory is constructed by reading `$HOME`. If `$HOME` is not set or not pointing to an existing directory, we check the path returned by `NSHomeDirectory()`, and finally checking the path member of the passwd struct returned by `getpwuid(getuid())`. If all attempts fail, data will be stored in RAM only and be lost when the app exits. The filename and path is then constructed as `$(directory)/Library/Preferences/$(vendor)/$(application).prefs`. The SYSTEM directory is hardcoded as `/Library/Preferences/$(vendor)/$(application).prefs`.

In FLTK versions before 1.4.0, if `$HOME` was not set, the USER path

would be NULL, generating `<null>/Library/Preferences/$(vendor)/$(application).prefs`, which would silently fail to create a preference file.

#### Parameters

in	<i>root</i>	can be <code>USER_L</code> or <code>SYSTEM_L</code> for user specific or system wide preferences, add the <code>CLEAR</code> flag to start with a clean set of preferences instead of reading them from a preexisting database
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid filepath segment
in	<i>application</i>	unique text describing the application, must be a valid filepath segment

#### See also

[Fl\\_Preferences\(Fl\\_Preferences \\*parent, const char \\*group\)](#) with parent set to NULL

### 13.101.4.2 Fl\_Preferences() [2/8]

`Fl_Preferences::Fl_Preferences (`

```

const char * path,
const char * vendor,
const char * application,
Root flags)

```

Use this constructor to create or read a preference file at an arbitrary position in the file system.

The file name is generated in the form \$(path)/\$(application).prefs. If application is NULL, path is taken literally as the file path and name.

```

// Example: read from an existing database and write modifications when flushed
// or destructor is called
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
 Fl_Preferences::C_LOCALE);

```

```

// Example: create a new preferences file with an empty data set
Fl_Preferences database("/user/matt/test.prefs", "org.fltk.test", NULL,
 (Fl_Preferences::Root) (Fl_Preferences::C_LOCALE|Fl_Preferences::CLEAR));

```

#### Note

the C\_LOCALE flag is is not set by default for backward compatibility, but it is highly recommended to set it when opening a database.

#### Parameters

in	<i>path</i>	path to the directory that contains the preference file
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid file path segment
in	<i>application</i>	unique text describing the application, must be a valid filename or NULL
in	<i>flags</i>	C_LOCALE to make the preferences file independent of the current locale, add the CLEAR flag to start with a clean set of preferences instead of reading from the database

#### 13.101.4.3 Fl\_Preferences() [3/8]

```

Fl_Preferences::Fl_Preferences (
 Fl_Preferences & parent,
 const char * group)

```

Generate or read a new group of entries within another group.

Use the group argument to name the group that you would like to access. Group can also contain a path to a group further down the hierarchy by separating group names with a forward slash '/'.

#### Parameters

in	<i>parent</i>	reference object for the new group
in	<i>group</i>	name of the group to access (may contain '/')

#### 13.101.4.4 Fl\_Preferences() [4/8]

```

Fl_Preferences::Fl_Preferences (
 Fl_Preferences * parent,
 const char * group)

```

Create or access a group of preferences using a name.

Parent should point to a previously created parent preferences group to create a preferences hierarchy.

If parent is set to NULL, an unnamed database will be accessed that exists only in local memory and is not associated with a file on disk. The root type of this database is set to `Fl_Preferences::MEMORY`.

- the memory database is *not* shared among multiple instances of the same app
- memory databases are *not* thread safe
- all data will be lost when the app quits

```
void some_function() {
 Fl_Preferences guide(NULL, "Guide");
 guide.set("answer", 42);
}

void other_function() {
 int x;
 Fl_Preferences guide(NULL, "Guide");
 guide.get("answer", x, -1);
}
```

FLTK uses the memory database to manage plugins. See [Fl\\_Plugin](#).

#### Parameters

in	<i>parent</i>	the parameter <i>parent</i> is a pointer to the parent group. If <i>parent</i> is NULL, the new preferences item refers to an application internal database ("runtime prefs") which exists only once, and remains in RAM only until the application quits. This database is used to manage plugins and other data indexes by strings. Runtime prefs are <i>not</i> thread-safe.
in	<i>group</i>	a group name that is used as a key into the database

#### See also

[Fl\\_Preferences\( Fl\\_Preferences&, const char \\*group \)](#)

#### 13.101.4.5 Fl\_Preferences() [5/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences & parent,
 int groupIndex)
```

Open a child group using a given index.

Use the *groupIndex* argument to find the group that you would like to access. If the given index is invalid (negative or too high), a new group is created with a UUID as a name.

The index needs to be fixed. It is currently backward. Index 0 points to the last member in the 'list' of preferences.

#### Parameters

in	<i>parent</i>	reference object for the new group
in	<i>groupIndex</i>	zero based index into child groups

#### 13.101.4.6 Fl\_Preferences() [6/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences * parent,
 int groupIndex)
```

#### See also

[Fl\\_Preferences\( Fl\\_Preferences&, int groupIndex \)](#)

#### 13.101.4.7 Fl\_Preferences() [7/8]

```
Fl_Preferences::Fl_Preferences (
 Fl_Preferences::ID id)
```

Create a new dataset access point using a dataset ID.

ID's are a great way to remember shortcuts to database entries that are deeply nested in a preferences database, as long as the database root is not deleted. An ID can be retrieved from any [Fl\\_Preferences](#) dataset, and can then be used to create multiple new references to the same dataset.

ID's can be very helpful when put into the `user_data()` field of widget callbacks.

#### 13.101.4.8 ~Fl\_Preferences()

```
Fl_Preferences::~~Fl_Preferences () [virtual]
```

The destructor removes allocated resources.

When used on the *base* preferences group, the destructor flushes all changes to the preference file and deletes all internal databases.

The destructor does not remove any data from the database. It merely deletes your reference to the database.

#### 13.101.4.9 Fl\_Preferences() [8/8]

```
Fl_Preferences::Fl_Preferences (
 const char * path,
 const char * vendor,
 const char * application)
```

Deprecated: Use this constructor to create or read a preference file at an arbitrary position in the file system.

**Deprecated** "since 1.4.0 - use Fl\_Preferences(path, vendor, application, flags) instead"

This constructor should no longer be used because the generated database uses the current locale, making it impossible to exchange floating point settings between machines with different language settings.

Use `Fl_Preferences(path, vendor, application, Fl_Preferences::C_LOCALE)` in new projects and `Fl_Preferences(path, vendor, application, 0)` if you must keep backward compatibility.

See also

`Fl_Preferences(const char *path, const char *vendor, const char *application, Root flags)`

### 13.101.5 Member Function Documentation

#### 13.101.5.1 delete\_entry()

```
char Fl_Preferences::delete_entry (
 const char * key)
```

Deletes a single name/value pair.

This function removes the entry *key* from the database.

##### Parameters

in	<i>key</i>	name of entry to delete
----	------------	-------------------------

##### Returns

0 if deleting the entry failed

#### 13.101.5.2 delete\_group()

```
char Fl_Preferences::delete_group (
 const char * group)
```

Deletes a group.

Removes a group and all keys and groups within that group from the database.

##### Parameters

in	<i>group</i>	name of the group to delete
----	--------------	-----------------------------

**Returns**

0 if call failed

**13.101.5.3 dirty()**

```
int Fl_Preferences::dirty ()
```

Check if there were changes to the database that need to be written to disk.

**Returns**

1 if the database will be written to disk by `flush` or destructor.

0 if the database is unchanged since the last write operation.

-1 if there is an internal database error.

**13.101.5.4 entries()**

```
int Fl_Preferences::entries ()
```

Returns the number of entries (name/value pairs) in a group.

**Returns**

number of entries

**13.101.5.5 entry()**

```
const char * Fl_Preferences::entry (
 int index)
```

Returns the name of an entry.

There is no guaranteed order of entry names. The index must be within the range given by [entries\(\)](#).

**Parameters**

in	<i>index</i>	number indexing the requested entry
----	--------------	-------------------------------------

**Returns**

pointer to value cstring

**13.101.5.6 entry\_exists()**

```
char Fl_Preferences::entry_exists (
 const char * key)
```

Returns non-zero if an entry with this name exists.

**Parameters**

in	<i>key</i>	name of entry that is searched for
----	------------	------------------------------------

**Returns**

0 if entry was not found

**13.101.5.7 file\_access()** [1/2]

```
unsigned int Fl_Preferences::file_access () [static]
```

Return the current file access permissions for the FLTK preferences system.

See also

[Fl\\_Preferences::file\\_access\(unsigned int\)](#)

### 13.101.5.8 file\_access() [2/2]

```
void Fl_Preferences::file_access (
 unsigned int flags) [static]
```

Tell the FLTK preferences system which files in the file system it may read, create, or write.

The FLTK core library will try to read or even create or write preference files when calling [Fl::option\(\)](#), [Fl\\_File\\_Chooser](#), the printing panel, and possibly some other internal functions. If your application wants to keep FLTK from touching the file system, call this function before making any other FLTK calls:

```
// neither FLTK nor the app may read, create, or write preference files
Fl_Preferences::file_access(Fl_Preferences::NONE);
```

or

```
// FLTK may not read, create, or write preference files, but the application may
Fl_Preferences::file_access(Fl_Preferences::APP_OK);
```

All flags can be combined using an OR operator. If flags are not set, that specific access to the file system will not be allowed. By default, all access is granted. To clear one or more flags from the default setting, use:

```
Fl_Preferences::file_access(Fl_Preferences::file_access()
 &~ Fl_Preferences::SYSTEM_WRITE);
```

If preferences are created using a filename (instead of [Fl\\_Preferences::USER](#) or [Fl\\_Preferences::SYSTEM](#)), file access is handled as if the [Fl\\_Preferences::USER](#) flag was set.

See also

[Fl\\_Preferences::NONE](#) and others for a list of flags.

[Fl\\_Preferences::file\\_access\(\)](#)

### 13.101.5.9 filename() [1/2]

```
Fl_Preferences::Root Fl_Preferences::filename (
 char * buffer,
 size_t buffer_size)
```

Return the file name and path to the preference file.

If the preferences have not changed or have not been flushed, the file or directory may not have been created yet.

#### Parameters

out	<i>buffer</i>	write the resulting path into this buffer
in	<i>buffer_size</i>	size of the buffer in bytes

#### Returns

the root type at creation type, or MEMORY for runtime prefs, it does not return CORE or LOCALE flags.

### 13.101.5.10 filename() [2/2]

```
Fl_Preferences::Root Fl_Preferences::filename (
 char * buffer,
 size_t buffer_size,
 Root root,
 const char * vendor,
 const char * application) [static]
```

Determine the file name and path to preferences that would be opened with these parameters.

Find the possible location of a preference file on disk without touching any of the pathname components. This can be used to check if a preference file already exists.

## Parameters

out	<i>buffer</i>	write the resulting path into this buffer
in	<i>buffer_size</i>	size of the <i>buffer</i> in bytes
in	<i>root</i>	can be <code>USER_L</code> or <code>SYSTEM_L</code> for user specific or system wide preferences
in	<i>vendor</i>	unique text describing the company or author of this file, must be a valid filepath segment
in	<i>application</i>	unique text describing the application, must be a valid filepath segment

## Returns

the input root value, or `Fl_Preferences::UNKNOWN_ROOT_TYPE` if the path could not be determined.

## See also

`Fl_Preferences( Root root, const char *vendor, const char *application )`

**13.101.5.11 flush()**

```
int Fl_Preferences::flush ()
```

Writes preferences to disk if they were modified.

This method can be used to verify that writing a preference file went well. Deleting the base preferences object will also write the contents of the database to disk.

## Returns

-1 if anything went wrong, i.e. file could not be opened, permissions blocked writing, etc.

0 if the file was written to disk. This does not check if the disk ran out of space and the file is truncated.

1 if no data was written to the database and no write attempt to disk was made.

**13.101.5.12 get() [1/9]**

```
char Fl_Preferences::get (
 const char * key,
 char *& text,
 const char * defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). `get()` allocates memory of sufficient size to hold the value. The buffer must be free'd by the developer using `'free(value)'`.

## Parameters

in	<i>key</i>	name of entry
out	<i>text</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

## Returns

0 if the default value was used

**13.101.5.13 get() [2/9]**

```
char Fl_Preferences::get (
 const char * key,
 char * text,
```

```
const char * defaultValue,
int maxSize)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). 'maxSize' is the maximum length of text that will be read. The text buffer must allow for one additional byte for a trailing zero.

#### Parameters

in	<i>key</i>	name of entry
out	<i>text</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>maxSize</i>	maximum length of value plus one byte for a trailing zero

#### Returns

0 if the default value was used

#### 13.101.5.14 get() [3/9]

```
char Fl_Preferences::get (
 const char * key,
 double & value,
 double defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

#### Parameters

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

#### Returns

0 if the default value was used

#### 13.101.5.15 get() [4/9]

```
char Fl_Preferences::get (
 const char * key,
 float & value,
 float defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

#### Parameters

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**13.101.5.16 get() [5/9]**

```
char Fl_Preferences::get (
 const char * key,
 int & value,
 int defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0).

**Parameters**

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**13.101.5.17 get() [6/9]**

```
char Fl_Preferences::get (
 const char * key,
 std::string & value,
 const std::string & defaultValue)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). NUL characters in std::string are treated as the end of the text.

**Parameters**

in	<i>key</i>	name of entry
out	<i>value</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set

**Returns**

0 if the default value was used

**13.101.5.18 get() [7/9]**

```
char Fl_Preferences::get (
 const char * key,
 void *& data,
 const void * defaultValue,
 int defaultSize)
```

Reads an entry from the group.

A default value must be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). [get\(\)](#) allocates memory of sufficient size to hold the value. The buffer must be free'd by the developer using 'free(value)'.

**Parameters**

in	<i>key</i>	name of entry
out	<i>data</i>	returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>defaultSize</i>	size of default value array

**Returns**

0 if the default value was used

**13.101.5.19 get() [8/9]**

```
char Fl_Preferences::get (
 const char * key,
 void * data,
 const void * defaultValue,
 int defaultSize,
 int * maxSize)
```

Reads a binary entry from the group, encoded in hexadecimal blocks.

A binary (not hex) default value can be supplied. The return value indicates if the value was available (non-zero) or the default was used (0). *maxSize* is the maximum length of text that will be read and returns the actual number of bytes read.

**Parameters**

in	<i>key</i>	name of entry
out	<i>data</i>	value returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value to be used if no preference was set
in	<i>defaultSize</i>	size of default value array
in, out	<i>maxSize</i>	maximum length of value and actual number of bytes set

**Returns**

0 if the default value was used

**13.101.5.20 get() [9/9]**

```
char Fl_Preferences::get (
 const char * key,
 void * data,
 const void * defaultValue,
 int defaultSize,
 int maxSize)
```

Reads a binary entry from the group, encoded in hexadecimal blocks.

**Parameters**

in	<i>key</i>	name of entry
out	<i>data</i>	value returned from preferences or default value if none was set
in	<i>defaultValue</i>	default value
in	<i>defaultSize</i>	size of default value array
in	<i>maxSize</i>	maximum length of value, to receive the number of bytes read, use the function below instead.

**Returns**

0 if the default value was used

**See also**

[Fl\\_Preferences::get\( const char \\*key, void \\*data, const void \\*defaultValue, int defaultSize, int \\*maxSize \)](#)

**13.101.5.21 get\_userdata\_path()**

```
char Fl_Preferences::get_userdata_path (
 char * path,
 int pathlen)
```

Creates a path that is related to the preference file and that is usable for additional application data.

This function creates a directory that is named after the preferences database without the .prefs extension and located in the same directory. It then fills the given buffer with the complete path name.

There is no way to verify that the path name fit into the buffer. If the name is too long, it will be clipped.

This function can be used with direct paths that don't end in .prefs . [get\\_userdata\\_path\(\)](#) will remove any extension and end the path with a / . If the file name has no extension, [get\\_userdata\\_path\(\)](#) will append .data/ to the path name.

**Example:**

```
Fl_Preferences prefs(USER, "matthiasm.com", "test");
char path[FL_PATH_MAX];
prefs.get_userdata_path(path, FL_PATH_MAX);
creates the preferences database in the directory (User 'matt' on Linux):
/Users/matt/.fltk/matthiasm.com/test.prefs
..and returns the userdata path:
/Users/matt/.fltk/matthiasm.com/test/
```

**Parameters**

out	<i>path</i>	buffer for user data path
in	<i>pathlen</i>	size of path buffer (should be at least FL_PATH_MAX )

**Returns**

1 if there is no filename (*path* will be unmodified)

1 if *pathlen* is 0 (*path* will be unmodified)

1 if a path was created successfully, *path* will contain the path name ending in a '/'

0 if path was not created for some reason; *path* will contain the pathname that could not be created

**See also**

[Fl\\_Preferences::Fl\\_Preferences\(Root, const char\\*, const char\\*\)](#)

**13.101.5.22 group()**

```
const char * Fl_Preferences::group (
 int num_group)
```

Returns the name of the Nth (num\_group) group.

There is no guaranteed order of group names. The index must be within the range given by [groups\(\)](#).

**Parameters**

in	<i>num_group</i>	number indexing the requested group
----	------------------	-------------------------------------

**Returns**

'C' string pointer to the group name

**13.101.5.23 group\_exists()**

```
char Fl_Preferences::group_exists (
 const char * key)
```

Returns non-zero if a group with this name exists.

Group names are relative to the [Fl\\_Preferences](#) node and can contain a path. "." describes the current node, "/" describes the topmost node. By preceding a groupname with a "/" its path becomes relative to the topmost node.

**Parameters**

in	key	name of group that is searched for
----	-----	------------------------------------

**Returns**

0 if no group by that name was found

**13.101.5.24 groups()**

```
int Fl_Preferences::groups ()
```

Returns the number of groups that are contained within a group.

**Returns**

0 for no groups at all

**13.101.5.25 new\_UUID()**

```
const char * Fl_Preferences::new_UUID () [static]
```

Returns a UUID as generated by the system.

A UUID is a "universally unique identifier" which is commonly used in configuration files to create identities. A UUID in ASCII looks like this: 937C4900-51AA-4C11-8DD3-7AB59944F03E. It has always 36 bytes plus a trailing zero.

**Returns**

a pointer to a static buffer containing the new UUID in ASCII format. The buffer is overwritten during every call to this function!

**13.101.5.26 set() [1/8]**

```
char Fl_Preferences::set (
 const char * key,
 const char * text)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	key	name of entry
in	text	set this entry to value

**Returns**

0 if setting the value failed

**13.101.5.27 set() [2/8]**

```
char Fl_Preferences::set (
 const char * entry,
 const std::string & value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file. NUL characters in std::string are treated as the end of the text.

**Parameters**

in	<i>entry</i>	name of entry
in	<i>value</i>	set this entry to value (stops at the first nul character).

**Returns**

0 if setting the value failed

**13.101.5.28 set() [3/8]**

```
char Fl_Preferences::set (
 const char * key,
 const void * data,
 int dsize)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>data</i>	set this entry to value
in	<i>dsize</i>	size of data array

**Returns**

0 if setting the value failed

**13.101.5.29 set() [4/8]**

```
char Fl_Preferences::set (
 const char * key,
 double value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to value

**Returns**

0 if setting the value failed

**13.101.5.30 set() [5/8]**

```
char Fl_Preferences::set (
 const char * key,
 double value,
 int precision)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>
in	<i>precision</i>	number of decimal digits to represent value

**Returns**

0 if setting the value failed

**13.101.5.31 set() [6/8]**

```
char Fl_Preferences::set (
 const char * key,
 float value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>

**Returns**

0 if setting the value failed

**13.101.5.32 set() [7/8]**

```
char Fl_Preferences::set (
 const char * key,
 float value,
 int precision)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to <i>value</i>
in	<i>precision</i>	number of decimal digits to represent value

**Returns**

0 if setting the value failed

**13.101.5.33 set() [8/8]**

```
char Fl_Preferences::set (
 const char * key,
 int value)
```

Sets an entry (name/value pair).

The return value indicates if there was a problem storing the data in memory. However it does not reflect if the value was actually stored in the preference file.

**Parameters**

in	<i>key</i>	name of entry
in	<i>value</i>	set this entry to value

**Returns**

0 if setting the value failed

**13.101.5.34 size()**

```
int Fl_Preferences::size (
 const char * key)
```

Returns the size of the value part of an entry.

**Parameters**

in	<i>key</i>	name of entry
----	------------	---------------

**Returns**

size of value

**13.101.6 Member Data Documentation****13.101.6.1 CORE\_READ\_OK**

```
const unsigned int Fl_Preferences::CORE_READ_OK = 0x0010 [static]
```

Set this if it is OK for FLTK to read preference files.

USER\_READ\_OK and/or SYSTEM\_READ\_OK must also be set.

**13.101.6.2 CORE\_WRITE\_OK**

```
const unsigned int Fl_Preferences::CORE_WRITE_OK = 0x0020 [static]
```

Set this if it is OK for FLTK to create or write preference files.

USER\_WRITE\_OK and/or SYSTEM\_WRITE\_OK must also be set.

**13.101.6.3 NONE**

```
const unsigned int Fl_Preferences::NONE = 0x0000 [static]
```

Set this if no call to [Fl\\_Preferences](#) shall access the file system.

*horizontal offset to the origin of graphics coordinates*
- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

### 13.102.1 Detailed Description

OS-independent print support.

[Fl\\_Printer](#) allows to use all drawing, color, text, image, and clip FLTK functions, and to have them operate on printed page(s). There are two main, non exclusive, ways to use it.

- Print any widget (standard, custom, [Fl\\_Window](#), [Fl\\_Gl\\_Window](#)) as it appears on screen, with optional translation, scaling and rotation. This is done by calling [print\\_widget\(\)](#), [print\\_window\(\)](#) or [print\\_window\\_part\(\)](#).
- Use a series of FLTK graphics commands (e.g., font, text, lines, colors, clip, image) to compose a page appropriately shaped for printing.

In both cases, begin by [begin\\_job\(\)](#), [begin\\_page\(\)](#), [printable\\_rect\(\)](#) and [origin\(\)](#) calls and finish by [end\\_page\(\)](#) and [end\\_job\(\)](#) calls.

Example of use: print a widget centered in a page

```
#include <FL/Fl_Printer.H>
#include <FL/fl_draw.H>
int width, height;
Fl_Widget *widget = ... // a widget we want printed
Fl_Printer *printer = new Fl_Printer();
if (printer->begin_job(1) == 0) {
 printer->begin_page();
 printer->printable_rect(&width, &height);
 fl_color(FL_BLACK);
 fl_line_style(FL_SOLID, 2);
 fl_rect(0, 0, width, height);
 fl_font(FL_COURIER, 12);
 time_t now; time(&now); fl_draw(ctime(&now), 0, fl_height());
 printer->origin(width/2, height/2);
 printer->print_widget(widget, -widget->w()/2, -widget->h()/2);
 printer->end_page();
 printer->end_job();
}
delete printer;
```

Recommended method to refresh GUI while printing :

```
printer->begin_job(0);
.....
Fl_Surface_Device::push_current(Fl_Display_Device::display_device());
Fl::check(); // or any operation that draws to display
Fl_Surface_Device::pop_current();
```

```
.....
printer->end_job();
```

### Platform specifics

- X11 and Wayland platforms:
  - FLTK expresses all graphics data using (Level 2) PostScript and sends that to the selected printer. See class [Fl\\_PostScript\\_File\\_Device](#) for a description of how text and transparent images appear in print.
  - If the GTK library is available at run-time, class [Fl\\_Printer](#) runs GTK's printer dialog which allows to set printer, paper size and orientation.
  - If the GTK library is not available, or if `Fl::option(Fl::OPTION_PRINTER_USES_GTK)` has been turned off, class [Fl\\_Printer](#) runs FLTK's print dialog.
    - \* Unless it has been previously changed, the default paper size is A4. To change that, press the "Properties" button of the "Print" dialog window opened by an [Fl\\_Printer::begin\\_job\(\)](#) call. This opens a "Printer Properties" window where it's possible to select the adequate paper size. Finally press the "Save" button therein to assign the chosen paper size to the chosen printer for this and all further print operations.
    - \* Use the static public attributes of this class to set the print dialog to other languages than English. For example, the "Printer:" dialog item [Fl\\_Printer::dialog\\_printer](#) can be set to French with:  
`Fl_Printer::dialog_printer = "Imprimante:";`  
before creation of the [Fl\\_Printer](#) object.
    - \* Use [Fl\\_PostScript\\_File\\_Device::file\\_chooser\\_title](#) to customize the title of the file chooser dialog that opens when using the "Print To File" option of the print dialog.
- Windows platform: Transparent [Fl\\_RGB\\_Image](#) 's don't print with exact transparency on most printers (a workaround is to use [print\\_window\\_part\(\)](#) ). [Fl\\_RGB\\_Image](#) 's don't [rotate\(\)](#) well.
- Mac OS X platform: all graphics requests print as on display and accept rotation and scaling.

## 13.102.2 Member Function Documentation

### 13.102.2.1 begin\_job()

```
int Fl_Printer::begin_job (
 int pagecount = 0,
 int * frompage = NULL,
 int * topage = NULL,
 char ** perr_message = NULL) [override], [virtual]
```

Begins a print job.

#### Parameters

in	<i>pagecount</i>	the total number of pages of the job (or 0 if you don't know the number of pages)
out	<i>frompage</i>	if non-null, *frompage is set to the first page the user wants printed
out	<i>topage</i>	if non-null, *topage is set to the last page the user wants printed
out	<i>perr_message</i>	if non-null and if the returned value is 2, *perr_message is set to a string describing the error. That string can be delete[]'d after use.

#### Returns

0 if OK, 1 if user cancelled the job, 2 if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.102.2.2 begin\_page()

```
int Fl_Printer::begin_page (
 void) [override], [virtual]
```

Begins a new printed page.

The page coordinates are initially in points, i.e., 1/72 inch, and with origin at the top left of the printable page area. This function also makes this surface the current drawing surface with [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Note

[begin\\_page\(\)](#) calls [Fl\\_Surface\\_Device::push\\_current\(\)](#) and leaves this device as the active surface. If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#), or the content of the dialog box will be rendered to the printer instead of the screen.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.102.2.3 end\_job()

```
void Fl_Printer::end_job (
 void) [override], [virtual]
```

To be called at the end of a print job.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.102.2.4 end\_page()

```
int Fl_Printer::end_page (
 void) [override], [virtual]
```

To be called at the end of each page.

This function also stops this surface from being the current drawing surface with [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

[end\\_page\(\)](#) calls [Fl\\_Surface\\_Device::pop\\_current\(\)](#). If any calls between [begin\\_page\(\)](#) and [end\\_page\(\)](#) open dialog boxes or will otherwise draw into FLTK windows, those calls must be put between a call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#) and a call to [Fl\\_Surface\\_Device::push\\_current\(\)](#).

#### Returns

0 if OK, non-zero if any error.

Reimplemented from [Fl\\_Paged\\_Device](#).

#### 13.102.2.5 is\_current()

```
bool Fl_Printer::is_current () [override], [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl\\_Surface\\_Device](#).

#### 13.102.2.6 margins()

```
void Fl_Printer::margins (
 int * left,
 int * top,
 int * right,
 int * bottom) [override], [virtual]
```

Computes the dimensions of margins that lie between the printable page area and the full page.

Values are in the same unit as that used by FLTK drawing functions. They are changed by [scale\(\)](#) calls.

#### Parameters

out	<i>left</i>	If non-null, *left is set to the left margin size.
out	<i>top</i>	If non-null, *top is set to the top margin size.
Generated by Doxygen		If non-null, *right is set to the right margin size.
out	<i>bottom</i>	If non-null, *bottom is set to the bottom margin size.

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.102.2.7 origin() [1/2]

```
void Fl_Printer::origin (
 int * x,
 int * y) [override], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

#### Parameters

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 13.102.2.8 origin() [2/2]

```
void Fl_Printer::origin (
 int x,
 int y) [override], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

#### Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 13.102.2.9 printable\_rect()

```
int Fl_Printer::printable_rect (
 int * w,
 int * h) [override], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

#### Returns

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 13.102.2.10 rotate()

```
void Fl_Printer::rotate (
 float angle) [override], [virtual]
```

Rotates the graphics operations relatively to paper.

The rotation is centered on the current graphics origin. Successive [rotate\(\)](#) calls don't combine their effects.

#### Parameters

angle	Rotation angle in counter-clockwise degrees.
-------	----------------------------------------------

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.102.2.11 scale()

```
void Fl_Printer::scale (
 float scale_x,
 float scale_y = 0.) [override], [virtual]
```

Changes the scaling of page coordinates.

This function also resets the origin of graphics functions at top left of printable page area. After a [scale\(\)](#) call, do a [printable\\_rect\(\)](#) call to get the new dimensions of the printable page area. Successive [scale\(\)](#) calls don't combine their effects.

#### Parameters

<a href="#">scale_x</a>	Horizontal dimensions of plot are multiplied by this quantity.
<a href="#">scale_y</a>	Same as above, vertically. The value 0. is equivalent to setting <code>scale_y = scale_x</code> . Thus, <code>scale(factor);</code> is equivalent to <code>scale(factor, factor);</code>

Reimplemented from [Fl\\_Paged\\_Device](#).

### 13.102.2.12 set\_current()

```
void Fl_Printer::set_current (
 void) [override], [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#);  
don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) and [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented from [Fl\\_Surface\\_Device](#).

### 13.102.2.13 translate()

```
void Fl_Printer::translate (
 int x,
 int y) [override], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

### 13.102.2.14 untranslate()

```
void Fl_Printer::untranslate (
 void) [override], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following files:

- [Fl\\_Printer.H](#)
- [Fl\\_Printer.cxx](#)

### 13.103 Fl\_Progress Class Reference

Displays a progress bar for the user.

```
#include <Fl_Progress.H>
```

Inheritance diagram for Fl\_Progress:

#### Public Member Functions

- [Fl\\_Progress](#) (int *x*, int *y*, int *w*, int *h*, const char \*l=0)  
*The constructor creates the progress bar using the position, size, and label.*
- float [maximum](#) () const  
*Gets the maximum value in the progress widget.*
- void [maximum](#) (float v)  
*Sets the maximum value in the progress widget.*

*Sets the background color of the widget.*

- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FL\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual int [handle](#) (int event)  
*Handles the specified event.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)

- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([FI\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [FI\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([FI\\_Color](#) c)
- Sets the label color.*

  - [FI\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([FI\\_Font](#) f)
- Sets the font to use.*

  - [FI\\_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([FI\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [FI\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([FI\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [FI\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int `x`, int `y`, int `w`, int `h`)  
*Changes the size or position of the widget.*
- `Fl_Color` `selection_color` () const  
*Gets the selection color.*
- void `selection_color` (`Fl_Color` `a`)  
*Sets the selection color.*
- int `send` (int `event`)  
*Sends the specified event to the widget.*
- void `set_active` ()  
*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()  
*Marks the value of the widget as changed.*
- void `set_output` ()  
*Sets a widget to output only.*
- void `set_visible` ()  
*Makes the widget visible.*
- void `set_visible_focus` ()  
*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int `value`)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()  
*Makes a widget visible.*
- void `size` (int `W`, int `H`)  
*Changes the size of the widget.*
- int `take_focus` ()  
*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const  
*Returns if the widget is able to take events.*
- int `test_shortcut` ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const  
*Gets the current tooltip text.*
- void `tooltip` (const char \*`text`)  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &`xoff`, int &`yoff`) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const  
*Gets the widget type.*
- void `type` (`uchar` `t`)  
*Sets the widget type.*
- int `use_accents_menu` ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const  
*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*`v`, bool `auto_free`)

- Sets the user data for this widget.*

  - void **user\_data** (void \*v)

*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()

*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const

*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const

*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)

*Modifies keyboard focus navigation.*
- int **visible\_r** () const

*Returns whether a widget and all its parents are visible.*
- int **w** () const

*Gets the widget width.*
- **FL\_When** **when** () const

*Returns the conditions under which the callback is called.*
- void **when** (uchar i)

*Sets the flags used to decide when a callback is called.*
- **FL\_Window** \* **window** () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const

*Gets the widget position in its window.*
- int **y** () const

*Gets the widget position in its window.*
- virtual **~FL\_Widget** ()

*Destroys the widget.*

### Protected Member Functions

- void **draw** () override
- Draws the progress bar.*

### Protected Member Functions inherited from FL\_Widget

- void **clear\_flag** (unsigned int c)
- Clears a flag in the flags mask.*
- void **draw\_backdrop** () const
- If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const
- Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const
- Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const
- Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const

- Draws a focus box for the widget at the given position and size.*
  - void `draw_label` () const
- Draws the widget's label at the defined label position.*
  - void `draw_label` (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
  - `FI_Widget` (int `x`, int `y`, int `w`, int `h`, const char \*`label`=0L)
- Creates a widget at the given position and size.*
  - unsigned int `flags` () const
- Gets the widget flags mask.*
  - void `h` (int `v`)
- Internal use only.*
  - void `set_flag` (unsigned int `c`)
- Sets a flag in the flags mask.*
  - void `w` (int `v`)
- Internal use only.*
  - void `x` (int `v`)
- Internal use only.*
  - void `y` (int `v`)
- Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*`widget`, void \*`data`)
  - The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*`t`)
  - Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool `require_alt`=false)
  - Returns true if the given text `t` contains the entered '&x' shortcut.*

### Protected Types inherited from `FI_Widget`

- enum {
  - `INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
  - `FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
  - ,
  - `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
  - ,
  - `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
  - ,
  - `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU` = 1<<19 ,
  - `NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
  - `AUTO_DELETE_USER_DATA` = 1<<23 ,
  - `MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
  - `USERFLAG1` = 1<<31 }
- flags possible values enumeration.*

### 13.103.1 Detailed Description

Displays a progress bar for the user.

## 13.103.2 Constructor & Destructor Documentation

### 13.103.2.1 Fl\_Progress()

```
Fl_Progress::Fl_Progress (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor creates the progress bar using the position, size, and label.

You can set the background color with [color\(\)](#) and the progress bar color with [selection\\_color\(\)](#), or you can set both colors together with [color\(unsigned bg, unsigned sel\)](#).

The default colors are FL\_BACKGROUND2\_COLOR and FL\_YELLOW, resp.

## 13.103.3 Member Function Documentation

### 13.103.3.1 draw()

```
void Fl_Progress::draw (
 void) [override], [protected], [virtual]
```

Draws the progress bar.

Implements [Fl\\_Widget](#).

### 13.103.3.2 maximum() [1/2]

```
float Fl_Progress::maximum () const [inline]
```

Gets the maximum value in the progress widget.

### 13.103.3.3 maximum() [2/2]

```
void Fl_Progress::maximum (
 float v) [inline]
```

Sets the maximum value in the progress widget.

### 13.103.3.4 minimum() [1/2]

```
float Fl_Progress::minimum () const [inline]
```

Gets the minimum value in the progress widget.

### 13.103.3.5 minimum() [2/2]

```
void Fl_Progress::minimum (
 float v) [inline]
```

Sets the minimum value in the progress widget.

### 13.103.3.6 value() [1/2]

```
float Fl_Progress::value () const [inline]
```

Gets the current value in the progress widget.

**13.103.3.7 value() [2/2]**

```
void Fl_Progress::value (
 float v) [inline]
```

Sets the current value in the progress widget.

The documentation for this class was generated from the following files:

- `Fl_Progress.H`
- `Fl_Progress.cxx`

**13.104 Fl\_Radio\_Button Class Reference**

Inheritance diagram for `Fl_Radio_Button`:

**Public Member Functions**

- `Fl_Radio_Button` (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*

**Public Member Functions inherited from `Fl_Button`**

- `int clear ()`  
*Same as `value (0)`.*
- `uchar compact () const`  
*Return true if buttons are rendered as compact buttons.*
- `void compact (uchar v)`  
*Decide if buttons should be rendered in compact mode.*
- `Fl_Boxtype down_box () const`  
*Returns the current down box type, which is drawn when `value()` is non-zero.*
- `void down_box (Fl_Boxtype b)`  
*Sets the down box type.*
- `Fl_Color down_color () const`  
*(for backwards compatibility)*
- `void down_color (unsigned c)`  
*(for backwards compatibility)*
- `Fl_Button` (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*
- `int handle (int) override`  
*Handles the specified event.*
- `int set ()`  
*Same as `value (1)`.*
- `void setonly ()`  
*Turns on this button and turns off all other radio buttons in the group (calling `value (1)` or `set ()` does not do this).*
- `int shortcut () const`

- Returns the current shortcut key for the button.*
  - void **shortcut** (const char \*s)  
*(for backwards compatibility)*
  - void **shortcut** (int s)  
*Sets the shortcut key to s.*
  - char **value** () const  
*Returns the current value of the button (0 or 1).*
  - int **value** (int v)  
*Sets the current value of the button.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align** align () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an FI\_Gl\_Window pointer if this widget is an FI\_Gl\_Window.*
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FI\_Group** \* **as\_group** ()  
*Returns an FI\_Group pointer if this widget is an FI\_Group.*
- virtual **FI\_Group** const \* **as\_group** () const
- virtual **FI\_Window** \* **as\_window** ()  
*Returns an FI\_Window pointer if this widget is an FI\_Window.*
- virtual **FI\_Window** const \* **as\_window** () const
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI\_Boxtype** box () const  
*Gets the box type of the widget.*
- void **box** (**FI\_Boxtype** new\_box)  
*Sets the box type for the widget.*
- **FI\_Callback\_p** callback () const  
*Gets the current callback function for the widget.*

- void `callback` (`FI_Callback` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (`uchar` c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FI_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)

- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - virtual void `hide` ()
- Makes a widget invisible.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

  - void `horizontal_label_margin` (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

  - `FL_Image` \* `image` ()
- Gets the image that is used as part of the widget label when in the active state.*

  - const `FL_Image` \* `image` () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void `image` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void `image` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int `image_bound` () const
- Returns whether the image is managed by the widget.*

  - int `inside` (const `FL_Widget` \*wgt) const
- Checks if this widget is a child of wgt.*

  - int `is_label_copied` () const
- Returns whether the current label was assigned with `copy_label()`.*

  - const char \* `label` () const
- Gets the current label text.*

  - void `label` (const char \*text)
- Sets the current label pointer.*

  - void `label` (`FL_Labeltype` a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int `label_image_spacing` ()
- Return the gap size between the label and the image.*

  - void `label_image_spacing` (int gap)
- Set the gap between the label and the image in pixels.*

  - `FL_Color` `labelcolor` () const
- Gets the label color.*

  - void `labelcolor` (`FL_Color` c)
- Sets the label color.*

  - `FL_Font` `labelfont` () const
- Gets the font to use.*

- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fontsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([FL\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [FL\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([FL\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

- Makes a widget visible.*

  - void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*

- int **y** () const  
*Gets the widget position in its window.*
- virtual **~FI\_Widget** ()  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from **FI\_Widget**

- static void **default\_callback** (**FI\_Widget** \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from **FI\_Widget**

## 13.104.1 Constructor & Destructor Documentation

### 13.104.1.1 `Fl_Radio_Button()`

```
Fl_Radio_Button::Fl_Radio_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor creates the button using the given position, size, and label. The Button `type()` is set to `FL_RADIO_BUTTON`.

#### Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

The documentation for this class was generated from the following files:

- `Fl_Radio_Button.H`
- `Fl_Button.cxx`

## 13.105 FI\_Radio\_Light\_Button Class Reference

Inheritance diagram for FI\_Radio\_Light\_Button:

### Public Member Functions

- **FI\_Radio\_Light\_Button** (int X, int Y, int W, int H, const char \*l=0)

### Public Member Functions inherited from FI\_Light\_Button

- **FI\_Light\_Button** (int x, int y, int w, int h, const char \*l=0)  
*Creates a new FI\_Light\_Button widget using the given position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*

### Public Member Functions inherited from FI\_Button

- int **clear** ()  
*Same as value (0).*
- uchar **compact** () const  
*Return true if buttons are rendered as compact buttons.*
- void **compact** (uchar v)  
*Decide if buttons should be rendered in compact mode.*
- FI\_Boxtype **down\_box** () const  
*Returns the current down box type, which is drawn when value() is non-zero.*
- void **down\_box** (FI\_Boxtype b)  
*Sets the down box type.*
- FI\_Color **down\_color** () const  
*(for backwards compatibility)*
- void **down\_color** (unsigned c)  
*(for backwards compatibility)*
- **FI\_Button** (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*
- int **set** ()  
*Same as value (1).*
- void **setonly** ()  
*Turns on this button and turns off all other radio buttons in the group (calling value (1) or set () does not do this).*
- int **shortcut** () const  
*Returns the current shortcut key for the button.*
- void **shortcut** (const char \*s)  
*(for backwards compatibility)*
- void **shortcut** (int s)

- Sets the shortcut key to `s`.*

  - char **value** () const
  - Returns the current value of the button (0 or 1).*
  - int **value** (int v)
  - Sets the current value of the button.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()
  - Activates the widget.*
- unsigned int **active** () const
  - Returns whether the widget is active.*
- int **active\_r** () const
  - Returns whether the widget and all of its parents are active.*
- FI\_Align **align** () const
  - Gets the label alignment.*
- void **align** (FI\_Align alignment)
  - Sets the label alignment.*
- long **argument** () const
  - Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
  - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class FI\_GL\_Window \* **as\_gl\_window** ()
  - Returns an FI\_GL\_Window pointer if this widget is an FI\_GL\_Window.*
- virtual class FI\_GL\_Window const \* **as\_gl\_window** () const
- virtual FI\_Group \* **as\_group** ()
  - Returns an FI\_Group pointer if this widget is an FI\_Group.*
- virtual FI\_Group const \* **as\_group** () const
- virtual FI\_Window \* **as\_window** ()
  - Returns an FI\_Window pointer if this widget is an FI\_Window.*
- virtual FI\_Window const \* **as\_window** () const
- void **bind\_deimage** (FI\_Image \*img)
  - Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)
  - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (FI\_Image \*img)
  - Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)
  - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- FI\_Boxtype **box** () const
  - Gets the box type of the widget.*
- void **box** (FI\_Boxtype new\_box)
  - Sets the box type for the widget.*
- FI\_Callback\_p **callback** () const
  - Gets the current callback function for the widget.*
- void **callback** (FI\_Callback \*cb)
  - Sets the current callback function for the widget.*
- void **callback** (FI\_Callback \*cb, FI\_Callback\_User\_Data \*p, bool auto\_free)
  - Sets the current callback function and managed user data for the widget.*

- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- uchar [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)  
*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

- Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FI\\_Widget](#) \*widget, long arg, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FI\\_Widget](#) \*widget, void \*arg=0, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FI\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FI\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FI\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FI\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FI\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FI\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FI\\_Color](#) c)  
*Sets the label color.*
- [FI\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FI\\_Font](#) f)  
*Sets the font to use.*
- [FI\\_Fonsize](#) [labelsizes](#) () const  
*Gets the font size in pixels.*

- void `labelsize` (`Fl_Fontsize` pix)  
*Sets the font size in pixels.*
- `Fl_Labeltype` `labeltype` () const  
*Gets the label type.*
- void `labeltype` (`Fl_Labeltype` a)  
*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const  
*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const  
*Returns if a widget is used for output only.*
- `Fl_Group` \* `parent` () const  
*Returns a pointer to the parent widget.*
- void `parent` (`Fl_Group` \*p)  
*Internal use only - "for hacks only".*
- void `position` (int X, int Y)  
*Repositions the window or widget.*
- void `redraw` ()  
*Schedules the drawing of the widget.*
- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- `Fl_Color` `selection_color` () const  
*Gets the selection color.*
- void `selection_color` (`Fl_Color` a)  
*Sets the selection color.*
- int `send` (int event)  
*Sends the specified event to the widget.*
- void `set_active` ()  
*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()  
*Marks the value of the widget as changed.*
- void `set_output` ()  
*Sets a widget to output only.*
- void `set_visible` ()  
*Makes the widget visible.*
- void `set_visible_focus` ()  
*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()  
*Makes a widget visible.*
- void `size` (int W, int H)  
*Changes the size of the widget.*
- int `take_focus` ()

- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*
- int [y](#) () const

*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()

*Destroys the widget.*

## Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

*Sets the down box type.*
- [FI\\_Color down\\_color](#) () const  
*(for backwards compatibility)*
- void [down\\_color](#) (unsigned c)  
*(for backwards compatibility)*
- [FI\\_Button](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*
- int [set](#) ()  
*Same as `value(1)`.*
- void [setonly](#) ()  
*Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*
- int [shortcut](#) () const  
*Returns the current shortcut key for the button.*
- void [shortcut](#) (const char \*s)  
*(for backwards compatibility)*
- void [shortcut](#) (int s)  
*Sets the shortcut key to `s`.*
- char [value](#) () const  
*Returns the current value of the button (0 or 1).*
- int [value](#) (int v)  
*Sets the current value of the button.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*

- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align](#) align () const  
*Gets the label alignment.*
- void [align](#) ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FL\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- virtual [FL\\_Group](#) const \* [as\\_group](#) () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) box () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) callback () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*

- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()

- Get the spacing between the label and the horizontal edge of the widget.*

  - void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

  - [FL\\_Image](#) \* [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*

  - const [FL\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FL\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([FL\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [FL\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([FL\\_Color](#) c)
- Sets the label color.*

  - [FL\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([FL\\_Font](#) f)
- Sets the font to use.*

  - [FL\\_Fonsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([FL\\_Fonsize](#) pix)
- Sets the font size in pixels.*

  - [FL\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([FL\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

- `Fl_Group * parent ()` const  
*Returns a pointer to the parent widget.*
- `void parent (Fl_Group *p)`  
*Internal use only - "for hacks only".*
- `void position (int X, int Y)`  
*Repositions the window or widget.*
- `void redraw ()`  
*Schedules the drawing of the widget.*
- `void redraw_label ()`  
*Schedules the drawing of the label.*
- `virtual void resize (int x, int y, int w, int h)`  
*Changes the size or position of the widget.*
- `Fl_Color selection_color ()` const  
*Gets the selection color.*
- `void selection_color (Fl_Color a)`  
*Sets the selection color.*
- `int send (int event)`  
*Sends the specified event to the widget.*
- `void set_active ()`  
*Marks the widget as active without sending events or changing focus.*
- `void set_changed ()`  
*Marks the value of the widget as changed.*
- `void set_output ()`  
*Sets a widget to output only.*
- `void set_visible ()`  
*Makes the widget visible.*
- `void set_visible_focus ()`  
*Enables keyboard focus navigation with this widget.*
- `int shortcut_label ()` const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- `void shortcut_label (int value)`  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- `virtual void show ()`  
*Makes a widget visible.*
- `void size (int W, int H)`  
*Changes the size of the widget.*
- `int take_focus ()`  
*Gives the widget the keyboard focus.*
- `unsigned int takeevents ()` const  
*Returns if the widget is able to take events.*
- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip ()` const  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window ()` const  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type ()` const

- Gets the widget type.*
- void **type** (uchar t)
  - Sets the widget type.*
- int **use\_accents\_menu** ()
  - Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const
  - Gets the user data for this widget.*
- void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)
  - Sets the user data for this widget.*
- void **user\_data** (void \*v)
  - Sets the user data for this widget.*
- int **vertical\_label\_margin** ()
  - Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)
  - Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const
  - Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const
  - Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)
  - Modifies keyboard focus navigation.*
- int **visible\_r** () const
  - Returns whether a widget and all its parents are visible.*
- int **w** () const
  - Gets the widget width.*
- **FI\_When when** () const
  - Returns the conditions under which the callback is called.*
- void **when** (uchar i)
  - Sets the flags used to decide when a callback is called.*
- **FI\_Window \* window** () const
  - Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const
  - Gets the widget position in its window.*
- int **y** () const
  - Gets the widget position in its window.*
- virtual **~FI\_Widget** ()
  - Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void **default\_callback** (FI\_Widget \*widget, void \*data)
  - The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)
  - Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)
  - Returns true if the given text t contains the entered '&x' shortcut.*

## 13.106.1 Constructor & Destructor Documentation

### 13.106.1.1 Fl\_Radio\_Round\_Button()

```
Fl_Radio_Round_Button::Fl_Radio_Round_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new **Fl\_Radio\_Button** widget using the given position, size, and label string. The button **type()** is set to FL\_RADIO\_BUTTON.

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- Fl\_Radio\_Round\_Button.H
- Fl\_Round\_Button.cxx

## 13.107 Fl\_Rect Class Reference

Rectangle with standard FLTK coordinates (X, Y, W, H).

```
#include <Fl_Rect.H>
```

### Public Member Functions

- int **b** () const

*gets the bottom edge (y + h).*

- void **b** (int B)

*sets the height based on B and y*

- **bool contains** (int X, int Y) const

- **Fl\_Rect** ()

*The default constructor creates an empty rectangle (x = y = w = h = 0).*

- **Fl\_Rect** (const **Fl\_Widget** &widget)

*This constructor creates a rectangle based on a widget's position and size.*

- **FI\_Rect** ([const FI\\_Widget](#) \*[const](#) widget)

*This constructor creates a rectangle based on a widget's position and size.*

- **FI\_Rect** ([int](#) W, [int](#) H)

*This constructor creates a rectangle with  $x = y = 0$  and the given width and height.*

- **FI\_Rect** ([int](#) X, [int](#) Y, [int](#) W, [int](#) H)

*This constructor creates a rectangle with the given  $x,y$  coordinates and the given width and height.*

- **FI\_Rect** ([int](#) X, [int](#) Y, [int](#) W, [int](#) H, [FI\\_Boxtype](#) bt)

*This constructor creates a rectangle with the given  $x,y$  coordinates and the given width and height reduced by the box frame size.*

- [int](#) **h** () [const](#)

*gets the height*

- [void](#) **h** ([int](#) H)

*sets the height*

- [void](#) **inset** ([FI\\_Boxtype](#) bt)

*Move all edges in by the frame size of box type  $bt$ .*

- [void](#) **inset** ([int](#) d)

*Move all edges in by  $d$ .*

- [void](#) **inset** ([int](#) left, [int](#) top, [int](#) right, [int](#) bottom)

*Move all edges in by  $left, top, right, bottom$ .*

- [int](#) **r** () [const](#)

*gets the right edge ( $x + w$ ).*

- [void](#) **r** ([int](#) R)

*sets the width based on  $R$  and  $x$*

- [int](#) **w** () [const](#)

*gets the width*

- [void](#) **w** ([int](#) W)

*sets the width*

- [int](#) **x** () [const](#)

*gets the  $x$  coordinate (left edge)*

- [void](#) **x** ([int](#) X)

*sets the  $x$  coordinate (left edge)*

- [int](#) **y** () [const](#)

*gets the  $y$  coordinate (top edge)*

- [void](#) **y** ([int](#) Y)

*sets the  $y$  coordinate (top edge)*

## Friends

- [bool](#) **operator!=** ([const FI\\_Rect](#) &lhs, [const FI\\_Rect](#) &rhs)
- [bool](#) **operator==** ([const FI\\_Rect](#) &lhs, [const FI\\_Rect](#) &rhs)

## 13.107.1 Detailed Description

Rectangle with standard FLTK coordinates (X, Y, W, H).

This may be used internally, for overloaded widget constructors and other overloaded methods like [fl\\_measure\(\)](#), [fl\\_text\\_extents\(\)](#), [fl\\_rect\(\)](#), [fl\\_rectf\(\)](#), and maybe more.

## 13.107.2 Constructor & Destructor Documentation

### 13.107.2.1 Fl\_Rect()

```
Fl_Rect::Fl_Rect (
 int X,
 int Y,
 int W,
 int H,
 Fl_Boxtype bt) [inline]
```

This constructor creates a rectangle with the given x,y coordinates and the given width and height reduced by the box frame size.

This is the same as using the constructor w/o `bt` and subsequently calling `inset(bt)`.

## 13.107.3 Member Function Documentation

### 13.107.3.1 b()

```
int Fl_Rect::b () const [inline]
```

gets the bottom edge (`y + h`).

#### Note

`r()` and `b()` are coordinates **outside** the area of the rectangle.

### 13.107.3.2 inset() [1/3]

```
void Fl_Rect::inset (
 Fl_Boxtype bt) [inline]
```

Move all edges in by the frame size of box type `bt`.

Shrinks the rectangle at all sides by the frame width or height of the given box type `bt`.

This method uses the frame sizes given by the box type `bt` using

- `Fl::box_dx(bt)`
- `Fl::box_dy(bt)`
- `Fl::box_dw(bt)`
- `Fl::box_dh(bt)`

If the rectangle is smaller than the frame sizes the result is undefined, i.e. an invalid or empty rectangle.

### 13.107.3.3 inset() [2/3]

```
void Fl_Rect::inset (
 int d) [inline]
```

Move all edges in by `d`.

Shrinks the rectangle by `d` at all sides keeping the center of the rectangle at the same spot.

If `d` is negative, the rectangle is enlarged.

If `d >= w()` or `h()` the result is undefined, i.e. an invalid or empty rectangle.

### 13.107.3.4 inset() [3/3]

```
void Fl_Rect::inset (
 int left,
 int top,
 int right,
 int bottom) [inline]
```

Move all edges in by `left`, `top`, `right`, `bottom`.

Shrinks the rectangle on all sides keeping the center of the rectangle at the same spot.

If any value is negative, the rectangle is enlarged.

Values are not range checked; it is possible to create an invalid or empty rectangle.

### 13.107.3.5 r()

```
int Fl_Rect::r () const [inline]
```

gets the right edge (x + w).

#### Note

`r()` and `b()` are coordinates **outside** the area of the rectangle.

The documentation for this class was generated from the following file:

- `Fl_Rect.H`

## 13.108 Fl\_Repeat\_Button Class Reference

The `Fl_Repeat_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

```
#include <Fl_Repeat_Button.H>
```

Inheritance diagram for `Fl_Repeat_Button`:

### Public Member Functions

- void **deactivate** ()
- `Fl_Repeat_Button` (int X, int Y, int W, int H, const char \*l=0)  
Creates a new `Fl_Repeat_Button` widget using the given position, size, and label string.
- int **handle** (int) override  
Handles the specified event.

### Public Member Functions inherited from `Fl_Button`

- int **clear** ()  
Same as `value(0)`.
- `uchar compact` () const  
Return true if buttons are rendered as compact buttons.
- void **compact** (`uchar` v)  
Decide if buttons should be rendered in compact mode.
- `Fl_Boxtype down_box` () const  
Returns the current down box type, which is drawn when `value()` is non-zero.
- void **down\_box** (`Fl_Boxtype` b)  
Sets the down box type.
- `Fl_Color down_color` () const  
(for backwards compatibility)
- void **down\_color** (unsigned c)  
(for backwards compatibility)
- `Fl_Button` (int X, int Y, int W, int H, const char \*L=0)  
The constructor creates the button using the given position, size, and label.
- int **set** ()

- Same as `value (1)`.
- void **setonly** ()
 

Turns on this button and turns off all other radio buttons in the group (calling `value (1)` or `set ()` does not do this).
  - int **shortcut** () const
 

Returns the current shortcut key for the button.
  - void **shortcut** (const char \*s)
 

(for backwards compatibility)
  - void **shortcut** (int s)
 

Sets the shortcut key to `s`.
  - char **value** () const
 

Returns the current value of the button (0 or 1).
  - int **value** (int v)
 

Sets the current value of the button.

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()
 

Activates the widget.
- unsigned int **active** () const
 

Returns whether the widget is active.
- int **active\_r** () const
 

Returns whether the widget and all of its parents are active.
- **FI\_Align align** () const
 

Gets the label alignment.
- void **align** (FI\_Align alignment)
 

Sets the label alignment.
- long **argument** () const
 

Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
 

Sets the current user data (long) argument that is passed to the callback function.
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()
 

Returns an **FI\_Gl\_Window** pointer if this widget is an **FI\_Gl\_Window**.
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FI\_Group** \* **as\_group** ()
 

Returns an **FI\_Group** pointer if this widget is an **FI\_Group**.
- virtual **FI\_Group** const \* **as\_group** () const
- virtual **FI\_Window** \* **as\_window** ()
 

Returns an **FI\_Window** pointer if this widget is an **FI\_Window**.
- virtual **FI\_Window** const \* **as\_window** () const
- void **bind\_deimage** (FI\_Image \*img)
 

Sets the image to use as part of the widget label when in the inactive state.
- void **bind\_deimage** (int f)
 

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind\_image** (FI\_Image \*img)
 

Sets the image to use as part of the widget label when in the active state.
- void **bind\_image** (int f)
 

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- **FI\_Boxtype box** () const
 

Gets the box type of the widget.

- void `box` (`FI_Boxtype` new\_box)  
*Sets the box type for the widget.*
- `FI_Callback_p` `callback` () const  
*Gets the current callback function for the widget.*
- void `callback` (`FI_Callback` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (`uchar` c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FI_Image` \* `deimage` ()

- Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
- Gets the widget height.*
- virtual void [hide](#) ()
- Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const
- Gets the current label text.*
- void [label](#) (const char \*text)
- Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

- void [labelcolor](#) ([Fl\\_Color](#) c)  
*Sets the label color.*
- [Fl\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([Fl\\_Font](#) f)  
*Sets the font to use.*
- [Fl\\_Fontsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

*Makes a widget visible.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*
- void [type](#) ([uchar](#) t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [FI\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)

*Sets the flags used to decide when a callback is called.*

- `FI_Window * window () const`  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`  
*Gets the widget position in its window.*
- `int y () const`  
*Gets the widget position in its window.*
- `virtual ~FI_Widget ()`  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Widget`

- `static void default_callback (FI_Widget *widget, void *data)`  
*The default callback for all widgets that don't set a callback.*
- `static unsigned int label_shortcut (const char *t)`  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- `static int test_shortcut (const char *, const bool require_alt=false)`  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from `FI_Widget`

- `enum {`  
`INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,`  
`FORCE_POSITION = 1<<4 , NON_MODAL = 1<<5 , SHORTCUT_LABEL = 1<<6 , CHANGED = 1<<7`  
`,`  
`OVERRIDE = 1<<8 , VISIBLE_FOCUS = 1<<9 , COPIED_LABEL = 1<<10 , CLIP_CHILDREN = 1<<11`  
`,`  
`MENU_WINDOW = 1<<12 , TOOLTIP_WINDOW = 1<<13 , MODAL = 1<<14 , NO_OVERLAY = 1<<15`  
`,`  
`GROUP_RELATIVE = 1<<16 , COPIED_TOOLTIP = 1<<17 , FULLSCREEN = 1<<18 , MAC_USE_ACCENTS_MENU`  
`= 1<<19 ,`  
`NEEDS_KEYBOARD = 1<<20 , IMAGE_BOUND = 1<<21 , DEIMAGE_BOUND = 1<<22 ,`  
`AUTO_DELETE_USER_DATA = 1<<23 ,`  
`MAXIMIZED = 1<<24 , POPUP = 1<<25 , USERFLAG3 = 1<<29 , USERFLAG2 = 1<<30 ,`  
`USERFLAG1 = 1<<31 }`  
*flags possible values enumeration.*

### Protected Member Functions inherited from `FI_Button`

- `void draw () override`  
*Draws the widget.*
- `void simulate_key_action ()`

### Protected Member Functions inherited from `FI_Widget`

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FI_Boxtype t, FI_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const`

- Draws a box of type `t`, of color `c` at the position `X,Y` and size `W,H`.*
- void `draw_focus` () const
- Draws a focus rectangle around the widget.*
- void `draw_focus` (`Fl_Boxtype` `t`, int `X`, int `Y`, int `W`, int `H`) const
- Draws a focus rectangle around the widget.*
- void `draw_focus` (`Fl_Boxtype` `t`, int `x`, int `y`, int `w`, int `h`, `Fl_Color` `bg`) const
- Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const
- Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- `Fl_Widget` (int `x`, int `y`, int `w`, int `h`, const char \*`label=0L`)
- Creates a widget at the given position and size.*
- unsigned int `flags` () const
- Gets the widget flags mask.*
- void `h` (int `v`)
- Internal use only.*
- void `set_flag` (unsigned int `c`)
- Sets a flag in the flags mask.*
- void `w` (int `v`)
- Internal use only.*
- void `x` (int `v`)
- Internal use only.*
- void `y` (int `v`)
- Internal use only.*

## Static Protected Member Functions inherited from `Fl_Button`

- static void `key_release_timeout` (void \*)

## Static Protected Attributes inherited from `Fl_Button`

- static `Fl_Widget_Tracker` \* `key_release_tracker` = 0

### 13.108.1 Detailed Description

The `Fl_Repeat_Button` is a subclass of `Fl_Button` that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down.

The speed of the repeat is fixed and depends on the implementation.

### 13.108.2 Constructor & Destructor Documentation

#### 13.108.2.1 `Fl_Repeat_Button()`

```
Fl_Repeat_Button::Fl_Repeat_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Repeat_Button` widget using the given position, size, and label string. The default boxtype is `FL_UP_BOX`. Deletes the button.

### 13.108.3 Member Function Documentation

#### 13.108.3.1 `handle()`

```
int Fl_Repeat_Button::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Button](#).

The documentation for this class was generated from the following files:

- [Fl\\_Repeat\\_Button.H](#)
- [Fl\\_Repeat\\_Button.cxx](#)

## 13.109 [Fl\\_Return\\_Button](#) Class Reference

The [Fl\\_Return\\_Button](#) is a subclass of [Fl\\_Button](#) that generates a callback when it is pressed or when the user presses the Enter key.

```
#include <Fl_Return_Button.H>
```

Inheritance diagram for [Fl\\_Return\\_Button](#):

#### Public Member Functions

- [Fl\\_Return\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)

Creates a new `Fl_Return_Button` widget using the given position, size, and label string.

- `int handle (int)` override  
Handles the specified event.

## Public Member Functions inherited from `Fl_Button`

- `int clear ()`  
Same as `value (0)`.
- `uchar compact () const`  
Return true if buttons are rendered as compact buttons.
- `void compact (uchar v)`  
Decide if buttons should be rendered in compact mode.
- `Fl_Boxtype down_box () const`  
Returns the current down box type, which is drawn when `value()` is non-zero.
- `void down_box (Fl_Boxtype b)`  
Sets the down box type.
- `Fl_Color down_color () const`  
(for backwards compatibility)
- `void down_color (unsigned c)`  
(for backwards compatibility)
- `Fl_Button (int X, int Y, int W, int H, const char *L=0)`  
The constructor creates the button using the given position, size, and label.
- `int set ()`  
Same as `value (1)`.
- `void setonly ()`  
Turns on this button and turns off all other radio buttons in the group (calling `value (1)` or `set ()` does not do this).
- `int shortcut () const`  
Returns the current shortcut key for the button.
- `void shortcut (const char *s)`  
(for backwards compatibility)
- `void shortcut (int s)`  
Sets the shortcut key to `s`.
- `char value () const`  
Returns the current value of the button (0 or 1).
- `int value (int v)`  
Sets the current value of the button.

## Public Member Functions inherited from `Fl_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
Activates the widget.
- `unsigned int active () const`  
Returns whether the widget is active.
- `int active_r () const`  
Returns whether the widget and all of its parents are active.
- `Fl_Align align () const`  
Gets the label alignment.
- `void align (Fl_Align alignment)`  
Sets the label alignment.
- `long argument () const`

- Gets the current user data (long) argument that is passed to the callback function.*

  - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

  - virtual class [Fl\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()
- Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).*

  - virtual class [Fl\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).*

  - virtual [Fl\\_Group](#) \* [as\\_group](#) ()
- Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*

  - virtual [Fl\\_Group](#) const \* [as\\_group](#) () const
  - virtual [Fl\\_Window](#) \* [as\\_window](#) ()
- Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*

  - virtual [Fl\\_Window](#) const \* [as\\_window](#) () const
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [bind\\_deimage](#) ([Fl\\_Image](#) \*img)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_deimage](#) (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_image](#) ([Fl\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

  - [Fl\\_Boxtype](#) [box](#) () const
- Gets the box type of the widget.*

  - void [box](#) ([Fl\\_Boxtype](#) new\_box)
- Sets the box type for the widget.*

  - [Fl\\_Callback\\_p](#) [callback](#) () const
- Gets the current callback function for the widget.*

  - void [callback](#) ([Fl\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([Fl\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*

  - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

  - void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_damage](#) (uchar c=0)
- Clears or sets the damage flags.*

  - void [clear\\_output](#) ()
- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()
- Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

  - [Fl\\_Color](#) [color](#) () const

- Gets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg)
- Sets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg, [Fl\\_Color](#) sel)
- Sets the background and selection color of the widget.*
- int [contains](#) (const [Fl\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*
- [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*
- void [deactivate](#) ()
- Deactivates the widget.*
- [Fl\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, long arg, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*arg=0, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [Fl\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
- Gets the widget height.*
- virtual void [hide](#) ()
- Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*
- [Fl\\_Image](#) \* [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*
- const [Fl\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

- void [image](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [Fl\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([Fl\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [Fl\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([Fl\\_Color](#) c)  
*Sets the label color.*
- [Fl\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*

*Sets the font to use.*
- [Fl\\_Fontsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()

- Schedules the drawing of the widget.*

  - void `redraw_label` ()
- Schedules the drawing of the label.*

  - virtual void `resize` (int `x`, int `y`, int `w`, int `h`)
- Changes the size or position of the widget.*

  - `Fl_Color` `selection_color` () const
- Gets the selection color.*

  - void `selection_color` (`Fl_Color` `a`)
- Sets the selection color.*

  - int `send` (int `event`)
- Sends the specified event to the widget.*

  - void `set_active` ()
- Marks the widget as active without sending events or changing focus.*

  - void `set_changed` ()
- Marks the value of the widget as changed.*

  - void `set_output` ()
- Sets a widget to output only.*

  - void `set_visible` ()
- Makes the widget visible.*

  - void `set_visible_focus` ()
- Enables keyboard focus navigation with this widget.*

  - int `shortcut_label` () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void `shortcut_label` (int `value`)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void `show` ()
- Makes a widget visible.*

  - void `size` (int `W`, int `H`)
- Changes the size of the widget.*

  - int `take_focus` ()
- Gives the widget the keyboard focus.*

  - unsigned int `takeevents` () const
- Returns if the widget is able to take events.*

  - int `test_shortcut` ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* `tooltip` () const
- Gets the current tooltip text.*

  - void `tooltip` (const char \*`text`)
- Sets the Tooltip Text for a Widget.*

  - `Fl_Window` \* `top_window` () const
- Returns a pointer to the top-level window for the widget.*

  - `Fl_Window` \* `top_window_offset` (int &`xoff`, int &`yoff`) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - `uchar` `type` () const
- Gets the widget type.*

  - void `type` (`uchar` `t`)
- Sets the widget type.*

  - int `use_accents_menu` ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* `user_data` () const
- Gets the user data for this widget.*

- void **user\_data** ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()  
*Destroys the widget.*

### 13.109.1 Detailed Description

The [Fl\\_Return\\_Button](#) is a subclass of [Fl\\_Button](#) that generates a callback when it is pressed or when the user presses the Enter key.

A carriage-return symbol is drawn next to the button label.

Figure 13.37 [Fl\\_Return\\_Button](#)

### 13.109.2 Constructor & Destructor Documentation

#### 13.109.2.1 [Fl\\_Return\\_Button\(\)](#)

```
Fl_Return_Button::Fl_Return_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new [Fl\\_Return\\_Button](#) widget using the given position, size, and label string.

The default boxtype is `FL_UP_BOX`.

The inherited destructor deletes the button.

### 13.109.3 Member Function Documentation

#### 13.109.3.1 `draw()`

```
void Fl_Return_Button::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Button](#).

#### 13.109.3.2 `handle()`

```
int Fl_Return_Button::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses)

in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

## 13.110 Fl\_RGB\_Image Class Reference

The [Fl\\_RGB\\_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.

```
#include <Fl_Image.H>
```

Inheritance diagram for [Fl\\_RGB\\_Image](#):

#### Public Member Functions

- virtual [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) ()  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- virtual const [Fl\\_SVG\\_Image](#) \* [as\\_svg\\_image](#) () const  
*Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.*
- int **cache\_h** () const
- int **cache\_w** () const
- void [color\\_average](#) ([Fl\\_Color](#) c, float i) override  
*The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.*
- [Fl\\_Image](#) \* **copy** () const
- [Fl\\_Image](#) \* [copy](#) (int W, int H) const override  
*Creates a resized copy of the image.*
- void [desaturate](#) () override

- The *desaturate()* method converts an image to grayscale.
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) override
  - Draws the image to the current drawing surface with a bounding box.
- **FI\_RGB\_Image** (const **FI\_Pixmap** \*pxm, **FI\_Color** bg=FL\_GRAY)
  - The constructor creates a new RGBA image from the specified **FI\_Pixmap**.
- **FI\_RGB\_Image** (const **uchar** \*bits, int bits\_length, int W, int H, int D, int LD)
  - The constructor creates a new image from the specified data.
- **FI\_RGB\_Image** (const **uchar** \*bits, int W, int H, int D=3, int LD=0)
  - The constructor creates a new image from the specified data.
- void **label** (**FI\_Menu\_Item** \*m) override
  - This method is an obsolete way to set the image attribute of a menu item.
- void **label** (**FI\_Widget** \*w) override
  - This method is an obsolete way to set the image attribute of a widget or menu item.
- virtual void **normalize** ()
  - Makes sure the object is fully initialized.
- void **uncache** () override
  - If the image has been cached for display, delete the cache data.
- ~**FI\_RGB\_Image** () override
  - The destructor frees all memory and server resources that are used by the image.

## Public Member Functions inherited from **FI\_Image**

- virtual class **FI\_Shared\_Image** \* **as\_shared\_image** ()
  - Returns whether an image is an **FI\_Shared\_Image** or not.
- **FI\_Image** \* **copy** () const
  - Creates a copy of the image in the same size.
- int **count** () const
  - Returns the number of data values associated with the image.
- int **d** () const
  - Returns the image depth.
- const char \*const \* **data** () const
  - Returns a pointer to the current image data array.
- int **data\_h** () const
  - Returns the height of the image data.
- int **data\_w** () const
  - Returns the width of the image data.
- void **draw** (int X, int Y)
  - Draws the image to the current drawing surface.
- int **fail** () const
  - Returns a value that is not 0 if there is currently no image available.
- **FI\_Image** (int W, int H, int D)
  - The constructor creates an empty image with the specified width, height, and depth.
- int **h** () const
  - Returns the current image drawing height in FLTK units.
- void **inactive** ()
  - The *inactive()* method calls *color\_average(FL\_BACKGROUND\_COLOR, 0.33f)* to produce an image that appears grayed out.
- int **ld** () const
  - Returns the current line data size in bytes.
- virtual void **release** ()

*Releases an [FI\\_Image](#) - the same as 'delete this'.*

- virtual void [scale](#) (int width, int height, int proportional=1, int can\_expand=0)

*Sets the drawing size of the image.*

- int [w](#) () const

*Returns the current image drawing width in FLTK units.*

- virtual [~FI\\_Image](#) ()

*The destructor is a virtual method that frees all memory used by the image.*

### Static Public Member Functions

- static size\_t [max\\_size](#) ()

*Returns the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*

- static void [max\\_size](#) (size\_t size)

*Sets the maximum allowed image size in bytes when creating an [FI\\_RGB\\_Image](#) object.*

### Static Public Member Functions inherited from [FI\\_Image](#)

- static [FI\\_Labeltype](#) [define\\_FL\\_IMAGE\\_LABEL](#) ()

- static [FI\\_RGB\\_Scaling](#) [RGB\\_scaling](#) ()

*Returns the currently used RGB image scaling method.*

- static void [RGB\\_scaling](#) ([FI\\_RGB\\_Scaling](#))

*Sets the RGB image scaling method used for copy(int, int).*

- static [FI\\_RGB\\_Scaling](#) [scaling\\_algorithm](#) ()

*Gets what algorithm is used when resizing a source image to draw it.*

- static void [scaling\\_algorithm](#) ([FI\\_RGB\\_Scaling](#) algorithm)

*Sets what algorithm is used when resizing a source image to draw it.*

### Public Attributes

- int [alloc\\_array](#)

*If non-zero, the object's data array is delete[]'d when deleting the object.*

- const [uchar](#) \* [array](#)

*Points to the start of the object's data array.*

### Friends

- class [FI\\_Graphics\\_Driver](#)

### Additional Inherited Members

### Static Public Attributes inherited from [FI\\_Image](#)

- static const int [ERR\\_FILE\\_ACCESS](#) = -2

## Protected Member Functions inherited from [FI\\_Image](#)

- void **d** (int D)  
*Sets the current image depth.*
- void **data** (const char \*const \*p, int c)  
*Sets the current data pointer and count of pointers in the array.*
- void **draw\_empty** (int X, int Y)  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int **draw\_scaled** (int X, int Y, int W, int H)  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void **h** (int H)  
*Sets the height of the image data.*
- void **ld** (int LD)  
*Sets the current line data size in bytes.*
- void **w** (int W)  
*Sets the width of the image data.*

## Static Protected Member Functions inherited from [FI\\_Image](#)

- static void **labeltype** (const [FI\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [FI\\_Align](#) la)
- static void **measure** (const [FI\\_Label](#) \*lo, int &lw, int &lh)

### 13.110.1 Detailed Description

The [FI\\_RGB\\_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.

Images with an even number of channels are assumed to contain alpha information, which is used to blend the image with the contents of the screen. Functions `fl_write_png(const char *filename, FI_RGB_Image *img)` and `fl_write_jpeg(const char *filename, FI_RGB_Image *img)` allow to save any [FI\\_RGB\\_Image](#) object to a PNG or JPEG file, respectively. Both require linking to the `fltk_images` library.

[FI\\_RGB\\_Image](#) is defined in `<FL/FI_Image.H>`, however for compatibility reasons `<FL/FI_RGB_Image.H>` should be included.

### 13.110.2 Constructor & Destructor Documentation

#### 13.110.2.1 [FI\\_RGB\\_Image\(\)](#) [1/3]

```
FI_RGB_Image::FI_RGB_Image (
 const uchar * bits,
 int W,
 int H,
 int D = 3,
 int LD = 0)
```

The constructor creates a new image from the specified data.

The data array `bits` must contain sufficient data to provide  $W * H * D$  image bytes and optional line padding, see `LD`.

`W` and `H` are the width and height of the image in pixels, resp.

`D` is the image depth and can be:

- D=1: each `uchar` in `bits[]` is a grayscale pixel value
- D=2: each `uchar` pair in `bits[]` is a grayscale + alpha pixel value
- D=3: each `uchar` triplet in `bits[]` is an R/G/B pixel value
- D=4: each `uchar` quad in `bits[]` is an R/G/B/A pixel value

`LD` specifies the line data size of the array, see [FI\\_Image::ld\(int\)](#). If `LD` is zero, then  $W * D$  is assumed, otherwise `LD` must be greater than or equal to  $W * D$  to account for (unused) extra data per line (padding). The caller is responsible that the image data array `bits` persists as long as the image is used. This constructor sets [FI\\_RGB\\_Image::alloc\\_array](#) to 0. To have the image object control the deallocation of the data array `bits`, set `alloc_array` to non-zero after construction.

#### Parameters

in	<i>bits</i>	The image data array.
in	<i>W</i>	The width of the image in pixels.
in	<i>H</i>	The height of the image in pixels.
in	<i>D</i>	The image depth, or 'number of channels' (default=3).
in	<i>LD</i>	Line data size (default=0).

#### See also

[FI\\_Image::data\(\)](#), [FI\\_Image::w\(\)](#), [FI\\_Image::h\(\)](#), [FI\\_Image::d\(\)](#), [FI\\_Image::ld\(int\)](#)

### 13.110.2.2 FI\_RGB\_Image() [2/3]

```
FI_RGB_Image::FI_RGB_Image (
 const uchar * bits,
 int bits_length,
 int W,
 int H,
 int D,
 int LD)
```

The constructor creates a new image from the specified data.

If the provided array is too small to contain all the image data, the constructor will not generate the image to avoid illegal memory read access and instead set `data` to NULL and `ld` to `ERR_MEMORY_ACCESS`.

#### Parameters

<i>bits</i>	image data
<i>bits_length</i>	length of the <code>bits</code> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels
<i>D</i>	image depth in bytes, 1 for gray scale, 2 for gray with alpha, 3 for RGB, and 4 for RGB plus alpha
<i>LD</i>	line length in bytes, or 0 to use $W * D$ .

#### See also

[FI\\_RGB\\_Image\(const uchar \\*bits, int W, int H, int D, int LD\)](#)

### 13.110.2.3 FI\_RGB\_Image() [3/3]

```
FI_RGB_Image::FI_RGB_Image (
 const FI_Pixmap * pxm,
 FI_Color bg = FL_GRAY)
```

The constructor creates a new RGBA image from the specified [FI\\_Pixmap](#).

The RGBA image is built fully opaque except for the transparent area of the pixmap that is assigned the `bg` color with full transparency.

This constructor creates a new internal data array and sets [FI\\_RGB\\_Image::alloc\\_array](#) to 1 so the data array is deleted when the image is destroyed.

### 13.110.3 Member Function Documentation

#### 13.110.3.1 `as_svg_image()` [1/2]

```
virtual Fl_SVG_Image * Fl_RGB_Image::as_svg_image () [inline], [virtual]
```

Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented in [Fl\\_SVG\\_Image](#).

#### 13.110.3.2 `as_svg_image()` [2/2]

```
virtual const Fl_SVG_Image * Fl_RGB_Image::as_svg_image () const [inline], [virtual]
```

Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of const [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented in [Fl\\_SVG\\_Image](#).

#### 13.110.3.3 `color_average()`

```
void Fl_RGB_Image::color_average (
 Fl_Color c,
 float i) [override], [virtual]
```

The `color_average()` method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

Reimplemented in [Fl\\_SVG\\_Image](#).

#### 13.110.3.4 `copy()`

```
Fl_Image * Fl_RGB_Image::copy (
 int W,
 int H) const [override], [virtual]
```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl\\_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator `delete` for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

**Note**

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_Image](#).

Reimplemented in [Fl\\_SVG\\_Image](#).

**13.110.3.5 desaturate()**

```
void Fl_RGB_Image::desaturate () [override], [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_Image](#).

Reimplemented in [Fl\\_SVG\\_Image](#).

**13.110.3.6 draw()**

```
void Fl_RGB_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [override], [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments.

Another way to see what part of the image gets drawn and where, is to consider this alternative writing producing the same output:

```
fl_push_clip(X,Y,W,H);
this->draw(X - cx, Y - cy);
fl_pop_clip();
```

Repeated calls to this member function with the same image but varying W, H, cx, or cy arguments can be more efficiently processed using the above alternative writing.

Reimplemented from [Fl\\_Image](#).

Reimplemented in [Fl\\_SVG\\_Image](#).

**13.110.3.7 label() [1/2]**

```
void Fl_RGB_Image::label (
 Fl_Menu_Item * m) [override], [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

**Deprecated** Please use [Fl\\_Menu\\_Item::image\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

**13.110.3.8 label() [2/2]**

```
void Fl_RGB_Image::label (
 Fl_Widget * widget) [override], [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

**Deprecated** Please use [Fl\\_Widget::image\(\)](#) or [Fl\\_Widget::deimage\(\)](#) instead.

Reimplemented from [Fl\\_Image](#).

### 13.110.3.9 max\_size() [1/2]

```
static size_t Fl_RGB_Image::max_size () [inline], [static]
```

Returns the maximum allowed image size in bytes when creating an [Fl\\_RGB\\_Image](#) object.

See also

void [Fl\\_RGB\\_Image::max\\_size\(size\\_t\)](#)

### 13.110.3.10 max\_size() [2/2]

```
static void Fl_RGB_Image::max_size (
 size_t size) [inline], [static]
```

Sets the maximum allowed image size in bytes when creating an [Fl\\_RGB\\_Image](#) object.

The image size in bytes of an [Fl\\_RGB\\_Image](#) object is the value of the product  $w() * h() * d()$ . If this product exceeds size, the created object of a derived class of [Fl\\_RGB\\_Image](#) won't be loaded with the image data. This does not apply to direct RGB image creation with [Fl\\_RGB\\_Image::Fl\\_RGB\\_Image\(const uchar \\*bits, int W, int H, int D, int LD\)](#). The default [max\\_size\(\)](#) value is essentially infinite.

### 13.110.3.11 normalize()

```
virtual void Fl_RGB_Image::normalize () [inline], [virtual]
```

Makes sure the object is fully initialized.

In particular, makes sure member variable [array](#) is non-null.

Reimplemented in [Fl\\_SVG\\_Image](#).

### 13.110.3.12 uncache()

```
void Fl_RGB_Image::uncache () [override], [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [Fl\\_Image](#).

## 13.110.4 Member Data Documentation

### 13.110.4.1 array

```
const uchar* Fl_RGB_Image::array
```

Points to the start of the object's data array.

See also

class [Fl\\_SVG\\_Image](#) which delays initialization of this member variable.

The documentation for this class was generated from the following files:

- [Fl\\_Image.H](#)
- [Fl\\_Image.cxx](#)

## 13.111 Fl\_Roller Class Reference

The [Fl\\_Roller](#) widget is a "dolly" control commonly used to move 3D objects.

```
#include <Fl_Roller.H>
```

Inheritance diagram for [Fl\\_Roller](#):

### Public Member Functions

- [Fl\\_Roller](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Roller](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

### Public Member Functions inherited from [Fl\\_Valuator](#)

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int [format](#) (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string [format\\_str](#) ()  
*C++11 API for [Fl\\_Valuator::format\(char\\* buffer\)](#).*
- double [increment](#) (double, int)  
*Adds n times the step value to the passed value.*
- double [maximum](#) () const  
*Gets the maximum value for the valuator.*
- void [maximum](#) (double a)  
*Sets the maximum value for the valuator.*
- double [minimum](#) () const  
*Gets the minimum value for the valuator.*
- void [minimum](#) (double a)  
*Sets the minimum value for the valuator.*
- void [precision](#) (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void [range](#) (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double [round](#) (double)  
*Round the passed value to the nearest step increment.*
- double [step](#) () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [Fl\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [Fl\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [Fl\\_Valuator::step\(\)](#) const*
- double [value](#) () const

- *Gets the floating point(double) value.*
- int [value](#) (double)
  - *Sets the current value.*
- ~[FI\\_Valuator](#) () override
  - *Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()
  - *Activates the widget.*
- unsigned int [active](#) () const
  - *Returns whether the widget is active.*
- int [active\\_r](#) () const
  - *Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const
  - *Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)
  - *Sets the label alignment.*
- long [argument](#) () const
  - *Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
  - *Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()
  - *Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()
  - *Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()
  - *Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)
  - *Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)
  - *Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)
  - *Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)
  - *Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const
  - *Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)
  - *Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const
  - *Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)
  - *Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
  - *Sets the current callback function and managed user data for the widget.*

- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FI_Widget` \*widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FI_Widget` \*widget, void \*arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FI_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const

*Gets the widget height.*
- virtual void `hide` ()

*Makes a widget invisible.*
- int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- `FI_Image` \* `image` ()

*Gets the image that is used as part of the widget label when in the active state.*
- const `FI_Image` \* `image` () const

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FI_Image` &img)

*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FI_Image` \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FI_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FI_Color` c)

*Sets the label color.*
- `FI_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FI_Font` f)

*Sets the font to use.*
- `FI_Fontsize` `labelsize` () const

*Gets the font size in pixels.*

- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)  
*Changes the size or position of the widget.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()

- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- uchar [type](#) () const

*Gets the widget type.*
- void [type](#) (uchar t)

*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const

*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)

*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)

*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*
- int [y](#) () const

*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()

*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

### Protected Member Functions inherited from **FL\_Valuator**

- **FL\_Valuator** (int X, int Y, int W, int H, const char \*L)  
*Creates a new **FL\_Valuator** widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value\_damage** ()  
*Asks for partial redraw.*

### Protected Member Functions inherited from **FL\_Widget**

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **FL\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*

- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from **FL\_Widget**

- static void **default\_callback** (**FL\_Widget** \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from **FL\_Widget**

**USERFLAG1** = 1<<31 }  
*flags possible values enumeration.*

### 13.111.1 Detailed Description

The **FL\_Roller** widget is a "dolly" control commonly used to move 3D objects.

The roller can be controlled by clicking and dragging the mouse, by the corresponding arrow keys when the roller has the keyboard focus, or by the mouse wheels when the mouse pointer is positioned over the roller widget.

Figure 13.38 **FL\_Roller**

## 13.111.2 Constructor & Destructor Documentation

### 13.111.2.1 Fl\_Roller()

```
Fl_Roller::Fl_Roller (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Roller](#) widget using the given position, size, and label string.

The default boxtype is FL\_NO\_BOX.

Inherited destructor destroys the valuator.

## 13.111.3 Member Function Documentation

### 13.111.3.1 draw()

```
void Fl_Roller::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

### 13.111.3.2 handle()

```
int Fl_Roller::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## 13.112 FI\_Round\_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

```
#include <FI_Round_Button.H>
```

Inheritance diagram for FI\_Round\_Button:

### Public Member Functions

- [FI\\_Round\\_Button](#) (int *x*, int *y*, int *w*, int *h*, const char \*l=0)  
*Creates a new FI\_Round\_Button widget using the given position, size, and label string.*

### Public Member Functions inherited from FI\_Light\_Button

- [FI\\_Light\\_Button](#) (int *x*, int *y*, int *w*, int *h*, const char \*l=0)  
*Creates a new FI\_Light\_Button widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

### Public Member Functions inherited from FI\_Button

- int [clear](#) ()  
*Same as value(0).*
- [uchar compact](#) () const  
*Return true if buttons are rendered as compact buttons.*
- void [compact](#) (uchar *v*)  
*Decide if buttons should be rendered in compact mode.*
- [FI\\_Boxtype down\\_box](#) () const  
*Returns the current down box type, which is drawn when value() is non-zero.*
- void [down\\_box](#) (FI\_Boxtype *b*)  
*Sets the down box type.*
- [FI\\_Color down\\_color](#) () const  
*(for backwards compatibility)*

- void **down\_color** (unsigned c)  
*(for backwards compatibility)*
- **FI\_Button** (int X, int Y, int W, int H, const char \*L=0)  
*The constructor creates the button using the given position, size, and label.*
- int **set** ()  
*Same as `value(1)`.*
- void **setonly** ()  
*Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*
- int **shortcut** () const  
*Returns the current shortcut key for the button.*
- void **shortcut** (const char \*s)  
*(for backwards compatibility)*
- void **shortcut** (int s)  
*Sets the shortcut key to `s`.*
- char **value** () const  
*Returns the current value of the button (0 or 1).*
- int **value** (int v)  
*Sets the current value of the button.*

### Public Member Functions inherited from **FI\_Widget**

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FI\_Align align** () const  
*Gets the label alignment.*
- void **align** (**FI\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI\_Gl\_Window** \* **as\_gl\_window** ()  
*Returns an **FI\_Gl\_Window** pointer if this widget is an **FI\_Gl\_Window**.*
- virtual class **FI\_Gl\_Window** const \* **as\_gl\_window** () const
- virtual **FI\_Group** \* **as\_group** ()  
*Returns an **FI\_Group** pointer if this widget is an **FI\_Group**.*
- virtual **FI\_Group** const \* **as\_group** () const
- virtual **FI\_Window** \* **as\_window** ()  
*Returns an **FI\_Window** pointer if this widget is an **FI\_Window**.*
- virtual **FI\_Window** const \* **as\_window** () const
- void **bind\_deimage** (**FI\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (**FI\_Image** \*img)

- Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) (int f)

*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const

*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)

*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const

*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

*Sets a widget to accept input.*
- void [clear\\_visible](#) ()

*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const

*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)

*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)

*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const

*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- uchar [damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*

- int **damage\_resize** (int, int, int, int)  
*Internal use only.*
- void **deactivate** ()  
*Deactivates the widget.*
- **FL\_Image** \* **deimage** ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const **FL\_Image** \* **deimage** () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **deimage** (**FL\_Image** \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int **deimage\_bound** () const  
*Returns whether the inactive image is managed by the widget.*
- void **do\_callback** (**FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with default arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, long arg, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with arbitrary arguments.*
- void **do\_callback** (**FL\_Widget** \*widget, void \*arg=0, **FL\_Callback\_Reason** reason=**FL\_REASON\_UNKNOWN**)  
*Calls the widget callback function with arbitrary arguments.*
- void **draw\_label** (int, int, int, int, **FL\_Align**) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int **h** () const  
*Gets the widget height.*
- virtual void **hide** ()  
*Makes a widget invisible.*
- int **horizontal\_label\_margin** ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void **horizontal\_label\_margin** (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- **FL\_Image** \* **image** ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const **FL\_Image** \* **image** () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void **image** (**FL\_Image** &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **image** (**FL\_Image** \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int **image\_bound** () const  
*Returns whether the image is managed by the widget.*
- int **inside** (const **FL\_Widget** \*wgt) const  
*Checks if this widget is a child of wgt.*
- int **is\_label\_copied** () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* **label** () const  
*Gets the current label text.*
- void **label** (const char \*text)  
*Sets the current label pointer.*
- void **label** (**FL\_Labeltype** a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int **label\_image\_spacing** ()

- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*
- [FI\\_Color labelcolor](#) () const

*Gets the label color.*
- void [labelcolor](#) ([FI\\_Color](#) c)

*Sets the label color.*
- [FI\\_Font labelfont](#) () const

*Gets the font to use.*
- void [labelfont](#) ([FI\\_Font](#) f)

*Sets the font to use.*
- [FI\\_Fonsize labelsiz](#)e () const

*Gets the font size in pixels.*
- void [labelsiz](#)e ([FI\\_Fonsize](#) pix)

*Sets the font size in pixels.*
- [FI\\_Labeltype labeltyp](#)e () const

*Gets the label type.*
- void [labeltyp](#)e ([FI\\_Labeltype](#) a)

*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const

*Returns if a widget is used for output only.*
- [FI\\_Group \\* parent](#) () const

*Returns a pointer to the parent widget.*
- void [parent](#) ([FI\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [FI\\_Color selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*

- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

- Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual ~[Fl\\_Widget](#) ()  
*Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from [Fl\\_Widget](#)

- static [Fl\\_Widget\\_Tracker](#) \* **key\_release\_tracker** = 0

### 13.112.1 Detailed Description

Buttons generate callbacks when they are clicked by the user.

You control exactly when and how by changing the values for [type\(\)](#) and [when\(\)](#).

Figure 13.39 [Fl\\_Round\\_Button](#)

The `Fl_Round_Button` subclass displays the "on" state by turning on a light, rather than drawing pushed in. The shape of the "light" is initially set to `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_FOREGROUND_COLOR`.

## 13.112.2 Constructor & Destructor Documentation

### 13.112.2.1 `Fl_Round_Button()`

```
Fl_Round_Button::Fl_Round_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Round_Button` widget using the given position, size, and label string.

Figure 13.40 `Fl_Round_Button`

The `Fl_Round_Button` subclass displays the "ON" state by turning on a light, rather than drawing pushed in. The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark. The shape of the "light" is set with `down_box()` and its default value is `FL_ROUND_DOWN_BOX`. The color of the light when on is controlled with `selection_color()`, which defaults to `FL_FOREGROUND_COLOR` (usually black).

#### Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

The documentation for this class was generated from the following files:

- `Fl_Round_Button.H`
- `Fl_Round_Button.cxx`

## 13.113 `Fl_Round_Clock` Class Reference

A clock widget of type `FL_ROUND_CLOCK`.

```
#include <Fl_Round_Clock.H>
```

Inheritance diagram for `Fl_Round_Clock`:

#### Public Member Functions

- `Fl_Round_Clock` (int X, int Y, int W, int H, const char \*L=0)  
*Creates the clock widget, setting his type and box.*

### Public Member Functions inherited from FI\_Clock

- [FI\\_Clock](#) (int X, int Y, int W, int H, const char \*L=0)  
*Create an [FI\\_Clock](#) widget using the given position, size, and label string.*
- [FI\\_Clock](#) (uchar t, int X, int Y, int W, int H, const char \*L)  
*Create an [FI\\_Clock](#) widget using the given clock type t, position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- [~FI\\_Clock](#) ()  
*The destructor removes the clock.*

### Public Member Functions inherited from FI\_Clock\_Output

- [FI\\_Clock\\_Output](#) (int X, int Y, int W, int H, const char \*L=0)  
*Create a new [FI\\_Clock\\_Output](#) widget with the given position, size and label.*
- int [hour](#) () const  
*Returns the displayed hour (0 to 23).*
- int [minute](#) () const  
*Returns the displayed minute (0 to 59).*
- int [second](#) () const  
*Returns the displayed second (0 to 60, 60=leap second).*
- int [shadow](#) () const  
*Returns the shadow drawing mode of the hands.*
- void [shadow](#) (int mode)  
*Sets the shadow drawing mode of the hands.*
- [ulong value](#) () const  
*Returns the displayed time.*
- void [value](#) (int H, int m, int s)  
*Set the displayed time.*
- void [value](#) (ulong v)  
*Set the displayed time.*

### Public Member Functions inherited from FI\_Widget

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align align](#) () const  
*Gets the label alignment.*
- void [align](#) (FI\_Align alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

- virtual class [Fl\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [Fl\\_Group](#) \* **as\_group** ()  
*Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).*
- virtual [Fl\\_Group](#) const \* **as\_group** () const
- virtual [Fl\\_Window](#) \* **as\_window** ()  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- virtual [Fl\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype](#) **box** () const  
*Gets the box type of the widget.*
- void **box** ([Fl\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [Fl\\_Callback\\_p](#) **callback** () const  
*Gets the current callback function for the widget.*
- void **callback** ([Fl\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void **callback** ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void **callback** ([Fl\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void **callback** ([Fl\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void **callback** ([Fl\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int **changed** () const  
*Checks if the widget value changed since the last callback.*
- void **clear\_active** ()  
*Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()  
*Marks the value of the widget as unchanged.*
- void **clear\_damage** (uchar c=0)  
*Clears or sets the damage flags.*
- void **clear\_output** ()  
*Sets a widget to accept input.*
- void **clear\_visible** ()  
*Hides the widget.*
- void **clear\_visible\_focus** ()  
*Disables keyboard focus navigation with this widget.*
- [Fl\\_Color](#) **color** () const  
*Gets the background color of the widget.*
- void **color** ([Fl\\_Color](#) bg)  
*Sets the background color of the widget.*
- void **color** ([Fl\\_Color](#) bg, [Fl\\_Color](#) sel)  
*Sets the background and selection color of the widget.*

- int [contains](#) (const [Fl\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [Fl\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, long arg, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*arg=0, [Fl\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [Fl\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [Fl\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [Fl\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

- Returns whether the image is managed by the widget.*

  - int `inside` (const `FI_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FI_Color` c)

*Sets the label color.*
- `FI_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FI_Font` f)

*Sets the font to use.*
- `FI_Fonsize` `labelsize` () const

*Gets the font size in pixels.*
- void `labelsize` (`FI_Fonsize` pix)

*Sets the font size in pixels.*
- `FI_Labeltype` `labeltype` () const

*Gets the label type.*
- void `labeltype` (`FI_Labeltype` a)

*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FI_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FI_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*

- [Fl\\_Color selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()

- Get the spacing between the label and the vertical edge of the widget.*

  - void `vertical_label_margin` (int px)
- Set the spacing between the label and the vertical edge of the widget.*

  - unsigned int `visible` () const
- Returns whether a widget is visible.*

  - unsigned int `visible_focus` () const
- Checks whether this widget has a visible focus.*

  - void `visible_focus` (int v)
- Modifies keyboard focus navigation.*

  - int `visible_r` () const
- Returns whether a widget and all its parents are visible.*

  - int `w` () const
- Gets the widget width.*

  - `Fl_When` `when` () const
- Returns the conditions under which the callback is called.*

  - void `when` (uchar i)
- Sets the flags used to decide when a callback is called.*

  - `Fl_Window` \* `window` () const
- Returns a pointer to the nearest parent window up the widget hierarchy.*

  - int `x` () const
- Gets the widget position in its window.*

  - int `y` () const
- Gets the widget position in its window.*

  - virtual `~Fl_Widget` ()
- Destroys the widget.*

### Additional Inherited Members

### Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget` \*widget, void \*data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from `Fl_Widget`

- enum {  
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,  
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7  
,   
`OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11  
,   
`MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15

`USERFLAG1` = 1<<31 }  
*flags possible values enumeration.*

## Protected Member Functions inherited from FL\_Clock\_Output

- void **draw** () override  
*Draw clock with current position and size.*
- void **draw** (int X, int Y, int W, int H)  
*Draw clock with the given position and size.*

## Protected Member Functions inherited from FL\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **FL\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.113.1 Detailed Description

A clock widget of type FL\_ROUND\_CLOCK.  
Has no box.

## 13.113.2 Constructor & Destructor Documentation

### 13.113.2.1 `Fl_Round_Clock()`

```
Fl_Round_Clock::Fl_Round_Clock (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates the clock widget, setting his type and box.

Create an [Fl\\_Round\\_Clock](#) widget using the given position, size, and label string.

The clock type is `FL_ROUND_CLOCK` and the boxtype is `FL_NO_BOX`.

This constructor is the same as [Fl\\_Clock\(FL\\_ROUND\\_CLOCK, X, Y, W, H, L\)](#).

See also

[Fl\\_Clock\(uchar, int, int, int, int, const char \\*\)](#)

#### Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- `Fl_Round_Clock.H`
- `Fl_Clock.cxx`

## 13.114 `Fl_Scheme` Class Reference

Base class with static methods for future [Fl\\_Scheme](#) classes.

```
#include <Fl_Scheme.H>
```

### Static Public Member Functions

- static int [add\\_scheme\\_name](#) (const char \*name)  
*Add a scheme name to the list of known schemes.*
- static const char \*\* [names](#) ()  
*Return a list of all known scheme names.*
- static int [num\\_schemes](#) ()  
*Return the number of currently registered schemes.*
- static void [plastic\\_color\\_average](#) (int av)  
*Set the color average value of the 'plastic' scheme in percent.*

### 13.114.1 Detailed Description

Base class with static methods for future [Fl\\_Scheme](#) classes.

This class is intentionally not fully documented and is subject to change in future FLTK versions.

#### Note

Do not rely on details of this class.

#### Since

1.4.0

## 13.114.2 Member Function Documentation

### 13.114.2.1 add\_scheme\_name()

```
int Fl_Scheme::add_scheme_name (
 const char * name) [static]
```

Add a scheme name to the list of known schemes.

This method is public since FLTK 1.4.0 because derived classes of [Fl\\_Scheme](#) are not yet implemented. Thus, users implementing their own schemes can use this method to add the scheme name to the list of known schemes which is for instance used in [Fl\\_Scheme::names\(\)](#).

#### Note

**Attention!** In a future version, when subclasses of [Fl\\_Scheme](#) will be implemented, this method will either be replaced by another `protected` method or it will no longer do anything (kept only for backwards compatibility).

The new scheme name must consist of valid ASCII characters as described below:

- lowercase letters 'a' - 'z'
- numbers '0' - '9'
- any character in "\$+\_. " (w/o the quotes).

The name must not be longer than 12 ASCII characters (bytes). The new scheme name is added to the **end** of the **unordered** list.

#### Note

Call this method only once for each scheme name. If the returned value is  $\leq 0$  you should check the scheme name.

The given scheme `name` is copied and may be freed directly after the call to [add\\_scheme\\_name\(\)](#).

#### Parameters

in	<i>name</i>	New scheme name
----	-------------	-----------------

#### Returns

The new number of schemes if the name was successfully added. This is the same as the index of the scheme + 1.

#### Return values

0	Scheme name already exists
-1	Invalid character(s) in <i>name</i>
-2	The <i>name</i> is too long

#### Since

1.4.0

### 13.114.2.2 names()

```
const char ** Fl_Scheme::names () [static]
```

Return a list of all known scheme names.

This list is only valid until a new scheme is added or one is removed. It is possible that scheme names are appended to the list during the runtime of the program but schemes can't be removed.

Getting the list of known schemes can be useful to populate a menu of scheme choices to let the user select a scheme. You should process the names immediately and you should never store a pointer to the list or any individual name for later reference because the location of the list can be changed (reallocated) when schemes are added.

The list of scheme names is nul-terminated.

#### Note

Currently (since FLTK 1.4.0) schemes can only be added and can't be removed from the list. This may change in a later version.

#### Returns

List of currently known scheme names.

### 13.114.2.3 num\_schemes()

```
static int Fl_Scheme::num_schemes () [inline], [static]
```

Return the number of currently registered schemes.

#### Returns

Number of registered schemes.

### 13.114.2.4 plastic\_color\_average()

```
void Fl_Scheme::plastic_color_average (
 int av) [static]
```

Set the color average value of the 'plastic' scheme in percent.

Legal values are in the range [ 10 ... 100 ], other values are clamped. The default value is 75 which is backwards compatible with FLTK 1.4 and earlier.

Higher values make the colors in boxes etc. appear "more gray" whereas lower values make colors appear more like the original color. The recommended value is about 40 to 60 but this is left to the user.

If this method is not called then the environment variable `FLTK_PLASTIC_AVERAGE` can be used to set the color average. The environment variable must be a pure numeric (integer) value in the given range, otherwise the behavior is undefined.

However, calling **this** method takes precedence over the environment variable. This method can be called at any time (e.g. to view dynamic changes). This will permanently change the appearance for all later box / background drawings.

For details see GitHub Issue 464: "RFE: plastic scheme with faithful colors".

#### Note

Program developers are supposed to use this method to apply "better" values than the default (1.↵4) look and feel. End users are supposed to use the environment variable for programs that **don't** use `Fl_Scheme::plastic_color_average()`.

Include the following header:

```
#include <FL/Fl_Scheme.H>
```

#### Parameters

in	av	color average value in the documented range.
----	----	----------------------------------------------

#### Since

1.5.0

The documentation for this class was generated from the following files:

- Fl\_Scheme.H

- [fl\\_plastic.cxx](#)
- [FI\\_Scheme.cxx](#)

## 13.115 FI\_Scheme\_Choice Class Reference

Inheritance diagram for FI\_Scheme\_Choice:

### Public Member Functions

- [FI\\_Scheme\\_Choice](#) (int X, int Y, int W, int H, const char \*L=0)  
*The constructor initializes the [FI\\_Scheme\\_Choice](#) object with all known schemes.*
- int [handle](#) (int event) override  
*Handle FLTK events.*
- virtual void [init\\_value](#) ()  
*Public method to initialize the value of the [FI\\_Scheme\\_Choice](#) widget.*

### Public Member Functions inherited from FI\_Choice

- [FI\\_Choice](#) (int X, int Y, int W, int H, const char \*L=0)  
*Create a new [FI\\_Choice](#) widget using the given position, size and label string.*
- int [value](#) () const  
*Gets the index of the last item chosen by the user.*
- int [value](#) (const [FI\\_Menu\\_Item](#) \*v)  
*Sets the currently selected value using a pointer to menu item.*
- int [value](#) (int v)  
*Sets the currently selected value using the index into the menu item array.*

### Public Member Functions inherited from FI\_Menu\_

- int [add](#) (const char \*)  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- int [add](#) (const char \*, int [shortcut](#), [FI\\_Callback](#) \*, void \*=0, int=0)  
*Adds a new menu item.*
- int [add](#) (const char \*a, const char \*b, [FI\\_Callback](#) \*c, void \*d=0, int e=0)  
*See int [FI\\_Menu\\_::add](#)(const char\* label, int shortcut, FI\_Callback\*, void \*user\_data=0, int flags=0)*
- void [clear](#) ()  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- int [clear\\_submenu](#) (int index)  
*Clears the specified submenu pointed to by *index* of all menu items.*
- void [copy](#) (const [FI\\_Menu\\_Item](#) \*m, void \*user\_data=0)  
*Sets the menu array pointer with a copy of m that will be automatically deleted.*

- **FL\_Boxtype down\_box ()** const  
*This box type is used to surround the currently-selected items in the menus.*
- void **down\_box (FL\_Boxtype b)**  
*Sets the box type used to surround the currently-selected items in the menus.*
- **FL\_Color down\_color ()** const  
*For back compatibility, same as [selection\\_color\(\)](#)*
- void **down\_color (unsigned c)**  
*For back compatibility, same as [selection\\_color\(\)](#)*
- int **find\_index (const char \*name)** const  
*Find the menu item index for a given menu *pathname*, such as "Edit/Copy".*
- int **find\_index (const FL\_Menu\_Item \*item)** const  
*Find the index into the menu array for a given *item*.*
- int **find\_index (FL\_Callback \*cb)** const  
*Find the index into the menu array for a given callback *cb*.*
- const **FL\_Menu\_Item \* find\_item (const char \*name)**  
*Find the menu item for a given menu *pathname*, such as "Edit/Copy".*
- const **FL\_Menu\_Item \* find\_item (FL\_Callback \*)**  
*Find the menu item for the given callback *cb*.*
- const **FL\_Menu\_Item \* find\_item\_with\_argument (long)**  
*Find the menu item for the given user argument *v*.*
- const **FL\_Menu\_Item \* find\_item\_with\_user\_data (void \*)**  
*Find the menu item for the given user data *v*.*
- **FL\_Menu\_ (int, int, int, int, const char \*\*=0)**  
*Creates a new [FL\\_Menu\\_](#) widget using the given position, size, and label string.*
- void **global ()**  
*Make the shortcuts for this menu work no matter what window has the focus when you type it.*
- int **insert (int index, const char \*, int shortcut, FL\_Callback \*, void \*\*=0, int e=0)**  
*Inserts a new menu item at the specified *index* position.*
- int **insert (int index, const char \*a, const char \*b, FL\_Callback \*c, void \*d=0, int e=0)**  
*See [int FL\\_Menu\\_::insert\(const char\\* label, int shortcut, FL\\_Callback\\*, void \\*user\\_data=0, int flags=0\)](#)*
- int **item\_pathname (char \*name, int namelen, const FL\_Menu\_Item \*finditem=0)** const  
*Get the menu 'pathname' for the specified menuitem.*
- const **FL\_Menu\_Item \* menu ()** const  
*Returns a pointer to the array of [FL\\_Menu\\_Items](#).*
- void **menu (const FL\_Menu\_Item \*m)**  
*Sets the menu array pointer directly.*
- **FL\_Boxtype menu\_box ()** const  
*Get the box type for the menu popup windows.*
- void **menu\_box (FL\_Boxtype b)**  
*Set the box type for the menu popup windows.*
- const **FL\_Menu\_Item \* menu\_end ()**  
*Finishes menu modifications and returns [menu\(\)](#).*
- int **mode (int i)** const  
*Get the flags of item *i*.*
- void **mode (int i, int fl)**  
*Set the flags of item *i*.*
- const **FL\_Menu\_Item \* mvalue ()** const  
*Return a pointer to the last menu item that was picked.*
- const **FL\_Menu\_Item \* picked (const FL\_Menu\_Item \*)**  
*When user picks a menu item, call this.*
- const **FL\_Menu\_Item \* prev\_mvalue ()** const

- Return a pointer to the menu item that was picked before the current one was picked.*

  - void **remove** (int)

*Deletes item *i* from the menu.*
- void **replace** (int, const char \*)

*Changes the text of item *i*.*
- void **setonly** (FI\_Menu\_Item \*item)

*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void **shortcut** (int i, int s)

*Change the shortcut of item *i* to *s*.*
- int **size** () const

*This returns the number of FI\_Menu\_Item structures that make up the menu, correctly counting submenus.*
- void **size** (int W, int H)
- const FI\_Menu\_Item \* **test\_shortcut** ()

*Returns the menu item with the entered shortcut (key value).*
- const char \* **text** () const

*Returns the title of the last item chosen.*
- const char \* **text** (int i) const

*Returns the title of item *i*.*
- FI\_Color **textcolor** () const

*Get the current color of menu item labels.*
- void **textcolor** (FI\_Color c)

*Sets the current color of menu item labels.*
- FI\_Font **textfont** () const

*Gets the current font of menu item labels.*
- void **textfont** (FI\_Font c)

*Sets the current font of menu item labels.*
- FI\_Fontsize **textsize** () const

*Gets the font size of menu item labels.*
- void **textsize** (FI\_Fontsize c)

*Sets the font size of menu item labels.*
- int **value** () const

*Return the index into the menu() of the last item chosen by the user.*
- int **value** (const FI\_Menu\_Item \*)

*Set the value of a menu to the menu item *m*.*
- int **value** (int i)

*Set the value of the menu to index *i*.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
  - void **\_set\_fullscreen** ()
  - void **activate** ()
- Activates the widget.*
- unsigned int **active** () const
- Returns whether the widget is active.*
- int **active\_r** () const
- Returns whether the widget and all of its parents are active.*
- FI\_Align **align** () const
- Gets the label alignment.*
- void **align** (FI\_Align alignment)
- Sets the label alignment.*

- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) box () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) callback () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*

- `Fl_Color color () const`  
*Gets the background color of the widget.*
- `void color (Fl_Color bg)`  
*Sets the background color of the widget.*
- `void color (Fl_Color bg, Fl_Color sel)`  
*Sets the background and selection color of the widget.*
- `int contains (const Fl_Widget *w) const`  
*Checks if w is a child of this widget.*
- `void copy_label (const char *new_label)`  
*Sets the current label.*
- `void copy_tooltip (const char *text)`  
*Sets the current tooltip text.*
- `uchar damage () const`  
*Returns non-zero if `draw()` needs to be called.*
- `void damage (uchar c)`  
*Sets the damage bits for the widget.*
- `void damage (uchar c, int x, int y, int w, int h)`  
*Sets the damage bits for an area inside the widget.*
- `int damage_resize (int, int, int, int)`  
*Internal use only.*
- `void deactivate ()`  
*Deactivates the widget.*
- `Fl_Image * deimage ()`  
*Gets the image that is used as part of the widget label when in the inactive state.*
- `const Fl_Image * deimage () const`  
*Gets the image that is used as part of the widget label when in the inactive state.*
- `void deimage (Fl_Image &img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void deimage (Fl_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `int deimage_bound () const`  
*Returns whether the inactive image is managed by the widget.*
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with default arguments.*
- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with arbitrary arguments.*
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`  
*Calls the widget callback function with arbitrary arguments.*
- `void draw_label (int, int, int, int, Fl_Align) const`  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- `int h () const`  
*Gets the widget height.*
- `virtual void hide ()`  
*Makes a widget invisible.*
- `int horizontal_label_margin ()`  
*Get the spacing between the label and the horizontal edge of the widget.*
- `void horizontal_label_margin (int px)`  
*Set the spacing between the label and the horizontal edge of the widget.*
- `Fl_Image * image ()`  
*Gets the image that is used as part of the widget label when in the active state.*
- `const Fl_Image * image () const`

- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FL\\_Widget](#) \*wgt) const

*Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const

*Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const

*Gets the current label text.*

  - void [label](#) (const char \*text)

*Sets the current label pointer.*

  - void [label](#) ([FL\\_Labeltype](#) a, const char \*b)

*Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()

*Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*

  - [FL\\_Color](#) [labelcolor](#) () const

*Gets the label color.*

  - void [labelcolor](#) ([FL\\_Color](#) c)

*Sets the label color.*

  - [FL\\_Font](#) [labelfont](#) () const

*Gets the font to use.*

  - void [labelfont](#) ([FL\\_Font](#) f)

*Sets the font to use.*

  - [FL\\_Fonsize](#) [labelsize](#) () const

*Gets the font size in pixels.*

  - void [labelsize](#) ([FL\\_Fonsize](#) pix)

*Sets the font size in pixels.*

  - [FL\\_Labeltype](#) [labeltype](#) () const

*Gets the label type.*

  - void [labeltype](#) ([FL\\_Labeltype](#) a)

*Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const

*Returns if a widget is used for output only.*

  - [FL\\_Group](#) \* [parent](#) () const

*Returns a pointer to the parent widget.*

  - void [parent](#) ([FL\\_Group](#) \*p)

*Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)

*Repositions the window or widget.*

- void `redraw` ()  
*Schedules the drawing of the widget.*
- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int `x`, int `y`, int `w`, int `h`)  
*Changes the size or position of the widget.*
- `Fl_Color` `selection_color` () const  
*Gets the selection color.*
- void `selection_color` (`Fl_Color` `a`)  
*Sets the selection color.*
- int `send` (int `event`)  
*Sends the specified event to the widget.*
- void `set_active` ()  
*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()  
*Marks the value of the widget as changed.*
- void `set_output` ()  
*Sets a widget to output only.*
- void `set_visible` ()  
*Makes the widget visible.*
- void `set_visible_focus` ()  
*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int `value`)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()  
*Makes a widget visible.*
- void `size` (int `W`, int `H`)  
*Changes the size of the widget.*
- int `take_focus` ()  
*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const  
*Returns if the widget is able to take events.*
- int `test_shortcut` ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const  
*Gets the current tooltip text.*
- void `tooltip` (const char \*`text`)  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &`xoff`, int &`yoff`) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const  
*Gets the widget type.*
- void `type` (`uchar` `t`)  
*Sets the widget type.*
- int `use_accents_menu` ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

- Gets the user data for this widget.*

  - void **user\_data** ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)

*Sets the user data for this widget.*

  - void **user\_data** (void \*v)

*Sets the user data for this widget.*

- int [vertical\\_label\\_margin](#) ()

*Get the spacing between the label and the vertical edge of the widget.*

- void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*

- unsigned int [visible](#) () const

*Returns whether a widget is visible.*

- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*

- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*

- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*

- int [w](#) () const

*Gets the widget width.*

- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*

- void [when](#) (uchar i)

*Sets the flags used to decide when a callback is called.*

- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*

- int [x](#) () const

*Gets the widget position in its window.*

- int [y](#) () const

*Gets the widget position in its window.*

- virtual [~Fl\\_Widget](#) ()

*Destroys the widget.*

### Static Protected Member Functions

- static void [scheme\\_cb\\_](#) ([Fl\\_Widget](#) \*w, void \*)

*Internal [Fl\\_Scheme\\_Choice](#) callback function (protected).*

### Additional Inherited Members

### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)

*The default callback for all widgets that don't set a callback.*

- static unsigned int [label\\_shortcut](#) (const char \*t)

*Returns the Unicode value of the '&x' shortcut in a given text.*

- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)

*Returns true if the given text t contains the entered '&x' shortcut.*

## Protected Types inherited from FI\_Widget

- [Fl\\_Fontsize](#) **textsize\_**

## 13.115.1 Constructor & Destructor Documentation

### 13.115.1.1 [Fl\\_Scheme\\_Choice](#)()

```
Fl_Scheme_Choice::Fl_Scheme_Choice (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor initializes the [Fl\\_Scheme\\_Choice](#) object with all known schemes.

#### Parameters

in	<i>X,Y</i>	Widget coordinates
in	<i>W,H</i>	Widget size (width, height)
in	<i>L</i>	Widget label (default: NULL, no label)

## 13.115.2 Member Function Documentation

### 13.115.2.1 [handle](#)()

```
int Fl_Scheme_Choice::handle (
 int event) [override], [virtual]
```

Handle FLTK events.

This widget uses FL\_SHOW and some other events to initialize its [value\(\)](#) according to the current scheme.

All events are also handled by the base class [Fl\\_Choice](#).

#### Parameters

in	<i>event</i>	
----	--------------	--

**Returns**

1 if the event was used, 0 otherwise

Reimplemented from [Fl\\_Choice](#).

**13.115.2.2 init\_value()**

```
void Fl_Scheme_Choice::init_value () [virtual]
```

Public method to initialize the value of the [Fl\\_Scheme\\_Choice](#) widget.

Normally you don't need to call this unless you change the current scheme by calling [Fl::scheme\(const char \\*\)](#).

The [Fl\\_Scheme\\_Choice](#) widget does this automatically when the widget is shown (when receiving the FL\_SHOW event) which should always be after [Fl\\_Window::show\(argc, argv\)](#) which may set the current scheme by interpreting the commandline.

**Since**

1.4.0

**13.115.2.3 scheme\_cb\_()**

```
void Fl_Scheme_Choice::scheme_cb_ (
 Fl_Widget * w,
 void *) [static], [protected]
```

Internal [Fl\\_Scheme\\_Choice](#) callback function (protected).

You don't need to set a callback for this widget. The default callback changes the scheme ([Fl::scheme\(\)](#)) and redraws all open windows.

You may override the callback if changing the scheme shall redraw other windows or don't redraw the window at all.

**Parameters**

in	w	The <a href="#">Fl_Scheme_Choice</a> widget
----	---	---------------------------------------------

The documentation for this class was generated from the following files:

- [Fl\\_Scheme\\_Choice.H](#)
- [Fl\\_Scheme\\_Choice.cxx](#)

**13.116 Fl\_Scroll Class Reference**

This container widget lets you maneuver around a set of widgets much larger than your window.

```
#include <Fl_Scroll.H>
```

Inheritance diagram for [Fl\\_Scroll](#):

**Classes**

- struct [Scrollbar\\_Data](#)  
A local struct to manage a scrollbar's xywh region and tab values.
- struct [ScrollInfo](#)  
Structure to manage scrollbar and widget interior sizes.

## Public Types

- enum {  
**HORIZONTAL** = 1 , **VERTICAL** = 2 , **BOTH** = 3 , **ALWAYS\_ON** = 4 ,  
**HORIZONTAL\_ALWAYS** = 5 , **VERTICAL\_ALWAYS** = 6 , **BOTH\_ALWAYS** = 7 }

## Public Member Functions

- void **clear** ()  
*Clear all but the scrollbars...*
- int **delete\_child** (int n) override  
*Removes the widget at `index` from the group and deletes it.*
- FL\_Scroll** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new **FL\_Scroll** widget using the given position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*
- void **resize** (int X, int Y, int W, int H) override  
*Resizes the **FL\_Scroll** widget and moves its children if necessary.*
- void **scroll\_to** (int, int)  
*Moves the contents of the scroll group to a new position.*
- int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)  
*Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.*
- int **xposition** () const  
*Gets the current horizontal scrolling position.*
- int **yposition** () const  
*Gets the current vertical scrolling position.*
- virtual ~**FL\_Scroll** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from **FL\_Group**

- FL\_Widget** \*& **\_ddfdesign\_kludge** ()  
*This is for forms compatibility only.*
- void **add** (**FL\_Widget** &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** (**FL\_Widget** \*o)  
*See void **FL\_Group::add(FL\_Widget &w)***
- void **add\_resizable** (**FL\_Widget** &o)  
*Adds a widget to the group and makes it the resizable widget.*
- FL\_Widget** \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- FL\_Group** const \* **as\_group** () const override
- FL\_Group** \* **as\_group** () override  
*Returns an **FL\_Group** pointer if this widget is an **FL\_Group**.*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- FL\_Widget** \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()

- Deletes all child widgets from memory recursively.*
- unsigned int `clip_children` () const
  - Returns the current clipping mode.*
- void `clip_children` (int c)
  - Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- void `end` ()
  - Exactly the same as `current(this->parent())`.*
- int `find` (const `FL_Widget` &o) const
  - See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` \*) const
  - Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \*s=0)
  - Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()
  - This is for forms compatibility only.*
- void `init_sizes` ()
  - Resets the internal array of widget sizes and positions.*
- void `insert` (`FL_Widget` &, int i)
  - The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)
  - This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)
  - Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)
  - Removes the widget o from the group.*
- void `remove` (int index)
  - Removes the widget at `index` from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const
  - Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)
  - Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)
  - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual `~FL_Group` ()
  - The destructor also deletes all the children.*

## Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
  - Activates the widget.*
- unsigned int `active` () const
  - Returns whether the widget is active.*
- int `active_r` () const
  - Returns whether the widget and all of its parents are active.*
- `FL_Align` `align` () const
  - Gets the label alignment.*
- void `align` (`FL_Align` alignment)
  - Sets the label alignment.*
- long `argument` () const

- Gets the current user data (long) argument that is passed to the callback function.*

  - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

  - virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()
- Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*

  - virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*

  - virtual [FI\\_Window](#) \* [as\\_window](#) ()
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [bind\\_deimage](#) ([FI\\_Image](#) \*img)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

  - void [bind\\_image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [bind\\_image](#) (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

  - [FI\\_Boxtype](#) [box](#) () const
- Gets the box type of the widget.*

  - void [box](#) ([FI\\_Boxtype](#) new\_box)
- Sets the box type for the widget.*

  - [FI\\_Callback\\_p](#) [callback](#) () const
- Gets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*

  - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

  - void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_damage](#) (uchar c=0)
- Clears or sets the damage flags.*

  - void [clear\\_output](#) ()
- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()
- Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

- Sets the image to use as part of the widget label when in the active state.*

  - int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FL_Color` c)

*Sets the label color.*
- `FL_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FL_Font` f)

*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const

*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)

*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const

*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)

*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FL_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FL_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*

- `Fl_Color selection_color ()` const  
*Gets the selection color.*
- `void selection_color (Fl_Color a)`  
*Sets the selection color.*
- `int send (int event)`  
*Sends the specified event to the widget.*
- `void set_active ()`  
*Marks the widget as active without sending events or changing focus.*
- `void set_changed ()`  
*Marks the value of the widget as changed.*
- `void set_output ()`  
*Sets a widget to output only.*
- `void set_visible ()`  
*Makes the widget visible.*
- `void set_visible_focus ()`  
*Enables keyboard focus navigation with this widget.*
- `int shortcut_label ()` const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- `void shortcut_label (int value)`  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- `virtual void show ()`  
*Makes a widget visible.*
- `void size (int W, int H)`  
*Changes the size of the widget.*
- `int take_focus ()`  
*Gives the widget the keyboard focus.*
- `unsigned int takeevents ()` const  
*Returns if the widget is able to take events.*
- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip ()` const  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window ()` const  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type ()` const  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data ()` const  
*Gets the user data for this widget.*
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`  
*Sets the user data for this widget.*
- `void user_data (void *v)`  
*Sets the user data for this widget.*
- `int vertical_label_margin ()`

- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const

*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const

*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)

*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const

*Returns whether a widget and all its parents are visible.*
- int [w](#) () const

*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const

*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)

*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

*Gets the widget position in its window.*
- int [y](#) () const

*Gets the widget position in its window.*
- virtual [~Fl\\_Widget](#) ()

*Destroys the widget.*

## Public Attributes

- [Fl\\_Scrollbar](#) **hscrollbar**
- [Fl\\_Scrollbar](#) **scrollbar**

## Protected Member Functions

- void [bbox](#) (int &, int &, int &, int &) const

## 13.116.1 Detailed Description

This container widget lets you maneuver around a set of widgets much larger than your window.

If the child widgets are larger than the size of this object then scrollbars will appear so that you can scroll over to them:

Figure 13.41 [FI\\_Scroll](#)

If all of the child widgets are packed together into a solid rectangle then you want to set [box\(\)](#) to [FL\\_NO\\_BOX](#) or one of the [\\_FRAME](#) types. This will result in the best output. However, if the child widgets are a sparse arrangement you must set [box\(\)](#) to a real [\\_BOX](#) type. This can result in some blinking during redrawing, but that can be solved by using a [FI\\_Double\\_Window](#).

The [Fl\\_Scroll](#) widget calculates the bounding box of all its children by using their widget positions and sizes (x, y, w, h). Outside labels are not considered. If you need outside labels of any widgets or free space outside of this bounding box you can add a tiny invisible [Fl\\_Box](#) at the relevant corner(s) of the [Fl\\_Scroll](#) widget, for instance:

```
Fl_Scroll scroll(100, 100, 200, 200); // Fl_Scroll at (100, 100)
Fl_Box(100, 100, 1, 1); // Fl_Box in top left corner
Fl_Input(150, 120, 60, 30, "Input:"); // left most widget with label
// ... more widgets ...
scroll.end();
```

By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the area of the scroll.

Use [Fl\\_Scroll::type\(\)](#) to change this as follows :

- 0 - No scrollbars
- [Fl\\_Scroll::HORIZONTAL](#) - Only a horizontal scrollbar.
- [Fl\\_Scroll::VERTICAL](#) - Only a vertical scrollbar.
- [Fl\\_Scroll::BOTH](#) - The default is both scrollbars.
- [Fl\\_Scroll::HORIZONTAL\\_ALWAYS](#) - Horizontal scrollbar always on, vertical always off.
- [Fl\\_Scroll::VERTICAL\\_ALWAYS](#) - Vertical scrollbar always on, horizontal always off.
- [Fl\\_Scroll::BOTH\\_ALWAYS](#) - Both always on.

Use [scrollbar.align\(int\)](#) ( see void [Fl\\_Widget::align\(Fl\\_Align\)](#) ) : to change what side the scrollbars are drawn on.

If the [FL\\_ALIGN\\_LEFT](#) bit is on, the vertical scrollbar is on the left. If the [FL\\_ALIGN\\_TOP](#) bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in [hscrollbar](#) however are ignored.

This widget can also be used to pan around a single child widget "canvas". This child widget should be of your own class, with a [draw\(\)](#) method that draws the contents. The scrolling is done by changing the [x\(\)](#) and [y\(\)](#) of the widget, so this child must use the [x\(\)](#) and [y\(\)](#) to position its drawing. To speed up drawing it should test [fl\\_not\\_clipped\(int x,int y,int w,int h\)](#) to find out if a particular area of the widget must be drawn.

Another very useful child is a single [Fl\\_Pack](#), which is itself a group that packs its children together and changes size to surround them. Filling the [Fl\\_Pack](#) with [Fl\\_Tabs](#) groups (and then putting normal widgets inside those) gives you a very powerful scrolling list of individually-openable panels.

Fluid lets you create these, but you can only lay out objects that fit inside the [Fl\\_Scroll](#) without scrolling. Be sure to leave space for the scrollbars, as Fluid won't show these either.

*You cannot use [Fl\\_Window](#) as a child of this since the clipping is not conveyed to it when drawn, and it will draw over the scrollbars and neighboring objects.*

*Widget overlap may result in scroll tearing, see [Fl\\_Tabs](#) for fuller explanation.*

## 13.116.2 Constructor & Destructor Documentation

### 13.116.2.1 Fl\_Scroll()

```
Fl_Scroll::Fl_Scroll (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Scroll](#) widget using the given position, size, and label string.

The default boxttype is [FL\\_NO\\_BOX](#).

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl\\_Scroll](#) and all of its children can be automatic (local) variables, but you must declare the [Fl\\_Scroll](#) *first*, so that it is destroyed last.

### 13.116.2.2 ~Fl\_Scroll()

```
Fl_Scroll::~~Fl_Scroll () [virtual]
```

The destructor also deletes all the children.

See also

[Fl\\_Group::~~Fl\\_Group\(\)](#)

### 13.116.3 Member Function Documentation

#### 13.116.3.1 bbox()

```
void Fl_Scroll::bbox (
 int & X,
 int & Y,
 int & W,
 int & H) const [protected]
```

Returns the bounding box for the interior of the scrolling area, inside the scrollbars.

This method does not change the scrollbars or their visibility. First the scrollbar positions and visibility are calculated as they **should** be, according to the positions and sizes of the children. Then the bounding box is calculated.

You may need to call [redraw\(\)](#) to make sure the widget gets updated.

See also

[recalc\\_scrollbars\(\)](#)

#### 13.116.3.2 delete\_child()

```
int Fl_Scroll::delete_child (
 int index) [override], [virtual]
```

Removes the widget at `index` from the group and deletes it.

This method does nothing if `index` is out of bounds or if `Fl_Group::child(index)` is one of the scrollbars.

##### Parameters

<code>in</code>	<code>index</code>	index of child to be removed
-----------------	--------------------	------------------------------

##### Returns

success (0) or error code

##### Return values

0	success
1	index out of range
2	widget not allowed to be removed (see note)

See also

[Fl\\_Group::delete\\_child\(int index\)](#)

Since

FLTK 1.4.0

Reimplemented from [Fl\\_Group](#).

#### 13.116.3.3 draw()

```
void Fl_Scroll::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

#### 13.116.3.4 fix\_scrollbar\_order()

```
void Fl_Scroll::fix_scrollbar_order () [protected]
```

Ensure the scrollbars are the last children.

When [Fl\\_Scroll](#) is instantiated the first child of the [Fl\\_Group](#) is the vertical scrollbar `scrollbar` and the second child is the horizontal scrollbar `hscrollbar`.

These two widgets must always be the last two widgets and in this order to guarantee the correct drawing order and event delivery.

Since FLTK 1.4.0 the new method [on\\_insert\(\)](#) modifies the insert position of other children if it would be after the scrollbars.

#### 13.116.3.5 handle()

```
int Fl_Scroll::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

##### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

##### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

##### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

#### 13.116.3.6 on\_insert()

```
int Fl_Scroll::on_insert (
 Fl_Widget * candidate,
 int index) [override], [protected], [virtual]
```

Change insert position of a child before it is added.

Fix insert position if the new child is planned to be inserted after the scrollbars. We can assume that the scrollbars are always the last two children!

[FI\\_Group](#) calls this when a new widget is added. We return the new index if the new widget would be added after the scrollbars.

#### Parameters

in	<i>candidate</i>	the candidate will be added to the child array_ after this method returns.
in	<i>index</i>	add the child at this position in the array_

#### Returns

- index to position the child as planned
- a new index to force the child to a different position
- 1 to keep the group from adding the candidate

#### Version

1.4.0

#### See also

[FI\\_Group::on\\_insert\(FI\\_Widget \\*candidate, int index\)](#)

Reimplemented from [FI\\_Group](#).

### 13.116.3.7 on\_move()

```
int FI_Scroll::on_move (
 int old_index,
 int new_index) [override], [protected], [virtual]
```

Change new position of a child before it is moved.

Fix new position if the new child is planned to be moved after the scrollbars. We can assume that the scrollbars are always the last two children!

[FI\\_Group](#) calls this when a widget is moved within the list of children. We return a new index if the widget would be moved after the scrollbars.

#### Parameters

<i>old_index</i>	the current index of the child that will be moved
<i>new_index</i>	the new index of the child

#### Returns

- new index, possibly corrected to avoid last two scrollbar entries

Reimplemented from [FI\\_Group](#).

### 13.116.3.8 recalc\_scrollbars()

```
void FI_Scroll::recalc_scrollbars (
 ScrollInfo & si) const [protected]
```

Calculate visibility/size/position of scrollbars, find children's bounding box.

The *si* parameter will be filled with data from the calculations. Derived classes can make use of this call to figure out the scrolling area eg. during [resize\(\)](#) handling.

This method does not change the scrollbars or their visibility. It calculates the scrollbar positions and visibility as they **should** be, according to the positions and sizes of the children.

You may need to call [redraw\(\)](#) to make sure the widget gets updated.

## Parameters

<code>in, out</code>	<code>si</code>	– <a href="#">ScrollInfo</a> structure, filled with data
----------------------	-----------------	----------------------------------------------------------

## See also

[bbox\(\)](#)

**13.116.3.9** [resize\(\)](#)

```
void Fl_Scroll::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Scroll](#) widget and moves its children if necessary.

The [Fl\\_Scroll](#) widget first resizes itself, and then it moves all its children if (and only if) the [Fl\\_Scroll](#) widget has been moved. The children are moved by the same amount as the [Fl\\_Scroll](#) widget has been moved, hence all children keep their relative positions.

## Note

[Fl\\_Scroll::resize\(\)](#) does **not** call [Fl\\_Group::resize\(\)](#), and child widgets are **not** resized.

Since children of an [Fl\\_Scroll](#) are not resized, the [resizable\(\)](#) widget is ignored (if it is set).

The scrollbars are moved to their proper positions, as given by [Fl\\_Scroll::scrollbar.align\(\)](#), and switched on or off as necessary.

## Note

Due to current (FLTK 1.3.x) implementation constraints some of this may effectively be postponed until the [Fl\\_Scroll](#) is drawn the next time. This may change in a future release.

## See also

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Group](#).

**13.116.3.10** [scroll\\_to\(\)](#)

```
void Fl_Scroll::scroll_to (
 int X,
 int Y)
```

Moves the contents of the scroll group to a new position.

This is like moving the scrollbars of the [Fl\\_Scroll](#) around. For instance:

```
Fl_Scroll scroll (10,10,200,200);
Fl_Box b1 (10, 10,50,50,"b1"); // relative (x,y) = (0,0)
Fl_Box b2 (60, 60,50,50,"b2"); // relative (x,y) = (50,50)
Fl_Box b3 (60,110,50,50,"b3"); // relative (x,y) = (50,100)
// populate scroll with more children ...
scroll.end();
scroll.scroll_to(50,100);
```

will move the logical origin of the internal scroll area to (-50,-100) relative to the origin of the [Fl\\_Scroll](#) (10,10), i.e. [Fl\\_Box](#) b3 will be visible in the top left corner of the scroll area.

**13.116.3.11** [scrollbar\\_size\(\)](#) [1/2]

```
int Fl_Scroll::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**13.116.3.12 scrollbar\_size() [2/2]**

```
void Fl_Scroll::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

**Parameters**

<code>in</code>	<code>newSize</code>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
-----------------	----------------------	-----------------------------------------------------------------------------------------------------------------------------

**See also**

[Fl::scrollbar\\_size\(\)](#)

**13.116.3.13 xposition()**

```
int Fl_Scroll::xposition () const [inline]
```

Gets the current horizontal scrolling position.

**13.116.3.14 yposition()**

```
int Fl_Scroll::yposition () const [inline]
```

Gets the current vertical scrolling position.

The documentation for this class was generated from the following files:

- `Fl_Scroll.H`
- `Fl_Scroll.cxx`

**13.117 Fl\_Scrollbar Class Reference**

The [Fl\\_Scrollbar](#) widget displays a slider with arrow buttons at the ends of the scrollbar.

```
#include <Fl_Scrollbar.H>
```

Inheritance diagram for [Fl\\_Scrollbar](#):

## Public Member Functions

- **FL\_Scrollbar** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [FL\\_Scrollbar](#) widget with given position, size, and label.*
- int **handle** (int) override  
*Handles the specified event.*
- int **linesize** () const  
*Get the size of step, in lines, that the arrow keys move.*
- void **linesize** (int i)  
*This number controls how big the steps are that the arrow keys do.*
- int **value** () const  
*Gets the integer value (position) of the slider in the scrollbar.*
- int **value** (int p)  
*Sets the value (position) of the slider in the scrollbar.*
- int **value** (int pos, int windowSize, int first\_line, int total\_lines)  
*Sets the position, size and range of the slider in the scrollbar.*
- ~**FL\_Scrollbar** ()  
*Destroys the Scrollbar.*

## Public Member Functions inherited from [FL\\_Slider](#)

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- **FL\_Slider** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [FL\\_Slider](#) widget using the given position, size, and label string.*
- **FL\_Slider** (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new [FL\\_Slider](#) widget using the given type, position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*
- uchar **num\_ticks** () const  
*Gets the number of tick marks.*
- **Scale\_Type** **scale** () const  
*Gets the scale type.*
- void **scale** (**Scale\_Type** s)  
*Sets the scale type.*
- int **scrollvalue** (int pos, int size, int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- **FL\_Boxtype** **slider** () const  
*Gets the slider box type.*
- void **slider** (**FL\_Boxtype** c)  
*Sets the slider box type.*

- float **slider\_size** () const  
*Get the dimensions of the moving piece of slider.*
- void **slider\_size** (double v)  
*Set the dimensions of the moving piece of slider.*
- uchar **ticks** () const  
*Gets the tick mark position.*
- void **ticks** (uchar t, uchar num\_ticks=11)  
*Sets the tick mark position for [FI\\_Nice\\_Slider](#).*

## Public Member Functions inherited from [FI\\_Valuator](#)

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for [FI\\_Valuator::format\(char\\* buffer\)](#).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [FI\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [FI\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [FI\\_Valuator::step\(\)](#) const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- **~FI\_Valuator** () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FL\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FL\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- virtual [FL\\_Group](#) const \* [as\\_group](#) () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

  - void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()

*Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)

*Clears or sets the damage flags.*
- void `clear_output` ()

*Sets a widget to accept input.*
- void `clear_visible` ()

*Hides the widget.*
- void `clear_visible_focus` ()

*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const

*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)

*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)

*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const

*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)

*Sets the current label.*
- void `copy_tooltip` (const char \*text)

*Sets the current tooltip text.*
- `uchar` `damage` () const

*Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)

*Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)

*Internal use only.*
- void `deactivate` ()

*Deactivates the widget.*
- `FL_Image` \* `deimage` ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const

*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*

- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

- Sets width ww and height hh accordingly with the label size.*

  - bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FI_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FI_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- `FI_Color` `selection_color` () const

*Gets the selection color.*
- void `selection_color` (`FI_Color` a)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*

- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window** \* **top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window** \* **top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const  
*Gets the widget type.*
- void **type** (**uchar** t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (**Fl\_Callback\_User\_Data** \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (**uchar** i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual **~Fl\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

### Protected Member Functions inherited from [FI\\_Slider](#)

- void [draw](#) () override  
*Draws the widget.*
- void **draw** (int, int, int, int)
- void [draw\\_ticks](#) (const [FI\\_Rect](#) &r, int S)  
*Draw tick marks.*
- int **handle** (int, int, int, int, int)
- double [increment\\_lin\\_log](#) (double v, int n, int [range](#))  
*Adds a sensible step value to the passed value.*
- double [position\\_to\\_value](#) (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double [value\\_to\\_position](#) (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

### Protected Member Functions inherited from [FI\\_Valuator](#)

- [FI\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FI\\_Valuator](#) widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*

- void `draw_focus` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` bg) const  
*Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int v)  
*Internal use only.*
- void `set_flag` (unsigned int c)  
*Sets a flag in the flags mask.*
- void `w` (int v)  
*Internal use only.*
- void `x` (int v)  
*Internal use only.*
- void `y` (int v)  
*Internal use only.*

### Additional Inherited Members

### Public Types inherited from `FI_Slider`

- enum `Scale_Type` : uchar { `LINEAR_SCALE` = 0 , `LOG_SCALE` }  
*Bitset for tick mark positions for `FI_Nice_Slider`.*
- enum `Tick_Position` : uchar {  
    `TICKS_NONE` = 0x00 , `TICKS_BELOW` = 0x01 , `TICKS_ABOVE` = 0x02 , `TICKS_LEFT` = 0x01 ,  
    `TICKS_RIGHT` = 0x02 }  
*Bitset for tick mark positions for `FI_Nice_Slider`.*

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### 13.117.1 Detailed Description

The [Fl\\_Scrollbar](#) widget displays a slider with arrow buttons at the ends of the scrollbar.

Clicking on the arrows move up/left and down/right by [linesize\(\)](#). Scrollbars also accept FL\_SHORTCUT events: the arrows move by [linesize\(\)](#), and vertical scrollbars take Page Up/Down (they move by the page size minus [linesize\(\)](#)) and Home/End (they jump to the top or bottom).

Scrollbars have step(1) preset (they always return integers). If desired you can set the [step\(\)](#) to non-integer values. You will then have to use casts to get at the floating-point versions of [value\(\)](#) from [Fl\\_Slider](#).

Figure 13.42 Fl\_Scrollbar

### 13.117.2 Constructor & Destructor Documentation

#### 13.117.2.1 Fl\_Scrollbar()

```
Fl_Scrollbar::Fl_Scrollbar (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Scrollbar](#) widget with given position, size, and label.

You need to do type(FL\_HORIZONTAL) if you want a horizontal scrollbar.

### 13.117.3 Member Function Documentation

#### 13.117.3.1 draw()

```
void Fl_Scrollbar::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own draw() method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

#### 13.117.3.2 handle()

```
int Fl_Scrollbar::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

#### Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

#### See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

#### 13.117.3.3 linesize()

```
void Fl_Scrollbar::linesize (
 int i) [inline]
```

This number controls how big the steps are that the arrow keys do.

In addition page up/down move by the size last sent to [value\(\)](#) minus one [linesize\(\)](#). The default is 16.

#### 13.117.3.4 value() [1/3]

```
int Fl_Scrollbar::value () const [inline]
```

Gets the integer value (position) of the slider in the scrollbar.

You can get the floating point value with [Fl\\_Slider::value\(\)](#).

#### See also

[Fl\\_Scrollbar::value\(int p\)](#)

[Fl\\_Scrollbar::value\(int pos, int size, int first, int total\)](#)

#### 13.117.3.5 value() [2/3]

```
int Fl_Scrollbar::value (
 int p) [inline]
```

Sets the value (position) of the slider in the scrollbar.

#### See also

[Fl\\_Scrollbar::value\(\)](#)

[Fl\\_Scrollbar::value\(int pos, int size, int first, int total\)](#)

**13.117.3.6 value() [3/3]**

```
int Fl_Scrollbar::value (
 int pos,
 int windowSize,
 int first_line,
 int total_lines) [inline]
```

Sets the position, size and range of the slider in the scrollbar.

**Parameters**

in	<i>pos</i>	position, first line displayed
in	<i>windowSize</i>	number of lines displayed
in	<i>first_line</i>	number of first line
in	<i>total_lines</i>	total number of lines

You should call this every time your window changes size, your data changes size, or your scroll position changes (even if in response to a callback from this scrollbar). All necessary calls to [redraw\(\)](#) are done.

Calls [Fl\\_Slider::scrollvalue\(int pos, int size, int first, int total\)](#).

The documentation for this class was generated from the following files:

- [Fl\\_Scrollbar.H](#)
- [Fl\\_Scrollbar.cxx](#)

**13.118 Fl\_Secret\_Input Class Reference**

The [Fl\\_Secret\\_Input](#) class is a subclass of [Fl\\_Input](#) that displays its input as a string of placeholders.

```
#include <Fl_Secret_Input.H>
```

Inheritance diagram for [Fl\\_Secret\\_Input](#):

**Public Member Functions**

- [Fl\\_Secret\\_Input](#) (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Secret\\_Input](#) widget using the given position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*

**Public Member Functions inherited from [Fl\\_Input](#)**

- [Fl\\_Input](#) (int, int, int, int, const char \*l=0)  
*Creates a new [Fl\\_Input](#) widget using the given position, size, and label string.*

**Public Member Functions inherited from [Fl\\_Input\\_](#)**

- int [append](#) (const char \*t, int l=0, char keep\_selection=0)

- Append text at the end.*

  - bool `can_redo` () const

*Check if there is a redo action available.*
- bool `can_undo` () const

*Check if the last operation can be undone.*
- int `copy` (int clipboard)

*Put the current selection into the clipboard.*
- int `copy_cuts` ()

*Copies the yank buffer to the clipboard.*
- `FI_Color` `cursor_color` () const

*Gets the color of the cursor.*
- void `cursor_color` (`FI_Color` n)

*Sets the color of the cursor.*
- int `cut` ()

*Deletes the current selection.*
- int `cut` (int a, int b)

*Deletes all characters between index a and b.*
- int `cut` (int n)

*Deletes the next n bytes rounded to characters before or after the cursor.*
- double `dvalue` () const

*Returns the widget text interpreted as a floating point number.*
- `FI_Input_` (int, int, int, int, const char \*=0)

*Creates a new `FI_Input_` widget.*
- unsigned int `index` (int i) const

*Returns the character at index i.*
- int `input_type` () const

*Gets the input field type.*
- void `input_type` (int t)

*Sets the input field type.*
- int `insert` (const char \*t, int l=0)

*Inserts text at the cursor position.*
- int `insert_position` () const

*Gets the position of the text cursor.*
- int `insert_position` (int p)

*Sets the cursor position and mark.*
- int `insert_position` (int p, int m)

*Sets the index for the cursor and mark.*
- int `ivalue` () const

*Returns the widget text interpreted as a signed integer.*
- int `mark` () const

*Gets the current selection mark.*
- int `mark` (int m)

*Sets the current selection mark.*
- int `maximum_size` () const

*Gets the maximum length of the input field in characters.*
- void `maximum_size` (int m)

*Sets the maximum length of the input field in characters.*
- const char \* `placeholder` () const

*Get the placeholder text.*
- void `placeholder` (const char \*text)

*Set the placeholder text.*

- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const
 

*Gets the read-only state of the input field.*
- void [readonly](#) (int b)
 

*Sets the read-only state of the input field.*
- int [redo](#) ()
 

*Redo previous undo operation.*
- int [replace](#) (int b, int e, const char \*text, int ilen=0)
 

*Deletes text from *b* to *e* and inserts the new string *text*.*
- void [resize](#) (int, int, int, int) override
 

*Changes the size of the widget.*
- int [shortcut](#) () const
 

*Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)
 

*Sets the shortcut key associated with this widget.*
- int [size](#) () const
 

*Returns the number of bytes in [value\(\)](#).*
- void [size](#) (int W, int H)
 

*Sets the width and height of this widget.*
- int [static\\_value](#) (const char \*)
 

*Changes the widget text.*
- int [static\\_value](#) (const char \*, int)
 

*Changes the widget text.*
- int [tab\\_nav](#) () const
 

*Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)
 

*Sets whether the Tab key does focus navigation, or inserts tab characters into [FL\\_Multiline\\_Input](#).*
- [FL\\_Color](#) [textcolor](#) () const
 

*Gets the color of the text in the input field.*
- void [textcolor](#) ([FL\\_Color](#) n)
 

*Sets the color of the text in the input field.*
- [FL\\_Font](#) [textfont](#) () const
 

*Gets the font of the text in the input field.*
- void [textfont](#) ([FL\\_Font](#) s)
 

*Sets the font of the text in the input field.*
- [FL\\_Fonsize](#) [textsize](#) () const
 

*Gets the size of the text in the input field.*
- void [textsize](#) ([FL\\_Fonsize](#) s)
 

*Sets the size of the text in the input field.*
- int [undo](#) ()
 

*Undoes previous changes to the text buffer.*
- const char \* [value](#) () const
 

*Returns the text displayed in the widget.*
- int [value](#) (const char \*)
 

*Changes the widget text.*
- int [value](#) (const char \*, int)
 

*Changes the widget text.*
- int [value](#) (double value)
 

*Changes the widget text to a floating point number ("%g").*

- int [value](#) (int value)  
*Changes the widget text to a signed integer number.*
- int [wrap](#) () const  
*Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)  
*Sets the word wrapping state of the input field.*
- [~FI\\_Input](#) ()  
*Destroys the widget.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_GI\\_Window](#) \* [as\\_gi\\_window](#) ()  
*Returns an [FI\\_GI\\_Window](#) pointer if this widget is an [FI\\_GI\\_Window](#).*
- virtual class [FI\\_GI\\_Window](#) const \* [as\\_gi\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)

- Sets the current callback function for the widget.*

  - void `callback` (`FI_Callback` \*cb, `FI_Callback_User_Data` \*p, bool auto\_free)

*Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` \*cb, void \*p)

*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)

*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)

*Sets the current callback function for the widget.*
- unsigned int `changed` () const

*Checks if the widget value changed since the last callback.*
- void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()

*Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)

*Clears or sets the damage flags.*
- void `clear_output` ()

*Sets a widget to accept input.*
- void `clear_visible` ()

*Hides the widget.*
- void `clear_visible_focus` ()

*Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const

*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)

*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)

*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const

*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)

*Sets the current label.*
- void `copy_tooltip` (const char \*text)

*Sets the current tooltip text.*
- uchar `damage` () const

*Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)

*Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)

*Internal use only.*
- void `deactivate` ()

*Deactivates the widget.*
- `FI_Image` \* `deimage` ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` \* `deimage` () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)

*Sets the image to use as part of the widget label when in the inactive state.*

- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)

- Sets the font to use.*

  - [FL\\_Fontsize](#) [labelsize](#) () const

*Gets the font size in pixels.*

  - void [labelsize](#) ([FL\\_Fontsize](#) pix)

*Sets the font size in pixels.*

  - [FL\\_Labeltype](#) [labeltype](#) () const

*Gets the label type.*

  - void [labeltype](#) ([FL\\_Labeltype](#) a)

*Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const

*Returns if a widget is used for output only.*

  - [FL\\_Group](#) \* [parent](#) () const

*Returns a pointer to the parent widget.*

  - void [parent](#) ([FL\\_Group](#) \*p)

*Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)

*Repositions the window or widget.*

  - void [redraw](#) ()

*Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()

*Schedules the drawing of the label.*

  - [FL\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*

  - void [selection\\_color](#) ([FL\\_Color](#) a)

*Sets the selection color.*

  - int [send](#) (int event)

*Sends the specified event to the widget.*

  - void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()

*Marks the value of the widget as changed.*

  - void [set\\_output](#) ()

*Sets a widget to output only.*

  - void [set\\_visible](#) ()

*Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()

*Makes a widget visible.*

  - void [size](#) (int W, int H)

*Changes the size of the widget.*

- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [FI\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)  
*Sets the flags used to decide when a callback is called.*
- [FI\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~FI\\_Widget](#) ()  
*Destroys the widget.*

## Additional Inherited Members

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Static Public Attributes inherited from [FI\\_Input](#)

- static const char \* [copy\\_menu\\_text](#) = "Copy"  
*[this text may be customized at run-time]*
- static const char \* [cut\\_menu\\_text](#) = "Cut"  
*[this text may be customized at run-time]*
- static const char \* [paste\\_menu\\_text](#) = "Paste"  
*[this text may be customized at run-time]*

### Protected Member Functions inherited from [FI\\_Input](#)

- void [draw](#) () override  
*Draws the widget.*
- int [handle\\_key](#) ()  
*Handles a keystroke.*
- int [handle\\_rmb](#) ()  
*Handle right mouse button down events.*

### Protected Member Functions inherited from [FI\\_Input\\_](#)

- int [apply\\_undo](#) ()  
*Apply the current undo/redo operation.*
- void [drawtext](#) (int, int, int, int)  
*Draws the text in the passed bounding box.*
- void [drawtext](#) (int, int, int, int, bool draw\_active)  
*Draws the text in the passed bounding box.*

- void **handle\_mouse** (int, int, int, int, int keepmark=0)  
*Handles mouse clicks and mouse moves.*
- int **handletext** (int e, int, int, int, int)  
*Handles all kinds of text field related events.*
- int **line\_end** (int i) const  
*Finds the end of a line.*
- int **line\_start** (int i) const  
*Finds the start of a line.*
- int **linesPerPage** ()
- void **maybe\_do\_callback** (FL\_Callback\_Reason reason=FL\_REASON\_UNKNOWN)
- int **up\_down\_position** (int, int keepmark=0)  
*Moves the cursor to the column given by up\_down\_pos.*
- int **word\_end** (int i) const  
*Finds the end of a word.*
- int **word\_start** (int i) const  
*Finds the start of a word.*
- int **xscroll** () const
- int **yscroll** () const
- void **yscroll** (int yOffset)

### Protected Member Functions inherited from FL\_Widget

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FL\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)

*Internal use only.*

- void `x` (int v)

*Internal use only.*

- void `y` (int v)

*Internal use only.*

### 13.118.1 Detailed Description

The `Fl_Secret_Input` class is a subclass of `Fl_Input` that displays its input as a string of placeholders. Depending on the platform this placeholder is either the asterisk ('\*') or the Unicode bullet character (U+2022). This subclass is usually used to receive passwords and other "secret" information.

### 13.118.2 Constructor & Destructor Documentation

#### 13.118.2.1 `Fl_Secret_Input()`

```
Fl_Secret_Input::Fl_Secret_Input (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new `Fl_Secret_Input` widget using the given position, size, and label string.

The default boxtype is `FL_DOWN_BOX`.

Inherited destructor destroys the widget and any value associated with it.

### 13.118.3 Member Function Documentation

#### 13.118.3.1 `handle()`

```
int Fl_Secret_Input::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited `handle()` method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your `handle()` method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the `handle()` method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

#### Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

[Fl\\_Event](#)

Reimplemented from [Fl\\_Input](#).

The documentation for this class was generated from the following files:

- [Fl\\_Secret\\_Input.H](#)
- [Fl\\_Input.cxx](#)

## 13.119 Fl\_Select\_Browser Class Reference

The class is a subclass of [Fl\\_Browser](#) which lets the user select a single item, or no items by clicking on the empty space.

```
#include <Fl_Select_Browser.H>
```

Inheritance diagram for Fl\_Select\_Browser:

### Public Member Functions

- [Fl\\_Select\\_Browser](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Select\\_Browser](#) widget using the given position, size, and label string.*

### Public Member Functions inherited from [Fl\\_Browser](#)

- void [add](#) (const char \*newtext, void \*d=0)  
*Adds a new line to the end of the browser.*
- void [bottomline](#) (int line)  
*Scrolls the browser so the bottom item in the browser is showing the specified *line*.*
- void [clear](#) ()  
*Removes all the lines in the browser.*
- char [column\\_char](#) () const  
*Gets the current column separator character.*
- void [column\\_char](#) (char c)  
*Sets the column separator to *c*.*
- const int \* [column\\_widths](#) () const  
*Gets the current column width array.*
- void [column\\_widths](#) (const int \*arr)  
*Sets the current array to *arr*.*
- void \* [data](#) (int line) const  
*Returns the user *data()* for specified *line*.*
- void [data](#) (int line, void \*d)  
*Sets the user data for specified *line* to *d*.*

- void **display** (int line, int val=1)  
*For back compatibility.*
- int **displayed** (int line) const  
*Returns non-zero if `line` has been scrolled to a position where it is being displayed.*
- **FL\_Browser** (int X, int Y, int W, int H, const char \*L=0)  
*The constructor makes an empty browser.*
- char **format\_char** () const  
*Gets the current format code prefix character, which by default is '@'.*
- void **format\_char** (char c)  
*Sets the current format code prefix character to `c`.*
- void **hide** () override  
*Hides the entire `FL_Browser` widget – opposite of `show()`.*
- void **hide** (int line)  
*Makes `line` invisible, preventing selection by the user.*
- **FL\_Image** \* **icon** (int line) const  
*Returns the icon currently defined for `line`.*
- void **icon** (int line, **FL\_Image** \*icon)  
*Set the image icon for `line` to the value `icon`.*
- void **insert** (int line, const char \*newtext, void \*d=0)  
*Insert a new entry whose label is `newtext` above given `line`, optional data `d`.*
- void **lineposition** (int line, **FL\_Line\_Position** pos)  
*Updates the browser so that `line` is shown at position `pos`.*
- int **load** (const char \*filename)  
*Clears the browser and reads the file, adding each line from the file to the browser.*
- void **make\_visible** (int line)  
*Make the item at the specified `line` `visible()`.*
- void **middleline** (int line)  
*Scrolls the browser so the middle item in the browser is showing the specified `line`.*
- void **move** (int to, int from)  
*Line `from` is removed and reinserted at `to`.*
- void **remove** (int line)  
*Remove entry for given `line` number, making the browser one line shorter.*
- void **remove\_icon** (int line)  
*Removes the icon for `line`.*
- void **replace** (int a, const char \*b)  
*For back compatibility only.*
- int **select** (int line, int val=1)  
*Sets the selection state of the item at `line` to the value `val`.*
- int **selected** (int line) const  
*Returns 1 if specified `line` is selected, 0 if not.*
- void **show** () override  
*Shows the entire `FL_Browser` widget – opposite of `hide()`.*
- void **show** (int line)  
*Makes `line` visible, and available for selection by user.*
- int **size** () const  
*Returns how many lines are in the browser.*
- void **size** (int W, int H)
- void **swap** (int a, int b)  
*Swaps two browser lines `a` and `b`.*
- const char \* **text** (int line) const  
*Returns the label text for the specified `line`.*

- void **text** (int line, const char \*newtext)  
*Sets the text for the specified line to newtext.*
- **FI\_Fontsize** **textsize** () const  
*Gets the default text size (in pixels) for the lines in the browser.*
- void **textsize** (**FI\_Fontsize** newSize)  
*Sets the default text size (in pixels) for the lines in the browser to newSize.*
- int **topline** () const  
*Returns the line that is currently visible at the top of the browser.*
- void **topline** (int line)  
*Scrolls the browser so the top item in the browser is showing the specified line.*
- int **value** () const  
*Returns the line number of the currently selected line, or 0 if none selected.*
- void **value** (int line)  
*Sets the browser's value(), which selects the specified line.*
- int **visible** (int line) const  
*Returns non-zero if the specified line is visible, 0 if hidden.*
- **~FI\_Browser** ()  
*The destructor deletes all list items and destroys the browser.*

### Public Member Functions inherited from **FI\_Browser\_**

- int **deselect** (int docallbacks=0)  
*Deselects all items in the list and returns 1 if the state changed or 0 if it did not.*
- void **display** (void \*item)  
*Displays the item, scrolling the list as necessary.*
- int **handle** (int event) override  
*Handles the event within the normal widget bounding box.*
- **uchar** **has\_scrollbar** () const  
*Returns the current scrollbar mode, see FI\_Browser\_::has\_scrollbar(uchar)*
- void **has\_scrollbar** (**uchar** mode)  
*Sets whether the widget should have scrollbars or not (default FI\_Browser\_::BOTH).*
- int **hposition** () const  
*Gets the horizontal scroll position of the list as a pixel position pos.*
- void **hposition** (int)  
*Sets the horizontal scroll position of the list to pixel position pos.*
- int **linespacing** () const  
*Return the height of additional spacing between browser lines.*
- void **linespacing** (int pixels)  
*Add some space between browser lines.*
- int **position** () const
- void **position** (int pos)
- void **position** (int x, int y)
- void **resize** (int X, int Y, int W, int H) override  
*Repositions and/or resizes the browser.*
- void **scrollbar\_left** ()  
*Moves the vertical scrollbar to the lefthand side of the list.*
- void **scrollbar\_right** ()  
*Moves the vertical scrollbar to the righthand side of the list.*
- int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar\_size** (int newSize)

- Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.*

  - `int select` (`void *item`, `int val=1`, `int docallbacks=0`)

*Sets the selection state of `item` to `val`, and returns 1 if the state changed or 0 if it did not.*

- `int select_only` (`void *item`, `int docallbacks=0`)
- Selects `item` and returns 1 if the state changed or 0 if it did not.*
- `void sort` (`int flags=0`)
- Sort the items in the browser based on `flags`.*
- `FL_Color textcolor` () const
- Gets the default text color for the lines in the browser.*
- `void textcolor` (`FL_Color col`)
- Sets the default text color for the lines in the browser to color `col`.*
- `FL_Font textfont` () const
- Gets the default text font for the lines in the browser.*
- `void textfont` (`FL_Font font`)
- Sets the default text font for the lines in the browser to `font`.*
- `FL_Fonsize textsize` () const
- Gets the default text size (in pixels) for the lines in the browser.*
- `void textsize` (`FL_Fonsize newSize`)
- Sets the default text size (in pixels) for the lines in the browser to `size`.*
- `int vposition` () const
- Gets the vertical scroll position of the list as a pixel position `pos`.*
- `void vposition` (`int pos`)
- Sets the vertical scroll position of the list to pixel position `pos`.*

## Public Member Functions inherited from `FL_Group`

- `FL_Widget *& _ddfdesign_kludge` ()
- This is for forms compatibility only.*
- `void add` (`FL_Widget &`)
- The widget is removed from its current group (if any) and then added to the end of this group.*
- `void add` (`FL_Widget *o`)
- See void `FL_Group::add(FL_Widget &w)`*
- `void add_resizable` (`FL_Widget &o`)
- Adds a widget to the group and makes it the resizable widget.*
- `FL_Widget *const * array` () const
- Returns a pointer to the internal array of children.*
- `FL_Group const * as_group` () const override
- `FL_Group * as_group` () override
- Returns an `FL_Group` pointer if this widget is an `FL_Group`.*
- `void begin` ()
- Sets the current group so you can build the widget tree by just constructing the widgets.*
- `FL_Widget * child` (`int n`) const
- Returns the `n`'th child.*
- `int children` () const
- Returns how many child widgets the group has.*
- `void clear` ()
- Deletes all child widgets from memory recursively.*
- `unsigned int clip_children` () const
- Returns the current clipping mode.*
- `void clip_children` (`int c`)
- Controls whether the group widget clips the drawing of child widgets to its bounding box.*

- virtual int `delete_child` (int n)  
*Removes the widget at `index` from the group and deletes it.*
- void `end` ()  
*Exactly the same as `current(this->parent())`.*
- int `find` (const `FL_Widget` &o) const  
*See int `FL_Group::find(const FL_Widget *w) const`.*
- int `find` (const `FL_Widget` \*) const  
*Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \*s=0)  
*Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()  
*This is for forms compatibility only.*
- int `handle` (int) override  
*Handles the specified event.*
- void `init_sizes` ()  
*Resets the internal array of widget sizes and positions.*
- void `insert` (`FL_Widget` &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (`FL_Widget` &o, `FL_Widget` \*before)  
*This does `insert(w, find(before))`.*
- void `remove` (`FL_Widget` &)  
*Removes a widget from the group but does not delete it.*
- void `remove` (`FL_Widget` \*o)  
*Removes the widget `o` from the group.*
- void `remove` (int index)  
*Removes the widget at `index` from the group but does not delete it.*
- `FL_Widget` \* `resizable` () const  
*Returns the group's resizable widget.*
- void `resizable` (`FL_Widget` &o)  
*Sets the group's resizable widget.*
- void `resizable` (`FL_Widget` \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- void `resize` (int, int, int, int) override  
*Resizes the `FL_Group` widget and all of its children.*
- virtual `~FL_Group` ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()  
*Activates the widget.*
- unsigned int `active` () const  
*Returns whether the widget is active.*
- int `active_r` () const  
*Returns whether the widget and all of its parents are active.*
- `FL_Align` `align` () const  
*Gets the label alignment.*
- void `align` (`FL_Align` alignment)  
*Sets the label alignment.*

- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)

- Sets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)
- Sets the background and selection color of the widget.*

  - int [contains](#) (const [FI\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*

  - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*

  - void [deactivate](#) ()
- Deactivates the widget.*

  - [FI\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const [FI\\_Image](#) \* [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FI\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int [deimage\\_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

  - void [do\\_callback](#) ([FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

  - void [do\\_callback](#) ([FI\\_Widget](#) \*widget, long arg, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - void [do\\_callback](#) ([FI\\_Widget](#) \*widget, void \*arg=0, [FI\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

  - void [draw\\_label](#) (int, int, int, int, [FI\\_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int [h](#) () const
- Gets the widget height.*

  - int [horizontal\\_label\\_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*

  - void [horizontal\\_label\\_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

  - [FI\\_Image](#) \* [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*

  - const [FI\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

- `int image_bound () const`  
*Returns whether the image is managed by the widget.*
- `int inside (const FL_Widget *wgt) const`  
*Checks if this widget is a child of wgt.*
- `int is_label_copied () const`  
*Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`  
*Gets the current label text.*
- `void label (const char *text)`  
*Sets the current label pointer.*
- `void label (FL_Labeltype a, const char *b)`  
*Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`  
*Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`  
*Set the gap between the label and the image in pixels.*
- `FL_Color labelcolor () const`  
*Gets the label color.*
- `void labelcolor (FL_Color c)`  
*Sets the label color.*
- `FL_Font labelfont () const`  
*Gets the font to use.*
- `void labelfont (FL_Font f)`  
*Sets the font to use.*
- `FL_Fonsize labelsz () const`  
*Gets the font size in pixels.*
- `void labelsz (FL_Fonsize pix)`  
*Sets the font size in pixels.*
- `FL_Labeltype labeltype () const`  
*Gets the label type.*
- `void labeltype (FL_Labeltype a)`  
*Sets the label type.*
- `void measure_label (int &ww, int &hh) const`  
*Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`  
*Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`  
*Sets whether this widget needs a keyboard.*
- `unsigned int output () const`  
*Returns if a widget is used for output only.*
- `FL_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (FL_Group *p)`  
*Internal use only - "for hacks only".*
- `void position (int X, int Y)`  
*Repositions the window or widget.*
- `void redraw ()`  
*Schedules the drawing of the widget.*
- `void redraw_label ()`  
*Schedules the drawing of the label.*
- `FL_Color selection_color () const`

- Gets the selection color.*

  - void [selection\\_color](#) ([FI\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

  - int [take\\_focus](#) ()
- Gives the widget the keyboard focus.*

  - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

  - int [test\\_shortcut](#) ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* [tooltip](#) () const
- Gets the current tooltip text.*

  - void [tooltip](#) (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - [FI\\_Window](#) \* [top\\_window](#) () const
- Returns a pointer to the top-level window for the widget.*

  - [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const
- Finds the x/y offset of the current widget relative to the top-level window.*

  - [uchar](#) [type](#) () const
- Gets the widget type.*

  - void [type](#) ([uchar](#) t)
- Sets the widget type.*

  - int [use\\_accents\\_menu](#) ()
- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* [user\\_data](#) () const
- Gets the user data for this widget.*

  - void [user\\_data](#) ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*

  - void [user\\_data](#) (void \*v)
- Sets the user data for this widget.*

  - int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*

  - void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*

- unsigned int `visible` () const  
*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const  
*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `Fl_When` `when` () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()  
*Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from `Fl_Browser`

- enum `Fl_Line_Position` { `TOP` , `BOTTOM` , `MIDDLE` }  
*For internal use only?*

### Public Types inherited from `Fl_Browser_`

- `FL_BLINE * _remove` (int line)  
*Removes the item at the specified `line`.*
- `const void * bline_data` (const `FL_BLINE *b`) const  
*Get `FL_BLINE` data.*
- `void *& bline_data` (`FL_BLINE *b`) const  
*Get writable reference to `FL_BLINE` data.*
- `char bline_flags` (const `FL_BLINE *b`) const  
*Get `FL_BLINE` flags.*
- `char & bline_flags` (`FL_BLINE *b`) const  
*Get writable reference to `FL_BLINE` flags.*
- `const FL\_Image * bline_icon` (const `FL_BLINE *b`) const  
*Get `FL_BLINE` icon.*
- `FL\_Image *& bline_icon` (`FL_BLINE *b`) const  
*Get writable reference to `FL_BLINE` icon.*
- `short bline_length` (const `FL_BLINE *b`) const  
*Get `FL_BLINE` allocated text buffer size (excl.*
- `const char * bline_txt` (const `FL_BLINE *b`) const  
*Get `FL_BLINE` text.*
- `char * bline_txt` (`FL_BLINE *b`) const  
*Get writable reference to `FL_BLINE` text.*
- `FL_BLINE * find_line` (int line) const  
*Returns the item for specified `line`.*
- `int full_height` () const override  
*The height of the entire list of all [visible\(\)](#) items in pixels.*
- `int incr_height` () const override  
*The default 'average' item height (including inter-item spacing) in pixels.*
- `void insert` (int line, `FL_BLINE *item`)

- Insert specified `item` above `line`.*

  - void \* [item\\_at](#) (int `line`) const override

*Return the item at specified `line`.*
- void [item\\_draw](#) (void \*`item`, int `X`, int `Y`, int `W`, int `H`) const override

*Draws `item` at the position specified by `X Y W H`.*
- void \* [item\\_first](#) () const override

*Returns the very first item in the list.*
- int [item\\_height](#) (void \*`item`) const override

*Returns height of `item` in pixels.*
- void \* [item\\_last](#) () const override

*Returns the very last item in the list.*
- void \* [item\\_next](#) (void \*`item`) const override

*Returns the next item after `item`.*
- void \* [item\\_prev](#) (void \*`item`) const override

*Returns the previous item before `item`.*
- void [item\\_select](#) (void \*`item`, int `val`) override

*Change the selection state of `item` to the value `val`.*
- int [item\\_selected](#) (void \*`item`) const override

*See if `item` is selected.*
- void [item\\_swap](#) (void \*`a`, void \*`b`) override

*Swap the items `a` and `b`.*
- const char \* [item\\_text](#) (void \*`item`) const override

*Returns the label text for `item`.*
- int [item\\_width](#) (void \*`item`) const override

*Returns width of `item` in pixels.*
- int [lineno](#) (void \*`item`) const

*Returns line number corresponding to `item`, or zero if not found.*
- void [swap](#) (FL\_BLINE \*`a`, FL\_BLINE \*`b`)

*Swap the two items `a` and `b`.*

### Protected Member Functions inherited from [FI\\_Browser\\_](#)

- void [bbox](#) (int &`X`, int &`Y`, int &`W`, int &`H`) const

*Returns the bounding box for the interior of the list's display window, inside the scrollbars.*
- void [deleting](#) (void \*`item`)

*This method should be used when `item` is being deleted from the list.*
- int [displayed](#) (void \*`item`) const

*Returns non-zero if `item` has been scrolled to a position where it is being displayed.*
- void [draw](#) () override

*Draws the list within the normal widget bounding box.*
- void \* [find\\_item](#) (int `ypos`)

*This method returns the item under mouse `y` position `ypos`.*
- [FI\\_Browser\\_](#) (int `X`, int `Y`, int `W`, int `H`, const char \*`L=0`)

*The constructor makes an empty browser.*
- virtual int [full\\_width](#) () const

*This method may be provided by the subclass to indicate the full width of the item list, in pixels.*
- void [inserting](#) (void \*`a`, void \*`b`)

*This method should be used when an item is in the process of being inserted into the list.*
- virtual int [item\\_quick\\_height](#) (void \*`item`) const

*This method may be provided by the subclass to return the height of the `item`, in pixels.*
- int [leftedge](#) () const

- This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.*

  - void **new\_list** ()

*This method should be called when the list data is completely replaced or cleared.*
- void **redraw\_line** (void \*item)

*This method should be called when the contents of *item* has changed, but not its height.*
- void **redraw\_lines** ()

*This method will cause the entire list to be redrawn.*
- void **replacing** (void \*a, void \*b)

*This method should be used when item *a* is being replaced by item *b*.*
- void \* **selection** () const

*Returns the item currently selected, or NULL if there is no selection.*
- void **swapping** (void \*a, void \*b)

*This method should be used when two items *a* and *b* are being swapped.*
- void \* **top** () const

*Returns the item that appears at the top of the list.*

### Protected Member Functions inherited from FL\_Group

- **FL\_Rect** \* **bounds** ()

*Returns the internal array of widget sizes and positions.*
- void **draw** () override

*Draws the widget.*
- void **draw\_child** (FL\_Widget &widget) const

*Forces a child to redraw.*
- void **draw\_children** ()

*Draws all children of the group.*
- void **draw\_outside\_label** (const FL\_Widget &widget) const

*Parents normally call this to draw outside labels of child widgets.*
- virtual int **on\_insert** (FL\_Widget \*, int)

*Allow derived groups to act when a widget is added as a child.*
- virtual int **on\_move** (int, int)

*Allow derived groups to act when a widget is moved within the group.*
- virtual void **on\_remove** (int)

*Allow derived groups to act when a child widget is removed from the group.*
- int \* **sizes** ()

*Returns the internal array of widget sizes and positions.*
- void **update\_child** (FL\_Widget &widget) const

*Draws a child only if it needs it.*

### Protected Member Functions inherited from FL\_Widget

- void **clear\_flag** (unsigned int c)

*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const

*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const

*Draws the widget box according to its box style.*
- void **draw\_box** (FL\_Boxtype t, FL\_Color c) const

*Draws a box of type *t*, of color *c* at the widget's position and size.*
- void **draw\_box** (FL\_Boxtype t, int x, int y, int w, int h, FL\_Color c) const

*Draws a box of type *t*, of color *c* at the position *X,Y* and size *W,H*.*
- void **draw\_focus** () const

- Draws a focus rectangle around the widget.*
- void `draw_focus` (`Fl_Boxtype` t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void `draw_focus` (`Fl_Boxtype` t, int x, int y, int w, int h, `Fl_Color` bg) const
- Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const
- Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- `Fl_Widget` (int x, int y, int w, int h, const char \*label=0L)
- Creates a widget at the given position and size.*
- unsigned int `flags` () const
- Gets the widget flags mask.*
- void `h` (int v)
- Internal use only.*
- void `set_flag` (unsigned int c)
- Sets a flag in the flags mask.*
- void `w` (int v)
- Internal use only.*
- void `x` (int v)
- Internal use only.*
- void `y` (int v)
- Internal use only.*

### Static Protected Attributes inherited from `Fl_Browser`

- static constexpr char `BLINE_NOTDISPLAYED` = 2
- static constexpr char `BLINE_SELECTED` = 1

#### 13.119.1 Detailed Description

The class is a subclass of `Fl_Browser` which lets the user select a single item, or no items by clicking on the empty space.

As long as the mouse button is held down on an unselected item it is highlighted. Normally the callback is done when the user presses the mouse, but you can change this with `when()`.

See `Fl_Browser` for methods to add and remove lines from the browser.

#### 13.119.2 Constructor & Destructor Documentation

##### 13.119.2.1 `Fl_Select_Browser()`

```
Fl_Select_Browser::Fl_Select_Browser (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Select_Browser` widget using the given position, size, and label string.

The default boxttype is `FL_DOWN_BOX`. The constructor specializes `Fl_Browser()` by setting the type to `FL_SELECT_BROWSER`. The destructor destroys the widget and frees all memory that has been allocated.

The documentation for this class was generated from the following files:

- `Fl_Select_Browser.H`
- `Fl_Browser.cxx`

## 13.120 FL\_Shared\_Image Class Reference

This class supports caching, loading, and drawing of image files.

```
#include <FL_Shared_Image.H>
```

Inheritance diagram for FL\_Shared\_Image:

### Classes

- class [Deleter](#)  
*Custom deleter for std::unique\_ptr<>.*

### Public Member Functions

- [FL\\_Shared\\_Image \\* as\\_shared\\_image \(\)](#) override  
*Returns whether an image is an [FL\\_Shared\\_Image](#) or not.*
- void [color\\_average](#) ([FL\\_Color](#) c, float i) override  
*Averages the colors in the image with the provided FLTK color value.*
- [FL\\_Image \\* copy \(\)](#)  
*Increments the reference counter and returns a pointer to itself.*
- [FL\\_Image \\* copy \(\)](#) const
- [FL\\_Image \\* copy](#) (int W, int H) const override  
*Return a shared image of this image with the requested size.*
- void [desaturate \(\)](#) override  
*Convert the image to gray scale.*
- void **draw** (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) override  
*Draw this image to the current graphics context.*
- const [FL\\_Image \\* image \(\)](#) const  
*Returns a pointer to the internal [FL\\_Image](#) object.*
- const char \* **name** () const  
*Returns the filename of the shared image.*
- int [original \(\)](#) const  
*Returns whether this is an original image.*
- int [refcount \(\)](#) const  
*Returns the number of references of this shared image.*
- void [release \(\)](#) override  
*Releases and possibly destroys (if refcount <= 0) a shared image.*
- virtual void **reload** ()  
*Reloads the shared image from disk.*
- void [uncache \(\)](#) override  
*Remove the cached device specific image data.*

## Public Member Functions inherited from [FI\\_Image](#)

- [FI\\_Image](#) \* [copy](#) () const  
*Creates a copy of the image in the same size.*
- int [count](#) () const  
*Returns the number of data values associated with the image.*
- int [d](#) () const  
*Returns the image depth.*
- const char \*const \* [data](#) () const  
*Returns a pointer to the current image data array.*
- int [data\\_h](#) () const  
*Returns the height of the image data.*
- int [data\\_w](#) () const  
*Returns the width of the image data.*
- void [draw](#) (int X, int Y)  
*Draws the image to the current drawing surface.*
- int [fail](#) () const  
*Returns a value that is not 0 if there is currently no image available.*
- [FI\\_Image](#) (int W, int H, int D)  
*The constructor creates an empty image with the specified width, height, and depth.*
- int [h](#) () const  
*Returns the current image drawing height in FLTK units.*
- void [inactive](#) ()  
*The [inactive\(\)](#) method calls [color\\_average\(FL\\_BACKGROUND\\_COLOR, 0.33f\)](#) to produce an image that appears grayed out.*
- virtual void [label](#) ([FI\\_Menu\\_Item](#) \*m)  
*This method is an obsolete way to set the image attribute of a menu item.*
- virtual void [label](#) ([FI\\_Widget](#) \*w)  
*This method is an obsolete way to set the image attribute of a widget or menu item.*
- int [ld](#) () const  
*Returns the current line data size in bytes.*
- virtual void [scale](#) (int width, int height, int proportional=1, int can\_expand=0)  
*Sets the drawing size of the image.*
- int [w](#) () const  
*Returns the current image drawing width in FLTK units.*
- virtual ~[FI\\_Image](#) ()  
*The destructor is a virtual method that frees all memory used by the image.*

## Static Public Member Functions

- static void [add\\_handler](#) ([FI\\_Shared\\_Handler](#) f)  
*Adds a shared image handler, which is basically a test function for adding new image formats.*
- static [FI\\_Shared\\_Image](#) \* [find](#) (const char \*name, int W=0, int H=0)  
*Finds a shared image from its name and size specifications.*
- static [FI\\_Shared\\_Image](#) \* [get](#) (const char \*name, int W=0, int H=0)  
*Find or load an image that can be shared by multiple widgets.*
- static [FI\\_Shared\\_Image](#) \* [get](#) ([FI\\_RGB\\_Image](#) \*rgb, int own\_it=1)  
*Builds a shared image from a pre-existing [FI\\_RGB\\_Image](#).*
- static [FI\\_Shared\\_Image](#) \*\* [images](#) ()  
*Returns the [FI\\_Shared\\_Image\\*](#) array.*
- static int [num\\_images](#) ()  
*Number of shared images in their various cached sizes.*
- static void [remove\\_handler](#) ([FI\\_Shared\\_Handler](#) f)  
*Removes a shared image handler.*

## Static Public Member Functions inherited from FI\_Image

- static [FI\\_Labeltype](#) [define\\_FL\\_IMAGE\\_LABEL](#) ()
- static [FI\\_RGB\\_Scaling](#) [RGB\\_scaling](#) ()  
*Returns the currently used RGB image scaling method.*
- static void [RGB\\_scaling](#) ([FI\\_RGB\\_Scaling](#))  
*Sets the RGB image scaling method used for copy(int, int).*
- static [FI\\_RGB\\_Scaling](#) [scaling\\_algorithm](#) ()  
*Gets what algorithm is used when resizing a source image to draw it.*
- static void [scaling\\_algorithm](#) ([FI\\_RGB\\_Scaling](#) algorithm)  
*Sets what algorithm is used when resizing a source image to draw it.*

## Protected Member Functions

- void [add](#) ()  
*Adds a shared image to the image pool.*
- [FI\\_Shared\\_Image](#) \* [copy](#) (int W, int H) const  
*Create a resized copy of the image and wrap it into the share image class.*
- [FI\\_Shared\\_Image](#) ()  
*Creates an empty shared image.*
- [FI\\_Shared\\_Image](#) (const char \*n, [FI\\_Image](#) \*img=0)  
*Creates a shared image from its filename and its corresponding FI\_Image\* img.*
- void [update](#) ()  
*Update the dimensions of the shared images.*
- virtual [~FI\\_Shared\\_Image](#) ()  
*The destructor frees all memory and server resources that are used by the image.*

## Protected Member Functions inherited from FI\_Image

- void [d](#) (int D)  
*Sets the current image depth.*
- void [data](#) (const char \*const \*p, int c)  
*Sets the current data pointer and count of pointers in the array.*
- void [draw\\_empty](#) (int X, int Y)  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int [draw\\_scaled](#) (int X, int Y, int W, int H)  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void [h](#) (int H)  
*Sets the height of the image data.*
- void [ld](#) (int LD)  
*Sets the current line data size in bytes.*
- void [w](#) (int W)  
*Sets the width of the image data.*

## Static Protected Member Functions

- static int [compare](#) ([FI\\_Shared\\_Image](#) \*\*i0, [FI\\_Shared\\_Image](#) \*\*i1)  
*Compares two shared images.*

## Static Protected Member Functions inherited from FI\_Image

- static void [labeltype](#) (const [FI\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [FI\\_Align](#) la)
- static void [measure](#) (const [FI\\_Label](#) \*lo, int &lw, int &lh)

### Static Public Attributes inherited from [Fl\\_Image](#)

- static const int **ERR\_FILE\_ACCESS** = -2
- static const int **ERR\_FORMAT** = -3
- static const int **ERR\_MEMORY\_ACCESS** = -4
- static const int **ERR\_NO\_IMAGE** = -1
- static bool **register\_images\_done** = false

*True after [fl\\_register\\_images\(\)](#) was called, false before.*

## 13.120.1 Detailed Description

This class supports caching, loading, and drawing of image files.

Most applications will also want to link against the fltk\_images library and call the [fl\\_register\\_images\(\)](#) function to support standard image formats such as BMP, GIF, JPEG, PNG, and SVG (unless the library was built with the option removing SVG support).

Images can be requested (loaded) with [Fl\\_Shared\\_Image::get\(\)](#), [find\(\)](#), and some other methods. All images are cached in an internal list of shared images and should be released when they are no longer needed. A refcount is used to determine if a released image is to be destroyed with delete.

[Fl\\_Shared\\_Image::find\(\)](#)  
[Fl\\_Shared\\_Image::release\(\)](#)

## 13.120.2 Constructor & Destructor Documentation

### 13.120.2.1 [Fl\\_Shared\\_Image\(\)](#) [1/2]

```
Fl_Shared_Image::Fl_Shared_Image () [protected]
```

Creates an empty shared image.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the [get\(\)](#) method instead.

### 13.120.2.2 FI\_Shared\_Image() [2/2]

```
Fl_Shared_Image::Fl_Shared_Image (
 const char * n,
 Fl_Image * img = 0) [protected]
```

Creates a shared image from its filename and its corresponding `Fl_Image*` `img`.

The constructors create a new shared image record in the image cache.

The constructors are protected and cannot be used directly from a program. Use the [get\(\)](#) method instead.

#### Parameters

in	<i>n</i>	filename or pool name of the image, must be unique among shared images
in	<i>img</i>	the image that is made available using the name

### 13.120.2.3 ~FI\_Shared\_Image()

```
Fl_Shared_Image::~~Fl_Shared_Image () [protected], [virtual]
```

The destructor frees all memory and server resources that are used by the image.

The destructor is protected and cannot be used directly from a program. Use the [Fl\\_Shared\\_Image::release\(\)](#) method instead.

## 13.120.3 Member Function Documentation

### 13.120.3.1 add()

```
void Fl_Shared_Image::add () [protected]
```

Adds a shared image to the image pool.

This **protected** method adds an image to the pool, an ordered list of shared images. The pool is searched for a matching image whenever one is requested, for instance with [Fl\\_Shared\\_Image::get\(\)](#) or [Fl\\_Shared\\_Image::find\(\)](#). This method does not increase or decrease reference counts!

### 13.120.3.2 add\_handler()

```
void Fl_Shared_Image::add_handler (
 Fl_Shared_Handler f) [static]
```

Adds a shared image handler, which is basically a test function for adding new image formats.

This function will be called when an [Fl\\_Shared\\_Image](#) is to be loaded (for instance with [Fl\\_Shared\\_Image::get\(\)](#)) and the image type is not known to FLTK.

All registered image handlers will be called in the order of registration. You should always call [fl\\_register\\_images\(\)](#) before adding your own handlers - unless you need to override a known image file type which should be rare.

See also

[Fl\\_Shared\\_Handler](#) for more information of the function you need to define.

### 13.120.3.3 as\_shared\_image()

```
Fl_Shared_Image * Fl_Shared_Image::as_shared_image () [inline], [override], [virtual]
```

Returns whether an image is an [Fl\\_Shared\\_Image](#) or not.

This virtual method returns a pointer to an [Fl\\_Shared\\_Image](#) if this object is an instance of [Fl\\_Shared\\_Image](#) or NULL if not. This can be used to detect if a given [Fl\\_Image](#) object is a shared image, i.e. derived from [Fl\\_Shared\\_Image](#).

Since

1.4.0

Reimplemented from [Fl\\_Image](#).

### 13.120.3.4 color\_average()

```
void Fl_Shared_Image::color_average (
 Fl_Color c,
 float i) [override], [virtual]
```

Averages the colors in the image with the provided FLTK color value.

This method changes the pixel data of this specific image.

#### Note

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

#### Parameters

in	<i>c</i>	blend with this color
in	<i>i</i>	blend fraction

#### See also

[Fl\\_Image::color\\_average\(Fl\\_Color c, float i\)](#)

Reimplemented from [Fl\\_Image](#).

### 13.120.3.5 compare()

```
int Fl_Shared_Image::compare (
 Fl_Shared_Image ** i0,
 Fl_Shared_Image ** i1) [static], [protected]
```

Compares two shared images.

The order of comparison is:

1. Image name, usually the filename used to load it
2. Image width
3. Image height

Binary search in a sorted array works only if we search for the same parameters that were also used for sorting. No special cases are possible here.

[Fl\\_Shared\\_Image::find\(\)](#) requires a search for an element with a matching name and the original\_ flags set. This is not implemented via binary search, but by a simple run of the array inside [Fl\\_Shared\\_Image::find\(\)](#).

#### Parameters

in	<i>i0,i1</i>	image pointer pointer for sorting
----	--------------	-----------------------------------

#### Returns

Whether the images match or their relative sort order (see text).

#### Return values

<i>0</i>	the images match
<i>&lt;0</i>	Image <i>i0</i> is <i>less</i> than image <i>i1</i>
<i>&gt;0</i>	Image <i>i0</i> is <i>greater</i> than image <i>i1</i>

**13.120.3.6 copy() [1/2]**

```
Fl_Image * Fl_Shared_Image::copy ()
```

Increments the reference counter and returns a pointer to itself.

When the image is no longer used, call `Fl_Shared_Image::release()`.

To get a copy of the image data, call `this->image()->copy()` instead.

**Returns**

pointer to an `Fl_Shared_Image` that can be safely cast

**13.120.3.7 copy() [2/2]**

```
Fl_Image * Fl_Shared_Image::copy (
 int W,
 int H) const [override], [virtual]
```

Return a shared image of this image with the requested size.

This is the same as calling `Fl_Shared_Image::get(this->name(), W, H)`.

If a shared image of the desired size already exists in the shared image pool, the existing image is returned and no copy is made. But the reference counter is incremented. When the image is no longer used, call `Fl_Shared_Image::release()`.

To get a copy of the image data, call `this->image()->copy(W, H)` instead.

**Parameters**

in	W,H	size of requested image
----	-----	-------------------------

**Returns**

pointer to an `Fl_Shared_Image` that can be safely cast, or NULL if the image can't be found and can't be created.

Reimplemented from `Fl_Image`.

**13.120.3.8 copy\_()**

```
Fl_Shared_Image * Fl_Shared_Image::copy_ (
 int W,
 int H) const [protected]
```

Create a resized copy of the image and wrap it into the share image class.

This function is usually followed by a call to `returned_image->add()` to add the image to the pool, and `this->refcounter++` to make sure that the original shared image keeps a reference to the copy. Don't call this function if an image of the given size is already in the pool.

**Parameters**

in	W,H	new image size
----	-----	----------------

**Returns**

a new shared image pointer that is not yet in the pool

**13.120.3.9 desaturate()**

```
void Fl_Shared_Image::desaturate () [override], [virtual]
```

Convert the image to gray scale.

This method changes the pixel data of this specific image.

**Note**

It does not change any of the resized copies of this image, nor does it necessarily apply the color changes if this image is resized later.

**See also**

[Fl\\_Image::desaturate\(\)](#)

Reimplemented from [Fl\\_Image](#).

**13.120.3.10 draw()**

```
void Fl_Shared_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [override], [virtual]
```

Draw this image to the current graphics context.

**Parameters**

in	<i>X,Y,W,H</i>	draw at this position and size
in	<i>cx,cy</i>	image origin

Reimplemented from [Fl\\_Image](#).

**13.120.3.11 find()**

```
Fl_Shared_Image * Fl_Shared_Image::find (
 const char * name,
 int W = 0,
 int H = 0) [static]
```

Finds a shared image from its name and size specifications.

This uses a binary search in the image cache.

If the image `name` exists with the exact width `W` and height `H`, then it is returned.

If `W == 0` and the image `name` exists with another size, then the **original** image with that `name` is returned.

In either case the refcount of the returned image is increased. The found image should be released with [Fl\\_Shared\\_Image::release\(\)](#) when no longer needed.

An image is marked `original` if it was directly loaded from a file or from memory as opposed to copied and resized images.

This comparison is used in [Fl\\_Shared\\_Image::find\(\)](#) to find an image that matches the requested one or to find the position where a new image should be entered into the sorted list of shared images.

It is used in two steps by [Fl\\_Shared\\_Image::add\(\)](#):

1. search with exact width and height
2. if not found, search again with width = 0 (and height = 0)

The first step will only return a match if the image exists with the same width and height. The second step will match if there is an image marked `original` with the same name, regardless of width and height.

**13.120.3.12 get() [1/2]**

```
Fl_Shared_Image * Fl_Shared_Image::get (
 const char * name,
 int W = 0,
 int H = 0) [static]
```

Find or load an image that can be shared by multiple widgets.

If the image exists with the requested size, this image will be returned.

If the image exists, but only with another size, then a new copy with the requested size (width *W* and height *H*) will be created as a resized copy of the original image. The new image is added to the internal list of shared images.

If the image does not yet exist, then a new image of the proper dimension is created from the filename *name*. The original image from filename *name* is always added to the list of shared images in its original size. If the requested size differs, then the resized copy with width *W* and height *H* is also added to the list of shared images.

#### Note

If the sizes differ, then *two* images are created as mentioned above. This is intentional so the original image is cached and preserved. If you request the same image with another size later, then the **original** image will be found, copied, resized, and returned.

Shared JPEG and PNG images can also be created from memory by using their named memory access constructor. You should [release\(\)](#) the image when you're done with it.

#### Parameters

<i>name</i>	name of the image
<i>W,H</i>	desired size

#### Returns

the image at the requested size, or NULL if the image could not be found or generated

#### See also

[Fl\\_Shared\\_Image::find\(const char \\*name, int W, int H\)](#)

[Fl\\_Shared\\_Image::release\(\)](#)

[Fl\\_JPEG\\_Image::Fl\\_JPEG\\_Image\(const char \\*name, const unsigned char \\*data\)](#)

[Fl\\_PNG\\_Image::Fl\\_PNG\\_Image](#) (const char \*name\_png, const unsigned char \*buffer, int maxsize)

### 13.120.3.13 get() [2/2]

```
Fl_Shared_Image * Fl_Shared_Image::get (
 Fl_RGB_Image * rgb,
 int own_it = 1) [static]
```

Builds a shared image from a pre-existing [Fl\\_RGB\\_Image](#).

#### Parameters

in	<i>rgb</i>	an <a href="#">Fl_RGB_Image</a> used to build a new shared image.
in	<i>own_it</i>	1 if the shared image should delete <i>rgb</i> when it is itself deleted, 0 otherwise

#### Version

1.3.4

### 13.120.3.14 image()

```
const Fl_Image * Fl_Shared_Image::image () const [inline]
```

Returns a pointer to the internal [Fl\\_Image](#) object.

The output is a pointer to the *internal* image ('[Fl\\_Image](#)' or subclass) which can be used to inspect or copy the image.

**Do not try to modify the image!** You can copy the image though if you want or need to change any attributes, size etc. If all you need to do is to resize the image you should use `Fl_Shared_Image::copy(int, int)` instead.

#### Note

The internal image (pointer) is protected for good reasons, e.g. to prevent access to the image so it can't be modified by user code. **DO NOT** cast away the 'const' attribute to modify the image.

User code should rarely need this method. Use with caution.

#### Returns

const `Fl_Image*` image, the internal [Fl\\_Image](#)

#### Since

1.4.0

### 13.120.3.15 images()

```
Fl_Shared_Image** Fl_Shared_Image::images () [static]
```

Returns the `Fl_Shared_Image*` array.

#### Returns

a pointer to an array of shared image pointers, sorted by name and size

#### See also

[Fl\\_Shared\\_Image::num\\_images\(\)](#)

### 13.120.3.16 num\_images()

```
int Fl_Shared_Image::num_images () [static]
```

Number of shared images in their various cached sizes.

#### Returns

number of entries in the array

#### See also

[Fl\\_Shared\\_Image::images\(\)](#)

### 13.120.3.17 original()

```
int Fl_Shared_Image::original () const [inline]
```

Returns whether this is an original image.

Images loaded from a file or from memory are marked `original` as opposed to images created as a copy of another image with different size (width or height).

#### Note

This is useful for debugging (rarely used in user code).

#### Since

FLTK 1.4.0

**13.120.3.18 refcount()**

```
int Fl_Shared_Image::refcount () const [inline]
```

Returns the number of references of this shared image.

When reference is below 1, the image is deleted.

**13.120.3.19 release()**

```
void Fl_Shared_Image::release () [override], [virtual]
```

Releases and possibly destroys (if refcount  $\leq 0$ ) a shared image.

In the latter case, it will reorganize the shared image array so that no hole will occur.

Reimplemented from [Fl\\_Image](#).

**13.120.3.20 uncache()**

```
void Fl_Shared_Image::uncache () [override], [virtual]
```

Remove the cached device specific image data.

See also

[Fl\\_Image::uncache\(\)](#)

Reimplemented from [Fl\\_Image](#).

**13.120.3.21 update()**

```
void Fl_Shared_Image::update () [protected]
```

Update the dimensions of the shared images.

Internal method to synchronize shared image data with the actual image data.

The documentation for this class was generated from the following files:

- [Fl\\_Shared\\_Image.H](#)
- [Fl\\_Shared\\_Image.cxx](#)

**13.121 Fl\_Shortcut\_Button Class Reference**

A button that allows the user to type a key combination to create shortcuts.

Inheritance diagram for Fl\_Shortcut\_Button:

**Public Member Functions**

- [Fl\\_Shortcut\\_Button](#) (int X, int Y, int W, int H, const char \*l=0)  
*Construct a shortcut button.*
- [Fl\\_Shortcut value](#) ()  
*Return the user selected shortcut.*
- void [value](#) ([Fl\\_Shortcut shortcut](#))  
*Set the displayed shortcut.*

## Public Member Functions inherited from [Fl\\_Button](#)

- `int clear ()`  
*Same as `value(0)`.*
- `uchar compact () const`  
*Return true if buttons are rendered as compact buttons.*
- `void compact (uchar v)`  
*Decide if buttons should be rendered in compact mode.*
- `Fl_Boxtype down_box () const`  
*Returns the current down box type, which is drawn when `value()` is non-zero.*
- `void down_box (Fl_Boxtype b)`  
*Sets the down box type.*
- `Fl_Color down_color () const`  
*(for backwards compatibility)*
- `void down_color (unsigned c)`  
*(for backwards compatibility)*
- `Fl_Button (int X, int Y, int W, int H, const char *L=0)`  
*The constructor creates the button using the given position, size, and label.*
- `int set ()`  
*Same as `value(1)`.*
- `void setonly ()`  
*Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).*
- `int shortcut () const`  
*Returns the current shortcut key for the button.*
- `void shortcut (const char *s)`  
*(for backwards compatibility)*
- `void shortcut (int s)`  
*Sets the shortcut key to `s`.*
- `char value () const`  
*Returns the current value of the button (0 or 1).*
- `int value (int v)`  
*Sets the current value of the button.*

## Public Member Functions inherited from [Fl\\_Widget](#)

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
*Activates the widget.*
- `unsigned int active () const`  
*Returns whether the widget is active.*
- `int active_r () const`  
*Returns whether the widget and all of its parents are active.*
- `Fl_Align align () const`  
*Gets the label alignment.*
- `void align (Fl_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `Fl_Gl_Window * as_gl_window ()`

- Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* **as\_gl\_window** () const
- virtual [FL\\_Group](#) \* **as\_group** ()
- Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- virtual [FL\\_Group](#) const \* **as\_group** () const
- virtual [FL\\_Window](#) \* **as\_window** ()
- Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* **as\_window** () const
- void **bind\_deimage** ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** ([FL\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) **box** () const
- Gets the box type of the widget.*
- void **box** ([FL\\_Boxtype](#) new\_box)
- Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) **callback** () const
- Gets the current callback function for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*
- void **callback** ([FL\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*
- void **callback** ([FL\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*
- void **callback** ([FL\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int **changed** () const
- Checks if the widget value changed since the last callback.*
- void **clear\_active** ()
- Marks the widget as inactive without sending events or changing focus.*
- void **clear\_changed** ()
- Marks the value of the widget as unchanged.*
- void **clear\_damage** (uchar c=0)
- Clears or sets the damage flags.*
- void **clear\_output** ()
- Sets a widget to accept input.*
- void **clear\_visible** ()
- Hides the widget.*
- void **clear\_visible\_focus** ()
- Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) **color** () const
- Gets the background color of the widget.*
- void **color** ([FL\\_Color](#) bg)
- Sets the background color of the widget.*
- void **color** ([FL\\_Color](#) bg, [FL\\_Color](#) sel)

- Sets the background and selection color of the widget.*

  - int `contains` (const `Fl_Widget *w`) const

*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)

*Sets the current label.*
- void `copy_tooltip` (const char \*text)

*Sets the current tooltip text.*
- `uchar damage` () const

*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar c`)

*Sets the damage bits for the widget.*
- void `damage` (`uchar c`, int `x`, int `y`, int `w`, int `h`)

*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)

*Internal use only.*
- void `deactivate` ()

*Deactivates the widget.*
- `Fl_Image * deimage` ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const `Fl_Image * deimage` () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`Fl_Image &img`)

*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`Fl_Image *img`)

*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const

*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`Fl_Widget *widget`, long arg, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`Fl_Widget *widget`, void \*arg=0, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `Fl_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const

*Gets the widget height.*
- virtual void `hide` ()

*Makes a widget invisible.*
- int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- `Fl_Image * image` ()

*Gets the image that is used as part of the widget label when in the active state.*
- const `Fl_Image * image` () const

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`Fl_Image &img`)

*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`Fl_Image *img`)

*Sets the image to use as part of the widget label when in the active state.*

- int `image_bound` () const  
*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FL_Color` c)  
*Sets the label color.*
- `FL_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FL_Font` f)  
*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const  
*Gets the font size in pixels.*
- void `labelsize` (`FL_Fonsize` pix)  
*Sets the font size in pixels.*
- `FL_Labeltype` `labeltype` () const  
*Gets the label type.*
- void `labeltype` (`FL_Labeltype` a)  
*Sets the label type.*
- void `measure_label` (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool `needs_keyboard` () const  
*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const  
*Returns if a widget is used for output only.*
- `FL_Group` \* `parent` () const  
*Returns a pointer to the parent widget.*
- void `parent` (`FL_Group` \*p)  
*Internal use only - "for hacks only".*
- void `position` (int X, int Y)  
*Repositions the window or widget.*
- void `redraw` ()  
*Schedules the drawing of the widget.*
- void `redraw_label` ()  
*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

- Changes the size or position of the widget.*
- `Fl_Color selection_color () const`  
*Gets the selection color.*
- `void selection_color (Fl_Color a)`  
*Sets the selection color.*
- `int send (int event)`  
*Sends the specified event to the widget.*
- `void set_active ()`  
*Marks the widget as active without sending events or changing focus.*
- `void set_changed ()`  
*Marks the value of the widget as changed.*
- `void set_output ()`  
*Sets a widget to output only.*
- `void set_visible ()`  
*Makes the widget visible.*
- `void set_visible_focus ()`  
*Enables keyboard focus navigation with this widget.*
- `int shortcut_label () const`  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- `void shortcut_label (int value)`  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- `virtual void show ()`  
*Makes a widget visible.*
- `void size (int W, int H)`  
*Changes the size of the widget.*
- `int take_focus ()`  
*Gives the widget the keyboard focus.*
- `unsigned int takeevents () const`  
*Returns if the widget is able to take events.*
- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip () const`  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window () const`  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type () const`  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data () const`  
*Gets the user data for this widget.*
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`  
*Sets the user data for this widget.*
- `void user_data (void *v)`  
*Sets the user data for this widget.*

- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [FI\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [FI\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual [~FI\\_Widget](#) ()  
*Destroys the widget.*

### Protected Member Functions

- void [do\\_end\\_hot\\_callback](#) ()  
*Call the callback if the user is interested.*
- void [draw](#) () override  
*Draw the textual representation of the shortcut button.*
- int [handle](#) (int) override  
*Handle keystrokes to catch the user's shortcut.*

### Protected Member Functions inherited from [FI\\_Button](#)

- void [simulate\\_key\\_action](#) ()

### Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If [FL\\_ALIGN\\_IMAGE\\_BACKDROP](#) is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*

- void `draw_focus` () const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (FI\_Boxtype t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void `draw_focus` (FI\_Boxtype t, int x, int y, int w, int h, FI\_Color bg) const  
*Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const  
*Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- FI\_Widget (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int `flags` () const  
*Gets the widget flags mask.*
- void `h` (int v)  
*Internal use only.*
- void `set_flag` (unsigned int c)  
*Sets a flag in the flags mask.*
- void `w` (int v)  
*Internal use only.*
- void `x` (int v)  
*Internal use only.*
- void `y` (int v)  
*Internal use only.*

### Protected Attributes

- FI\_Shortcut `shortcut_value`

### Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void `default_callback` (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

## Static Protected Member Functions inherited from [Fl\\_Button](#)

- static void **key\_release\_timeout** (void \*)

## Static Protected Attributes inherited from [Fl\\_Button](#)

- static [Fl\\_Widget\\_Tracker](#) \* **key\_release\_tracker** = 0

### 13.121.1 Detailed Description

A button that allows the user to type a key combination to create shortcuts.

After clicked once, the button catches the following keyboard events and records the pressed keys and all modifiers.

It draws a text representation of the shortcut.

The backspace key deletes the current shortcut. A second click on the button or moving focus makes the last shortcut permanent.

The Shortcut button calls the user callback after every change if FL\_WHEN\_CHANGED is set, and when the button is no longer recording shortcuts if FL\_WHEN\_RELEASE is set.

### 13.121.2 Constructor & Destructor Documentation

#### 13.121.2.1 Fl\_Shortcut\_Button()

```
Fl_Shortcut_Button::Fl_Shortcut_Button (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Construct a shortcut button.

#### Parameters

<i>X,Y,W,H</i>	position and size of the button
<i>l</i>	label text when no shortcut is set

### 13.121.3 Member Function Documentation

#### 13.121.3.1 draw()

```
void Fl_Shortcut_Button::draw (
 void) [override], [protected], [virtual]
```

Draw the textual representation of the shortcut button.

When the button can receive shortcut key events, it's "hot". A hot button is drawn in selection color. A cold button is drawn as a regular text box containing a human readable version of the shortcut key.

Reimplemented from [Fl\\_Button](#).

#### 13.121.3.2 handle()

```
int Fl_Shortcut_Button::handle (
 int e) [override], [protected], [virtual]
```

Handle keystrokes to catch the user's shortcut.

Reimplemented from [Fl\\_Button](#).

#### 13.121.3.3 value() [1/2]

```
Fl_Shortcut Fl_Shortcut_Button::value ()
```

Return the user selected shortcut.

#### Returns

shortcut encoded as key and modifier

#### 13.121.3.4 value() [2/2]

```
void Fl_Shortcut_Button::value (
 Fl_Shortcut shortcut)
```

Set the displayed shortcut.

#### Parameters

in	shortcut	encoded as key and modifier
----	----------	-----------------------------

The documentation for this class was generated from the following files:

- Fl\_Shortcut\_Button.H
- Fl\_Shortcut\_Button.cxx

## 13.122 Fl\_Simple\_Counter Class Reference

This widget creates a counter with only 2 arrow buttons.

```
#include <Fl_Simple_Counter.H>
```

Inheritance diagram for Fl\_Simple\_Counter:

#### Public Member Functions

- **Fl\_Simple\_Counter** (int X, int Y, int W, int H, const char \*L=0)

#### Public Member Functions inherited from **Fl\_Counter**

- **Fl\_Counter** (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new **Fl\_Counter** widget using the given position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*
- void **lstep** (double a)  
*Sets the increment for the large step buttons.*
- double **step** () const  
*Returns the increment for normal step buttons.*
- void **step** (double a)  
*Sets the increment for the normal step buttons.*
- void **step** (double a, double b)  
*Sets the increments for the normal and large step buttons.*

- [FI\\_Color](#) **textcolor** () const  
*Gets the font color.*
- void **textcolor** ([FI\\_Color](#) s)  
*Sets the font color to s.*
- [FI\\_Font](#) **textfont** () const  
*Gets the text font.*
- void **textfont** ([FI\\_Font](#) s)  
*Sets the text font to s.*
- [FI\\_Fontsize](#) **textsize** () const  
*Gets the font size.*
- void **textsize** ([FI\\_Fontsize](#) s)  
*Sets the font size to s.*
- **~FI\_Counter** ()  
*Destroys the valuator.*

### Public Member Functions inherited from [FI\\_Valuator](#)

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for [FI\\_Valuator::format\(char\\* buffer\)](#).*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double [FI\\_Valuator::step\(\)](#) const*
- void **step** (double s)  
*See double [FI\\_Valuator::step\(\)](#) const.*
- void **step** (int a)  
*See double [FI\\_Valuator::step\(\)](#) const*

- double [value](#) () const  
*Gets the floating point(double) value.*
- int [value](#) (double)  
*Sets the current value.*
- [~FI\\_Valuator](#) () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)

- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)

*Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)

*Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)

*Sets the current callback function for the widget.*

  - unsigned int [changed](#) () const

*Checks if the widget value changed since the last callback.*

  - void [clear\\_active](#) ()

*Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_changed](#) ()

*Marks the value of the widget as unchanged.*

  - void [clear\\_damage](#) (uchar c=0)

*Clears or sets the damage flags.*

  - void [clear\\_output](#) ()

*Sets a widget to accept input.*

  - void [clear\\_visible](#) ()

*Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()

*Disables keyboard focus navigation with this widget.*

  - [FI\\_Color](#) [color](#) () const

*Gets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg)

*Sets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)

*Sets the background and selection color of the widget.*

  - int [contains](#) (const [FI\\_Widget](#) \*w) const

*Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*

  - uchar [damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) (uchar c)

*Sets the damage bits for the widget.*

  - void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*

  - void [deactivate](#) ()

*Deactivates the widget.*

  - [FI\\_Image](#) \* [deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*

  - const [FI\\_Image](#) \* [deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FI\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*

  - void [deimage](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*

- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FI_Widget` \*widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FI_Widget` \*widget, void \*arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FI_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FI_Image` \* `image` ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const `FI_Image` \* `image` () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FI_Image` &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FI_Image` \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const  
*Returns whether the image is managed by the widget.*
- int `inside` (const `FI_Widget` \*wgt) const  
*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const  
*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const  
*Gets the current label text.*
- void `label` (const char \*text)  
*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()  
*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)  
*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const  
*Gets the label color.*
- void `labelcolor` (`FI_Color` c)  
*Sets the label color.*
- `FI_Font` `labelfont` () const  
*Gets the font to use.*
- void `labelfont` (`FI_Font` f)  
*Sets the font to use.*
- `FI_Fontsize` `labelsize` () const

- Gets the font size in pixels.*

  - void [labelsize](#) ([Fl\\_Fontsize](#) pix)
- Sets the font size in pixels.*

  - [Fl\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([Fl\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [Fl\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([Fl\\_Group](#) \*p)
- Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)
- Repositions the window or widget.*

  - void [redraw](#) ()
- Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()
- Schedules the drawing of the label.*

  - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

  - [Fl\\_Color](#) [selection\\_color](#) () const
- Gets the selection color.*

  - void [selection\\_color](#) ([Fl\\_Color](#) a)
- Sets the selection color.*

  - int [send](#) (int event)
- Sends the specified event to the widget.*

  - void [set\\_active](#) ()
- Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()
- Marks the value of the widget as changed.*

  - void [set\\_output](#) ()
- Sets a widget to output only.*

  - void [set\\_visible](#) ()
- Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()
- Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void [show](#) ()
- Makes a widget visible.*

  - void [size](#) (int W, int H)
- Changes the size of the widget.*

- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- uchar [type](#) () const  
*Gets the widget type.*
- void [type](#) (uchar t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const  
*Gets the widget position in its window.*
- int [y](#) () const  
*Gets the widget position in its window.*
- virtual ~[Fl\\_Widget](#) ()  
*Destroys the widget.*

## Additional Inherited Members

### Static Public Member Functions inherited from FI\_Widget

- static void [default\\_callback](#) (FI\_Widget \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from FI\_Widget

### Protected Member Functions inherited from FI\_Counter

- void [arrow\\_widths](#) (int &w1, int &w2)  
*Compute sizes (widths) of arrow boxes.*
- void [draw](#) () override  
*Draws the widget.*

### Protected Member Functions inherited from FI\_Valuator

- [FI\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new FI\_Valuator widget using the given position, size, and label string.*
- void [handle\\_drag](#) (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void [handle\\_push](#) ()  
*Stores the current value in the previous value.*
- void [handle\\_release](#) ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int [horizontal](#) () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double [previous\\_value](#) () const  
*Gets the previous floating point value before an event changed it.*
- void [set\\_value](#) (double v)  
*Sets the current floating point value.*
- double [softclamp](#) (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from [FI\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.122.1 Detailed Description

This widget creates a counter with only 2 arrow buttons.

Figure 13.43 [FI\\_Simple\\_Counter](#)

The documentation for this class was generated from the following files:

- [FI\\_Simple\\_Counter.H](#)
- [FI\\_Counter.cxx](#)

## 13.123 Fl\_Single\_Window Class Reference

This is the same as [Fl\\_Window](#).

```
#include <Fl_Single_Window.H>
```

Inheritance diagram for Fl\_Single\_Window:

### Public Member Functions

- **Fl\_Single\_Window** (int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Single\\_Window](#) widget using the given size, and label (title) string.*
- **Fl\_Single\_Window** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new [Fl\\_Single\\_Window](#) widget using the given position, size, and label (title) string.*
- void **flush** () **override**  
*Same as [Fl\\_Window::flush\(\)](#)*
- void **make\_current** ()  
*Same as [Fl\\_Window::make\\_current\(\)](#)*
- void **show** () **override**  
*Makes a widget visible.*
- void **show** (int argc, char \*\*argv)  
*Same as [Fl\\_Window::show\(int argc, char \\*\\*argv\)](#)*

### Public Member Functions inherited from [Fl\\_Window](#)

- void **allow\_expand\_outside\_parent** ()  
*Allow this subwindow to expand outside the area of its parent window.*
- virtual class [Fl\\_Double\\_Window](#) \* **as\_double\_window** ()  
*Return non-null if this is an [Fl\\_Double\\_Window](#) object.*
- virtual class [Fl\\_Overlay\\_Window](#) \* **as\_overlay\_window** ()  
*Return non-null if this is an [Fl\\_Overlay\\_Window](#) object.*
- [Fl\\_Window](#) const \* **as\_window** () const **override**
- [Fl\\_Window](#) \* **as\_window** () **override**  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- unsigned int **border** () const  
*Returns whether the window possesses a border.*
- void **border** (int b)  
*Sets whether or not the window manager border is around the window.*
- void **clear\_border** ()  
*Fast inline function to turn the window manager border off.*
- void **clear\_modal\_states** ()  
*Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.*

- void **copy\_label** (const char \*a)  
*Sets the window titlebar label to a copy of a character string.*
- void **cursor** (const [FI\\_RGB\\_Image](#) \*, int, int)  
*Changes the cursor for this window using the provided image as cursor's shape.*
- void **cursor** ([FI\\_Cursor](#) c, [FI\\_Color](#), [FI\\_Color](#)=[FL\\_WHITE](#))  
*For back compatibility only.*
- void **cursor** ([FI\\_Cursor](#))  
*Changes the cursor for this window.*
- int **decorated\_h** () const  
*Returns the window height including any window title bar and any frame added by the window manager.*
- int **decorated\_w** () const  
*Returns the window width including any frame added by the window manager.*
- void **default\_cursor** ([FI\\_Cursor](#) c, [FI\\_Color](#), [FI\\_Color](#)=[FL\\_WHITE](#))  
*For back compatibility only.*
- void **default\_cursor** ([FI\\_Cursor](#))  
*Sets the default window cursor.*
- void **draw\_backdrop** ()  
*Draw the background image if one is set and is aligned inside.*
- [FI\\_Window](#) (int w, int h, const char \*title=0)  
*Creates a window from the given width w, height h, and title.*
- [FI\\_Window](#) (int x, int y, int w, int h, const char \*title=0)  
*Creates a window from the given position (x, y), size (w, h) and title.*
- void **free\_position** ()  
*Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.*
- void **fullscreen** ()  
*Makes the window completely fill one or more screens, without any window manager border visible.*
- unsigned int **fullscreen\_active** () const  
*Returns non zero if [FULLSCREEN](#) flag is set, 0 otherwise.*
- void **fullscreen\_off** ()  
*Turns off any side effects of [fullscreen\(\)](#)*
- void **fullscreen\_off** (int X, int Y, int W, int H)  
*Turns off any side effects of [fullscreen\(\)](#) and does [resize\(X,Y,W,H\)](#).*
- void **fullscreen\_screens** (int top, int bottom, int left, int right)  
*Sets which screens should be used when this window is in fullscreen mode.*
- [uchar](#) **get\_size\_range** (int \*minw, int \*minh, int \*maxw=NULL, int \*maxh=NULL, int \*dw=NULL, int \*dh=NULL, int \*aspect=NULL) const  
*Gets the allowable range to which the user can resize this window.*
- int **handle** (int) [override](#)  
*Handles the specified event.*
- void **hide** () [override](#)  
*Removes the window from the screen.*
- void **hotspot** (const [FI\\_Widget](#) &p, int offscreen=0)  
*See void [FI\\_Window::hotspot\(int x, int y, int offscreen = 0\)](#)*
- void **hotspot** (const [FI\\_Widget](#) \*, int offscreen=0)  
*See void [FI\\_Window::hotspot\(int x, int y, int offscreen = 0\)](#)*
- void **hotspot** (int x, int y, int offscreen=0)  
*Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.*
- const void \* **icon** () const  
*Gets the current icon window target dependent data.*

- void **icon** (const [FL\\_RGB\\_Image](#) \*)  
*Sets or resets a single window icon.*
- void **icon** (const void \*ic)  
*Platform-specific method to set the window icon usable on Windows and X11 only.*
- void **iconize** ()  
*Iconifies the window.*
- const char \* **iconlabel** () const  
*See void [FL\\_Window::iconlabel\(const char\\*\)](#)*
- void **iconlabel** (const char \*)  
*Sets the icon label.*
- void **icons** (const [FL\\_RGB\\_Image](#) \*[], int)  
*Sets the window icons.*
- void **icons** (HICON big\_icon, HICON small\_icon)  
*Sets the window icons using HICON handles (Windows platform only).*
- const char \* **label** () const  
*See void [FL\\_Window::label\(const char\\*\)](#)*
- void **label** (const char \*)  
*Sets the window title bar label.*
- void **label** (const char \*label, const char \*iconlabel)  
*Sets the icon label.*
- void **make\_current** ()  
*Sets things up so that the drawing functions in <[FL/fl\\_draw.H](#)> will go into this window.*
- void **maximize** ()  
*Maximizes a top-level window to its current screen.*
- unsigned int **maximize\_active** () const  
*Returns whether the window is currently maximized.*
- unsigned int **menu\_window** () const  
*Returns true if this window is a menu window.*
- unsigned int **modal** () const  
*Returns true if this window is modal.*
- unsigned int **non\_modal** () const  
*Returns true if this window is modal or non-modal.*
- [fl\\_uintptr\\_t](#) **os\_id** () const  
*Returns a platform-specific identification of a shown window, or 0 if not shown.*
- unsigned int **override** () const  
*Returns non zero if OVERRIDE flag is set, 0 otherwise.*
- void **resize** (int X, int Y, int W, int H) **override**  
*Changes the size and position of the window.*
- int **screen\_num** () const  
*The number of the screen containing the mapped window.*
- void **screen\_num** (int screen\_num)  
*Set the number of the screen where to map the window.*
- void **set\_menu\_window** ()  
*Marks the window as a menu window.*
- void **set\_modal** ()  
*A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void **set\_non\_modal** ()

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.

- void **set\_override** ()  
*Activates the flags NOBORDER|OVERRIDE.*
- void **set\_tooltip\_window** ()  
*Marks the window as a tooltip window.*
- const [FL\\_Image](#) \* **shape** () const  
*Returns the image controlling the window shape or NULL.*
- void **shape** (const [FL\\_Image](#) &b)  
*Set the window's shape with an [FL\\_Image](#).*
- void **shape** (const [FL\\_Image](#) \*img)  
*Assigns a non-rectangular shape to the window.*
- void **show** () **override**  
*Puts the window on the screen.*
- void **show** (int argc, char \*\*argv)  
*Puts the window on the screen with [show\(\)](#) and parses command-line arguments.*
- int **shown** () const  
*Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#) ).*
- void **size\_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)  
*Sets the allowable range to which the user can resize this window.*
- unsigned int **tooltip\_window** () const  
*Returns true if this window is a tooltip window.*
- void **un\_maximize** ()  
*Returns a previously maximized top-level window to its previous size.*
- void **wait\_for\_expose** ()  
*Waits for the window to be displayed after calling [show\(\)](#).*
- int **x\_root** () const  
*Gets the x position of the window on the screen.*
- const char \* **xclass** () const  
*Returns the xclass for this window, or a default.*
- void **xclass** (const char \*c)  
*Sets the xclass for this window.*
- int **y\_root** () const  
*Gets the y position of the window on the screen.*
- virtual [~FL\\_Window](#) ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*& **\_ddfdesign\_kludge** ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const **override**
- [FL\\_Group](#) \* **as\_group** () **override**

- Returns an *FL\_Group* pointer if this widget is an *FL\_Group*.
- void **begin** ()
 

Sets the current group so you can build the widget tree by just constructing the widgets.
- *FL\_Widget* \* **child** (int n) const
 

Returns the n'th child.
- int **children** () const
 

Returns how many child widgets the group has.
- void **clear** ()
 

Deletes all child widgets from memory recursively.
- unsigned int **clip\_children** () const
 

Returns the current clipping mode.
- void **clip\_children** (int c)
 

Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete\_child** (int n)
 

Removes the widget at *index* from the group and deletes it.
- void **end** ()
 

Exactly the same as *current(this->parent())*.
- int **find** (const *FL\_Widget* &o) const
 

See int *FL\_Group::find(const FL\_Widget \*w) const*.
- int **find** (const *FL\_Widget* \*) const
 

Searches the children for the widget and returns the index.
- *FL\_Group* (int, int, int, int, const char \*s)
 

Creates a new *FL\_Group* widget using the given position, size, and label string.
- void **forms\_end** ()
 

This is for forms compatibility only.
- void **init\_sizes** ()
 

Resets the internal array of widget sizes and positions.
- void **insert** (*FL\_Widget* &, int i)
 

The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** (*FL\_Widget* &o, *FL\_Widget* \*before)
 

This does *insert(w, find(before))*.
- void **remove** (*FL\_Widget* &)
 

Removes a widget from the group but does not delete it.
- void **remove** (*FL\_Widget* \*o)
 

Removes the widget *o* from the group.
- void **remove** (int index)
 

Removes the widget at *index* from the group but does not delete it.
- *FL\_Widget* \* **resizable** () const
 

Returns the group's resizable widget.
- void **resizable** (*FL\_Widget* &o)
 

Sets the group's resizable widget.
- void **resizable** (*FL\_Widget* \*o)
 

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual **~FL\_Group** ()
 

The destructor also deletes all the children.

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*

- void `clear_damage` (`uchar` c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=FL\_REASON\_UNKNOWN)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- int `horizontal_label_margin` ()

- Get the spacing between the label and the horizontal edge of the widget.*

  - void [horizontal\\_label\\_margin](#) (int px)

*Set the spacing between the label and the horizontal edge of the widget.*

  - [FI\\_Image](#) \* [image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*

  - const [FI\\_Image](#) \* [image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const

*Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const

*Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const

*Gets the current label text.*

  - void [label](#) (const char \*text)

*Sets the current label pointer.*

  - void [label](#) ([FI\\_Labeltype](#) a, const char \*b)

*Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()

*Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)

*Set the gap between the label and the image in pixels.*

  - [FI\\_Color](#) [labelcolor](#) () const

*Gets the label color.*

  - void [labelcolor](#) ([FI\\_Color](#) c)

*Sets the label color.*

  - [FI\\_Font](#) [labelfont](#) () const

*Gets the font to use.*

  - void [labelfont](#) ([FI\\_Font](#) f)

*Sets the font to use.*

  - [FI\\_Fontsize](#) [labelsize](#) () const

*Gets the font size in pixels.*

  - void [labelsize](#) ([FI\\_Fontsize](#) pix)

*Sets the font size in pixels.*

  - [FI\\_Labeltype](#) [labeltype](#) () const

*Gets the label type.*

  - void [labeltype](#) ([FI\\_Labeltype](#) a)

*Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const

*Returns if a widget is used for output only.*

- `Fl_Group * parent () const`  
*Returns a pointer to the parent widget.*
- `void parent (Fl_Group *p)`  
*Internal use only - "for hacks only".*
- `void position (int X, int Y)`  
*Repositions the window or widget.*
- `void redraw ()`  
*Schedules the drawing of the widget.*
- `void redraw_label ()`  
*Schedules the drawing of the label.*
- `Fl_Color selection_color () const`  
*Gets the selection color.*
- `void selection_color (Fl_Color a)`  
*Sets the selection color.*
- `int send (int event)`  
*Sends the specified event to the widget.*
- `void set_active ()`  
*Marks the widget as active without sending events or changing focus.*
- `void set_changed ()`  
*Marks the value of the widget as changed.*
- `void set_output ()`  
*Sets a widget to output only.*
- `void set_visible ()`  
*Makes the widget visible.*
- `void set_visible_focus ()`  
*Enables keyboard focus navigation with this widget.*
- `int shortcut_label () const`  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- `void shortcut_label (int value)`  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- `void size (int W, int H)`  
*Changes the size of the widget.*
- `int take_focus ()`  
*Gives the widget the keyboard focus.*
- `unsigned int takeevents () const`  
*Returns if the widget is able to take events.*
- `int test_shortcut ()`  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- `const char * tooltip () const`  
*Gets the current tooltip text.*
- `void tooltip (const char *text)`  
*Sets the Tooltip Text for a Widget.*
- `Fl_Window * top_window () const`  
*Returns a pointer to the top-level window for the widget.*
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type () const`  
*Gets the widget type.*
- `void type (uchar t)`  
*Sets the widget type.*
- `int use_accents_menu ()`

- Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*

  - void \* **user\_data** () const
  - Gets the user data for this widget.*
  - void **user\_data** (FI\_Callback\_User\_Data \*v, bool auto\_free)
  - Sets the user data for this widget.*
  - void **user\_data** (void \*v)
  - Sets the user data for this widget.*
  - int **vertical\_label\_margin** ()
  - Get the spacing between the label and the vertical edge of the widget.*
  - void **vertical\_label\_margin** (int px)
  - Set the spacing between the label and the vertical edge of the widget.*
  - unsigned int **visible** () const
  - Returns whether a widget is visible.*
  - unsigned int **visible\_focus** () const
  - Checks whether this widget has a visible focus.*
  - void **visible\_focus** (int v)
  - Modifies keyboard focus navigation.*
  - int **visible\_r** () const
  - Returns whether a widget and all its parents are visible.*
  - int **w** () const
  - Gets the widget width.*
  - FI\_When **when** () const
  - Returns the conditions under which the callback is called.*
  - void **when** (uchar i)
  - Sets the flags used to decide when a callback is called.*
  - FI\_Window \* **window** () const
  - Returns a pointer to the nearest parent window up the widget hierarchy.*
  - int **x** () const
  - Gets the widget position in its window.*
  - int **y** () const
  - Gets the widget position in its window.*
  - virtual ~FI\_Widget ()
  - Destroys the widget.*

### Additional Inherited Members

### Public Types inherited from FI\_Window

- typedef struct HICON\_\_ \* **HICON**

### Static Public Member Functions inherited from FI\_Window

- static FI\_Window \* **current** ()
- Returns the last window that was made current.*
- static void **default\_callback** (FI\_Window \*, void \*v)
- Back compatibility: Sets the default callback v for win to call on close event.*
- static void **default\_icon** (const FI\_RGB\_Image \*)
- Sets a single default window icon.*
- static void **default\_icons** (const FI\_RGB\_Image \*[], int)
- Sets the default window icons.*
- static void **default\_icons** (HICON big\_icon, HICON small\_icon)
- Sets the default window icons (Windows platform only).*

- static const char \* [default\\_xclass](#) ()  
*Returns the default xclass.*
- static void [default\\_xclass](#) (const char \*)  
*Sets the default window xclass.*
- static bool [is\\_a\\_rescale](#) ()  
*Returns true when a window is being rescaled.*
- static char [show\\_next\\_window\\_iconic](#) ()  
*Returns the static flag whether the next window should be opened iconified.*
- static void [show\\_next\\_window\\_iconic](#) (char stat)  
*Sets a static flag whether the next window should be opened iconified.*

### Static Public Member Functions inherited from [FI\\_Group](#)

- static [FI\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*
- static void [current](#) ([FI\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FI\\_Widget](#)

- static void [default\\_callback](#) ([FI\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Member Functions inherited from [FI\\_Window](#)

- void [default\\_size\\_range](#) ()  
*Protected method to calculate the default size range of a window.*
- void [draw](#) () [override](#)  
*Draws the widget.*
- int [force\\_position](#) () const  
*Returns the internal state of the window's `FORCE_POSITION` flag.*
- void [force\\_position](#) (int force)

*Sets an internal flag that tells FLTK and the window manager to honor position requests.*

- void [free\\_icons](#) ()

*Deletes all icons previously attached to the window.*

- int [is\\_resizable](#) ()

*Protected method to determine whether a window is resizable.*

## Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* [bounds](#) ()

*Returns the internal array of widget sizes and positions.*

- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const

*Forces a child to redraw.*

- void [draw\\_children](#) ()

*Draws all children of the group.*

- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const

*Parents normally call this to draw outside labels of child widgets.*

- virtual int [on\\_insert](#) ([FI\\_Widget](#) \*, int)

*Allow derived groups to act when a widget is added as a child.*

- virtual int [on\\_move](#) (int, int)

*Allow derived groups to act when a widget is moved within the group.*

- virtual void [on\\_remove](#) (int)

*Allow derived groups to act when a child widget is removed from the group.*

- int \* [sizes](#) ()

*Returns the internal array of widget sizes and positions.*

- void [update\\_child](#) ([FI\\_Widget](#) &widget) const

*Draws a child only if it needs it.*

## Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)

*Clears a flag in the flags mask.*

- void [draw\\_backdrop](#) () const

*If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*

- void [draw\\_box](#) () const

*Draws the widget box according to its box style.*

- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const

*Draws a box of type t, of color c at the widget's position and size.*

- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const

*Draws a box of type t, of color c at the position X,Y and size W,H.*

- void [draw\\_focus](#) () const

*Draws a focus rectangle around the widget.*

- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const

*Draws a focus rectangle around the widget.*

- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const

*Draws a focus box for the widget at the given position and size.*

- void [draw\\_label](#) () const

*Draws the widget's label at the defined label position.*

- void [draw\\_label](#) (int, int, int, int) const

*Draws the label in an arbitrary bounding box.*

- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)

*Creates a widget at the given position and size.*

- unsigned int [flags](#) () const

*Gets the widget flags mask.*

- void [h](#) (int v)

*Internal use only.*

- void **set\_flag** (unsigned int c)

*Sets a flag in the flags mask.*

- void [w](#) (int v)

*Internal use only.*

- void [x](#) (int v)

*Internal use only.*

- void [y](#) (int v)

*Internal use only.*

## Static Protected Attributes inherited from [Fl\\_Window](#)

- static [Fl\\_Window](#) \* [current\\_](#)

*Stores the last window that was made current.*

### 13.123.1 Detailed Description

This is the same as [Fl\\_Window](#).

However, it is possible that some implementations will provide double-buffered windows by default. This subclass can be used to force single-buffering. This may be useful for modifying existing programs that use incremental update, or for some types of image data, such as a movie flipbook.

### 13.123.2 Member Function Documentation

#### 13.123.2.1 flush()

```
void Fl_Single_Window::flush () [inline], [override], [virtual]
```

Same as [Fl\\_Window::flush\(\)](#)

Reimplemented from [Fl\\_Window](#).

#### 13.123.2.2 show()

```
void Fl_Single_Window::show () [override], [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL\_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible\\_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL\_SHOW or FL\_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL\_SHOW or FL\_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible\\_r\(\)](#)

Reimplemented from [Fl\\_Widget](#).

The documentation for this class was generated from the following files:

- Fl\_Single\_Window.H
- Fl\_Single\_Window.cxx

## 13.124 FL\_Slider Class Reference

The [FL\\_Slider](#) widget contains a sliding knob inside a box.

```
#include <Fl_Slider.H>
```

Inheritance diagram for [FL\\_Slider](#):

### Public Types

- enum [Scale\\_Type](#) : uchar { [LINEAR\\_SCALE](#) = 0 , [LOG\\_SCALE](#) }  
*Bitset for tick mark positions for [FL\\_Nice\\_Slider](#).*
- enum [Tick\\_Position](#) : uchar {  
[TICKS\\_NONE](#) = 0x00 , [TICKS\\_BELOW](#) = 0x01 , [TICKS\\_ABOVE](#) = 0x02 , [TICKS\\_LEFT](#) = 0x01 ,  
[TICKS\\_RIGHT](#) = 0x02 }  
*Bitset for tick mark positions for [FL\\_Nice\\_Slider](#).*

### Public Member Functions

- void [bounds](#) (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- [FL\\_Slider](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [FL\\_Slider](#) widget using the given position, size, and label string.*
- [FL\\_Slider](#) (uchar t, int X, int Y, int W, int H, const char \*L)  
*Creates a new [FL\\_Slider](#) widget using the given type, position, size, and label string.*
- int [handle](#) (int) override  
*Handles the specified event.*
- uchar [num\\_ticks](#) () const  
*Gets the number of tick marks.*
- [Scale\\_Type](#) [scale](#) () const  
*Gets the scale type.*
- void [scale](#) ([Scale\\_Type](#) s)  
*Sets the scale type.*
- int [scrollvalue](#) (int pos, int [size](#), int first, int total)  
*Sets the size and position of the sliding knob in the box.*
- [FL\\_Boxtype](#) [slider](#) () const  
*Gets the slider box type.*
- void [slider](#) ([FL\\_Boxtype](#) c)  
*Sets the slider box type.*
- float [slider\\_size](#) () const  
*Get the dimensions of the moving piece of slider.*
- void [slider\\_size](#) (double v)  
*Set the dimensions of the moving piece of slider.*
- uchar [ticks](#) () const  
*Gets the tick mark position.*
- void [ticks](#) (uchar t, uchar [num\\_ticks](#)=11)  
*Sets the tick mark position for [FL\\_Nice\\_Slider](#).*

## Public Member Functions inherited from FI\_Valuator

- void **bounds** (double a, double b)  
*Sets the minimum (a) and maximum (b) values for the valuator widget.*
- double **clamp** (double)  
*Clamps the passed value to the valuator range.*
- virtual int **format** (char \*)  
*Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.*
- virtual std::string **format\_str** ()  
*C++11 API for `FI_Valuator::format(char* buffer)`.*
- double **increment** (double, int)  
*Adds n times the step value to the passed value.*
- double **maximum** () const  
*Gets the maximum value for the valuator.*
- void **maximum** (double a)  
*Sets the maximum value for the valuator.*
- double **minimum** () const  
*Gets the minimum value for the valuator.*
- void **minimum** (double a)  
*Sets the minimum value for the valuator.*
- void **precision** (int digits)  
*Sets the step value to  $1.0 / 10^{\text{digits}}$ .*
- void **range** (double a, double b)  
*Sets the minimum and maximum values for the valuator.*
- double **round** (double)  
*Round the passed value to the nearest step increment.*
- double **step** () const  
*Gets or sets the step value.*
- void **step** (double a, int b)  
*See double `FI_Valuator::step()` const*
- void **step** (double s)  
*See double `FI_Valuator::step()` const.*
- void **step** (int a)  
*See double `FI_Valuator::step()` const*
- double **value** () const  
*Gets the floating point(double) value.*
- int **value** (double)  
*Sets the current value.*
- **~FI\_Valuator** () override  
*Destructor is accessible despite protected constructor.*

## Public Member Functions inherited from FI\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const

- Returns whether the widget and all of its parents are active.*
- [Fl\\_Align align](#) () const  
*Gets the label alignment.*
- void [align](#) ([Fl\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [Fl\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [Fl\\_Gl\\_Window](#) pointer if this widget is an [Fl\\_Gl\\_Window](#).*
- virtual class [Fl\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [Fl\\_Group](#) \* [as\\_group](#) ()  
*Returns an [Fl\\_Group](#) pointer if this widget is an [Fl\\_Group](#).*
- virtual [Fl\\_Group](#) const \* [as\\_group](#) () const
- virtual [Fl\\_Window](#) \* [as\\_window](#) ()  
*Returns an [Fl\\_Window](#) pointer if this widget is an [Fl\\_Window](#).*
- virtual [Fl\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [Fl\\_Boxtype box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([Fl\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [Fl\\_Callback\\_p callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, [Fl\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([Fl\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()

- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

  - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

  - int `h` () const
- Gets the widget height.*

  - virtual void `hide` ()
- Makes a widget invisible.*

  - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [FL\\_Group](#) \* [parent](#) () const

- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)

*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)

*Repositions the window or widget.*
- void [redraw](#) ()

*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()

*Schedules the drawing of the label.*
- virtual void [resize](#) (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- [FI\\_Color](#) [selection\\_color](#) () const

*Gets the selection color.*
- void [selection\\_color](#) ([FI\\_Color](#) a)

*Sets the selection color.*
- int [send](#) (int event)

*Sends the specified event to the widget.*
- void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()

*Marks the value of the widget as changed.*
- void [set\\_output](#) ()

*Sets a widget to output only.*
- void [set\\_visible](#) ()

*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()

*Makes a widget visible.*
- void [size](#) (int W, int H)

*Changes the size of the widget.*
- int [take\\_focus](#) ()

*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const

*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)

*Sets the Tooltip Text for a Widget.*
- [FI\\_Window](#) \* [top\\_window](#) () const

*Returns a pointer to the top-level window for the widget.*
- [FI\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const

*Gets the widget type.*

- void **type** (uchar t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (Fl\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** when () const  
*Returns the conditions under which the callback is called.*
- void **when** (uchar i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~**Fl\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*
- void **draw** (int, int, int, int)
- void **draw\_ticks** (const **Fl\_Rect** &r, int S)  
*Draw tick marks.*
- int **handle** (int, int, int, int, int)
- double **increment\_lin\_log** (double v, int n, int range)  
*Adds a sensible step value to the passed value.*
- double **position\_to\_value** (double pos) const  
*Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double **value\_to\_position** (double val) const  
*Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

## Protected Member Functions inherited from [FL\\_Valuator](#)

- [FL\\_Valuator](#) (int X, int Y, int W, int H, const char \*L)  
*Creates a new [FL\\_Valuator](#) widget using the given position, size, and label string.*
- void **handle\_drag** (double newvalue)  
*Called during a drag operation, after an FL\_WHEN\_CHANGED event is received and before the callback.*
- void **handle\_push** ()  
*Stores the current value in the previous value.*
- void **handle\_release** ()  
*Called after an FL\_WHEN\_RELEASE event is received and before the callback.*
- int **horizontal** () const  
*Tells if the valuator is an FL\_HORIZONTAL one.*
- double **previous\_value** () const  
*Gets the previous floating point value before an event changed it.*
- void **set\_value** (double v)  
*Sets the current floating point value.*
- double **softclamp** (double)  
*Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void [value\\_damage](#) ()  
*Asks for partial redraw.*

## Protected Member Functions inherited from [FL\\_Widget](#)

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** ([FL\\_Boxtype](#) t, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FL\\_Boxtype](#) t, int x, int y, int w, int h, [FL\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FL\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)

*Internal use only.*

- void **x** (int v)

*Internal use only.*

- void **y** (int v)

*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from **FL\_Widget**

- static void **default\_callback** (**FL\_Widget** \*widget, void \*data)

*The default callback for all widgets that don't set a callback.*

- static unsigned int **label\_shortcut** (const char \*t)

*Returns the Unicode value of the '&x' shortcut in a given text.*

- static int **test\_shortcut** (const char \*, const bool require\_alt=false)

*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from **FL\_Widget**

*flags possible values enumeration.*

### 13.124.1 Detailed Description

The **FL\_Slider** widget contains a sliding knob inside a box.

It is often used as a scrollbar. Moving the box all the way to the top/left sets it to the **minimum()**, and to the bottom/right to the **maximum()**. The **minimum()** may be greater than the **maximum()** to reverse the slider direction.

Use void **FL\_Widget::type**(int) to set how the slider is drawn, which can be one of the following:

- **FL\_VERTICAL** - Draws a vertical slider (this is the default).
- **FL\_HORIZONTAL** - Draws a horizontal slider.
- **FL\_VERT\_FILL\_SLIDER** - Draws a filled vertical slider, useful as a progress or value meter.
- **FL\_HOR\_FILL\_SLIDER** - Draws a filled horizontal slider, useful as a progress or value meter.
- **FL\_VERT\_NICE\_SLIDER** - Draws a vertical slider with a nice looking control knob.
- **FL\_HOR\_NICE\_SLIDER** - Draws a horizontal slider with a nice looking control knob.

Figure 13.44 Fl\_Slider

## 13.124.2 Member Enumeration Documentation

### 13.124.2.1 Scale\_Type

enum `Fl_Slider::Scale_Type` : `uchar`

Bitset for tick mark positions for `Fl_Nice_Slider`.

See also

`Fl_Slider::ticks()`, `Fl_Slider::ticks(Tick_Position)`

Enumerator

LINEAR_SCALE	Linear scale (default)
LOG_SCALE	Logarithmic scale.

### 13.124.2.2 Tick\_Position

enum `Fl_Slider::Tick_Position` : `uchar`

Bitset for tick mark positions for `Fl_Nice_Slider`.

See also

`Fl_Slider::ticks()`, `Fl_Slider::ticks(Tick_Position)`

Enumerator

TICKS_NONE	draw no ticks
TICKS_BELOW	draw ticks below a horizontal slider
TICKS_ABOVE	draw ticks above a horizontal slider
TICKS_LEFT	draw ticks to the left of a vertical slider
TICKS_RIGHT	draw ticks to the right of a vertical slider

## 13.124.3 Constructor & Destructor Documentation

### 13.124.3.1 Fl\_Slider()

```
Fl_Slider::Fl_Slider (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `Fl_Slider` widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

## 13.124.4 Member Function Documentation

### 13.124.4.1 bounds()

```
void Fl_Slider::bounds (
 double a,
 double b)
```

Sets the minimum (a) and maximum (b) values for the valuator widget.  
if at least one of the values is changed, a partial redraw is asked.

### 13.124.4.2 draw()

```
void Fl_Slider::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements [Fl\\_Widget](#).

Reimplemented in [Fl\\_Value\\_Slider](#).

### 13.124.4.3 draw\_ticks()

```
void Fl_Slider::draw_ticks (
 const Fl_Rect & r,
 int S) [protected]
```

Draw tick marks.

Ported from fltk2's Slider::draw\_ticks(): tick marks are placed at "nice" round-number intervals (multiples of 1, 2, or 5 times a power of ten) that are never closer together on screen than about half the slider size, and every few ticks is drawn longer and labeled with its value.

#### Parameters

in	<i>r</i>	motion range of the slider
in	<i>S</i>	size of the slider, horizontal or vertical, in pixels

### 13.124.4.4 handle()

```
int Fl_Slider::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited handle() method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your handle() method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the handle() method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

#### Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

## Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Widget](#).

Reimplemented in [Fl\\_Value\\_Slider](#).

**13.124.4.5 increment\_lin\_log()**

```
double Fl_Slider::increment_lin_log (
 double v,
 int n,
 int range) [protected]
```

Adds a sensible step value to the passed value.

The step size is not useful in logarithmic scales.

**13.124.4.6 num\_ticks()**

```
uchar Fl_Slider::num_ticks () const [inline]
```

Gets the number of tick marks.

## Returns

number of tick marks

**13.124.4.7 position\_to\_value()**

```
double Fl_Slider::position_to_value (
 double pos) const [protected]
```

Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.

For linear scale, this is a simple linear interpolation. For logarithmic scale, this uses exponential interpolation.

## Parameters

in	<i>pos</i>	The normalized position to convert.
----	------------	-------------------------------------

## Returns

The corresponding value.

**13.124.4.8 scale() [1/2]**

```
Scale_Type Fl_Slider::scale () const [inline]
```

Gets the scale type.

## Returns

scale type

**13.124.4.9 scale() [2/2]**

```
void Fl_Slider::scale (
 Scale_Type s) [inline]
```

Sets the scale type.

## Parameters

in	s	scale type
----	---	------------

**13.124.4.10 scrollvalue()**

```
int Fl_Slider::scrollvalue (
 int pos,
 int size,
 int first,
 int total)
```

Sets the size and position of the sliding knob in the box.

## Parameters

in	<i>pos</i>	position of first line displayed
in	<i>size</i>	size of window in lines
in	<i>first</i>	number of first line
in	<i>total</i>	total number of lines Returns Fl_Valuator::value(p)

**13.124.4.11 slider\_size()**

```
void Fl_Slider::slider_size (
 double v)
```

Set the dimensions of the moving piece of slider.

This is the fraction of the size of the entire widget. If you set this to 1 then the slider cannot move. The default value is .08.

For the "fill" sliders this is the size of the area around the end that causes a drag effect rather than causing the slider to jump to the mouse.

**13.124.4.12 ticks() [1/2]**

```
uchar Fl_Slider::ticks () const [inline]
```

Gets the tick mark position.

## Returns

tick mark position bitset

**13.124.4.13 ticks() [2/2]**

```
void Fl_Slider::ticks (
 uchar t,
 uchar num_ticks = 11) [inline]
```

Sets the tick mark position for [Fl\\_Nice\\_Slider](#).

FL\_TICKS\_BELOW and FL\_TICKS\_ABOVE can be or'd together for horizontal sliders, and FL\_TICKS\_LEFT and FL\_TICKS\_RIGHT for vertical sliders.

## Parameters

in	<i>t</i>	tick mark position bitset
in	<i>num_ticks</i>	number of tick marks to draw

**13.124.4.14 value\_to\_position()**

```
double Fl_Slider::value_to_position (
 double val) const [protected]
```

Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.

For linear scale, this is a simple linear interpolation. For logarithmic scale, this uses logarithmic interpolation.

**Parameters**

in	val	The value to convert.
----	-----	-----------------------

**Returns**

A normalized position between 0.0 and 1.0.

The documentation for this class was generated from the following files:

- Fl\_Slider.H
- Fl\_Slider.cxx

**13.125 Fl\_Spinner Class Reference**

This widget is a combination of a numerical input widget and repeat buttons.

```
#include <Fl_Spinner.H>
```

Inheritance diagram for Fl\_Spinner:

**Classes**

- class [Fl\\_Spinner\\_Input](#)

**Public Member Functions**

- [Fl\\_Color](#) **color** () const  
*Returns the background color of the spinner widget's input field.*
- void **color** ([Fl\\_Color](#) v)  
*Sets the background color of the spinner widget's input field.*
- [Fl\\_Spinner](#) (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new [Fl\\_Spinner](#) widget using the given position, size, and label string.*
- const char \* **format** () const  
*Returns the format string for the value.*
- void **format** (const char \*f)  
*Sets the format string for the value.*
- int [handle](#) (int event) override  
*Handles the specified event.*
- double **maximum** () const  
*Gets the maximum value of the widget.*
- void **maximum** (double m)

- Sets the maximum value of the widget.*

  - int **maximum\_size** () const

*Returns the maximum width of the input field.*
- void **maximum\_size** (int m)

*Sets the maximum width of the input field.*
- double **minimum** () const

*Gets the minimum value of the widget.*
- void **minimum** (double m)

*Sets the minimum value of the widget.*
- void **range** (double a, double b)

*Sets the minimum and maximum values for the widget.*
- void **resize** (int X, int Y, int W, int H) override

*Resizes the [FL\\_Group](#) widget and all of its children.*
- [FL\\_Color](#) **selection\_color** () const

*Returns the selection color of the spinner widget's input field.*
- void **selection\_color** ([FL\\_Color](#) val)

*Sets the selection color of the spinner widget's input field.*
- double **step** () const

*Gets the amount to change the value when the user clicks a button.*
- void **step** (double s)

*Sets or returns the amount to change the value when the user clicks a button.*
- [FL\\_Color](#) **textcolor** () const

*Gets the color of the text in the input field.*
- void **textcolor** ([FL\\_Color](#) c)

*Sets the color of the text in the input field.*
- [FL\\_Font](#) **textfont** () const

*Gets the font of the text in the input field.*
- void **textfont** ([FL\\_Font](#) f)

*Sets the font of the text in the input field.*
- [FL\\_Fontsize](#) **textsize** () const

*Gets the size of the text in the input field.*
- void **textsize** ([FL\\_Fontsize](#) s)

*Sets the size of the text in the input field.*
- [uchar](#) **type** () const

*Gets the numeric representation in the input field.*
- void **type** ([uchar](#) v)

*Sets the numeric representation in the input field.*
- double **value** () const

*Gets the current value of the widget.*
- void **value** (double v)

*Sets the current value of the input widget.*
- int **wrap** () const

*Gets the wrap mode of the [FL\\_Spinner](#) widget.*
- void **wrap** (int set)

*Sets whether the spinner wraps around at upper and lower bounds.*

## Public Member Functions inherited from FL\_Group

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*

- [FI\\_Widget](#) \* [resizable](#) () const  
*Returns the group's resizable widget.*
- void [resizable](#) ([FI\\_Widget](#) &o)  
*Sets the group's resizable widget.*
- void [resizable](#) ([FI\\_Widget](#) \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual ~[FI\\_Group](#) ()  
*The destructor also deletes all the children.*

- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*

- void [callback](#) ([Fl\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([Fl\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([Fl\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [Fl\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([Fl\\_Color](#) bg, [Fl\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [Fl\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [Fl\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [Fl\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([Fl\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FI_Widget` \*widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FI_Widget` \*widget, void \*arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FI_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const

*Gets the widget height.*
- virtual void `hide` ()

*Makes a widget invisible.*
- int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- `FI_Image` \* `image` ()

*Gets the image that is used as part of the widget label when in the active state.*
- const `FI_Image` \* `image` () const

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FI_Image` &img)

*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FI_Image` \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FI_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FI_Color` c)

*Sets the label color.*
- `FI_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FI_Font` f)

*Sets the font to use.*
- `FI_Fontsize` `labelsize` () const

*Gets the font size in pixels.*

- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

- Returns if the widget is able to take events.*

  - int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const

*Gets the widget type.*
- void `type` (`uchar` t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (`uchar` i)

*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()

*Destroys the widget.*

### Protected Member Functions

- void **draw** () override  
*Draws the widget.*

### Protected Member Functions inherited from **Fl\_Group**

- **Fl\_Rect** \* **bounds** ()  
*Returns the internal array of widget sizes and positions.*
- void **draw\_child** (**Fl\_Widget** &widget) const  
*Forces a child to redraw.*
- void **draw\_children** ()  
*Draws all children of the group.*
- void **draw\_outside\_label** (const **Fl\_Widget** &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- virtual int **on\_insert** (**Fl\_Widget** \*, int)  
*Allow derived groups to act when a widget is added as a child.*
- virtual int **on\_move** (int, int)  
*Allow derived groups to act when a widget is moved within the group.*
- virtual void **on\_remove** (int)  
*Allow derived groups to act when a child widget is removed from the group.*
- int \* **sizes** ()  
*Returns the internal array of widget sizes and positions.*
- void **update\_child** (**Fl\_Widget** &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from **Fl\_Widget**

- void **clear\_flag** (unsigned int c)  
*Clears a flag in the flags mask.*
- void **draw\_backdrop** () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void **draw\_box** () const  
*Draws the widget box according to its box style.*
- void **draw\_box** (**Fl\_Boxtype** t, **Fl\_Color** c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void **draw\_box** (**Fl\_Boxtype** t, int x, int y, int w, int h, **Fl\_Color** c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw\_focus** () const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (**Fl\_Boxtype** t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void **draw\_focus** (**Fl\_Boxtype** t, int x, int y, int w, int h, **Fl\_Color** bg) const  
*Draws a focus box for the widget at the given position and size.*
- void **draw\_label** () const  
*Draws the widget's label at the defined label position.*
- void **draw\_label** (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- **Fl\_Widget** (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int **flags** () const  
*Gets the widget flags mask.*

- void [h](#) (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void [w](#) (int v)  
*Internal use only.*
- void [x](#) (int v)  
*Internal use only.*
- void [y](#) (int v)  
*Internal use only.*

### Protected Attributes

- [FL\\_Repeat\\_Button](#) **down\_button\_**
- [FL\\_Spinner\\_Input](#) **input\_**
- [FL\\_Repeat\\_Button](#) **up\_button\_**

### Additional Inherited Members

### Static Public Member Functions inherited from [FL\\_Group](#)

- static [FL\\_Group](#) \* **current** ()  
*Returns the currently active group.*
- static void **current** ([FL\\_Group](#) \*g)  
*Sets the current group.*

### Static Public Member Functions inherited from [FL\\_Widget](#)

- static void **default\_callback** ([FL\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

*flags possible values enumeration.*

### 13.125.1 Detailed Description

This widget is a combination of a numerical input widget and repeat buttons. The user can either type into the input area or use the buttons to change the value.

Figure 13.45 Fl\_Spinner widget

### 13.125.2 Constructor & Destructor Documentation

#### 13.125.2.1 Fl\_Spinner()

```
Fl_Spinner::Fl_Spinner (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new [Fl\\_Spinner](#) widget using the given position, size, and label string. The inherited destructor destroys the widget and any value associated with it.

### 13.125.3 Member Function Documentation

#### 13.125.3.1 draw()

```
void Fl_Spinner::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Group](#).

#### 13.125.3.2 handle()

```
int Fl_Spinner::handle (
 int event) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

## Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

## Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

## See also

[Fl\\_Event](#)

Reimplemented from [Fl\\_Group](#).

**13.125.3.3 `resize()`**

```
void Fl_Spinner::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Resizes the [Fl\\_Group](#) widget and all of its children.

The [Fl\\_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

## See also

[Fl\\_Group::resizable\(Fl\\_Widget\\*\)](#)

[Fl\\_Group::resizable\(\)](#)

[Fl\\_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl\\_Group](#).

**13.125.3.4 `step()` [1/2]**

```
double Fl_Spinner::step () const [inline]
```

Gets the amount to change the value when the user clicks a button.

## See also

[Fl\\_Spinner::step\(double\)](#)

**13.125.3.5 `step()` [2/2]**

```
void Fl_Spinner::step (
 double s)
```

Sets or returns the amount to change the value when the user clicks a button.

Before setting step to a non-integer value, the spinner [type\(\)](#) should be changed to floating point.

## See also

`double Fl\_Spinner::step\(\) const`

**13.125.3.6 `type()` [1/2]**

```
uchar Fl_Spinner::type () const [inline]
```

Gets the numeric representation in the input field.

## See also

[Fl\\_Spinner::type\(uchar\)](#)

**13.125.3.7 type()** [2/2]

```
void Fl_Spinner::type (
 uchar v)
```

Sets the numeric representation in the input field.

Valid values are FL\_INT\_INPUT and FL\_FLOAT\_INPUT. Also changes the [format\(\)](#) template. Setting a new spinner type via a superclass pointer will not work.

**Note**

[type\(\)](#) is not a virtual function.

**13.125.3.8 value()**

```
void Fl_Spinner::value (
 double v) [inline]
```

Sets the current value of the input widget.

Before setting value to a non-integer value, the spinner [type\(\)](#) should be changed to floating point.

**13.125.3.9 wrap()** [1/2]

```
int Fl_Spinner::wrap () const [inline]
```

Gets the wrap mode of the [Fl\\_Spinner](#) widget.

**See also**

void [wrap\(int\)](#)

**Since**

1.4.0

**13.125.3.10 wrap()** [2/2]

```
void Fl_Spinner::wrap (
 int set) [inline]
```

Sets whether the spinner wraps around at upper and lower bounds.

If wrap mode is on the spinner value is set to the [minimum\(\)](#) or [maximum\(\)](#) if the value exceeds the upper or lower bounds, resp., if it was changed by one of the buttons or the FL\_Up or FL\_Down keys.

The spinner stops at the upper and lower bounds if wrap mode is off.

The default wrap mode is on for backwards compatibility with FLTK 1.3.x and older versions.

**Note**

Wrap mode does not apply to the input field if the input value is edited directly as a number. The input value is always clipped to the allowed range as if wrap mode was off when the input field is left (i.e. loses focus).

**See also**

[minimum\(\)](#), [maximum\(\)](#)

**Parameters**

<code>in</code>	<code>set</code>	non-zero sets wrap mode, zero resets wrap mode
-----------------	------------------	------------------------------------------------

**Since**

1.4.0

The documentation for this class was generated from the following files:

- `Fl_Spinner.H`
- `Fl_Spinner.cxx`

## 13.126 `Fl_Spinner::Fl_Spinner_Input` Class Reference

Inheritance diagram for `Fl_Spinner::Fl_Spinner_Input`:

### Public Member Functions

- **`Fl_Spinner_Input`** (int X, int Y, int W, int H)
- int `handle` (int event) override  
*Handles events of `Fl_Spinner`'s embedded input widget.*

### Public Member Functions inherited from `Fl_Input`

- `Fl_Input` (int, int, int, int, const char \*=0)  
*Creates a new `Fl_Input` widget using the given position, size, and label string.*

### Public Member Functions inherited from `Fl_Input_`

- int `append` (const char \*t, int l=0, char keep\_selection=0)  
*Append text at the end.*
- bool `can_redo` () const  
*Check if there is a redo action available.*
- bool `can_undo` () const  
*Check if the last operation can be undone.*
- int `copy` (int clipboard)  
*Put the current selection into the clipboard.*
- int `copy_cuts` ()  
*Copies the yank buffer to the clipboard.*
- `Fl_Color` `cursor_color` () const  
*Gets the color of the cursor.*
- void `cursor_color` (`Fl_Color` n)  
*Sets the color of the cursor.*
- int `cut` ()  
*Deletes the current selection.*
- int `cut` (int a, int b)  
*Deletes all characters between index a and b.*
- int `cut` (int n)  
*Deletes the next n bytes rounded to characters before or after the cursor.*
- double `dvalue` () const  
*Returns the widget text interpreted as a floating point number.*

- [FI\\_Input\\_](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FI\\_Input\\_](#) widget.*
- unsigned int [index](#) (int i) const  
*Returns the character at index *i*.*
- int [input\\_type](#) () const  
*Gets the input field type.*
- void [input\\_type](#) (int t)  
*Sets the input field type.*
- int [insert](#) (const char \*t, int l = 0)  
*Inserts text at the cursor position.*
- int [insert\\_position](#) () const  
*Gets the position of the text cursor.*
- int [insert\\_position](#) (int p)  
*Sets the cursor position and mark.*
- int [insert\\_position](#) (int p, int m)  
*Sets the index for the cursor and mark.*
- int [ivalue](#) () const  
*Returns the widget text interpreted as a signed integer.*
- int [mark](#) () const  
*Gets the current selection mark.*
- int [mark](#) (int m)  
*Sets the current selection mark.*
- int [maximum\\_size](#) () const  
*Gets the maximum length of the input field in characters.*
- void [maximum\\_size](#) (int m)  
*Sets the maximum length of the input field in characters.*
- const char \* [placeholder](#) () const  
*Get the placeholder text.*
- void [placeholder](#) (const char \*text)  
*Set the placeholder text.*
- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const  
*Gets the read-only state of the input field.*
- void [readonly](#) (int b)  
*Sets the read-only state of the input field.*
- int [redo](#) ()  
*Redo previous undo operation.*
- int [replace](#) (int b, int e, const char \*text, int llen = 0)  
*Deletes text from *b* to *e* and inserts the new string *text*.*
- void [resize](#) (int, int, int, int) override  
*Changes the size of the widget.*
- int [shortcut](#) () const  
*Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)  
*Sets the shortcut key associated with this widget.*
- int [size](#) () const  
*Returns the number of bytes in [value\(\)](#).*
- void [size](#) (int W, int H)  
*Sets the width and height of this widget.*

- int [static\\_value](#) (const char \*)  
*Changes the widget text.*
- int [static\\_value](#) (const char \*, int)  
*Changes the widget text.*
- int [tab\\_nav](#) () const  
*Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab\\_nav](#) (int val)  
*Sets whether the Tab key does focus navigation, or inserts tab characters into [FI\\_Multiline\\_Input](#).*
- [FI\\_Color](#) [textcolor](#) () const  
*Gets the color of the text in the input field.*
- void [textcolor](#) ([FI\\_Color](#) n)  
*Sets the color of the text in the input field.*
- [FI\\_Font](#) [textfont](#) () const  
*Gets the font of the text in the input field.*
- void [textfont](#) ([FI\\_Font](#) s)  
*Sets the font of the text in the input field.*
- [FI\\_Fontsize](#) [textsize](#) () const  
*Gets the size of the text in the input field.*
- void [textsize](#) ([FI\\_Fontsize](#) s)  
*Sets the size of the text in the input field.*
- int [undo](#) ()  
*Undoes previous changes to the text buffer.*
- const char \* [value](#) () const  
*Returns the text displayed in the widget.*
- int [value](#) (const char \*)  
*Changes the widget text.*
- int [value](#) (const char \*, int)  
*Changes the widget text.*
- int [value](#) (double value)  
*Changes the widget text to a floating point number ("%g").*
- int [value](#) (int value)  
*Changes the widget text to a signed integer number.*
- int [wrap](#) () const  
*Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)  
*Sets the word wrapping state of the input field.*
- [~FI\\_Input\\_](#) ()  
*Destroys the widget.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*

- void `align` (`Fl_Align` alignment)  
*Sets the label alignment.*
- long `argument` () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void `argument` (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class `Fl_Gl_Window` \* `as_gl_window` ()  
*Returns an `Fl_Gl_Window` pointer if this widget is an `Fl_Gl_Window`.*
- virtual class `Fl_Gl_Window` const \* `as_gl_window` () const
- virtual `Fl_Group` \* `as_group` ()  
*Returns an `Fl_Group` pointer if this widget is an `Fl_Group`.*
- virtual `Fl_Group` const \* `as_group` () const
- virtual `Fl_Window` \* `as_window` ()  
*Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.*
- virtual `Fl_Window` const \* `as_window` () const
- void `bind_deimage` (`Fl_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `bind_deimage` (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void `bind_image` (`Fl_Image` \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void `bind_image` (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `Fl_Boxtype` `box` () const  
*Gets the box type of the widget.*
- void `box` (`Fl_Boxtype` new\_box)  
*Sets the box type for the widget.*
- `Fl_Callback_p` `callback` () const  
*Gets the current callback function for the widget.*
- void `callback` (`Fl_Callback` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`Fl_Callback` \*cb, `Fl_Callback_User_Data` \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void `callback` (`Fl_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`Fl_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`Fl_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*

- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FL_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FL_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FL_Color` bg, `FL_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FL_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FL_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FL_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const  
*Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)  
*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const  
*Gets the widget height.*
- virtual void `hide` ()  
*Makes a widget invisible.*
- int `horizontal_label_margin` ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()

- Gets the image that is used as part of the widget label when in the active state.*

  - const [FI\\_Image](#) \* [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

  - void [image](#) ([FI\\_Image](#) \*img)
- Sets the image to use as part of the widget label when in the active state.*

  - int [image\\_bound](#) () const
- Returns whether the image is managed by the widget.*

  - int [inside](#) (const [FI\\_Widget](#) \*wgt) const
- Checks if this widget is a child of wgt.*

  - int [is\\_label\\_copied](#) () const
- Returns whether the current label was assigned with [copy\\_label\(\)](#).*

  - const char \* [label](#) () const
- Gets the current label text.*

  - void [label](#) (const char \*text)
- Sets the current label pointer.*

  - void [label](#) ([FI\\_Labeltype](#) a, const char \*b)
- Shortcut to set the label text and type in one call.*

  - int [label\\_image\\_spacing](#) ()
- Return the gap size between the label and the image.*

  - void [label\\_image\\_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

  - [FI\\_Color](#) [labelcolor](#) () const
- Gets the label color.*

  - void [labelcolor](#) ([FI\\_Color](#) c)
- Sets the label color.*

  - [FI\\_Font](#) [labelfont](#) () const
- Gets the font to use.*

  - void [labelfont](#) ([FI\\_Font](#) f)
- Sets the font to use.*

  - [FI\\_Fonsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

  - void [labelsize](#) ([FI\\_Fonsize](#) pix)
- Sets the font size in pixels.*

  - [FI\\_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

  - void [labeltype](#) ([FI\\_Labeltype](#) a)
- Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

  - [FI\\_Group](#) \* [parent](#) () const
- Returns a pointer to the parent widget.*

  - void [parent](#) ([FI\\_Group](#) \*p)
- Internal use only - "for hacks only".*

- void **position** (int X, int Y)  
*Repositions the window or widget.*
- void **redraw** ()  
*Schedules the drawing of the widget.*
- void **redraw\_label** ()  
*Schedules the drawing of the label.*
- **Fl\_Color selection\_color** () const  
*Gets the selection color.*
- void **selection\_color** (**Fl\_Color** a)  
*Sets the selection color.*
- int **send** (int event)  
*Sends the specified event to the widget.*
- void **set\_active** ()  
*Marks the widget as active without sending events or changing focus.*
- void **set\_changed** ()  
*Marks the value of the widget as changed.*
- void **set\_output** ()  
*Sets a widget to output only.*
- void **set\_visible** ()  
*Makes the widget visible.*
- void **set\_visible\_focus** ()  
*Enables keyboard focus navigation with this widget.*
- int **shortcut\_label** () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void **shortcut\_label** (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void **show** ()  
*Makes a widget visible.*
- void **size** (int W, int H)  
*Changes the size of the widget.*
- int **take\_focus** ()  
*Gives the widget the keyboard focus.*
- unsigned int **takeevents** () const  
*Returns if the widget is able to take events.*
- int **test\_shortcut** ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* **tooltip** () const  
*Gets the current tooltip text.*
- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window \* top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window \* top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar type** () const  
*Gets the widget type.*
- void **type** (**uchar** t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const

- Gets the user data for this widget.*
- void **user\_data** ([FI\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)
- Sets the user data for this widget.*
- void **user\_data** (void \*v)
- Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const
- Returns whether a widget is visible.*

*Internal use only.*

## 13.126.1 Member Function Documentation

### 13.126.1.1 **handle()**

```
int Fl_Spinner::Fl_Spinner_Input::handle (
 int event) [override], [virtual]
```

Handles events of [Fl\\_Spinner](#)'s embedded input widget.

Works like [Fl\\_Input::handle\(\)](#) but ignores FL\_Up and FL\_Down keys so they can be handled by the parent widget ([Fl\\_Spinner](#)).

Reimplemented from [Fl\\_Input](#).

The documentation for this class was generated from the following files:

- [Fl\\_Spinner.H](#)
- [Fl\\_Spinner.cxx](#)

## 13.127 FL\_Surface\_Device Class Reference

A drawing surface that's susceptible to receive graphical output.

```
#include <Fl_Device.H>
```

### 13.127.1 Detailed Description

A drawing surface that's susceptible to receive graphical output.

Any FLTK application has at any time a current drawing surface to which all drawing requests are directed. The current surface is given by `FL_Surface_Device::surface()`. When `main()` begins running, the current drawing surface has been set to the computer's display, an instance of the `FL_Display_Device` class.

A drawing surface other than the computer's display, is typically used as follows:

1. Create `surface`, an object from an `FL_Surface_Device` derived class (e.g., `FL_Image_Surface`, `FL_Printer`, `FL_Copy_Surface`).
2. Call `FL_Surface_Device::push_current(surface);` to redirect all graphics requests to `surface` which becomes the new current drawing surface (not necessary with classes `FL_Printer` / `FL_PostScript_File_Device` / `FL_PDF_File_Surface` because it is done by `FL_Paged_Device::begin_page()`).

3. At this point all of the [Drawing functions](#) (e.g., [fl\\_rect\(\)](#)) or the [Color & Font functions](#) or [Drawing Images functions](#) (e.g., [fl\\_draw\\_image\(\)](#), [Fl\\_Image::draw\(\)](#)) operate on the new current drawing surface. It's also possible to draw to the current surface any widget with [Fl\\_Widget\\_Surface::draw\(Fl\\_Widget\\*, int, int\)](#), a window and its titlebar with [Fl\\_Widget\\_Surface::draw\\_decorated\\_window\(\)](#), or the content of a rectangular zone of a window with [Fl\\_Widget\\_Surface::print\\_window\\_part\(\)](#).
4. After all drawing requests have been performed, redirect graphics requests back to their previous destination with [Fl\\_Surface\\_Device::pop\\_current\(\)](#); (not necessary with classes [Fl\\_Printer](#) / [Fl\\_PostScript\\_File\\_Device](#) / [Fl\\_PDF\\_File\\_Surface](#)).
5. Delete surface.

For back-compatibility, it is also possible to use the [Fl\\_Surface\\_Device::set\\_current\(\)](#) member function to change the current drawing surface, once to the new surface, once to the previous one.

## 13.127.2 Member Function Documentation

### 13.127.2.1 end\_current()

```
virtual void Fl_Surface_Device::end_current () [inline], [protected], [virtual]
```

FLTK calls this each time a surface ceases to be the current drawing surface.

This member function is mostly of interest to developers of new [Fl\\_Surface\\_Device](#) derived classes. It allows to perform surface-specific operations necessary when this surface ceases to be current. Each implementation should end with a call to [Fl\\_Surface\\_Device::end\\_current\(\)](#).

Reimplemented in [Fl\\_PostScript\\_File\\_Device](#).

### 13.127.2.2 is\_current()

```
bool Fl_Surface_Device::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), and [Fl\\_Printer](#).

### 13.127.2.3 pop\_current()

```
Fl_Surface_Device * Fl_Surface_Device::pop_current () [static]
```

Removes the top element from the current drawing surface stack, and makes the new top element current.

#### Returns

A pointer to the new current drawing surface.

#### See also

[Fl\\_Surface\\_Device::push\\_current\(Fl\\_Surface\\_Device \\*\)](#)

#### Version

1.4.0

### 13.127.2.4 push\_current()

```
void Fl_Surface_Device::push_current (
 Fl_Surface_Device * new_current) [static]
```

Pushes *new\_current* on top of the stack of current drawing surfaces, and makes it current.

*new\_current* will receive all future graphics requests.

Any call to [push\\_current\(\)](#) must be matched by a subsequent call to [Fl\\_Surface\\_Device::pop\\_current\(\)](#). The max height of this stack is 16.

#### Version

1.4.0

### 13.127.2.5 set\_current()

```
void Fl_Surface_Device::set_current (
 void) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [Fl\\_Surface\\_Device::push\\_current\(\)](#) / [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

#### Note

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl\\_Printer](#) or an [Fl\\_Image\\_Surface](#) object, calling [set\\_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl\\_Display\\_Device::display\\_device\(\)->set\\_current\(\)](#);  
don't do any other call to [set\\_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl\\_Surface\\_Device::push\\_current\(\)](#) and [Fl\\_Surface\\_Device::pop\\_current\(\)](#).

Reimplemented in [Fl\\_Copy\\_Surface](#), [Fl\\_Image\\_Surface](#), [Fl\\_PDF\\_File\\_Surface](#), [Fl\\_PostScript\\_File\\_Device](#), and [Fl\\_Printer](#).

### 13.127.2.6 surface()

```
static Fl_Surface_Device * Fl_Surface_Device::surface () [inline], [static]
```

The current drawing surface.

In other words, the [Fl\\_Surface\\_Device](#) object that currently receives all graphics requests.

#### Note

It's possible to transiently remove the GUI scaling factor in place in the current drawing surface with [fl\\_override\\_scale\(\)](#).

The documentation for this class was generated from the following files:

- [Fl\\_Device.H](#)
- [Fl\\_Device.cxx](#)

## 13.128 Fl\_SVG\_File\_Surface Class Reference

A drawing surface producing a Scalable Vector Graphics (SVG) file.

```
#include <Fl_SVG_File_Surface.H>
```

- int **y\_offset**  
*vertical offset to the origin of graphics coordinates*

### 13.128.1 Detailed Description

A drawing surface producing a Scalable Vector Graphics (SVG) file.

This drawing surface allows to store any FLTK graphics in vectorial form in a "Scalable Vector Graphics" file.

Usage example:

```
Fl_Window *win = ...// Window to draw to a .svg file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *svg = fl_fopen("/path/to/mywindow.svg", "w");
if (svg) {
 Fl_SVG_File_Surface *surface = new Fl_SVG_File_Surface(ww, wh, svg);
 Fl_Surface_Device::push_current(surface);
 fl_color(FL_WHITE);
 fl_rectf(0, 0, ww, wh);
 surface->draw_decorated_window(win);
 Fl_Surface_Device::pop_current();
 delete surface; // the .svg file is not complete until the destructor was run
 fclose(svg);
}
```

#### Note

FLTK uses the PNG and JPEG libraries to encode images to the SVG format. For this reason, class [Fl\\_SVG\\_File\\_Surface](#) is placed in the fltk\_images library. If JPEG is not available at application build time, PNG is enough (but produces a quite larger output). If PNG isn't available either, images don't appear in the SVG output.

### 13.128.2 Constructor & Destructor Documentation

#### 13.128.2.1 [Fl\\_SVG\\_File\\_Surface](#)()

```
Fl_SVG_File_Surface::Fl_SVG_File_Surface (
 int width,
 int height,
 FILE * svg,
 int (*) (FILE *) closef = NULL)
```

Constructor of the SVG drawing surface.

#### Parameters

<i>width,height</i>	Width and height of the graphics area in FLTK drawing units
<i>svg</i>	A writable FILE pointer where the SVG data are to be sent. The resulting SVG data are not complete until after destruction of the <a href="#">Fl_SVG_File_Surface</a> object or after calling <a href="#">close()</a> .
<i>closef</i>	If not NULL, the destructor and <a href="#">close()</a> will call <code>closef(svg)</code> after all SVG data has been sent. If NULL, <code>fclose(svg)</code> is called instead. This allows to close the FILE pointer by, e.g., <code>pclose</code> , or, using a function such as <code>"int keep_open(FILE*) {return 0;}"</code> , to keep it open after completion of all output to <code>svg</code> . Function <code>closef</code> should return non zero to indicate an error.

**13.128.2.2 ~Fl\_SVG\_File\_Surface()**

```
Fl_SVG_File_Surface::~~Fl_SVG_File_Surface ()
```

Destructor.

The underlying FILE pointer is processed as by [close\(\)](#).

**13.128.3 Member Function Documentation****13.128.3.1 close()**

```
int Fl_SVG_File_Surface::close ()
```

Closes the FILE pointer where SVG data is output.

The underlying FILE is closed by function `fclose()` unless another function was set at object's construction time. The only operation possible after this on the [Fl\\_SVG\\_File\\_Surface](#) object is its destruction.

**Returns**

The value returned by the closing function call.

**13.128.3.2 origin() [1/2]**

```
void Fl_SVG_File_Surface::origin (
 int * x,
 int * y) [override], [virtual]
```

Computes the coordinates of the current origin of graphics functions.

**Parameters**

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---------------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.128.3.3 origin() [2/2]**

```
void Fl_SVG_File_Surface::origin (
 int x,
 int y) [override], [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable\\_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl\\_Paged\\_Device](#)).

**Parameters**

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---------------------------------------------------------------------------------------------

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.128.3.4 printable\_rect()**

```
int Fl_SVG_File_Surface::printable_rect (
 int * w,
 int * h) [override], [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl\\_Paged\\_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

**Returns**

0 if OK, non-zero if any error

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.128.3.5 translate()**

```
void Fl_SVG_File_Surface::translate (
 int x,
 int y) [override], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl\\_Widget\\_Surface](#).

**13.128.3.6 untranslate()**

```
void Fl_SVG_File_Surface::untranslate (
 void) [override], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl\\_Widget\\_Surface](#).

The documentation for this class was generated from the following file:

- [Fl\\_SVG\\_File\\_Surface.H](#)

**13.129 Fl\_SVG\_Image Class Reference**

The [Fl\\_SVG\\_Image](#) class supports loading, caching and drawing of scalable vector graphics (SVG) images.

```
#include <Fl_SVG_Image.H>
```

Inheritance diagram for [Fl\\_SVG\\_Image](#):

  - int `w` () const
 

*Returns the current image drawing width in FLTK units.*
  - virtual `~FI_Image` ()
 

*The destructor is a virtual method that frees all memory used by the image.*

### Public Attributes

- bool `proportional`

*Set this to `false` to allow image re-scaling that alters the image aspect ratio.*

### Public Attributes inherited from `FI_RGB_Image`

- int `alloc_array`

*If non-zero, the object's data array is delete[]'d when deleting the object.*
- const `uchar` \* `array`

*Points to the start of the object's data array.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_RGB_Image`

- static `size_t` `max_size` ()
 

*Returns the maximum allowed image size in bytes when creating an `FI_RGB_Image` object.*
- static void `max_size` (`size_t` size)
 

*Sets the maximum allowed image size in bytes when creating an `FI_RGB_Image` object.*

### Static Public Member Functions inherited from `FI_Image`

- static `FI_Labeltype` `define_FL_IMAGE_LABEL` ()
- static `FI_RGB_Scaling` `RGB_scaling` ()
 

*Returns the currently used RGB image scaling method.*
- static void `RGB_scaling` (`FI_RGB_Scaling`)
 

*Sets the RGB image scaling method used for copy(int, int).*
- static `FI_RGB_Scaling` `scaling_algorithm` ()
 

*Gets what algorithm is used when resizing a source image to draw it.*
- static void `scaling_algorithm` (`FI_RGB_Scaling` algorithm)
 

*Sets what algorithm is used when resizing a source image to draw it.*

### Static Public Attributes inherited from FI\_Image

- static const int **ERR\_FILE\_ACCESS** = -2
- static const int **ERR\_FORMAT** = -3
- static const int **ERR\_MEMORY\_ACCESS** = -4
- static const int **ERR\_NO\_IMAGE** = -1
- static bool **register\_images\_done** = false  
*True after [fl\\_register\\_images\(\)](#) was called, false before.*

### Protected Member Functions inherited from FI\_Image

- void **d** (int D)  
*Sets the current image depth.*
- void **data** (const char \*const \*p, int c)  
*Sets the current data pointer and count of pointers in the array.*
- void **draw\_empty** (int X, int Y)  
*The protected method [draw\\_empty\(\)](#) draws a box with an X in it.*
- int **draw\_scaled** (int X, int Y, int W, int H)  
*Draw the image to the current drawing surface rescaled to a given width and height.*
- void **h** (int H)  
*Sets the height of the image data.*
- void **ld** (int LD)  
*Sets the current line data size in bytes.*
- void **w** (int W)  
*Sets the width of the image data.*

### Static Protected Member Functions inherited from FI\_Image

- static void **labeltype** (const [FI\\_Label](#) \*lo, int lx, int ly, int lw, int lh, [FI\\_Align](#) la)
- static void **measure** (const [FI\\_Label](#) \*lo, int &lw, int &lh)

#### 13.129.1 Detailed Description

The [FI\\_SVG\\_Image](#) class supports loading, caching and drawing of scalable vector graphics (SVG) images.

The FLTK library performs parsing and rasterization of SVG data using a modified version of the `nanosvg` software (<https://github.com/memononen/nanosvg>). The software modification allows the option to change the aspect ratio while performing rasterization.

Use [FI\\_Image::fail\(\)](#) to check if the [FI\\_SVG\\_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, and `ERR_FORMAT` if the SVG format could not be decoded. If the image has loaded correctly, [w\(\)](#), [h\(\)](#), and [d\(\)](#) should return values greater than zero.

Member `proportional` of an [FI\\_SVG\\_Image](#) object must be set to `false` to allow the image object to be rasterized with an altered aspect ratio.

Rasterization is not done until the image is first drawn or [resize\(\)](#) or [normalize\(\)](#) is called. Therefore, `array` is NULL until then. The delayed rasterization ensures an [FI\\_SVG\\_Image](#) is always rasterized to the exact screen resolution at which it is drawn.

The [FI\\_SVG\\_Image](#) class draws images computed by `nanosvg` with the following known limitations

- text between `<text>` and `</text>` marks,
- image elements, and
- `<use>` statements

are not rendered.

The FLTK library can optionally be built without SVG support; in that case, class [FI\\_SVG\\_Image](#) is unavailable.

Example of displaying a hard-coded svg file:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
```

```
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>

// A black rotated rectangle
const char *svg_data = "<svg viewBox=\"0 0 200 200\" version = \"1.1\">\n"
 "<rect x=\"25\" y=\"50\" width=\"150\" height=\"100\" fill=\"black\" \" "
 "transform=\"rotate(45 100 100)\"> </svg>\n";

int main(int argc, char **argv) {
 Fl_SVG_Image *svg = new Fl_SVG_Image(0, svg_data); // create SVG object
 Fl_Window *win = new Fl_Window(720, 486, "svg test");
 Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());
 box->image(svg); // assign svg object to Fl_Box
 win->end();
 win->show(argc, argv);
 return(Fl::run());
}
```

Example of displaying an svg image from a file:

```
#include <errno.h> // errno
#include <string.h> // strerror
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/fl_message.H>
int main(int argc, char **argv) {
 Fl_Window *win = new Fl_Window(720, 486, "svg test");
 Fl_Box *box = new Fl_Box(0, 0, win->w(), win->h());

 // Load svg image from disk, assign to a box
 const char *svgpath = "/var/tmp/simple.svg";
 Fl_SVG_Image *svg = new Fl_SVG_Image(svgpath); // load SVG object from disk
 switch (svg->fail()) {
 case Fl_Image::ERR_FILE_ACCESS:
 // File couldn't load? show path + os error to user
 fl_alert("%s: %s", svgpath, strerror(errno));
 return 1;
 case Fl_Image::ERR_FORMAT:
 // Parsing error
 fl_alert("%s: couldn't decode image", svgpath);
 return 1;
 }
 box->image(svg); // assign svg object to box

 win->end();
 win->show(argc, argv);
 return(Fl::run());
}
```

Example of fitting an svg image to a resizable [Fl\\_Box](#):

```
#include <FL/Fl_Window.H>
#include <FL/Fl_SVG_Image.H>
#include <FL/Fl_Box.H>

class resizable_box : public Fl_Box {
public:
 resizable_box(int w, int h) : Fl_Box(0, 0, w, h, NULL) {}
 virtual void resize(int x, int y, int w, int h) {
 image()->scale(w, h, 1, 1); // p3 = proportional, p4 = can_expand
 Fl_Box::resize(x, y, w, h);
 }
};

int main(int argc, char **argv) {
 Fl_Window *win = new Fl_Window(130, 130);
 resizable_box *box = new resizable_box(win->w(), win->h());
 Fl_SVG_Image *svg = new Fl_SVG_Image("/path/to/image.svg");
 box->image(svg);
 svg->scale(box->w(), box->h());
 win->end();
 win->resizable(win);
 win->show(argc, argv);
 return Fl::run();
}
```

## 13.129.2 Constructor & Destructor Documentation

### 13.129.2.1 Fl\_SVG\_Image() [1/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * filename)
```

Load an SVG image from a file.

This constructor loads the SVG image from a .svg or .svgz file. The reader recognizes if the data is compressed,

and decompresses it if zlib is available (HAVE\_LIBZ).

#### Parameters

<i>filename</i>	the filename for a .svg or .svgz file
-----------------	---------------------------------------

### 13.129.2.2 Fl\_SVG\_Image() [2/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * sharedname,
 const char * svg_data)
```

Load an SVG image from memory.

This constructor loads the SVG image from a block of memory. This version is commonly used for uncompressed text data, but the reader recognizes if the data is compressed, and decompresses it if zlib is available (HAVE\_LIBZ).

#### Parameters

<i>sharedname</i>	if not NULL, a shared image will be generated with this name
<i>svg_data</i>	a pointer to the memory location of the SVG image data

#### Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

### 13.129.2.3 Fl\_SVG\_Image() [3/3]

```
Fl_SVG_Image::Fl_SVG_Image (
 const char * name,
 const unsigned char * svg_data,
 size_t length)
```

Load an SVG image from memory.

This constructor loads the SVG image from a block of memory. This version is commonly used for compressed binary data, but the reader recognizes if the data is uncompressed, and reads it as a text block.

#### Parameters

<i>name</i>	if not NULL, a shared image will be generated with this name
<i>svg_data</i>	a pointer to the memory location of the SVG image data
<i>length</i>	of <i>svg_data</i> or 0 if the length is unknown. This will protect memory outside of the <i>svg_data</i> array from illegal read operations for compressed SVG data

#### Note

In-memory SVG data is parsed by the object constructor and is no longer needed after construction.

## 13.129.3 Member Function Documentation

### 13.129.3.1 as\_svg\_image() [1/2]

```
const Fl_SVG_Image * Fl_SVG_Image::as_svg_image () const [inline], [override], [virtual]
```

Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of const [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.2 as\_svg\_image() [2/2]

`Fl_SVG_Image * Fl_SVG_Image::as_svg_image ( ) [inline], [override], [virtual]`

Returns whether an RGB image is an [Fl\\_SVG\\_Image](#) or not.

This virtual method returns a pointer to the [Fl\\_SVG\\_Image](#) if this object is an instance of [Fl\\_SVG\\_Image](#) or NULL if not.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.3 color\_average()

```
void Fl_SVG_Image::color_average (
 Fl_Color c,
 float i) [override], [virtual]
```

The [color\\_average\(\)](#) method averages the colors in the image with the provided FLTK color value.

The first argument specifies the FLTK color to be used.

The second argument specifies the amount of the original image to combine with the color, so a value of 1.0 results in no color blend, and a value of 0.0 results in a constant image of the specified color.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.4 copy()

```
Fl_Image * Fl_SVG_Image::copy (
 int W,
 int H) const [override], [virtual]
```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl\\_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl\\_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl\\_Image](#)) instead of operator *delete* for [Fl\\_Image](#)'s and [Fl\\_Image::release\(\)](#) for [Fl\\_Shared\\_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl\\_Image::RGB\\_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

#### Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---------------------------------------------

#### Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl\\_RGB\\_Image](#), [Fl\\_SVG\\_Image](#), [Fl\\_Pixmap](#), [Fl\\_Bitmap](#), [Fl\\_Tiled\\_Image](#), [Fl\\_Anim\\_GIF\\_Image](#) and [Fl\\_Shared\\_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl\\_GIF\\_Image](#) is an object of class [Fl\\_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl\\_Image](#) or any subclass your overridden methods of '[Fl\\_Image::copy\(\) const](#)' and '[Fl\\_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.5 desaturate()

```
void Fl_SVG_Image::desaturate () [override], [virtual]
```

The [desaturate\(\)](#) method converts an image to grayscale.

If the image contains an alpha channel (depth = 4), the alpha channel is preserved.

An internal copy is made of the original image data before changes are applied, to avoid modifying the original image data in memory.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.6 draw()

```
void Fl_SVG_Image::draw (
 int X,
 int Y,
 int W,
 int H,
 int cx = 0,
 int cy = 0) [override], [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments X, Y, W, H specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the cx and cy arguments.

Another way to see what part of the image gets drawn and where, is to consider this alternative writing producing the same output:

```
fl_push_clip(X,Y,W,H);
this->draw(X - cx, Y - cy);
fl_pop_clip();
```

Repeated calls to this member function with the same image but varying W, H, cx, or cy arguments can be more efficiently processed using the above alternative writing.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.7 normalize()

```
void Fl_SVG_Image::normalize () [override], [virtual]
```

Makes sure the object is fully initialized.

This function rasterizes the SVG image, and consequently initializes its [array](#) member, if that was not done before.

Reimplemented from [Fl\\_RGB\\_Image](#).

### 13.129.3.8 resize()

```
void Fl_SVG_Image::resize (
 int width,
 int height)
```

Have the svg data (re-)rasterized using the given width and height values.

By default, the resulting image w() and h() will be close to width and height while preserving the width/height ratio of the SVG data. If [proportional](#) was set to false, the image is rasterized to the exact width and height values. In both cases, [data\\_w\(\)](#) and [data\\_h\(\)](#) values are set to w() and h(), respectively.

### 13.129.3.9 scale()

```
void Fl_SVG_Image::scale (
 int width,
 int height,
 int proportional = 1,
 int can_expand = 0) [override], [virtual]
```

Sets the drawing size of the image.

This function controls the values returned by member functions w() and h() which in turn control how the image is drawn: the full image data (whose size is given by [data\\_w\(\)](#) and [data\\_h\(\)](#)) are drawn scaled to an area of the drawing surface sized at w() x h() FLTK units. This can make a difference if the drawing surface has more than 1 pixel per FLTK unit because the image can be drawn at the full resolution of the drawing surface. Examples of such drawing surfaces: HiDPI displays, laser printers, PostScript files, PDF printers.

## Parameters

<i>width,height</i>	maximum values, in FLTK units, that <code>w()</code> and <code>h()</code> should return
<i>proportional</i>	if not null, keep the values returned by <code>w()</code> and <code>h()</code> proportional to <code>data_w()</code> and <code>data_h()</code>
<i>can_expand</i>	if null, the values returned by <code>w()</code> and <code>h()</code> will not be larger than <code>data_w()</code> and <code>data_h()</code> , respectively

## Note

This function generally changes the values returned by the `w()` and `h()` member functions. In contrast, the values returned by `data_w()` and `data_h()` remain unchanged.

If the processed image is an `Fl_SVG_Image`, setting `Fl_SVG_Image::proportional` to `false` is required if `proportional` here is null.

## Version

1.4 (1.3.4 and `FL_ABI_VERSION` for `Fl_Shared_Image` only)

Example code: scale an image to fit in a box

```
Fl_Box *b = ... // a box
Fl_Image *img = new Fl_PNG_Image("/path/to/picture.png"); // read a picture file
// set the drawing size of the image to the size of the box keeping its aspect ratio
img->scale(b->w(), b->h());
b->image(img); // use the image as the box image
```

Reimplemented from `Fl_Image`.

## 13.129.4 Member Data Documentation

### 13.129.4.1 proportional

```
bool Fl_SVG_Image::proportional
```

Set this to `false` to allow image re-scaling that alters the image aspect ratio.

Upon object creation, `proportional` is set to `true`, and the aspect ratio is kept constant.

The documentation for this class was generated from the following files:

- `Fl_SVG_Image.H`
- `Fl_SVG_Image.cxx`

## 13.130 Fl\_Sys\_Menu\_Bar Class Reference

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

```
#include <Fl_Sys_Menu_Bar.H>
```

Inheritance diagram for `Fl_Sys_Menu_Bar`:

## Public Types

- enum `window_menu_style_enum` { `no_window_menu` = 0, `tabbing_mode_none`, `tabbing_mode_automatic`, `tabbing_mode_preferred` }

*Possible styles of the Window menu in the system menu bar.*

## Public Member Functions

- int **add** (const char \*label, const char \*shortcut, Fl\_Callback \*cb, void \*user\_data=0, int flags=0)  
*Adds a new menu item.*
- int **add** (const char \*label, int shortcut, Fl\_Callback \*, void \*user\_data=0, int flags=0)  
*Add a new menu item to the system menu bar.*
- int **add** (const char \*str)  
*Forms-compatible procedure to add items to the system menu bar.*
- void **clear** ()  
*Set the Fl\_Menu\_Item array pointer to null, indicating a zero-length menu.*
- int **clear\_submenu** (int index)  
*Clears the specified submenu pointed to by index of all menu items.*
- **Fl\_Sys\_Menu\_Bar** (int x, int y, int w, int h, const char \*l=0)  
*The constructor.*
- int **insert** (int index, const char \*label, const char \*shortcut, Fl\_Callback \*cb, void \*user\_data=0, int flags=0)  
*Insert a new menu item.*
- int **insert** (int index, const char \*label, int shortcut, Fl\_Callback \*cb, void \*user\_data=0, int flags=0)  
*insert in the system menu bar a new menu item*
- bool **is\_global** () const  
*Find out if this is a global app menubar (macOS) or part of the FLTK window.*
- const **Fl\_Menu\_Item** \* **menu** () const  
*Return the system menu's array of Fl\_Menu\_Item's.*
- void **menu** (const **Fl\_Menu\_Item** \*m)  
*create a system menu bar using the given list of menu structs*
- int **mode** (int i) const  
*Gets the flags of item i.*
- void **mode** (int i, int fl)  
*Sets the flags of item i.*
- void **play\_menu** (const **Fl\_Menu\_Item** \*) override  
*Opens the 1st level submenu of the menubar corresponding to item.*
- void **remove** (int n)  
*remove an item from the system menu bar*
- void **replace** (int index, const char \*name)  
*rename an item from the system menu bar*
- void **setonly** (**Fl\_Menu\_Item** \*item)  
*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void **shortcut** (int i, int s)  
*Changes the shortcut of item i to n.*
- void **update** () override  
*Updates the menu bar after any change to its items.*
- virtual ~**Fl\_Sys\_Menu\_Bar** ()  
*The destructor.*

## Public Member Functions inherited from Fl\_Menu\_Bar

- **Fl\_Menu\_Bar** (int X, int Y, int W, int H, const char \*l=0)  
*Creates a new Fl\_Menu\_Bar widget using the given position, size, and label string.*
- int **handle** (int) override  
*Handles the specified event.*

## Public Member Functions inherited from [Fl\\_Menu\\_](#)

- int [add](#) (const char \*)  
*This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.*
- int [add](#) (const char \*, int [shortcut](#), [Fl\\_Callback](#) \*, void \*=0, int=0)  
*Adds a new menu item.*
- int [add](#) (const char \*a, const char \*b, [Fl\\_Callback](#) \*c, void \*d=0, int e=0)  
*See int [Fl\\_Menu\\_::add](#)(const char\* label, int shortcut, [Fl\\_Callback](#)\*, void \*user\_data=0, int flags=0)*
- void [clear](#) ()  
*Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.*
- int [clear\\_submenu](#) (int index)  
*Clears the specified submenu pointed to by index of all menu items.*
- void [copy](#) (const [Fl\\_Menu\\_Item](#) \*m, void \*user\_data=0)  
*Sets the menu array pointer with a copy of m that will be automatically deleted.*
- [Fl\\_Boxtype](#) [down\\_box](#) () const  
*This box type is used to surround the currently-selected items in the menus.*
- void [down\\_box](#) ([Fl\\_Boxtype](#) b)  
*Sets the box type used to surround the currently-selected items in the menus.*
- [Fl\\_Color](#) [down\\_color](#) () const  
*For back compatibility, same as [selection\\_color](#)()*
- void [down\\_color](#) (unsigned c)  
*For back compatibility, same as [selection\\_color](#)()*
- int [find\\_index](#) (const char \*name) const  
*Find the menu item index for a given menu pathname, such as "Edit/Copy".*
- int [find\\_index](#) (const [Fl\\_Menu\\_Item](#) \*item) const  
*Find the index into the menu array for a given item.*
- int [find\\_index](#) ([Fl\\_Callback](#) \*cb) const  
*Find the index into the menu array for a given callback cb.*
- const [Fl\\_Menu\\_Item](#) \* [find\\_item](#) (const char \*name)  
*Find the menu item for a given menu pathname, such as "Edit/Copy".*
- const [Fl\\_Menu\\_Item](#) \* [find\\_item](#) ([Fl\\_Callback](#) \*)  
*Find the menu item for the given callback cb.*
- const [Fl\\_Menu\\_Item](#) \* [find\\_item\\_with\\_argument](#) (long)  
*Find the menu item for the given user argument v.*
- const [Fl\\_Menu\\_Item](#) \* [find\\_item\\_with\\_user\\_data](#) (void \*)  
*Find the menu item for the given user data v.*
- [Fl\\_Menu\\_](#) (int, int, int, int, const char \*=0)  
*Creates a new [Fl\\_Menu\\_](#) widget using the given position, size, and label string.*
- void [global](#) ()  
*Make the shortcuts for this menu work no matter what window has the focus when you type it.*
- int [insert](#) (int index, const char \*, int [shortcut](#), [Fl\\_Callback](#) \*, void \*=0, int=0)  
*Inserts a new menu item at the specified index position.*
- int [insert](#) (int index, const char \*a, const char \*b, [Fl\\_Callback](#) \*c, void \*d=0, int e=0)  
*See int [Fl\\_Menu\\_::insert](#)(const char\* label, int shortcut, [Fl\\_Callback](#)\*, void \*user\_data=0, int flags=0)*
- int [item\\_pathname](#) (char \*name, int namelen, const [Fl\\_Menu\\_Item](#) \*finditem=0) const  
*Get the menu 'pathname' for the specified menuitem.*
- const [Fl\\_Menu\\_Item](#) \* [menu](#) () const  
*Returns a pointer to the array of [Fl\\_Menu\\_Items](#).*
- void [menu](#) (const [Fl\\_Menu\\_Item](#) \*m)  
*Sets the menu array pointer directly.*

- [Fl\\_Boxtype menu\\_box](#) () const  
*Get the box type for the menu popup windows.*
- void [menu\\_box](#) ([Fl\\_Boxtype](#) b)  
*Set the box type for the menu popup windows.*
- const [Fl\\_Menu\\_Item](#) \* [menu\\_end](#) ()  
*Finishes menu modifications and returns menu().*
- int [mode](#) (int i) const  
*Get the flags of item i.*
- void [mode](#) (int i, int fl)  
*Set the flags of item i.*
- const [Fl\\_Menu\\_Item](#) \* [mvalue](#) () const  
*Return a pointer to the last menu item that was picked.*
- const [Fl\\_Menu\\_Item](#) \* [picked](#) (const [Fl\\_Menu\\_Item](#) \*)  
*When user picks a menu item, call this.*
- const [Fl\\_Menu\\_Item](#) \* [prev\\_mvalue](#) () const  
*Return a pointer to the menu item that was picked before the current one was picked.*
- void [remove](#) (int)  
*Deletes item i from the menu.*
- void [replace](#) (int, const char \*)  
*Changes the text of item i.*
- void [setonly](#) ([Fl\\_Menu\\_Item](#) \*item)  
*Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.*
- void [shortcut](#) (int i, int s)  
*Change the shortcut of item i to s.*
- int [size](#) () const  
*This returns the number of [Fl\\_Menu\\_Item](#) structures that make up the menu, correctly counting submenus.*
- void [size](#) (int W, int H)
- const [Fl\\_Menu\\_Item](#) \* [test\\_shortcut](#) ()  
*Returns the menu item with the entered shortcut (key value).*
- const char \* [text](#) () const  
*Returns the title of the last item chosen.*
- const char \* [text](#) (int i) const  
*Returns the title of item i.*
- [Fl\\_Color](#) [textcolor](#) () const  
*Get the current color of menu item labels.*
- void [textcolor](#) ([Fl\\_Color](#) c)  
*Sets the current color of menu item labels.*
- [Fl\\_Font](#) [textfont](#) () const  
*Gets the current font of menu item labels.*
- void [textfont](#) ([Fl\\_Font](#) c)  
*Sets the current font of menu item labels.*
- [Fl\\_Fontsize](#) [textsize](#) () const  
*Gets the font size of menu item labels.*
- void [textsize](#) ([Fl\\_Fontsize](#) c)  
*Sets the font size of menu item labels.*
- int [value](#) () const  
*Return the index into the menu() of the last item chosen by the user.*
- int [value](#) (const [Fl\\_Menu\\_Item](#) \*)  
*Set the value of a menu to the menu item m.*
- int [value](#) (int i)  
*Set the value of the menu to index i.*

## Public Member Functions inherited from [FI\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FI\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FI\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FI\\_Gl\\_Window](#) pointer if this widget is an [FI\\_Gl\\_Window](#).*
- virtual class [FI\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FI\\_Group](#) \* [as\\_group](#) ()  
*Returns an [FI\\_Group](#) pointer if this widget is an [FI\\_Group](#).*
- virtual [FI\\_Group](#) const \* [as\\_group](#) () const
- virtual [FI\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FI\\_Window](#) pointer if this widget is an [FI\\_Window](#).*
- virtual [FI\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FI\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FI\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

    - void `clear_active` ()

*Marks the widget as inactive without sending events or changing focus.*

  - void `clear_changed` ()
- Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `Fl_Color` `color` () const
- Gets the background color of the widget.*
- void `color` (`Fl_Color` bg)
- Sets the background color of the widget.*
- void `color` (`Fl_Color` bg, `Fl_Color` sel)
- Sets the background and selection color of the widget.*
- int `contains` (const `Fl_Widget` \*w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)
- Sets the current label.*
- void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*
- `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)
- Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `Fl_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `Fl_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`Fl_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`Fl_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*
- void `do_callback` (`Fl_Widget` \*widget, long arg, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`Fl_Widget` \*widget, void \*arg=0, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const

- Sets width ww and height hh accordingly with the label size.*

  - bool `needs_keyboard` () const

*Returns whether this widget needs a keyboard.*
- void `needs_keyboard` (bool needs)

*Sets whether this widget needs a keyboard.*
- unsigned int `output` () const

*Returns if a widget is used for output only.*
- `FI_Group` \* `parent` () const

*Returns a pointer to the parent widget.*
- void `parent` (`FI_Group` \*p)

*Internal use only - "for hacks only".*
- void `position` (int X, int Y)

*Repositions the window or widget.*
- void `redraw` ()

*Schedules the drawing of the widget.*
- void `redraw_label` ()

*Schedules the drawing of the label.*
- virtual void `resize` (int x, int y, int w, int h)

*Changes the size or position of the widget.*
- `FI_Color` `selection_color` () const

*Gets the selection color.*
- void `selection_color` (`FI_Color` a)

*Sets the selection color.*
- int `send` (int event)

*Sends the specified event to the widget.*
- void `set_active` ()

*Marks the widget as active without sending events or changing focus.*
- void `set_changed` ()

*Marks the value of the widget as changed.*
- void `set_output` ()

*Sets a widget to output only.*
- void `set_visible` ()

*Makes the widget visible.*
- void `set_visible_focus` ()

*Enables keyboard focus navigation with this widget.*
- int `shortcut_label` () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void `shortcut_label` (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void `show` ()

*Makes a widget visible.*
- void `size` (int W, int H)

*Changes the size of the widget.*
- int `take_focus` ()

*Gives the widget the keyboard focus.*
- unsigned int `takeevents` () const

*Returns if the widget is able to take events.*
- int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*

- void **tooltip** (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- **Fl\_Window** \* **top\_window** () const  
*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window** \* **top\_window\_offset** (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const  
*Gets the widget type.*
- void **type** (**uchar** t)  
*Sets the widget type.*
- int **use\_accents\_menu** ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const  
*Gets the user data for this widget.*
- void **user\_data** (**Fl\_Callback\_User\_Data** \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void **user\_data** (void \*v)  
*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const  
*Returns whether a widget is visible.*
- unsigned int **visible\_focus** () const  
*Checks whether this widget has a visible focus.*
- void **visible\_focus** (int v)  
*Modifies keyboard focus navigation.*
- int **visible\_r** () const  
*Returns whether a widget and all its parents are visible.*
- int **w** () const  
*Gets the widget width.*
- **Fl\_When** **when** () const  
*Returns the conditions under which the callback is called.*
- void **when** (**uchar** i)  
*Sets the flags used to decide when a callback is called.*
- **Fl\_Window** \* **window** () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const  
*Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual ~**Fl\_Widget** ()  
*Destroys the widget.*

### Static Public Member Functions

- static void [about](#) ([Fl\\_Callback](#) \*cb, void \*data)  
*Attaches a callback to the "About myprog" item of the system application menu.*
- static void [create\\_window\\_menu](#) ()  
*Adds a Window menu, to the end of the system menu bar.*
- static [window\\_menu\\_style\\_enum](#) [window\\_menu\\_style](#) ()  
*Get the style of the Window menu in the system menu bar.*
- static void [window\\_menu\\_style](#) ([window\\_menu\\_style\\_enum](#) style)  
*Set the desired style of the Window menu in the system menu bar.*

### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void [default\\_callback](#) ([Fl\\_Widget](#) \*widget, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int [label\\_shortcut](#) (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Member Functions

- void [draw](#) () override  
*Draws the widget.*

### Protected Member Functions inherited from [Fl\\_Menu\\_](#)

- int [item\\_pathname](#)\_ (char \*name, int namelen, const [Fl\\_Menu\\_Item](#) \*finditem, const [Fl\\_Menu\\_Item](#) \*menu=0) const

### Protected Member Functions inherited from [Fl\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([Fl\\_Boxtype](#) t, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([Fl\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([Fl\\_Boxtype](#) t, int x, int y, int w, int h, [Fl\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [Fl\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)

- Creates a widget at the given position and size.*
  - unsigned int **flags** () const  
*Gets the widget flags mask.*
- void **h** (int v)  
*Internal use only.*
- void **set\_flag** (unsigned int c)  
*Sets a flag in the flags mask.*
- void **w** (int v)  
*Internal use only.*
- void **x** (int v)  
*Internal use only.*
- void **y** (int v)  
*Internal use only.*

### 13.130.1 Detailed Description

A class to create and modify menus that appear on macOS in the menu bar at the top of the screen.

On other than macOS platforms, [FI\\_Sys\\_Menu\\_Bar](#) is a synonym of class [FI\\_Menu\\_Bar](#).

On the macOS platform, replace [FI\\_Menu\\_Bar](#) with [FI\\_Sys\\_Menu\\_Bar](#), and a system menu at the top of the screen will be available. This menu will match an array of [FI\\_Menu\\_Item](#)'s exactly as in all other FLTK menus (except for the submenu with the application's own name and the 'Window' menu; see below). There is, though, an important difference between an [FI\\_Sys\\_Menu\\_Bar](#) object under macOS and under other platforms: only a single object from this class can be created, because macOS uses a single system menu bar. Therefore, porting to macOS an app that creates, on other platforms, several [FI\\_Menu\\_Bar](#) objects, one for each of several windows, is more complex than just replacing [FI\\_Menu\\_Bar](#) by [FI\\_Sys\\_Menu\\_Bar](#).

On the macOS platform, the system menu bar of any FLTK app begins with the Application menu which the FLTK library automatically constructs. Functions [FI\\_Mac\\_App\\_Menu::custom\\_application\\_menu\\_items\(\)](#) and

`Fl_Sys_Menu_Bar::about()` can be used to further customize the Application menu. The FLTK library also automatically constructs and handles a Window menu which can be further customized (or even removed) calling `Fl_Sys_Menu_Bar::window_menu_style(window_menu_style_enum style)`. Other member functions of this class allow the app to generate the rest of the system menu bar. It is recommended to localize the system menu bar using the standard Mac OS X localization procedure (see [Internationalization](#)).

Changes to the menu state are immediately visible in the menubar when they are made using member functions of the `Fl_Sys_Menu_Bar` class. Other changes (e.g., by a call to `Fl_Menu_Item::set()`) should be followed by a call to `update()` to be visible in the menubar across all platforms. macOS global variable `fl_sys_menu_bar` points to the unique, current system menu bar.

A few FLTK menu features are not supported by the Mac System menu:

- no symbolic labels
- no embossed labels
- no font sizes

As described above, the submenu with the application's own name (usually the second submenu from the left, immediately following the "Apple" submenu) is a special case, and can be managed with `Fl_Mac_App_Menu::custom_application_menu_items()`. For example, to make your own "Appname -> Preferences" dialog, you might use:

```
#include <FL/platform.H> // for Fl_Mac_App_Menu class
#include <FL/Fl_Sys_Menu_Bar.H> // for Fl_Menu_Item
:
void prefs_cb(Fl_Widget *w, void *data) {
 // ..Open your preferences dialog here..
}
:
int main(..) {
 :
 // Items to add to the application menu
 static Fl_Menu_Item appitems[] = {
 { "Preferences", 0, prefs_cb, 0, 0 },
 { 0 }, { 0 }
 };
 Fl_Mac_App_Menu::custom_application_menu_items(appitems); // adds it
}
```

..the result being:

Figure 13.46 Mac Application submenu

## 13.130.2 Member Enumeration Documentation

### 13.130.2.1 window\_menu\_style\_enum

enum `Fl_Sys_Menu_Bar::window_menu_style_enum`

Possible styles of the Window menu in the system menu bar.

Enumerator

<code>no_window_menu</code>	No Window menu in the system menu bar.
<code>tabbing_mode_none</code>	No tabbed windows, but the system menu bar contains a Window menu.
<code>tabbing_mode_automatic</code>	Windows are created by themselves but can be tabbed later.
<code>tabbing_mode_preferred</code>	Windows are tabbed when created.

### 13.130.3 Constructor & Destructor Documentation

#### 13.130.3.1 Fl\_Sys\_Menu\_Bar()

```
Fl_Sys_Menu_Bar::Fl_Sys_Menu_Bar (
 int x,
 int y,
 int w,
 int h,
 const char * l = 0)
```

The constructor.

On Mac OS X, all arguments are unused. On other platforms they are used as by [Fl\\_Menu\\_Bar::Fl\\_Menu\\_Bar\(\)](#).

### 13.130.4 Member Function Documentation

#### 13.130.4.1 about()

```
void Fl_Sys_Menu_Bar::about (
 Fl_Callback * cb,
 void * data) [static]
```

Attaches a callback to the "About myprog" item of the system application menu.

This cross-platform function is effective only under the MacOS platform.

##### Parameters

<i>cb</i>	a callback that will be called by "About myprog" menu item with NULL 1st argument.
<i>data</i>	a pointer transmitted as 2nd argument to the callback.

#### 13.130.4.2 add() [1/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * label,
 const char * shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0) [inline]
```

Adds a new menu item.

##### See also

[Fl\\_Menu\\_::add](#)(const char\* [label](#), int [shortcut](#), [Fl\\_Callback\\*](#), void \*[user\\_data](#)=0, int [flags](#)=0)

#### 13.130.4.3 add() [2/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * label,
 int shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0)
```

Add a new menu item to the system menu bar.

Add to the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

##### Parameters

<i>label</i>	- new menu item's label
<i>shortcut</i>	- new menu item's integer shortcut (can be 0 for none, or e.g. FL_ALT+'x')

## Parameters

<i>cb</i>	- callback to be invoked when item selected (can be 0 for none, in which case the menubar's <a href="#">callback()</a> can be used instead)
<i>user_data</i>	- argument to the callback
<i>flags</i>	- item's flags, e.g. <a href="#">FL_MENU_TOGGLE</a> , etc.

## Returns

the index into the menu() array, where the entry was added

## See also

[Fl\\_Menu\\_::add\(const char\\* label, int shortcut, Fl\\_Callback \\*cb, void \\*user\\_data, int flags\)](#)

**13.130.4.4 add()** [3/3]

```
int Fl_Sys_Menu_Bar::add (
 const char * str)
```

Forms-compatible procedure to add items to the system menu bar.

## Returns

the index into the menu() array, where the entry was added

## See also

[Fl\\_Menu\\_::add\(const char\\* str\)](#)

**13.130.4.5 clear()**

```
void Fl_Sys_Menu_Bar::clear ()
```

Set the [Fl\\_Menu\\_Item](#) array pointer to null, indicating a zero-length menu.

## See also

[Fl\\_Menu\\_::clear\(\)](#)

**13.130.4.6 clear\_submenu()**

```
int Fl_Sys_Menu_Bar::clear_submenu (
 int index)
```

Clears the specified submenu pointed to by index of all menu items.

## See also

[Fl\\_Menu\\_::clear\\_submenu\(int index\)](#)

**13.130.4.7 create\_window\_menu()**

```
void Fl_Sys_Menu_Bar::create_window_menu () [static]
```

Adds a Window menu, to the end of the system menu bar.

FLTK apps typically don't need to call this function which is automatically called by the library the first time a window is shown. The default system menu bar contains a Window menu with a "Merge All Windows" item. Other Window menu styles can be obtained calling [Fl\\_Sys\\_Menu\\_Bar::window\\_menu\\_style\(window\\_menu\\_style\\_enum\)](#) before the first [Fl\\_Window::show\(\)](#). Alternatively, an app can call [create\\_window\\_menu\(\)](#) after having populated the system menu bar, for example with [menu\(const Fl\\_Menu\\_Item \\*\)](#), and before the first [Fl\\_Window::show\(\)](#). This function does nothing on non MacOS platforms.

## Version

1.4

**13.130.4.8 draw()**

```
void Fl_Sys_Menu_Bar::draw () [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl\\_Menu\\_Bar](#).

**13.130.4.9 insert()** [1/2]

```
int Fl_Sys_Menu_Bar::insert (
 int index,
 const char * label,
 const char * shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0) [inline]
```

Insert a new menu item.

See also

[Fl\\_Menu\\_::insert](#)(int index, const char\* [label](#), const char\* [shortcut](#), [Fl\\_Callback](#) \*cb, void \*user\_data=0, int flags=0)

**13.130.4.10 insert()** [2/2]

```
int Fl_Sys_Menu_Bar::insert (
 int index,
 const char * label,
 int shortcut,
 Fl_Callback * cb,
 void * user_data = 0,
 int flags = 0)
```

insert in the system menu bar a new menu item

Insert in the system menu bar a new menu item, with a title string, shortcut int, callback, argument to the callback, and flags.

Returns

the index into the menu() array, where the entry was inserted

See also

[Fl\\_Menu\\_::insert](#)(int index, const char\* label, int shortcut, [Fl\\_Callback](#) \*cb, void \*user\_data, int flags)

**13.130.4.11 is\_global()**

```
bool Fl_Sys_Menu_Bar::is_global () const
```

Find out if this is a global app menubar (macOS) or part of the FLTK window.

Returns

true if the menu bar is located at the top of the desktop window and will not take up any space in the FLTK window.

false if the menu bar is rendered inside the FLTK window, using the coordinates and size specified in the constructor.

**13.130.4.12 menu()**

```
void Fl_Sys_Menu_Bar::menu (
 const Fl_Menu_Item * m)
```

create a system menu bar using the given list of menu structs

**Author**

Matthias Melcher

**Parameters**

<i>m</i>	Zero-ending list of <a href="#">Fl_Menu_Item</a> 's
----------	-----------------------------------------------------

**13.130.4.13 mode()**

```
void Fl_Sys_Menu_Bar::mode (
 int i,
 int fl)
```

Sets the flags of item *i*.

**See also**

[Fl\\_Menu\\_::mode\(int i, int fl\)](#)

**13.130.4.14 play\_menu()**

```
void Fl_Sys_Menu_Bar::play_menu (
 const Fl_Menu_Item * item) [override], [virtual]
```

Opens the 1st level submenu of the menubar corresponding to *item*.

**Since**

1.4.0

Reimplemented from [Fl\\_Menu\\_Bar](#).

**13.130.4.15 remove()**

```
void Fl_Sys_Menu_Bar::remove (
 int index)
```

remove an item from the system menu bar

**Parameters**

<i>index</i>	the index of the item to remove
--------------	---------------------------------

**13.130.4.16 replace()**

```
void Fl_Sys_Menu_Bar::replace (
 int index,
 const char * name)
```

rename an item from the system menu bar

**Parameters**

<i>index</i>	the index of the item to rename
<i>name</i>	the new item name as a UTF8 string

### 13.130.4.17 update()

```
void Fl_Sys_Menu_Bar::update () [override], [virtual]
```

Updates the menu bar after any change to its items.

This is useful when the menu bar can be an [Fl\\_Sys\\_Menu\\_Bar](#) object.

Reimplemented from [Fl\\_Menu\\_Bar](#).

### 13.130.4.18 window\_menu\_style()

```
void Fl_Sys_Menu_Bar::window_menu_style (
 Fl_Sys_Menu_Bar::window_menu_style_enum style) [static]
```

Set the desired style of the Window menu in the system menu bar.

This function, to be called before the first call to [Fl\\_Window::show\(\)](#), allows to control whether the system menu bar should contain a Window menu, and if yes, whether new windows should be displayed in tabbed form. These are the effects of various values for *style*:

- `no_window_menu`: don't add a Window menu to the system menu bar
- `tabbing_mode_none`: add a simple Window menu to the system menu bar
- `tabbing_mode_automatic`: the window menu also contains "Merge All Windows" to group all windows in a single tabbed display mode. This is the **default** Window menu style for FLTK apps.
- `tabbing_mode_preferred`: new windows are displayed in tabbed mode when first created

The Window menu, if present, is entirely created and controlled by the FLTK library. Mac OS version 10.12 or later must be running for windows to be displayed in tabbed form. Under non MacOS platforms, this function does nothing.

Version

1.4

The documentation for this class was generated from the following files:

- [Fl\\_Sys\\_Menu\\_Bar.H](#)
- [Fl\\_Sys\\_Menu\\_Bar.cxx](#)

## 13.131 Fl\_Table Class Reference

A table of widgets or other content.

```
#include <Fl_Table.H>
```

Inheritance diagram for [Fl\\_Table](#):

### Public Types

- enum [TableContext](#) {  
[CONTEXT\\_NONE](#) = 0 , [CONTEXT\\_STARTPAGE](#) = 0x01 , [CONTEXT\\_ENDPAGE](#) = 0x02 , [CONTEXT\\_ROW\\_HEADER](#)  
 = 0x04 ,  
[CONTEXT\\_COL\\_HEADER](#) = 0x08 , [CONTEXT\\_CELL](#) = 0x10 , [CONTEXT\\_TABLE](#) = 0x20 , [CONTEXT\\_RC\\_RESIZE](#)  
 = 0x40 }

*The context bit flags for [Fl\\_Table](#) related callbacks.*

## Public Member Functions

- void **add** (FL\_Widget &wgt)  
*The specified widget is removed from its current group (if any) and added to the end of FL\_Table's group.*
- void **add** (FL\_Widget \*wgt)  
*The specified widget is removed from its current group (if any) and added to the end of FL\_Table's group.*
- FL\_Widget \*const \* **array** () const  
*Returns a pointer to the array of children.*
- void **begin** ()
- void **callback** (FL\_Widget \*, void \*)  
*Callbacks will be called depending on the setting of FL\_Widget::when().*
- int **callback\_col** () const  
*Returns the current column the event occurred on.*
- TableContext **callback\_context** () const  
*Returns the current 'table context'.*
- int **callback\_row** () const  
*Returns the current row the event occurred on.*
- FL\_Widget \* **child** (int n) const  
*Returns the child widget by an index.*
- int **children** () const  
*Returns the number of children in the table.*
- virtual void **clear** ()  
*Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.*
- int **col\_header** () const  
*Returns if column headers are enabled or not.*
- void **col\_header** (int flag)  
*Enable or disable column headers.*
- FL\_Color **col\_header\_color** () const  
*Gets the color for column headers.*
- void **col\_header\_color** (FL\_Color val)  
*Sets the color for column headers and redraws the table.*
- int **col\_header\_height** () const  
*Gets the column header height.*
- void **col\_header\_height** (int height)  
*Sets the height in pixels for column headers and redraws the table.*
- int **col\_position** () const  
*Returns the current column scroll position as a column number.*
- void **col\_position** (int col)  
*Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.*
- int **col\_resize** () const  
*Returns if column resizing by the user is allowed.*
- void **col\_resize** (int flag)  
*Allows/disallows column resizing by the user.*
- int **col\_resize\_min** () const  
*Returns the current column minimum resize value.*
- void **col\_resize\_min** (int val)  
*Sets the current column minimum resize value.*
- int **col\_width** (int col) const  
*Returns the current width of the specified column in pixels.*
- void **col\_width** (int col, int width)

- Sets the width of the specified column in pixels, and the table is redrawn.*

  - void **col\_width\_all** (int width)

*Convenience method to set the width of all columns to the same value, in pixels.*
- int **cols** () const

*Get the number of columns in the table.*
- virtual void **cols** (int val)

*Set the number of columns in the table and redraw.*
- void **do\_callback** (TableContext context, int row, int col)

*Calls the widget callback.*
- void **end** ()
- int **find** (const FI\_Widget &wgt) const
- int **find** (const FI\_Widget \*wgt) const
- **FI\_Table** (int X, int Y, int W, int H, const char \*l=0)

*The constructor for FI\_Table.*
- void **get\_selection** (int &row\_top, int &col\_left, int &row\_bot, int &col\_right) const

*Gets the region of cells selected (highlighted).*
- void **init\_sizes** ()

*Resets the internal array of widget sizes and positions.*
- void **insert** (FI\_Widget &wgt, FI\_Widget \*w2)

*The specified widget is removed from its current group (if any) and inserted into FI\_Table's group before widget 'w2'.*
- void **insert** (FI\_Widget &wgt, int n)

*The specified widget is removed from its current group (if any) and inserted into the FI\_Table's group at position 'n'.*
- int **is\_interactive\_resize** () const

*Returns 1 if someone is interactively resizing a row or column.*
- int **is\_selected** (int r, int c) const

*See if the cell at row  $r$  and column  $c$  is selected.*
- int **move\_cursor** (int R, int C)

*Same as move\_cursor(R,C,1):.*
- int **move\_cursor** (int R, int C, int shiftselect)

*Moves the selection cursor a relative number of rows/columns specified by R/C.*
- void **remove** (FI\_Widget &wgt)

*The specified widget is removed from FI\_Table's group.*
- void **resize** (int X, int Y, int W, int H) override

*Handle resize events if user resizes parent window.*
- int **row\_header** () const

*Returns if row headers are enabled or not.*
- void **row\_header** (int flag)

*Enables/disables showing the row headers.*
- **FI\_Color** **row\_header\_color** () const

*Returns the current row header color.*
- void **row\_header\_color** (FI\_Color val)

*Sets the row header color and causes the screen to redraw.*
- int **row\_header\_width** () const

*Returns the current row header width (in pixels).*
- void **row\_header\_width** (int width)

*Sets the row header width to  $n$  and causes the screen to redraw.*
- int **row\_height** (int row) const

*Returns the current height of the specified row as a value in pixels.*
- void **row\_height** (int row, int height)

*Sets the height of the specified row in pixels, and the table is redrawn.*
- void **row\_height\_all** (int height)

- Convenience method to set the height of all rows to the same value, in pixels.*

  - **int row\_position () const**  
*Returns the current row scroll position as a row number.*
  - **void row\_position (int row)**  
*Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.*
  - **int row\_resize () const**  
*Returns if row resizing by the user is allowed.*
  - **void row\_resize (int flag)**  
*Allows/disallows row resizing by the user.*
  - **int row\_resize\_min () const**  
*Returns the current row minimum resize value.*
  - **void row\_resize\_min (int val)**  
*Sets the current row minimum resize value.*
  - **int rows () const**  
*Returns the number of rows in the table.*
  - **virtual void rows (int val)**  
*Sets the number of rows in the table, and the table is redrawn.*
  - **int scrollbar\_size () const**  
*Gets the current size of the scrollbars' troughs, in pixels.*
  - **void scrollbar\_size (int newSize)**  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
  - **void set\_selection (int row\_top, int col\_left, int row\_bot, int col\_right)**  
*Sets the region of cells to be selected (highlighted).*
  - **int tab\_cell\_nav () const**  
*Get state of table's 'Tab' key cell navigation flag.*
  - **void tab\_cell\_nav (int val)**  
*Flag to control if Tab navigates table cells or not.*
  - **void table\_box (FL\_Boxtype val)**  
*Sets the kind of box drawn around the data table, the default being FL\_NO\_BOX.*
  - **FL\_Boxtype table\_box (void) const**  
*Returns the current box type used for the data table.*
  - **int top\_row () const**  
*Returns the current top row shown in the table.*
  - **void top\_row (int row)**  
*Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.*
  - **void visible\_cells (int &r1, int &r2, int &c1, int &c2) const**  
*Returns the range of row and column numbers for all visible and partially visible cells in the table.*
  - **void when (FL\_When flags)**  
*The FL\_Widget::when() function is used to set a group of flags, determining when the widget callback is called:*
  - **~FL\_Table ()**  
*The destructor for FL\_Table.*

## Public Member Functions inherited from FL\_Group

- **FL\_Widget \*& \_ddfdesign\_kludge ()**  
*This is for forms compatibility only.*
- **void add (FL\_Widget &)**  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- **void add (FL\_Widget \*o)**  
*See void FL\_Group::add(FL\_Widget &w)*
- **void add\_resizable (FL\_Widget &o)**

- Adds a widget to the group and makes it the resizable widget.*

  - `FL_Widget *const * array () const`

*Returns a pointer to the internal array of children.*
- `FL_Group const * as_group () const` override
- `FL_Group * as_group ()` override
- Returns an `FL_Group` pointer if this widget is an `FL_Group`.*

  - `void begin ()`

*Sets the current group so you can build the widget tree by just constructing the widgets.*
- `FL_Widget * child (int n) const`
- Returns the n'th child.*

  - `int children () const`

*Returns how many child widgets the group has.*
- `void clear ()`
- Deletes all child widgets from memory recursively.*

  - `unsigned int clip_children () const`

*Returns the current clipping mode.*
- `void clip_children (int c)`
- Controls whether the group widget clips the drawing of child widgets to its bounding box.*

  - `virtual int delete_child (int n)`

*Removes the widget at `index` from the group and deletes it.*
- `void end ()`
- Exactly the same as `current(this->parent())`.*

  - `int find (const FL_Widget &o) const`

*See `int FL_Group::find(const FL_Widget *w) const`.*
- `int find (const FL_Widget *) const`
- Searches the children for the widget and returns the index.*

  - `FL_Group (int, int, int, int, const char * = 0)`

*Creates a new `FL_Group` widget using the given position, size, and label string.*
- `void forms_end ()`
- This is for forms compatibility only.*

  - `void init_sizes ()`

*Resets the internal array of widget sizes and positions.*
- `void insert (FL_Widget &, int i)`
- The widget is removed from its current group (if any) and then inserted into this group.*

  - `void insert (FL_Widget &o, FL_Widget *before)`

*This does `insert(w, find(before))`.*
- `void remove (FL_Widget &)`
- Removes a widget from the group but does not delete it.*

  - `void remove (FL_Widget *o)`

*Removes the widget `o` from the group.*
- `void remove (int index)`
- Removes the widget at `index` from the group but does not delete it.*

  - `FL_Widget * resizable () const`

*Returns the group's resizable widget.*
- `void resizable (FL_Widget &o)`
- Sets the group's resizable widget.*

  - `void resizable (FL_Widget *o)`

*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- `virtual ~FL_Group ()`
- The destructor also deletes all the children.*

## Public Member Functions inherited from [FL\\_Widget](#)

- void [\\_clear\\_fullscreen](#) ()
- void [\\_set\\_fullscreen](#) ()
- void [activate](#) ()  
*Activates the widget.*
- unsigned int [active](#) () const  
*Returns whether the widget is active.*
- int [active\\_r](#) () const  
*Returns whether the widget and all of its parents are active.*
- [FL\\_Align](#) [align](#) () const  
*Gets the label alignment.*
- void [align](#) ([FL\\_Align](#) alignment)  
*Sets the label alignment.*
- long [argument](#) () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()

- Marks the widget as inactive without sending events or changing focus.*

  - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

  - void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*

  - void `clear_output` ()
- Sets a widget to accept input.*

  - void `clear_visible` ()
- Hides the widget.*

  - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

  - `FL_Color` `color` () const
- Gets the background color of the widget.*

  - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

  - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

  - int `contains` (const `FL_Widget` \*w) const
- Checks if w is a child of this widget.*

  - void `copy_label` (const char \*new\_label)
- Sets the current label.*

  - void `copy_tooltip` (const char \*text)
- Sets the current tooltip text.*

  - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

  - void `damage` (uchar c)
- Sets the damage bits for the widget.*

  - void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int `damage_resize` (int, int, int, int)
- Internal use only.*

  - void `deactivate` ()
- Deactivates the widget.*

  - `FL_Image` \* `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

  - const `FL_Image` \* `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - void `deimage` (`FL_Image` \*img)
- Sets the image to use as part of the widget label when in the inactive state.*

  - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

  - void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

  - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)  
*Sets the label color.*
- [FL\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([FL\\_Font](#) f)  
*Sets the font to use.*
- [FL\\_Fonsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([FL\\_Fonsize](#) pix)  
*Sets the font size in pixels.*
- [FL\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([FL\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const

- Returns whether this widget needs a keyboard.*

  - void `needs_keyboard` (bool needs)
- Sets whether this widget needs a keyboard.*

  - unsigned int `output` () const
- Returns if a widget is used for output only.*

  - `Fl_Group` \* `parent` () const
- Returns a pointer to the parent widget.*

  - void `parent` (`Fl_Group` \*p)
- Internal use only - "for hacks only".*

  - void `position` (int X, int Y)
- Repositions the window or widget.*

  - void `redraw` ()
- Schedules the drawing of the widget.*

  - void `redraw_label` ()
- Schedules the drawing of the label.*

  - `Fl_Color` `selection_color` () const
- Gets the selection color.*

  - void `selection_color` (`Fl_Color` a)
- Sets the selection color.*

  - int `send` (int event)
- Sends the specified event to the widget.*

  - void `set_active` ()
- Marks the widget as active without sending events or changing focus.*

  - void `set_changed` ()
- Marks the value of the widget as changed.*

  - void `set_output` ()
- Sets a widget to output only.*

  - void `set_visible` ()
- Makes the widget visible.*

  - void `set_visible_focus` ()
- Enables keyboard focus navigation with this widget.*

  - int `shortcut_label` () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void `shortcut_label` (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

  - virtual void `show` ()
- Makes a widget visible.*

  - void `size` (int W, int H)
- Changes the size of the widget.*

  - int `take_focus` ()
- Gives the widget the keyboard focus.*

  - unsigned int `takeevents` () const
- Returns if the widget is able to take events.*

  - int `test_shortcut` ()
- Returns true if the widget's label contains the entered '&x' shortcut.*

  - const char \* `tooltip` () const
- Gets the current tooltip text.*

  - void `tooltip` (const char \*text)
- Sets the Tooltip Text for a Widget.*

  - `Fl_Window` \* `top_window` () const
- Returns a pointer to the top-level window for the widget.*

- `Fl_Window * top_window_offset` (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar type` () const  
*Gets the widget type.*
- `void type` (uchar t)  
*Sets the widget type.*
- `int use_accents_menu` ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- `void * user_data` () const  
*Gets the user data for this widget.*
- `void user_data` (Fl\_Callback\_User\_Data \*v, bool auto\_free)  
*Sets the user data for this widget.*
- `void user_data` (void \*v)  
*Sets the user data for this widget.*
- `int vertical_label_margin` ()  
*Get the spacing between the label and the vertical edge of the widget.*
- `void vertical_label_margin` (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- `unsigned int visible` () const  
*Returns whether a widget is visible.*
- `unsigned int visible_focus` () const  
*Checks whether this widget has a visible focus.*
- `void visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- `int visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- `int w` () const  
*Gets the widget width.*
- `Fl_When when` () const  
*Returns the conditions under which the callback is called.*
- `void when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window * window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x` () const  
*Gets the widget position in its window.*
- `int y` () const  
*Gets the widget position in its window.*
- `virtual ~Fl_Widget` ()  
*Destroys the widget.*

### Protected Types

- enum **ResizeFlag** {  
RESIZE\_NONE = 0 , RESIZE\_COL\_LEFT = 1 , RESIZE\_COL\_RIGHT = 2 , RESIZE\_ROW\_ABOVE = 3 ,  
RESIZE\_ROW\_BELOW = 4 }

## Protected Member Functions

- void **change\_cursor** ([FL\\_Cursor](#) newcursor)  
*Change mouse cursor to different type.*
- long **col\_scroll\_position** (int col)  
*Returns the scroll position (in pixels) of the specified column 'col'.*
- [TableContext](#) **cursor2rowcol** (int &R, int &C, ResizeFlag &resizeflag)  
*Find row/col for the recent mouse event.*
- void **damage\_zone** (int r1, int c1, int r2, int c2, int r3=0, int c3=0)  
*Sets the damage zone to the specified row/col values.*
- void **draw** () override  
*Draws the entire [FL\\_Table](#).*
- virtual void **draw\_cell** ([TableContext](#) context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)  
*Subclass should override this method to handle drawing the cells.*
- int **find\_cell** ([TableContext](#) context, int R, int C, int &X, int &Y, int &W, int &H)  
*Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.*
- void **get\_bounds** ([TableContext](#) context, int &X, int &Y, int &W, int &H)  
*Returns the (X,Y,W,H) bounding region for the specified 'context'.*
- int **handle** (int e) override  
*Handle FLTK events.*
- int **is\_fltk\_container** () const  
*Does the table contain any child fltk widgets?*
- void **recalc\_dimensions** ()  
*Recalculate the dimensions of the table, and affect any children.*
- void **redraw\_range** (int topRow, int botRow, int leftCol, int rightCol)  
*Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE\_CHILD).*
- int **row\_col\_clamp** ([TableContext](#) context, int &R, int &C)  
*Return specified row/col values R and C to within the table's current row/col limits.*
- long **row\_scroll\_position** (int row)  
*Returns the scroll position (in pixels) of the specified 'row'.*
- void **table\_resized** ()  
*Call this if table was resized, to recalculate internal data.*
- void **table\_scrolled** ()  
*Recalculate internals after a scroll.*

## Protected Member Functions inherited from FL\_Group

- `FL_Rect * bounds ()`  
*Returns the internal array of widget sizes and positions.*
- `void draw_child (FL_Widget &widget) const`  
*Forces a child to redraw.*
- `void draw_children ()`  
*Draws all children of the group.*
- `void draw_outside_label (const FL_Widget &widget) const`  
*Parents normally call this to draw outside labels of child widgets.*
- `virtual int on_insert (FL_Widget *, int)`  
*Allow derived groups to act when a widget is added as a child.*
- `virtual int on_move (int, int)`  
*Allow derived groups to act when a widget is moved within the group.*
- `virtual void on_remove (int)`  
*Allow derived groups to act when a child widget is removed from the group.*
- `int * sizes ()`  
*Returns the internal array of widget sizes and positions.*
- `void update_child (FL_Widget &widget) const`  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from FL\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FL_Boxtype t, FL_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*
- `void h (int v)`  
*Internal use only.*
- `void set_flag (unsigned int c)`  
*Sets a flag in the flags mask.*
- `void w (int v)`

*Internal use only.*

- void **x** (int v)

*Internal use only.*

- void **y** (int v)

*Internal use only.*

### Static Protected Member Functions

- static void **scroll\_cb** ([Fl\\_Widget](#) \*, void \*)

*Callback for when someone moves a scrollbar.*

### Protected Attributes

- int **botrow**

*bottom row# of currently visible table on screen*

- int **current\_col**

*selection cursor's current column (-1 if none)*

- int **current\_row**

*selection cursor's current row (-1 if none)*

- [Fl\\_Scrollbar](#) \* **hscrollbar**

*child horizontal scrollbar widget*

- int **leftcol**

*left column# of currently visible table on screen*

- int **leftcol\_scrollpos**

*precomputed scroll position for left column*

- int **rightcol**

*right column# of currently visible table on screen*

- int **select\_col**

*extended selection column (-1 if none)*

- int **select\_row**

*extended selection row (-1 if none)*

- [Fl\\_Scroll](#) \* **table**

*child [Fl\\_Scroll](#) widget container for child fltk widgets (if any)*

- int **table\_h**

*table's virtual height (in pixels)*

- int **table\_w**

*table's virtual width (in pixels)*

- int **tih**

*Data table's inner h dimension, inside bounding box. See [Table Dimension Diagram](#).*

- int **tiw**

*Data table's inner w dimension, inside bounding box. See [Table Dimension Diagram](#).*

- int **tix**

*Data table's inner x dimension, inside bounding box. See [Table Dimension Diagram](#).*

- int **tiy**

*Data table's inner y dimension, inside bounding box. See [Table Dimension Diagram](#).*

- int **toh**

*Data table's outer h dimension, outside bounding box. See [Table Dimension Diagram](#).*

- int **toprow**

*top row# of currently visible table on screen*

- int **toprow\_scrollpos**

*precomputed scroll position for top row*

- int **tow**

- *Data table's outer w dimension, outside bounding box. See [Table Dimension Diagram](#).*
- int **tox**
  - *Data table's outer x dimension, outside bounding box. See [Table Dimension Diagram](#).*
- int **toy**
  - *Data table's outer y dimension, outside bounding box. See [Table Dimension Diagram](#).*
- [Fl\\_Scrollbar](#) \* **vscrollbar**
  - *child vertical scrollbar widget*
- int **wih**
  - *Table widget's inner h dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wiw**
  - *Table widget's inner w dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wix**
  - *Table widget's inner x dimension, inside bounding box. See [Table Dimension Diagram](#).*
- int **wiy**
  - *Table widget's inner y dimension, inside bounding box. See [Table Dimension Diagram](#).*

### Additional Inherited Members

#### Static Public Member Functions inherited from [Fl\\_Group](#)

- static [Fl\\_Group](#) \* **current** ()
  - *Returns the currently active group.*
- static void **current** ([Fl\\_Group](#) \*g)
  - *Sets the current group.*

#### Static Public Member Functions inherited from [Fl\\_Widget](#)

- static void **default\_callback** ([Fl\\_Widget](#) \*widget, void \*data)
  - *The default callback for all widgets that don't set a callback.*
- static unsigned int **label\_shortcut** (const char \*t)
  - *Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test\_shortcut** (const char \*, const bool require\_alt=false)
  - *Returns true if the given text t contains the entered '&x' shortcut.*

### 13.131.1 Detailed Description

A table of widgets or other content.

This is the base class for table widgets.

To be useful it must be subclassed and several virtual functions defined. Normally applications use widgets derived from this widget, and do not use this widget directly; this widget is usually too low level to be used directly by applications.

This widget does *not* handle the data in the table. The [draw\\_cell\(\)](#) method must be overridden by a subclass to manage drawing the contents of the cells.

This widget can be used in several ways:

- As a custom widget; see examples/table-simple.cxx and test/table.cxx. Very optimal for even extremely large tables.
- As a table made up of a single FLTK widget instanced all over the table, simulating a numeric spreadsheet. See examples/table-spreadsheet.cxx and examples/table-spreadsheet-with-keyboard-nav.cxx. Optimal for large tables.
- As a regular container of FLTK widgets, one widget per cell. See examples/table-as-container.cxx. *Not* recommended for large tables.

	A	B	C	D	E

001:	2000	2001	2002	2003	2004
002:	3000	3001	3002	3003	3004
003:	4000	4001	4002	4003	4004
004:	5000	5001	5002	5003	5004
005:	6000	6001	6002	6003	6004
006:	7000	7001	7002	7003	7004
007:	8000	8001	8002	8003	8004
008:	9000	9001	9002	9003	9004
009:	10000	10001	10002	10003	10004

Figure 13.47 table-simple example

	Column 0	Column 1	Column 2	Column 3	Column 4	Column 5
Row 0	0/0	0.1	0/2	0.3	0/4	0.5
Row 1	1/0	1.1	1/2	1.3	1/4	1.5
Row 2	2/0	2.1	2/2	2.3	2/4	2.5
Row 3	3/0	3.1	3/2	3.3	3/4	3.5
Row 4	4/0	4.1	4/2	4.3	4/4	4.5
Row 5	5/0	5.1	5/2	5.3	5/4	5.5
Row 6	6/0	6.1	6/2	6.3	6/4	6.5
Row 7	7/0	7.1	7/2	7.3	7/4	7.5

Figure 13.48 table-as-container example

When acting as part of a custom widget, events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the setting for `FI_Table::when()`.

When acting as a container for FLTK widgets, the FLTK widgets maintain themselves. Although the `draw_cell()` method must be overridden, its contents can be very simple. See the `draw_cell()` code in `examples/table-simple.cxx`.

The following variables are available to classes deriving from `FI_Table`:

Figure 13.49 FI\_Table Dimensions

<code>x()/y()/w()/h()</code>	<code>FI_Table</code> widget's outer dimension. The outer edge of the border of the <code>FI_Table</code> . (Red in the diagram above)
<code>wix/wiy/wiw/wih</code>	<code>FI_Table</code> widget's inner dimension. The inner edge of the border of the <code>FI_Table</code> . eg. if the <code>FI_Table</code> 's <code>box()</code> is <code>FL_NO_BOX</code> , these values are the same as <code>x()/y()/w()/h()</code> . (Yellow in the diagram above)
<code>tox/toy/tow/toh</code>	The table's outer dimension. The outer edge of the border around the cells, but inside the row/col headings and scrollbars. (Green in the diagram above)

tix/tiy/tiw/tih	The table's inner dimension. The inner edge of the border around the cells, but inside the row/col headings and scrollbars. AKA the table's clip region. eg. if the <code>table_box()</code> is <code>FL_↔</code> NO_BOX, these values are the same as <code>tox/toy/tow/toh</code> . (Blue in the diagram above)
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## CORE DEVELOPERS

- Greg Ercolano : 12/16/2002 - initial implementation 12/16/02. [Fl\\_Table](#), [Fl\\_Table\\_Row](#), docs.
- Jean-Marc Lienher : 02/22/2004 - added keyboard nav + mouse selection, and ported [Fl\\_Table](#) into fltk-utf8-1.1.4

## OTHER CONTRIBUTORS

- Inspired by the Feb 2000 version of FLVW's Flvw\_Table widget. Mucho thanks to those folks.
- Mister Satan : 04/07/2003 - MinGW porting mods, and singleinput.cxx; a cool [Fl\\_Input](#) oriented spreadsheet example
- Marek Paliwoda : 01/08/2003 - Porting mods for Borland
- Ori Berger : 03/16/2006 - Optimizations for >500k rows/cols

## LICENSE

Greg kindly gave his permission to integrate [Fl\\_Table](#) and [Fl\\_Table\\_Row](#) into FLTK, allowing FLTK license to apply while his widgets are part of the library. [updated by Greg, 04/26/17]

## 13.131.2 Member Enumeration Documentation

## 13.131.2.1 TableContext

enum [Fl\\_Table::TableContext](#)

The context bit flags for [Fl\\_Table](#) related callbacks.

Should be used in [draw\\_cell\(\)](#) to determine what's being drawn, or in a [callback\(\)](#) to determine where a recent event occurred.

## Enumerator

CONTEXT_NONE	no known context
CONTEXT_STARTPAGE	before the table is redrawn
CONTEXT_ENDPAGE	after the table is redrawn
CONTEXT_ROW_HEADER	drawing or event occurred in the row header
CONTEXT_COL_HEADER	drawing or event occurred in the col header
CONTEXT_CELL	drawing or event occurred in a cell
CONTEXT_TABLE	drawing or event occurred in a dead zone of table
CONTEXT_RC_RESIZE	column or row is being resized

## 13.131.3 Constructor &amp; Destructor Documentation

## 13.131.3.1 Fl\_Table()

```
Fl_Table::Fl_Table (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

The constructor for [Fl\\_Table](#).

This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

### 13.131.3.2 ~Fl\_Table()

`Fl_Table::~~Fl_Table ( )`

The destructor for `Fl_Table`.

Destroys the table and its associated widgets.

## 13.131.4 Member Function Documentation

### 13.131.4.1 array()

`Fl_Widget *const * Fl_Table::array ( ) const [inline]`

Returns a pointer to the array of children.

*This pointer is only valid until the next time a child is added or removed.*

### 13.131.4.2 callback()

```
void Fl_Table::callback (
 Fl_Widget * ,
 void *)
```

Callbacks will be called depending on the setting of `Fl_Widget::when()`.

Callback functions should use the following functions to determine the context/row/column:

- `Fl_Table::callback_row()` returns current row
- `Fl_Table::callback_col()` returns current column
- `Fl_Table::callback_context()` returns current table context

`callback_row()` and `callback_col()` will be set to the row and column number the event occurred on. If someone clicked on a row header, `col` will be 0. If someone clicked on a column header, `row` will be 0.

`callback_context()` will return one of the following:

<code>Fl_Table::CONTEXT_ROW_HEADER</code>	Someone clicked on a row header. Excludes resizing.
<code>Fl_Table::CONTEXT_COL_HEADER</code>	Someone clicked on a column header. Excludes resizing.
<code>Fl_Table::CONTEXT_CELL</code>	Someone clicked on a cell. To receive callbacks for <code>FL_RELEASE</code> events, you must set <code>when(FL_WHEN_RELEASE)</code> .
<code>Fl_Table::CONTEXT_RC_RESIZE</code>	Someone is resizing rows/columns either interactively, or via the <code>col_width()</code> or <code>row_height()</code> API. Use <code>is_interactive_resize()</code> to determine interactive resizing. If resizing a column, <code>R=0</code> and <code>C=column</code> being resized. If resizing a row, <code>C=0</code> and <code>R=row</code> being resized. NOTE: To receive resize events, you must set <code>when(FL_WHEN↵_CHANGED)</code> .

```
class MyTable : public Fl_Table {
 [...]
private:
 // Handle events that happen on the table
 void event_callback2() {
 int R = callback_row(), // row where event occurred
 C = callback_col(); // column where event occurred
 TableContext context = callback_context(); // which part of table
 fprintf(stderr, "callback: Row=%d Col=%d Context=%d Event=%d\n",
 R, C, (int)context, (int)Fl::event());
 }

 // Actual static callback
 static void event_callback(Fl_Widget*, void* data) {
 MyTable *o = (MyTable*)data;
 o->event_callback2();
 }

public:
 // Constructor
 MyTable() {
 [...]
 }
}
```

```

 table.callback(&event_callback, (void*)this); // setup callback
 table.when(FL_WHEN_CHANGED|FL_WHEN_RELEASE); // when to call it
}
};

```

#### 13.131.4.3 callback\_col()

```
int Fl_Table::callback_col () const [inline]
```

Returns the current column the event occurred on.

This function should only be used from within the user's callback function.

#### 13.131.4.4 callback\_context()

```
TableContext Fl_Table::callback_context () const [inline]
```

Returns the current 'table context'.

This function should only be used from within the user's callback function.

#### 13.131.4.5 callback\_row()

```
int Fl_Table::callback_row () const [inline]
```

Returns the current row the event occurred on.

This function should only be used from within the user's callback function.

#### 13.131.4.6 child()

```
Fl_Widget * Fl_Table::child (
 int n) const [inline]
```

Returns the child widget by an index.

When using the [Fl\\_Table](#) as a container for FLTK widgets, this method returns the widget pointer from the internal array of widgets in the container.

Typically used in loops, eg:

```

for (int i=0; i<children(); i++) {
 Fl_Widget *w = child(i);
 [...]
}

```

#### 13.131.4.7 children()

```
int Fl_Table::children () const [inline]
```

Returns the number of children in the table.

When using the [Fl\\_Table](#) as a container for FLTK widgets, this method returns how many child widgets the table has.

See also

[child\(int\)](#)

#### 13.131.4.8 clear()

```
virtual void Fl_Table::clear () [inline], [virtual]
```

Clears the table to zero rows ([rows\(0\)](#)), zero columns ([cols\(0\)](#)), and clears any widgets ([table->clear\(\)](#)) that were added with [begin\(\)/end\(\)](#) or [add\(\)/insert\(\)/etc.](#)

See also

[rows\(int\)](#), [cols\(int\)](#)

Reimplemented in [Fl\\_Table\\_Row](#).

#### 13.131.4.9 col\_header()

```
void Fl_Table::col_header (
 int flag) [inline]
```

Enable or disable column headers.

If changed, the table is redrawn.

**13.131.4.10 col\_resize()**

```
void Fl_Table::col_resize (
 int flag) [inline]
```

Allows/disallows column resizing by the user.

1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the column headers, [col\\_header\(\)](#) must also be enabled to allow resizing.

**13.131.4.11 col\_resize\_min()**

```
void Fl_Table::col_resize_min (
 int val) [inline]
```

Sets the current column minimum resize value.

This is used to prevent the user from interactively resizing any column to be smaller than 'pixels'. Must be a value  $\geq 1$ .

**13.131.4.12 col\_width()**

```
void Fl_Table::col_width (
 int col,
 int width)
```

Sets the width of the specified column in pixels, and the table is redrawn.

[callback\(\)](#) will be invoked with CONTEXT\_RC\_RESIZE if the column's width was actually changed, and [when\(\)](#) is FL\_WHEN\_CHANGED.

**13.131.4.13 col\_width\_all()**

```
void Fl_Table::col_width_all (
 int width) [inline]
```

Convenience method to set the width of all columns to the same value, in pixels.

The screen is redrawn.

**13.131.4.14 cursor2rowcol()**

```
Fl_Table::TableContext Fl_Table::cursor2rowcol (
 int & R,
 int & C,
 ResizeFlag & resizeflag) [protected]
```

Find row/col for the recent mouse event.

Returns the context, and the row/column values in R/C. Also returns 'resizeflag' if mouse is hovered over a resize boundary.

**13.131.4.15 damage\_zone()**

```
void Fl_Table::damage_zone (
 int r1,
 int c1,
 int r2,
 int c2,
 int r3 = 0,
 int c3 = 0) [protected]
```

Sets the damage zone to the specified row/col values.

Calls [redraw\\_range\(\)](#).

**13.131.4.16 do\_callback()**

```
void Fl_Table::do_callback (
 TableContext context,
 int row,
 int col) [inline]
```

Calls the widget callback.

Saves the specified 'context', 'row', and 'col' values, so that the user's callback can then access them with the member functions [callback\\_context\(\)](#), [callback\\_row\(\)](#) and [callback\\_col\(\)](#).

#### 13.131.4.17 draw()

```
void Fl_Table::draw (
 void) [override], [protected], [virtual]
```

Draws the entire [Fl\\_Table](#).

Lets fltk widgets draw themselves first, followed by the cells via calls to [draw\\_cell\(\)](#).

Reimplemented from [Fl\\_Group](#).

#### 13.131.4.18 draw\_cell()

```
virtual void Fl_Table::draw_cell (
 TableContext context,
 int R = 0,
 int C = 0,
 int X = 0,
 int Y = 0,
 int W = 0,
 int H = 0) [inline], [protected], [virtual]
```

Subclass should override this method to handle drawing the cells.

This method will be called whenever the table is redrawn, once per cell.

Only cells that are completely (or partially) visible will be told to draw.

context will be one of the following:

<a href="#">Fl_Table::CONTEXT_STARTPAGE</a>	When table, or parts of the table, are about to be redrawn. Use to initialize static data, such as font selections. R/C will be zero, X/Y/W/H will be the dimensions of the table's entire data area. (Useful for locking a database before accessing; see also <a href="#">visible_cells()</a> )
<a href="#">Fl_Table::CONTEXT_ENDPAGE</a>	When table has completed being redrawn. R/C will be zero, X/Y/W/H dimensions of table's data area. (Useful for unlocking a database after accessing)
<a href="#">Fl_Table::CONTEXT_ROW_HEADER</a>	Whenever a row header cell needs to be drawn. R will be the row number of the header being redrawn, C will be zero, X/Y/W/H will be the fltk drawing area of the row header in the window
<a href="#">Fl_Table::CONTEXT_COL_HEADER</a>	Whenever a column header cell needs to be drawn. R will be zero, C will be the column number of the header being redrawn, X/Y/W/H will be the fltk drawing area of the column header in the window
<a href="#">Fl_Table::CONTEXT_CELL</a>	Whenever a data cell in the table needs to be drawn. R/C will be the row/column of the cell to be drawn, X/Y/W/H will be the fltk drawing area of the cell in the window
<a href="#">Fl_Table::CONTEXT_RC_RESIZE</a>	Whenever table or row/column is resized or scrolled, either interactively or via <a href="#">col_width()</a> or <a href="#">row_height()</a> . R/C/X/Y/W/H will all be zero. Useful for fltk containers that need to resize or move the child fltk widgets.

R and C will be set to the row and column number of the cell being drawn. In the case of row headers, C will be 0. In the case of column headers, R will be 0.

X/Y/W/H will be the position and dimensions of where the cell should be drawn.

In the case of custom widgets, a minimal `draw_cell()` override might look like the following. With custom widgets it is up to the caller to handle drawing everything within the dimensions of the cell, including handling the selection color. Note all clipping must be handled as well; this allows drawing outside the dimensions of the cell if so desired for 'custom effects'.

```
// This is called whenever Fl_Table wants you to draw a cell
void MyTable::draw_cell(TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0) {
 static char s[40];
 sprintf(s, "%d/%d", R, C); // text for each cell
 switch (context) {
 case CONTEXT_STARTPAGE: // Fl_Table telling us it's starting to draw page
 fl_font(FL_HELVETICA, 16);
 return;

 case CONTEXT_ROW_HEADER: // Fl_Table telling us to draw row/col headers
 case CONTEXT_COL_HEADER:
 fl_push_clip(X, Y, W, H);
 {
 fl_draw_box(FL_THIN_UP_BOX, X, Y, W, H, color());
 fl_color(FL_BLACK);
 fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);
 }
 fl_pop_clip();
 return;

 case CONTEXT_CELL: // Fl_Table telling us to draw cells
 fl_push_clip(X, Y, W, H);
 {
 // BG COLOR
 fl_color(is_selected(R, C) ? selection_color() : FL_WHITE);
 fl_rectf(X, Y, W, H);

 // TEXT
 fl_color(FL_BLACK);
 fl_draw(s, X, Y, W, H, FL_ALIGN_CENTER);

 // BORDER
 fl_color(FL_LIGHT2);
 fl_rect(X, Y, W, H);
 }
 fl_pop_clip();
 return;

 default:
 return;
 }
 //NOTREACHED
}
```

#### 13.131.4.19 find\_cell()

```
int Fl_Table::find_cell (
 TableContext context,
 int R,
 int C,
 int & X,
 int & Y,
 int & W,
 int & H) [protected]
```

Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.

##### Returns

- 0 – on success, XYWH returns the region of the specified cell.
- -1 – if R or C are out of range, and X/Y/W/H will be set to zero.

#### 13.131.4.20 get\_selection()

```
void Fl_Table::get_selection (
 int & row_top,
 int & col_left,
 int & row_bot,
 int & col_right) const
```

Gets the region of cells selected (highlighted).

## Parameters

in	<i>row_top</i>	Returns the top row of selection area
in	<i>col_left</i>	Returns the left column of selection area
in	<i>row_bot</i>	Returns the bottom row of selection area
in	<i>col_right</i>	Returns the right column of selection area

**13.131.4.21 handle()**

```
int Fl_Table::handle (
 int e) [override], [protected], [virtual]
```

Handle FLTK events.

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Table\\_Row](#).

**13.131.4.22 init\_sizes()**

```
void Fl_Table::init_sizes () [inline]
```

Resets the internal array of widget sizes and positions.

See also

[Fl\\_Group::init\\_sizes\(\)](#)

**13.131.4.23 insert()**

```
void Fl_Table::insert (
 Fl_Widget & wgt,
 Fl_Widget * w2) [inline]
```

The specified widget is removed from its current group (if any) and inserted into [Fl\\_Table](#)'s group before widget 'w2'. This will append if 'w2' is not in [Fl\\_Table](#)'s group.

**13.131.4.24 is\_interactive\_resize()**

```
int Fl_Table::is_interactive_resize () const [inline]
```

Returns 1 if someone is interactively resizing a row or column.

You can currently call this only from within your [callback\(\)](#).

**13.131.4.25 is\_selected()**

```
int Fl_Table::is_selected (
 int r,
 int c) const
```

See if the cell at row *r* and column *c* is selected.

Returns

1 if the cell is selected, 0 if not.

**13.131.4.26 move\_cursor()**

```
int Fl_Table::move_cursor (
 int R,
 int C,
 int shiftselect)
```

Moves the selection cursor a relative number of rows/columns specified by R/C.

R/C can be positive or negative, depending on the direction to move. A value of 0 for R or C prevents cursor movement on that axis.

If `shiftselect` is set, the selection range is extended to the new cursor position. If clear, the cursor is simply moved, and any previous selection is cancelled.

Used mainly by keyboard events (e.g. `FL_Right`, `FL_Home`, `FL_End..`) to let the user keyboard navigate the selection cursor around.

The scroll positions may be modified if the selection cursor traverses into cells off the screen's edge.

Internal variables `select_row/select_col` and `current_row/current_col` are modified, among others.

Examples:

```
R=1, C=0 -- moves the selection cursor one row downward.
R=5, C=0 -- moves the selection cursor 5 rows downward.
R=-5, C=0 -- moves the cursor 5 rows upward.
R=2, C=2 -- moves the cursor 2 rows down and 2 columns to the right.
```

#### 13.131.4.27 recalc\_dimensions()

```
void Fl_Table::recalc_dimensions () [protected]
```

Recalculate the dimensions of the table, and affect any children.

Internally, `Fl_Group::resize()` and `init_sizes()` are called.

#### 13.131.4.28 redraw\_range()

```
void Fl_Table::redraw_range (
 int topRow,
 int botRow,
 int leftCol,
 int rightCol) [inline], [protected]
```

Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(`DAMAGE_CHILD`).

Extends any previously defined range to redraw.

#### 13.131.4.29 resize()

```
void Fl_Table::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Handle resize events if user resizes parent window.

This changes the size of `Fl_Table`, causing it to redraw.

Reimplemented from `Fl_Group`.

#### 13.131.4.30 row\_col\_clamp()

```
int Fl_Table::row_col_clamp (
 TableContext context,
 int & R,
 int & C) [protected]
```

Return specified row/col values `R` and `C` to within the table's current row/col limits.

**Returns**

0 if no changes were made, or 1 if they were.

#### 13.131.4.31 row\_header()

```
void Fl_Table::row_header (
 int flag) [inline]
```

Enables/disables showing the row headers.

1=enabled, 0=disabled. If changed, the table is redrawn.

**13.131.4.32 row\_height()**

```
void Fl_Table::row_height (
 int row,
 int height)
```

Sets the height of the specified row in pixels, and the table is redrawn.

[callback\(\)](#) will be invoked with CONTEXT\_RC\_RESIZE if the row's height was actually changed, and [when\(\)](#) is FL\_WHEN\_CHANGED.

**13.131.4.33 row\_height\_all()**

```
void Fl_Table::row_height_all (
 int height) [inline]
```

Convenience method to set the height of all rows to the same value, in pixels.

The screen is redrawn.

**13.131.4.34 row\_resize()**

```
void Fl_Table::row_resize (
 int flag) [inline]
```

Allows/disallows row resizing by the user.

1=allow interactive resizing, 0=disallow interactive resizing. Since interactive resizing is done via the row headers, [row\\_header\(\)](#) must also be enabled to allow resizing.

**13.131.4.35 row\_resize\_min()**

```
void Fl_Table::row_resize_min (
 int val) [inline]
```

Sets the current row minimum resize value.

This is used to prevent the user from interactively resizing any row to be smaller than 'pixels'. Must be a value  $\geq 1$ .

**13.131.4.36 rows()**

```
void Fl_Table::rows (
 int val) [virtual]
```

Sets the number of rows in the table, and the table is redrawn.

Reimplemented in [Fl\\_Table\\_Row](#).

**13.131.4.37 scrollbar\_size() [1/2]**

```
int Fl_Table::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar\\_size\(\)](#) value as the scrollbar's width.

**Returns**

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

**See also**

[Fl::scrollbar\\_size\(int\)](#)

**13.131.4.38 scrollbar\_size() [2/2]**

```
void Fl_Table::scrollbar_size (
 int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to newSize, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar\\_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare. Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#), which is the default.

#### Parameters

<code>in</code>	<code>newSize</code>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global <a href="#">Fl::scrollbar_size()</a>
-----------------	----------------------	-----------------------------------------------------------------------------------------------------------------------------

#### See also

[Fl::scrollbar\\_size\(\)](#)

### 13.131.4.39 set\_selection()

```
void Fl_Table::set_selection (
 int row_top,
 int col_left,
 int row_bot,
 int col_right)
```

Sets the region of cells to be selected (highlighted).

So for instance, `set_selection(0,0,0,0)` selects the top/left cell in the table. And `set_selection(0,0,1,1)` selects the four cells in rows 0 and 1, column 0 and 1.

To deselect all cells, use `set_selection(-1,-1,-1,-1)`;

#### Parameters

<code>in</code>	<code>row_top</code>	Top row of selection area
<code>in</code>	<code>col_left</code>	Left column of selection area
<code>in</code>	<code>row_bot</code>	Bottom row of selection area
<code>in</code>	<code>col_right</code>	Right column of selection area

### 13.131.4.40 tab\_cell\_nav() [1/2]

```
int Fl_Table::tab_cell_nav () const [inline]
```

Get state of table's 'Tab' key cell navigation flag.

#### Returns

1 if Tab configured to navigate cells in table  
0 to navigate widget focus (default)

#### See also

[tab\\_cell\\_nav\(int\)](#)

### 13.131.4.41 tab\_cell\_nav() [2/2]

```
void Fl_Table::tab_cell_nav (
 int val) [inline]
```

Flag to control if Tab navigates table cells or not.

If on, Tab key navigates table cells. If off, Tab key navigates fltk widget focus. (default)

As of fltk 1.3, the default behavior of the Tab key is to navigate focus off of the current widget, and on to the next one. But in some applications, it's useful for Tab to be used to navigate cells in the [Fl\\_Table](#).

## Parameters

in	val	If val is 1, Tab key navigates cells in table, not fltk widgets. If val is 0, Tab key will advance focus to the next fltk widget (default), and does not navigate cells in table.
----	-----	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**13.131.4.42 table\_box()**

```
void Fl_Table::table_box (
 Fl_Boxtype val) [inline]
```

Sets the kind of box drawn around the data table, the default being FL\_NO\_BOX.  
Changing this value will cause the table to redraw.

**13.131.4.43 table\_resized()**

```
void Fl_Table::table_resized () [protected]
```

Call this if table was resized, to recalculate internal data.  
Calls `recall_dimensions()`, and recalculates scrollbar sizes.

**13.131.4.44 table\_scrolled()**

```
void Fl_Table::table_scrolled () [protected]
```

Recalculate internals after a scroll.

Call this if table has been scrolled or resized. Does not handle `redraw()`. TODO: Assumes `ti[xywh]` has already been recalculated.

**13.131.4.45 top\_row()** [1/2]

```
int Fl_Table::top_row () const [inline]
```

Returns the current top row shown in the table.  
This row may be partially obscured.

**13.131.4.46 top\_row()** [2/2]

```
void Fl_Table::top_row (
 int row) [inline]
```

Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.  
If the table cannot be scrolled that far, it is scrolled as far as possible.

**13.131.4.47 visible\_cells()**

```
void Fl_Table::visible_cells (
 int & r1,
 int & r2,
 int & c1,
 int & c2) const [inline]
```

Returns the range of row and column numbers for all visible and partially visible cells in the table.

These values can be used e.g. by your `draw_cell()` routine during `CONTEXT_STARTPAGE` to figure out what cells are about to be redrawn for the purposes of locking the data from a database before it's drawn.

```

leftcol rightcol
: :
toprow .. .-----:
| | |
| V I S I B L E |
| | |
| T A B L E |
| | |
botrow .. '-----'
```

e.g. in a table where the visible rows are 5-20, and the visible columns are 100-120, then those variables would be:

- `toprow = 5`

- botrow = 20
- leftcol = 100
- rightcol = 120

#### 13.131.4.48 when()

```
void Fl_Table::when (
 Fl_When flags)
```

The `Fl_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:

FL_WHEN_CHANGED	<code>callback()</code> will be called when rows or columns are resized (interactively or via <code>col_width()</code> or <code>row_height()</code> ), passing <code>CONTEXT_RC_RESIZE</code> via <code>callback_context()</code> .
FL_WHEN_RELEASE	<code>callback()</code> will be called during <code>FL_RELEASE</code> events, such as when someone releases a mouse button somewhere on the table.

The `callback()` routine is sent a `TableContext` that indicates the context the event occurred in, such as in a cell, in a header, or elsewhere on the table. When an event occurs in a cell or header, `callback_row()` and `callback_col()` can be used to determine the row and column. The callback can also look at the regular fltk event values (ie. `Fl::event()` and `Fl::event_button()`) to determine what kind of event is occurring.

The documentation for this class was generated from the following files:

- `Fl_Table.H`
- `Fl_Table.cxx`

## 13.132 Fl\_Table\_Row Class Reference

A table with row selection capabilities.

```
#include <Fl_Table_Row.H>
```

Inheritance diagram for `Fl_Table_Row`:

### Public Types

- enum `TableRowSelectMode` { `SELECT_NONE` , `SELECT_SINGLE` , `SELECT_MULTI` }

### Public Types inherited from `Fl_Table`

- enum `TableContext` {  
`CONTEXT_NONE` = 0 , `CONTEXT_STARTPAGE` = 0x01 , `CONTEXT_ENDPAGE` = 0x02 , `CONTEXT_ROW_HEADER` = 0x04 ,  
`CONTEXT_COL_HEADER` = 0x08 , `CONTEXT_CELL` = 0x10 , `CONTEXT_TABLE` = 0x20 , `CONTEXT_RC_RESIZE` = 0x40 }

*The context bit flags for `Fl_Table` related callbacks.*

## Public Member Functions

- void **clear** () override  
*Clears the table to zero rows (rows(0)), zero columns (cols(0)), and clears any widgets (table->clear()) that were added with begin()/end() or add()/insert()/etc.*
- **FL\_Table\_Row** (int X, int Y, int W, int H, const char \*l=0)  
*The constructor for the FL\_Table\_Row.*
- int **row\_selected** (int row)  
*Checks to see if 'row' is selected.*
- int **rows** ()
- void **rows** (int val) override  
*Sets the number of rows in the table, and the table is redrawn.*
- void **select\_all\_rows** (int flag=1)  
*This convenience function changes the selection state for all rows based on 'flag'.*
- int **select\_row** (int row, int flag=1)  
*Changes the selection state for 'row', depending on the value of 'flag'.*
- TableRowSelectMode **type** () const
- void **type** (TableRowSelectMode val)  
*Sets the table selection mode.*
- ~**FL\_Table\_Row** ()  
*The destructor for the FL\_Table\_Row.*

## Public Member Functions inherited from FL\_Table

- void **add** (FL\_Widget &wgt)  
*The specified widget is removed from its current group (if any) and added to the end of FL\_Table's group.*
- void **add** (FL\_Widget \*wgt)  
*The specified widget is removed from its current group (if any) and added to the end of FL\_Table's group.*
- **FL\_Widget** \*const \* **array** () const  
*Returns a pointer to the array of children.*
- void **begin** ()
- void **callback** (FL\_Widget \*, void \*)  
*Callbacks will be called depending on the setting of FL\_Widget::when().*
- int **callback\_col** () const  
*Returns the current column the event occurred on.*
- **TableContext** **callback\_context** () const  
*Returns the current 'table context'.*
- int **callback\_row** () const  
*Returns the current row the event occurred on.*
- **FL\_Widget** \* **child** (int n) const  
*Returns the child widget by an index.*
- int **children** () const  
*Returns the number of children in the table.*
- int **col\_header** () const  
*Returns if column headers are enabled or not.*
- void **col\_header** (int flag)  
*Enable or disable column headers.*
- **FL\_Color** **col\_header\_color** () const  
*Gets the color for column headers.*
- void **col\_header\_color** (FL\_Color val)  
*Sets the color for column headers and redraws the table.*
- int **col\_header\_height** () const

- Gets the column header height.*

  - void **col\_header\_height** (int height)

*Sets the height in pixels for column headers and redraws the table.*
- int **col\_position** () const

*Returns the current column scroll position as a column number.*
- void **col\_position** (int col)

*Sets the horizontal scroll position so 'col' is at the left, and causes the screen to redraw.*
- int **col\_resize** () const

*Returns if column resizing by the user is allowed.*
- void **col\_resize** (int flag)

*Allows/disallows column resizing by the user.*
- int **col\_resize\_min** () const

*Returns the current column minimum resize value.*
- void **col\_resize\_min** (int val)

*Sets the current column minimum resize value.*
- int **col\_width** (int col) const

*Returns the current width of the specified column in pixels.*
- void **col\_width** (int col, int width)

*Sets the width of the specified column in pixels, and the table is redrawn.*
- void **col\_width\_all** (int width)

*Convenience method to set the width of all columns to the same value, in pixels.*
- int **cols** () const

*Get the number of columns in the table.*
- virtual void **cols** (int val)

*Set the number of columns in the table and redraw.*
- void **do\_callback** (TableContext context, int row, int col)

*Calls the widget callback.*
- void **end** ()
- int **find** (const FL\_Widget &wgt) const
- int **find** (const FL\_Widget \*wgt) const
- **FL\_Table** (int X, int Y, int W, int H, const char \*l=0)

*The constructor for FL\_Table.*
- void **get\_selection** (int &row\_top, int &col\_left, int &row\_bot, int &col\_right) const

*Gets the region of cells selected (highlighted).*
- void **init\_sizes** ()

*Resets the internal array of widget sizes and positions.*
- void **insert** (FL\_Widget &wgt, FL\_Widget \*w2)

*The specified widget is removed from its current group (if any) and inserted into FL\_Table's group before widget 'w2'.*
- void **insert** (FL\_Widget &wgt, int n)

*The specified widget is removed from its current group (if any) and inserted into the FL\_Table's group at position 'n'.*
- int **is\_interactive\_resize** () const

*Returns 1 if someone is interactively resizing a row or column.*
- int **is\_selected** (int r, int c) const

*See if the cell at row *r* and column *c* is selected.*
- int **move\_cursor** (int R, int C)

*Same as move\_cursor(R,C,1);.*
- int **move\_cursor** (int R, int C, int shiftselect)

*Moves the selection cursor a relative number of rows/columns specified by R/C.*
- void **remove** (FL\_Widget &wgt)

*The specified widget is removed from FL\_Table's group.*
- void **resize** (int X, int Y, int W, int H) override

- Handle resize events if user resizes parent window.*

  - int **row\_header** () const  
*Returns if row headers are enabled or not.*
  - void **row\_header** (int flag)  
*Enables/disables showing the row headers.*
  - **Fl\_Color** **row\_header\_color** () const  
*Returns the current row header color.*
  - void **row\_header\_color** (**Fl\_Color** val)  
*Sets the row header color and causes the screen to redraw.*
  - int **row\_header\_width** () const  
*Returns the current row header width (in pixels).*
  - void **row\_header\_width** (int width)  
*Sets the row header width to n and causes the screen to redraw.*
  - int **row\_height** (int row) const  
*Returns the current height of the specified row as a value in pixels.*
  - void **row\_height** (int row, int height)  
*Sets the height of the specified row in pixels, and the table is redrawn.*
  - void **row\_height\_all** (int height)  
*Convenience method to set the height of all rows to the same value, in pixels.*
  - int **row\_position** () const  
*Returns the current row scroll position as a row number.*
  - void **row\_position** (int row)  
*Sets the vertical scroll position so 'row' is at the top, and causes the screen to redraw.*
  - int **row\_resize** () const  
*Returns if row resizing by the user is allowed.*
  - void **row\_resize** (int flag)  
*Allows/disallows row resizing by the user.*
  - int **row\_resize\_min** () const  
*Returns the current row minimum resize value.*
  - void **row\_resize\_min** (int val)  
*Sets the current row minimum resize value.*
  - int **rows** () const  
*Returns the number of rows in the table.*
  - int **scrollbar\_size** () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
  - void **scrollbar\_size** (int newSize)  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
  - void **set\_selection** (int row\_top, int col\_left, int row\_bot, int col\_right)  
*Sets the region of cells to be selected (highlighted).*
  - int **tab\_cell\_nav** () const  
*Get state of table's 'Tab' key cell navigation flag.*
  - void **tab\_cell\_nav** (int val)  
*Flag to control if Tab navigates table cells or not.*
  - void **table\_box** (**Fl\_Boxtype** val)  
*Sets the kind of box drawn around the data table, the default being FL\_NO\_BOX.*
  - **Fl\_Boxtype** **table\_box** (void) const  
*Returns the current box type used for the data table.*
  - int **top\_row** () const  
*Returns the current top row shown in the table.*
  - void **top\_row** (int row)  
*Sets which row should be at the top of the table, scrolling as necessary, and the table is redrawn.*

- void `visible_cells` (int &r1, int &r2, int &c1, int &c2) const  
*Returns the range of row and column numbers for all visible and partially visible cells in the table.*
- void `when` (FL\_Widget flags)  
*The `FL_Widget::when()` function is used to set a group of flags, determining when the widget callback is called:*
- `~FL_Table` ()  
*The destructor for `FL_Table`.*

## Public Member Functions inherited from `FL_Group`

- `FL_Widget * & _ddfdesign_kludge` ()  
*This is for forms compatibility only.*
- void `add` (FL\_Widget &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void `add` (FL\_Widget \*o)  
*See void `FL_Group::add(FL_Widget &w)`*
- void `add_resizable` (FL\_Widget &o)  
*Adds a widget to the group and makes it the resizable widget.*
- `FL_Widget * const * array` () const  
*Returns a pointer to the internal array of children.*
- `FL_Group const * as_group` () const override
- `FL_Group * as_group` () override  
*Returns an `FL_Group` pointer if this widget is an `FL_Group`.*
- void `begin` ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- `FL_Widget * child` (int n) const  
*Returns the n'th child.*
- int `children` () const  
*Returns how many child widgets the group has.*
- void `clear` ()  
*Deletes all child widgets from memory recursively.*
- unsigned int `clip_children` () const  
*Returns the current clipping mode.*
- void `clip_children` (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int `delete_child` (int n)  
*Removes the widget at `index` from the group and deletes it.*
- void `end` ()  
*Exactly the same as `current(this->parent())`.*
- int `find` (const FL\_Widget &o) const  
*See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const FL\_Widget \*) const  
*Searches the children for the widget and returns the index.*
- `FL_Group` (int, int, int, int, const char \* = 0)  
*Creates a new `FL_Group` widget using the given position, size, and label string.*
- void `forms_end` ()  
*This is for forms compatibility only.*
- void `init_sizes` ()  
*Resets the internal array of widget sizes and positions.*
- void `insert` (FL\_Widget &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void `insert` (FL\_Widget &o, FL\_Widget \*before)

- This does insert(w, find(before)).*
- void **remove** (FL\_Widget &)  
*Removes a widget from the group but does not delete it.*
- void **remove** (FL\_Widget \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at index from the group but does not delete it.*
- FL\_Widget \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (FL\_Widget &o)  
*Sets the group's resizable widget.*
- void **resizable** (FL\_Widget \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual ~FL\_Group ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from FL\_Widget

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- FL\_Align **align** () const  
*Gets the label alignment.*
- void **align** (FL\_Align alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*
- virtual class FL\_Gl\_Window \* **as\_gl\_window** ()  
*Returns an FL\_Gl\_Window pointer if this widget is an FL\_Gl\_Window.*
- virtual class FL\_Gl\_Window const \* **as\_gl\_window** () const
- virtual FL\_Window \* **as\_window** ()  
*Returns an FL\_Window pointer if this widget is an FL\_Window.*
- virtual FL\_Window const \* **as\_window** () const
- void **bind\_deimage** (FL\_Image \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void **bind\_deimage** (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind\_image** (FL\_Image \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void **bind\_image** (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- FL\_Boxtype **box** () const  
*Gets the box type of the widget.*
- void **box** (FL\_Boxtype new\_box)

- Sets the box type for the widget.*

  - [FI\\_Callback\\_p](#) [callback](#) () const
- Gets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, [FI\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)
- Sets the current callback function and managed user data for the widget.*

  - void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)
- Sets the current callback function and data for the widget.*

  - void [callback](#) ([FI\\_Callback0](#) \*cb)
- Sets the current callback function for the widget.*

  - void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)
- Sets the current callback function for the widget.*

  - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

  - void [clear\\_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

  - void [clear\\_changed](#) ()
- Marks the value of the widget as unchanged.*

  - void [clear\\_damage](#) (uchar c=0)
- Clears or sets the damage flags.*

  - void [clear\\_output](#) ()
- Sets a widget to accept input.*

  - void [clear\\_visible](#) ()
- Hides the widget.*

  - void [clear\\_visible\\_focus](#) ()
- Disables keyboard focus navigation with this widget.*

  - [FI\\_Color](#) [color](#) () const
- Gets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg)
- Sets the background color of the widget.*

  - void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)
- Sets the background and selection color of the widget.*

  - int [contains](#) (const [FI\\_Widget](#) \*w) const
- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)
- Sets the current label.*

  - void [copy\\_tooltip](#) (const char \*text)
- Sets the current tooltip text.*

  - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

  - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

  - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

  - int [damage\\_resize](#) (int, int, int, int)
- Internal use only.*

  - void [deactivate](#) ()
- Deactivates the widget.*

  - [FI\\_Image](#) \* [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

- const [FL\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const  
*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))  
*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const  
*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const  
*Gets the widget height.*
- virtual void [hide](#) ()  
*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()  
*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image](#) \* [image](#) ()  
*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image](#) \* [image](#) () const  
*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const  
*Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([FL\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [FL\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([FL\\_Color](#) c)

- Sets the label color.*

  - [FL\\_Font labelfont](#) () const

*Gets the font to use.*

  - void [labelfont](#) ([FL\\_Font](#) f)

*Sets the font to use.*

  - [FL\\_Fontsize labelsize](#) () const

*Gets the font size in pixels.*

  - void [labelsize](#) ([FL\\_Fontsize](#) pix)

*Sets the font size in pixels.*

  - [FL\\_Labeltype labeltype](#) () const

*Gets the label type.*

  - void [labeltype](#) ([FL\\_Labeltype](#) a)

*Sets the label type.*

  - void [measure\\_label](#) (int &ww, int &hh) const

*Sets width ww and height hh accordingly with the label size.*

  - bool [needs\\_keyboard](#) () const

*Returns whether this widget needs a keyboard.*

  - void [needs\\_keyboard](#) (bool needs)

*Sets whether this widget needs a keyboard.*

  - unsigned int [output](#) () const

*Returns if a widget is used for output only.*

  - [FL\\_Group \\* parent](#) () const

*Returns a pointer to the parent widget.*

  - void [parent](#) ([FL\\_Group](#) \*p)

*Internal use only - "for hacks only".*

  - void [position](#) (int X, int Y)

*Repositions the window or widget.*

  - void [redraw](#) ()

*Schedules the drawing of the widget.*

  - void [redraw\\_label](#) ()

*Schedules the drawing of the label.*

  - [FL\\_Color selection\\_color](#) () const

*Gets the selection color.*

  - void [selection\\_color](#) ([FL\\_Color](#) a)

*Sets the selection color.*

  - int [send](#) (int event)

*Sends the specified event to the widget.*

  - void [set\\_active](#) ()

*Marks the widget as active without sending events or changing focus.*

  - void [set\\_changed](#) ()

*Marks the value of the widget as changed.*

  - void [set\\_output](#) ()

*Sets a widget to output only.*

  - void [set\\_visible](#) ()

*Makes the widget visible.*

  - void [set\\_visible\\_focus](#) ()

*Enables keyboard focus navigation with this widget.*

  - int [shortcut\\_label](#) () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*

  - void [shortcut\\_label](#) (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*

- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const  
*Returns if the widget is able to take events.*
- int [test\\_shortcut](#) ()  
*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* [tooltip](#) () const  
*Gets the current tooltip text.*
- void [tooltip](#) (const char \*text)  
*Sets the Tooltip Text for a Widget.*
- [Fl\\_Window](#) \* [top\\_window](#) () const  
*Returns a pointer to the top-level window for the widget.*
- [Fl\\_Window](#) \* [top\\_window\\_offset](#) (int &xoff, int &yoff) const  
*Finds the x/y offset of the current widget relative to the top-level window.*
- [uchar](#) [type](#) () const  
*Gets the widget type.*
- void [type](#) ([uchar](#) t)  
*Sets the widget type.*
- int [use\\_accents\\_menu](#) ()  
*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* [user\\_data](#) () const  
*Gets the user data for this widget.*
- void [user\\_data](#) ([Fl\\_Callback\\_User\\_Data](#) \*v, bool auto\_free)  
*Sets the user data for this widget.*
- void [user\\_data](#) (void \*v)  
*Sets the user data for this widget.*
- int [vertical\\_label\\_margin](#) ()  
*Get the spacing between the label and the vertical edge of the widget.*
- void [vertical\\_label\\_margin](#) (int px)  
*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const  
*Returns whether a widget is visible.*
- unsigned int [visible\\_focus](#) () const  
*Checks whether this widget has a visible focus.*
- void [visible\\_focus](#) (int v)  
*Modifies keyboard focus navigation.*
- int [visible\\_r](#) () const  
*Returns whether a widget and all its parents are visible.*
- int [w](#) () const  
*Gets the widget width.*
- [Fl\\_When](#) [when](#) () const  
*Returns the conditions under which the callback is called.*
- void [when](#) ([uchar](#) i)  
*Sets the flags used to decide when a callback is called.*
- [Fl\\_Window](#) \* [window](#) () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const

- *Gets the widget position in its window.*
- int **y** () const  
*Gets the widget position in its window.*
- virtual **~FI\_Widget** ()  
*Destroys the widget.*

### Protected Member Functions

- int **find\_cell** (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)
- int **handle** (int event) override  
*Handle FLTK events.*

### Protected Member Functions inherited from FI\_Table

- void **change\_cursor** (FI\_Cursor newcursor)  
*Change mouse cursor to different type.*
- long **col\_scroll\_position** (int col)  
*Returns the scroll position (in pixels) of the specified column 'col'.*
- TableContext **cursor2rowcol** (int &R, int &C, ResizeFlag &resizeflag)  
*Find row/col for the recent mouse event.*
- void **damage\_zone** (int r1, int c1, int r2, int c2, int r3=0, int c3=0)  
*Sets the damage zone to the specified row/col values.*
- void **draw** () override  
*Draws the entire FI\_Table.*
- virtual void **draw\_cell** (TableContext context, int R=0, int C=0, int X=0, int Y=0, int W=0, int H=0)  
*Subclass should override this method to handle drawing the cells.*
- int **find\_cell** (TableContext context, int R, int C, int &X, int &Y, int &W, int &H)  
*Find a cell's X/Y/W/H region for the specified cell in row 'R', column 'C'.*
- void **get\_bounds** (TableContext context, int &X, int &Y, int &W, int &H)  
*Returns the (X,Y,W,H) bounding region for the specified 'context'.*
- int **is\_fltk\_container** () const  
*Does the table contain any child fltk widgets?*
- void **recalc\_dimensions** ()  
*Recalculate the dimensions of the table, and affect any children.*
- void **redraw\_range** (int topRow, int botRow, int leftCol, int rightCol)  
*Define region of cells to be redrawn by specified range of rows/cols, and then sets damage(DAMAGE\_CHILD).*
- int **row\_col\_clamp** (TableContext context, int &R, int &C)  
*Return specified row/col values R and C to within the table's current row/col limits.*
- long **row\_scroll\_position** (int row)  
*Returns the scroll position (in pixels) of the specified 'row'.*
- void **table\_resized** ()  
*Call this if table was resized, to recalculate internal data.*
- void **table\_scrolled** ()  
*Recalculate internals after a scroll.*

## Protected Member Functions inherited from FL\_Group

- `FL_Rect * bounds ()`  
*Returns the internal array of widget sizes and positions.*
- `void draw_child (FL_Widget &widget) const`  
*Forces a child to redraw.*
- `void draw_children ()`  
*Draws all children of the group.*
- `void draw_outside_label (const FL_Widget &widget) const`  
*Parents normally call this to draw outside labels of child widgets.*
- `virtual int on_insert (FL_Widget *, int)`  
*Allow derived groups to act when a widget is added as a child.*
- `virtual int on_move (int, int)`  
*Allow derived groups to act when a widget is moved within the group.*
- `virtual void on_remove (int)`  
*Allow derived groups to act when a child widget is removed from the group.*
- `int * sizes ()`  
*Returns the internal array of widget sizes and positions.*
- `void update_child (FL_Widget &widget) const`  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from FL\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FL_Boxtype t, FL_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*
- `void h (int v)`  
*Internal use only.*
- `void set_flag (unsigned int c)`  
*Sets a flag in the flags mask.*
- `void w (int v)`

*Internal use only.*

- void `x` (int v)

*Internal use only.*

- void `y` (int v)

*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Group`

- static `FI_Group * current` ()  
*Returns the currently active group.*
- static void `current` (`FI_Group *g`)  
*Sets the current group.*

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget *widget`, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

Table widget's inner x dimension, inside bounding box. See [Table Dimension Diagram](#).

- int **wiy**

Table widget's inner y dimension, inside bounding box. See [Table Dimension Diagram](#).

### 13.132.1 Detailed Description

A table with row selection capabilities.

This class implements a simple table with the ability to select rows. This widget is similar to an [Fl\\_Browser](#) with columns. Most methods of importance will be found in the [Fl\\_Table](#) widget, such as [Fl\\_Table::rows\(\)](#) and [Fl\\_Table::cols\(\)](#).

To be useful it must be subclassed and at minimum the [draw\\_cell\(\)](#) method must be overridden to provide the content of the cells. This widget does *not* manage the cell's data content; it is up to the parent class's [draw\\_cell\(\)](#) method override to provide this.

Events on the cells and/or headings generate callbacks when they are clicked by the user. You control when events are generated based on the values you supply for [Fl\\_Table::when\(\)](#).

### 13.132.2 Constructor & Destructor Documentation

#### 13.132.2.1 Fl\_Table\_Row()

```
Fl_Table_Row::Fl_Table_Row (
 int X,
 int Y,
 int W,
 int H,
 const char * I = 0) [inline]
```

The constructor for the [Fl\\_Table\\_Row](#).

This creates an empty table with no rows or columns, with headers and row/column resize behavior disabled.

#### 13.132.2.2 ~Fl\_Table\_Row()

```
Fl_Table_Row::~Fl_Table_Row () [inline]
```

The destructor for the [Fl\\_Table\\_Row](#).

Destroys the table and its associated widgets.

### 13.132.3 Member Function Documentation

#### 13.132.3.1 clear()

```
void Fl_Table_Row::clear () [inline], [override], [virtual]
```

Clears the table to zero rows ([rows\(0\)](#)), zero columns ([cols\(0\)](#)), and clears any widgets ([table->clear\(\)](#)) that were added with [begin\(\)/end\(\)](#) or [add\(\)/insert\(\)](#)/etc.

See also

[rows\(int\)](#), [cols\(int\)](#)

Reimplemented from [Fl\\_Table](#).

#### 13.132.3.2 handle()

```
int Fl_Table_Row::handle (
 int e) [override], [protected], [virtual]
```

Handle FLTK events.

Reimplemented from [Fl\\_Table](#).

**13.132.3.3 row\_selected()**

```
int Fl_Table_Row::row_selected (
 int row)
```

Checks to see if 'row' is selected.

Returns 1 if selected, 0 if not. You can change the selection of a row by clicking on it, or by using [select\\_row\(row, flag\)](#)

row **should** be a valid row. If the row is out of range the return value is 0 (zero).

**Parameters**

in	row	row to be checked
----	-----	-------------------

**Returns**

whether given row is selected

**Return values**

1	row is selected
0	row is not selected or row is out of range

**13.132.3.4 rows()**

```
void Fl_Table_Row::rows (
 int val) [override], [virtual]
```

Sets the number of rows in the table, and the table is redrawn.

Reimplemented from [Fl\\_Table](#).

**13.132.3.5 select\_all\_rows()**

```
void Fl_Table_Row::select_all_rows (
 int flag = 1)
```

This convenience function changes the selection state for *all* rows based on 'flag'.

0=deselect, 1=select, 2=toggle existing state.

**13.132.3.6 select\_row()**

```
int Fl_Table_Row::select_row (
 int row,
 int flag = 1)
```

Changes the selection state for 'row', depending on the value of 'flag'.

The optional flag can be:

- 0: clear selection
- 1: set selection (default)
- 2: toggle selection

**Parameters**

in	row	row to be selected, deselected, or toggled
in	flag	change mode, see description

**Returns**

result of modification, see description

**Return values**

0	selection state did not change
1	selection state changed
-1	row out of range or incorrect selection mode ( <i>flag</i> )

**13.132.3.7 type()**

```
void Fl_Table_Row::type (
 TableRowSelectMode val)
```

Sets the table selection mode.

- `Fl_Table_Row::SELECT_NONE` - No selection allowed
- `Fl_Table_Row::SELECT_SINGLE` - Only single rows can be selected
- `Fl_Table_Row::SELECT_MULTI` - Multiple rows can be selected

The documentation for this class was generated from the following files:

- `Fl_Table_Row.H`
- `Fl_Table_Row.cxx`

**13.133 Fl\_Tabs Class Reference**

The `Fl_Tabs` widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

```
#include <Fl_Tabs.H>
```

Inheritance diagram for `Fl_Tabs`:

**Public Types**

- enum { `OVERFLOW_COMPRESS` = 0, `OVERFLOW_CLIP`, `OVERFLOW_PULLDOWN`, `OVERFLOW_DRAG` }

**Public Member Functions**

- void `client_area` (int &rx, int &ry, int &rw, int &rh, int tabh=0)  
*Returns the position and size available to be used by its children.*
- `Fl_Tabs` (int X, int Y, int W, int H, const char \*L=0)  
*Creates a new `Fl_Tabs` widget using the given position, size, and label string.*
- int `handle` (int) override  
*Handle all events in the tabs area and forward the rest to the selected child.*
- void `handle_overflow` (int ov)

- Set a method to handle an overflowing tab bar.*

  - `FL_Widget * push ()` const
 

*Returns the tab group for the tab the user has currently down-clicked on and remains over until FL\_RELEASE.*
  - `int push (FL_Widget *)`

*This is called by the tab widget's `handle()` method to set the tab group widget the user last FL\_PUSH'ed on.*
  - `void resize (int, int, int, int)` override
 

*Make sure that we redraw all tabs when the widget size changes.*
  - `void show ()` override
 

*Ensure proper placement of selected tab.*
  - `FL_Align tab_align ()` const
 

*Gets the tab label alignment.*
  - `void tab_align (FL_Align a)`

*Sets the tab label alignment.*
  - `FL_Widget * value ()`

*Gets the currently visible widget/tab.*
  - `int value (FL_Widget *)`

*Sets the widget to become the currently visible widget/tab.*
  - `int value (int)`

*Sets the widget to become the currently visible tab.*
  - `virtual FL_Widget * which (int event_x, int event_y)`

*Return a pointer to the child widget with a tab at the given coordinates.*
  - `~FL_Tabs ()` override
 

*Delete allocated resources and destroy all children.*

## Public Member Functions inherited from FL\_Group

- `FL_Widget *& _ddfdesign_kludge ()`

*This is for forms compatibility only.*
- `void add (FL_Widget &)`

*The widget is removed from its current group (if any) and then added to the end of this group.*
- `void add (FL_Widget *o)`

*See void FL\_Group::add(FL\_Widget &w)*
- `void add_resizable (FL_Widget &o)`

*Adds a widget to the group and makes it the resizable widget.*
- `FL_Widget *const * array ()` const
 

*Returns a pointer to the internal array of children.*
- `FL_Group const * as_group ()` const override
- `FL_Group * as_group ()` override
 

*Returns an FL\_Group pointer if this widget is an FL\_Group.*
- `void begin ()`

*Sets the current group so you can build the widget tree by just constructing the widgets.*
- `FL_Widget * child (int n)` const
 

*Returns the n'th child.*
- `int children ()` const
 

*Returns how many child widgets the group has.*
- `void clear ()`

*Deletes all child widgets from memory recursively.*
- `unsigned int clip_children ()` const
 

*Returns the current clipping mode.*
- `void clip_children (int c)`

*Controls whether the group widget clips the drawing of child widgets to its bounding box.*

- virtual int **delete\_child** (int n)  
*Removes the widget at `index` from the group and deletes it.*
- void **end** ()  
*Exactly the same as `current(this->parent())`.*
- int **find** (const **FL\_Widget** &o) const  
*See int `FL_Group::find(const FL_Widget *w)` const.*
- int **find** (const **FL\_Widget** \*) const  
*Searches the children for the widget and returns the index.*
- **FL\_Group** (int, int, int, int, const char \*s=0)  
*Creates a new `FL_Group` widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** (**FL\_Widget** &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** (**FL\_Widget** &o, **FL\_Widget** \*before)  
*This does `insert(w, find(before))`.*
- void **remove** (**FL\_Widget** &)  
*Removes a widget from the group but does not delete it.*
- void **remove** (**FL\_Widget** \*o)  
*Removes the widget `o` from the group.*
- void **remove** (int index)  
*Removes the widget at `index` from the group but does not delete it.*
- **FL\_Widget** \* **resizable** () const  
*Returns the group's resizable widget.*
- void **resizable** (**FL\_Widget** &o)  
*Sets the group's resizable widget.*
- void **resizable** (**FL\_Widget** \*o)  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- virtual **~FL\_Group** ()  
*The destructor also deletes all the children.*

## Public Member Functions inherited from **FL\_Widget**

- void **\_clear\_fullscreen** ()
- void **\_set\_fullscreen** ()
- void **activate** ()  
*Activates the widget.*
- unsigned int **active** () const  
*Returns whether the widget is active.*
- int **active\_r** () const  
*Returns whether the widget and all of its parents are active.*
- **FL\_Align** **align** () const  
*Gets the label alignment.*
- void **align** (**FL\_Align** alignment)  
*Sets the label alignment.*
- long **argument** () const  
*Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)  
*Sets the current user data (long) argument that is passed to the callback function.*

- virtual class [FL\\_Gl\\_Window](#) \* [as\\_gl\\_window](#) ()  
*Returns an [FL\\_Gl\\_Window](#) pointer if this widget is an [FL\\_Gl\\_Window](#).*
- virtual class [FL\\_Gl\\_Window](#) const \* [as\\_gl\\_window](#) () const
- virtual [FL\\_Window](#) \* [as\\_window](#) ()  
*Returns an [FL\\_Window](#) pointer if this widget is an [FL\\_Window](#).*
- virtual [FL\\_Window](#) const \* [as\\_window](#) () const
- void [bind\\_deimage](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [bind\\_deimage](#) (int f)  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind\\_image](#) ([FL\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the active state.*
- void [bind\\_image](#) (int f)  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FL\\_Boxtype](#) [box](#) () const  
*Gets the box type of the widget.*
- void [box](#) ([FL\\_Boxtype](#) new\_box)  
*Sets the box type for the widget.*
- [FL\\_Callback\\_p](#) [callback](#) () const  
*Gets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, [FL\\_Callback\\_User\\_Data](#) \*p, bool auto\_free)  
*Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FL\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FL\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FL\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) (uchar c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FL\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FL\\_Color](#) bg, [FL\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FL\\_Widget](#) \*w) const

- Checks if w is a child of this widget.*

  - void [copy\\_label](#) (const char \*new\_label)

*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)

*Sets the current tooltip text.*
- [uchar damage](#) () const

*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) (uchar c)

*Sets the damage bits for the widget.*
- void [damage](#) (uchar c, int x, int y, int w, int h)

*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)

*Internal use only.*
- void [deactivate](#) ()

*Deactivates the widget.*
- [FL\\_Image \\* deimage](#) ()

*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL\\_Image \\* deimage](#) () const

*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

*Returns whether the inactive image is managed by the widget.*
- void [do\\_callback](#) ([FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with default arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, long arg, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [do\\_callback](#) ([FL\\_Widget](#) \*widget, void \*arg=0, [FL\\_Callback\\_Reason](#) reason=[FL\\_REASON\\_UNKNOWN](#))

*Calls the widget callback function with arbitrary arguments.*
- void [draw\\_label](#) (int, int, int, int, [FL\\_Align](#)) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const

*Gets the widget height.*
- virtual void [hide](#) ()

*Makes a widget invisible.*
- int [horizontal\\_label\\_margin](#) ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal\\_label\\_margin](#) (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- [FL\\_Image \\* image](#) ()

*Gets the image that is used as part of the widget label when in the active state.*
- const [FL\\_Image \\* image](#) () const

*Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) &img)

*Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL\\_Image](#) \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int [image\\_bound](#) () const

*Returns whether the image is managed by the widget.*

- int [inside](#) (const [Fl\\_Widget](#) \*wgt) const  
*Checks if this widget is a child of wgt.*
- int [is\\_label\\_copied](#) () const  
*Returns whether the current label was assigned with [copy\\_label\(\)](#).*
- const char \* [label](#) () const  
*Gets the current label text.*
- void [label](#) (const char \*text)  
*Sets the current label pointer.*
- void [label](#) ([Fl\\_Labeltype](#) a, const char \*b)  
*Shortcut to set the label text and type in one call.*
- int [label\\_image\\_spacing](#) ()  
*Return the gap size between the label and the image.*
- void [label\\_image\\_spacing](#) (int gap)  
*Set the gap between the label and the image in pixels.*
- [Fl\\_Color](#) [labelcolor](#) () const  
*Gets the label color.*
- void [labelcolor](#) ([Fl\\_Color](#) c)  
*Sets the label color.*
- [Fl\\_Font](#) [labelfont](#) () const  
*Gets the font to use.*
- void [labelfont](#) ([Fl\\_Font](#) f)  
*Sets the font to use.*
- [Fl\\_Fontsize](#) [labelsize](#) () const  
*Gets the font size in pixels.*
- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)

- Sets the selection color.*

  - int **send** (int event)

*Sends the specified event to the widget.*
- void **set\_active** ()

*Marks the widget as active without sending events or changing focus.*
- void **set\_changed** ()

*Marks the value of the widget as changed.*
- void **set\_output** ()

*Sets a widget to output only.*
- void **set\_visible** ()

*Makes the widget visible.*
- void **set\_visible\_focus** ()

*Enables keyboard focus navigation with this widget.*
- int **shortcut\_label** () const

*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void **shortcut\_label** (int value)

*Sets whether the widget's label uses '&' to indicate shortcuts.*
- void **size** (int W, int H)

*Changes the size of the widget.*
- int **take\_focus** ()

*Gives the widget the keyboard focus.*
- unsigned int **takeevents** () const

*Returns if the widget is able to take events.*
- int **test\_shortcut** ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* **tooltip** () const

*Gets the current tooltip text.*
- void **tooltip** (const char \*text)

*Sets the Tooltip Text for a Widget.*
- **Fl\_Window** \* **top\_window** () const

*Returns a pointer to the top-level window for the widget.*
- **Fl\_Window** \* **top\_window\_offset** (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const

*Gets the widget type.*
- void **type** (**uchar** t)

*Sets the widget type.*
- int **use\_accents\_menu** ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* **user\_data** () const

*Gets the user data for this widget.*
- void **user\_data** (**Fl\_Callback\_User\_Data** \*v, bool auto\_free)

*Sets the user data for this widget.*
- void **user\_data** (void \*v)

*Sets the user data for this widget.*
- int **vertical\_label\_margin** ()

*Get the spacing between the label and the vertical edge of the widget.*
- void **vertical\_label\_margin** (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const

*Returns whether a widget is visible.*

- unsigned int `visible_focus` () const  
*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)  
*Modifies keyboard focus navigation.*
- int `visible_r` () const  
*Returns whether a widget and all its parents are visible.*
- int `w` () const  
*Gets the widget width.*
- `Fl_When` when () const  
*Returns the conditions under which the callback is called.*
- void `when` (uchar i)  
*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const  
*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const  
*Gets the widget position in its window.*
- int `y` () const  
*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()  
*Destroys the widget.*

### Protected Member Functions

- void `check_overflow_menu` ()  
*Check if the tabs overflow and sets the `has_overflow_menu` flag accordingly.*
- virtual void `clear_tab_positions` ()  
*Clear internal array of tab positions and widths.*
- void `draw` () override  
*Draw the tabs area, the optional pulldown button, and all children.*
- void `draw_overflow_menu_button` ()  
*Draw square button-like graphics with a down arrow in the top or bottom right corner.*
- virtual void `draw_tab` (int x1, int x2, int W, int H, `Fl_Widget` \*o, int flags, int sel)  
*Draw a tab in the top or bottom tabs area.*
- void `handle_overflow_menu` ()  
*This is called when the user clicks the overflow pulldown menu button.*
- virtual int `hit_close` (`Fl_Widget` \*o, int event\_x, int event\_y)  
*Check whether the coordinates fall within the "close" button area of the tab.*
- virtual int `hit_overflow_menu` (int event\_x, int event\_y)  
*Determine if the coordinates are in the area of the overflow menu button.*
- virtual int `hit_tabs_area` (int event\_x, int event\_y)  
*Determine if the coordinates are within the tabs area.*
- int `maybe_do_callback` (`Fl_Widget` \*o)  
*Set tab o as selected and call callbacks if needed.*
- int `on_insert` (`Fl_Widget` \*, int) override  
*Make sure that we redraw all tabs when new children are added.*
- int `on_move` (int, int) override  
*Make sure that we redraw all tabs when children are moved.*
- void `on_remove` (int) override  
*Make sure that we redraw all tabs when new children are removed.*
- virtual void `redraw_tabs` ()  
*Redraw all tabs (and only the tabs).*

- virtual int [tab\\_height](#) ()  
*Return space (height) in pixels usable for tabs.*
- virtual int [tab\\_positions](#) ()  
*Calculate tab positions and widths.*
- void [take\\_focus](#) ([FI\\_Widget](#) \*o)  
*Take keyboard focus if o is not NULL.*

### Protected Member Functions inherited from [FI\\_Group](#)

- [FI\\_Rect](#) \* [bounds](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [draw\\_child](#) ([FI\\_Widget](#) &widget) const  
*Forces a child to redraw.*
- void [draw\\_children](#) ()  
*Draws all children of the group.*
- void [draw\\_outside\\_label](#) (const [FI\\_Widget](#) &widget) const  
*Parents normally call this to draw outside labels of child widgets.*
- int \* [sizes](#) ()  
*Returns the internal array of widget sizes and positions.*
- void [update\\_child](#) ([FI\\_Widget](#) &widget) const  
*Draws a child only if it needs it.*

### Protected Member Functions inherited from [FI\\_Widget](#)

- void [clear\\_flag](#) (unsigned int c)  
*Clears a flag in the flags mask.*
- void [draw\\_backdrop](#) () const  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- void [draw\\_box](#) () const  
*Draws the widget box according to its box style.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the widget's position and size.*
- void [draw\\_box](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) c) const  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- void [draw\\_focus](#) () const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int X, int Y, int W, int H) const  
*Draws a focus rectangle around the widget.*
- void [draw\\_focus](#) ([FI\\_Boxtype](#) t, int x, int y, int w, int h, [FI\\_Color](#) bg) const  
*Draws a focus box for the widget at the given position and size.*
- void [draw\\_label](#) () const  
*Draws the widget's label at the defined label position.*
- void [draw\\_label](#) (int, int, int, int) const  
*Draws the label in an arbitrary bounding box.*
- [FI\\_Widget](#) (int x, int y, int w, int h, const char \*label=0L)  
*Creates a widget at the given position and size.*
- unsigned int [flags](#) () const  
*Gets the widget flags mask.*
- void [h](#) (int v)  
*Internal use only.*
- void [set\\_flag](#) (unsigned int c)

- *Sets a flag in the flags mask.*
- void [w](#) (int v)  
*Internal use only.*
- void [x](#) (int v)  
*Internal use only.*
- void [y](#) (int v)  
*Internal use only.*

### Protected Attributes

- int [has\\_overflow\\_menu](#)  
*set in OVERFLOW\_PULLDOWN mode if tabs overflow. The actual menu array is created only on demand*
- int [overflow\\_type](#)
- [FI\\_Align](#) [tab\\_align\\_](#)  
*tab label alignment*
- int [tab\\_count](#)  
*Array size of tab positions etc.*
- int \* [tab\\_flags](#)  
*Array of tab flag of tabs per child.*
- int [tab\\_offset](#)  
*for pulldown and drag overflow, this is the horizontal offset when the tabs bar is dragged by the user*
- int \* [tab\\_pos](#)  
*Array of x-offsets of tabs per child + 1.*
- int \* [tab\\_width](#)  
*Array of widths of tabs per child.*

### Additional Inherited Members

#### Static Public Member Functions inherited from [FI\\_Group](#)

- static [FI\\_Group](#) \* [current](#) ()  
*Returns the currently active group.*

### 13.133.1 Detailed Description

The `Fl_Tabs` widget is a container widget that displays a set of tabs, with each tab representing a different child widget.

The user can select a tab by clicking on it, and the corresponding child widget will be displayed. The `Fl_Tabs` widget is useful for organizing a large number of controls or other widgets into a compact space, allowing the user to switch between different sets of controls as needed.

**Figure 13.50** `Fl_Tabs`

Clicking the tab makes a child `visible()` by calling `show()` on it, and all other children are made invisible by calling `hide()` on them. Usually the children are `Fl_Group` widgets containing several widgets themselves.

Each child makes a card, and its `label()` is printed on the card tab, including the label font and style. The selection color of that child is used to color the tab, while the color of the child determines the background color of the pane. '&' in labels are used to prefix a shortcut that is drawn underlined and that activates the corresponding tab; repeated '&&' avoids that.

The size of the tabs is controlled by the bounding box of the children (there should be some space between the children and the edge of the `Fl_Tabs`), and the tabs may be placed "inverted" on the bottom - this is determined by which gap is larger. It is easiest to lay this out in FLUID, using the FLUID browser to select each child group and resize them until the tabs look the way you want them to.

**Note:** The widgets contained in each child should leave some clear space (five pixels as of FLTK 1.4.x) at the top or bottom of the group (where the tabs are displayed). Otherwise drawing the children may interfere with the selection border between the tabs and the children. This is particularly important if the child group is an `Fl_Scroll` widget: either the `Fl_Scroll` widget must be inset by five pixels relative to other children or it can be wrapped inside another `Fl_Group` and inset by five pixels within this group so the contents of the `Fl_Scroll` widget are kept away from the tabs by this amount.

The background area behind and to the right of the tabs is "transparent", exposing the background detail of the parent. The value of `Fl_Tabs::box()` does not affect this area. So if `Fl_Tabs` is resized by itself without the parent, force the appropriate parent (visible behind the tabs) to `redraw()` to prevent artifacts.

See "Resizing Caveats" below on how to keep tab heights constant. See "Callback's Use Of `when()`" on how to control the details of how clicks invoke the `callback()`.

A typical use of the `Fl_Tabs` widget:

```
// Typical use of Fl_Tabs
Fl_Tabs *tabs = new Fl_Tabs(10,10,300,200);
{
 Fl_Group *grp1 = new Fl_Group(20,30,280,170,"Tab1");
 {
 ..widgets that go in tab#1..
 }
 grp1->end();
 Fl_Group *grp2 = new Fl_Group(20,30,280,170,"Tab2");
 {
 ..widgets that go in tab#2..
 }
 grp2->end();
}
tabs->end();
```

### Default Appearance

The appearance of each "tab" is taken from the [label\(\)](#) and [color\(\)](#) of the child group corresponding to that "tab" and panel. Where the "tabs" appear depends on the position and size of the child groups that make up the panels within the [Fl\\_Tabs](#) widget, i.e. whether there is more space above or below them. The height of the "tabs" depends on how much free space is available.

Figure 13.51 Fl\_Tabs Default Appearance

### Highlighting The Selected Tab

The selected "tab" can be highlighted further by setting the [selection\\_color\(\)](#) of the [Fl\\_Tab](#) itself, e.g.

```
..
tabs = new Fl_Tabs(..);
tabs->selection_color(FL_DARK3);
..
```

The result of the above looks like:

Figure 13.52 Highlighting the selected tab

### Uniform Tab and Panel Appearance

In order to have uniform tab and panel appearance, not only must the [color\(\)](#) and [selection\\_color\(\)](#) for each child group be set, but also the [selection\\_color\(\)](#) of the [Fl\\_Tab](#) itself any time a new "tab" is selected. This can be achieved within the [Fl\\_Tab](#) callback, e.g.

```
void MyTabCallback(Fl_Widget *w, void*) {
 Fl_Tabs *tabs = (Fl_Tabs*)w;
 // When tab changed, make sure it has same color as its group
 tabs->selection_color((tabs->value())->color());
}
..
int main(..) {
 // Define tabs widget
 tabs = new Fl_Tabs(..);
 tabs->callback(MyTabCallback);

 // Create three tabs each colored differently
 grp1 = new Fl_Group(.. "One");
 grp1->color(9);
```

```

 grp1->selection_color(9);
 grp1->end();

 grp2 = new Fl_Group(.. "Two");
 grp2->color(10);
 grp2->selection_color(10);
 grp2->end();

 grp3 = new Fl_Group(.. "Three");
 grp3->color(14);
 grp3->selection_color(14);
 grp3->end();
 ..
 // Make sure default tab has same color as its group
 tabs->selection_color((tab->value())->color());
 ..
 return Fl::run();
}

```

The result of the above looks like:

Figure 13.53 `Fl_Tabs` with uniform colors

If `Fl_Tabs` has no children, the widget will be drawn as a flat rectangle in the background color set by `color()`.

#### Close Button on Tabs

The `Fl_Tabs` widget allows you to specify that a child widget should display a close button in its tab. If the `FL_WHEN_CLOSED` flag is set for the child widget, an "X" symbol will be displayed to the left of the label text in the tab. When the close button is clicked, the child widget's callback function will be called with the `FL_REASON_CLOSED` reason. It is then the responsibility of the child widget to remove itself from the `Fl_Tabs` container.

Tabs that are in a compressed state will not display a close button until they are fully expanded.

#### Overflowing Tabs

When the combined width of the tabs exceeds that of the `Fl_Tabs` widget, the tabs will overflow. `Fl_Tabs` provides four options for managing tabs overflow:

- `Fl_Tabs::OVERFLOW_COMPRESS`: proportionally compress the tabs to the left and right of the selected tab until they all fit within the widget.
- `Fl_Tabs::OVERFLOW_CLIP`: clip any tabs that extend beyond the right edge of the `Fl_Tabs` widget, making some tabs unreachable.
- `Fl_Tabs::OVERFLOW_PULLDOWN`: don't compress the tabs but instead generate a pulldown menu at the right end of the tabs area, displaying all available tabs.
- `Fl_Tabs::OVERFLOW_DRAG`: maintain the tabs' original sizes, allowing horizontal dragging of the tabs area using the mouse, a horizontal mouse wheel, or the horizontal scrolling gesture on touchpads.

#### Resizing Caveats

When `Fl_Tabs` is resized vertically, the default behavior scales the tab's height as well as its children. To keep the tab height constant during resizing, set the tab widget's `resizable()` to one of the tab's child groups, i.e.

```

tabs = new Fl_Tabs(..);
grp1 = new Fl_Group(..);
..
grp2 = new Fl_Group(..);
..
tabs->end();
tabs->resizable(grp1); // keeps tab height constant

```

### Callback's Use Of when()

As of FLTK 1.3.3, `FL_Tabs()` supports the following flags for `when()`:

- `FL_WHEN_NEVER` – callback never invoked (all flags off)
- `FL_WHEN_CHANGED` – if flag set, invokes callback when a tab has been changed (on click or keyboard navigation)
- `FL_WHEN_NOT_CHANGED` – if flag set, invokes callback when the tabs remain unchanged (on click or keyboard navigation)
- `FL_WHEN_RELEASE` – if flag set, invokes callback on RELEASE of mouse button or keyboard navigation

Notes:

1. The above flags can be logically OR-ed (`|`) or added (`+`) to combine behaviors.
2. The default value for `when()` is `FL_WHEN_RELEASE` (inherited from `FL_Widget`).
3. If `FL_WHEN_RELEASE` is the *only* flag specified, the behavior will be as if (`FL_WHEN_RELEASE|FL_WHEN_CHANGED`) was specified.
4. The value of `changed()` will be valid during the callback.
5. If both `FL_WHEN_CHANGED` and `FL_WHEN_NOT_CHANGED` are specified, the callback is invoked whether the tab has been changed or not. The `changed()` method can be used to determine the cause.
6. `FL_WHEN_NOT_CHANGED` can happen if someone clicks on an already selected tab, or if a keyboard navigation attempt results in no change to the tabs, such as using the arrow keys while at the left or right end of the tabs.
7. `Fl::callback_reason()` returns `FL_REASON_SELECTED` or `FL_REASON_RESELECTED`

## 13.133.2 Member Enumeration Documentation

### 13.133.2.1 anonymous enum

anonymous enum

Enumerator

OVERFLOW_COMPRESS	Tabs will be compressed and overlaid on top of each other.
OVERFLOW_CLIP	Only the first tabs that fit will be displayed.
OVERFLOW_PULLDOWN	Tabs that do not fit will be placed in a pull-down menu.
OVERFLOW_DRAG	The tab bar can be dragged horizontally to reveal additional tabs.

## 13.133.3 Constructor & Destructor Documentation

### 13.133.3.1 FL\_Tabs()

```
Fl_Tabs::Fl_Tabs (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

Creates a new `FL_Tabs` widget using the given position, size, and label string. The default boxtype is `FL_THIN_UP_BOX`.

Use `add(Fl_Widget*)` to add each child, which are usually `Fl_Group` widgets. The children should be sized to stay away from the top or bottom edge of the `Fl_Tabs` widget, which is where the tabs will be drawn.

All children of `Fl_Tabs` should have the same size and exactly fit on top of each other. They should only leave space above or below where the tabs will go, but not on the sides. If the first child of `Fl_Tabs` is set to "resizable()", the riders will not resize when the tabs are resized.

The destructor *also deletes all the children*. This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the `Fl_Tabs` and all of its children can be automatic (local) variables, but you must declare the `Fl_Tabs` widget *first* so that it is destroyed last.

### 13.133.4 Member Function Documentation

#### 13.133.4.1 `clear_tab_positions()`

```
void Fl_Tabs::clear_tab_positions () [protected], [virtual]
```

Clear internal array of tab positions and widths.

See also

[tab\\_positions\(\)](#).

#### 13.133.4.2 `client_area()`

```
void Fl_Tabs::client_area (
 int & rx,
 int & ry,
 int & rw,
 int & rh,
 int tabh = 0)
```

Returns the position and size available to be used by its children.

If there isn't any child yet the `tabh` parameter will be used to calculate the return values. This assumes that the children's labelsize is the same as the `Fl_Tabs`' labelsize and adds a small border.

If there are already children, the values of `child(0)` are returned, and `tabh` is ignored.

Note

Children should always use the same positions and sizes.

This function requires access to the display drivers to determine the selected font height. If `client_area` is invoked before the first window is displayed, ensure that `fl_open_display()` is called beforehand.

`tabh` can be one of

- 0: calculate label size, tabs on top
- -1: calculate label size, tabs on bottom
- > 0: use given `tabh` value, tabs on top (height = `tabh`)
- < -1: use given `tabh` value, tabs on bottom (height = -`tabh`)

Parameters

in	<i>tabh</i>	position and optional height of tabs (see above)
out	<i>rx,ry,rw,rh</i>	(x,y,w,h) of client area for children

Since

FLTK 1.3.0

#### 13.133.4.3 draw()

```
void Fl_Tabs::draw (
 void) [override], [protected], [virtual]
```

Draw the tabs area, the optional pulldown button, and all children.

Reimplemented from [Fl\\_Group](#).

#### 13.133.4.4 draw\_tab()

```
void Fl_Tabs::draw_tab (
 int x1,
 int x2,
 int W,
 int H,
 Fl_Widget * o,
 int flags,
 int what) [protected], [virtual]
```

Draw a tab in the top or bottom tabs area.

Tabs can be selected, or on the left or right side of the selected tab. If overlapping, left tabs are drawn bottom to top using clipping. The selected tab is then the topmost, followed by the right side tabs drawn top to bottom.

Tabs with the FL\_WHEN\_CLOSE bit set will draw a cross on their left side only if they are not compressed/overlapping.

##### Parameters

in	<i>x1</i>	horizontal position of the left visible edge of the tab
in	<i>x2</i>	horizontal position of the following tab
in	<i>W,H</i>	width and height of the tab
in	<i>o</i>	the child widget that corresponds to this tab
in	<i>flags</i>	if bit 1 is set, this tab is overlapped by another tab
in	<i>what</i>	can be LEFT, SELECTED, or RIGHT to indicate if the tab is to the left side or the right side of the selected tab, or the selected tab itself

#### 13.133.4.5 handle()

```
int Fl_Tabs::handle (
 int event) [override], [virtual]
```

Handle all events in the tabs area and forward the rest to the selected child.

##### Parameters

in	<i>event</i>	handle this event
----	--------------	-------------------

##### Returns

1 if the event was handled

Reimplemented from [Fl\\_Group](#).

#### 13.133.4.6 handle\_overflow()

```
void Fl_Tabs::handle_overflow (
 int ov)
```

Set a method to handle an overflowing tab bar.

The [Fl\\_Tabs](#) widget allows you to specify how to handle the situation where there are more tabs than can be displayed at once. The available options are:

- `OVERFLOW_COMPRESS` : Tabs will be compressed and overlaid on top of each other.
- `OVERFLOW_CLIP` : Only the first tabs that fit will be displayed.
- `OVERFLOW_PULLDOWN` : Tabs that do not fit will be placed in a pull-down menu.
- `OVERFLOW_DRAG` : The tab bar can be dragged horizontally to reveal additional tabs.

You can set the desired behavior using the `overflow()` method.

#### Parameters

<i>ov</i>	overflow type
-----------	---------------

#### See also

[OVERFLOW\\_COMPRESS](#), [OVERFLOW\\_CLIP](#), [OVERFLOW\\_PULLDOWN](#), [OVERFLOW\\_DRAG](#)

#### 13.133.4.7 `handle_overflow_menu()`

```
void Fl_Tabs::handle_overflow_menu () [protected]
```

This is called when the user clicks the overflow pulldown menu button.

This method creates a menu item array that contains the titles of all tabs in the [Fl\\_Tabs](#) group. Visible and invisible tabs are separated by dividers to indicate their state.

The menu is then presented until the user selects an item or cancels. The chosen tab is then selected and made visible.

The menu item array is then deleted.

#### 13.133.4.8 `hit_close()`

```
int Fl_Tabs::hit_close (
 Fl_Widget * o,
 int event_x,
 int event_y) [protected], [virtual]
```

Check whether the coordinates fall within the "close" button area of the tab.

The [Fl\\_Tabs::hit\\_close\(\)](#) method checks whether the given event coordinates fall within the area of the "close" button on the tab of the specified child widget. This method should be called after the [Fl\\_Tabs::which\(\)](#) method, which updates a lookup table used to determine the width of each tab.

#### Parameters

<i>o</i>	check the tab of this widget
<i>event_x, event_y</i>	event coordinates

#### Returns

1 if we hit the close button, and 0 otherwise

#### 13.133.4.9 `hit_overflow_menu()`

```
int Fl_Tabs::hit_overflow_menu (
 int event_x,
 int event_y) [protected], [virtual]
```

Determine if the coordinates are in the area of the overflow menu button.

## Parameters

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

## Returns

1 if we hit the overflow menu button, and 0 otherwise

**13.133.4.10 hit\_tabs\_area()**

```
int Fl_Tabs::hit_tabs_area (
 int event_x,
 int event_y) [protected], [virtual]
```

Determine if the coordinates are within the tabs area.

## Parameters

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

## Returns

1 if we hit the tabs area, and 0 otherwise

**13.133.4.11 maybe\_do\_callback()**

```
int Fl_Tabs::maybe_do_callback (
 Fl_Widget * o) [protected]
```

Set tab o as selected and call callbacks if needed.

## Parameters

in	o	the newly selected tab
----	---	------------------------

## Returns

0 if o is invalid or was deleted by the callback and must no longer be used

**13.133.4.12 on\_insert()**

```
int Fl_Tabs::on_insert (
 Fl_Widget * candidate,
 int index) [override], [protected], [virtual]
```

Make sure that we redraw all tabs when new children are added.

Reimplemented from [Fl\\_Group](#).

**13.133.4.13 on\_move()**

```
int Fl_Tabs::on_move (
 int a,
 int b) [override], [protected], [virtual]
```

Make sure that we redraw all tabs when children are moved.

Reimplemented from [Fl\\_Group](#).

#### 13.133.4.14 on\_remove()

```
void Fl_Tabs::on_remove (
 int index) [override], [protected], [virtual]
```

Make sure that we redraw all tabs when new children are removed.

Reimplemented from [Fl\\_Group](#).

#### 13.133.4.15 push() [1/2]

```
Fl_Widget * Fl_Tabs::push () const [inline]
```

Returns the tab group for the tab the user has currently down-clicked on and remains over until FL\_RELEASE.

Otherwise, returns NULL.

While the user is down-clicked on a tab, the return value is the tab group for that tab. But as soon as the user releases, or drags off the tab with the button still down, the return value will be NULL.

See also

[push\(Fl\\_Widget\\*\)](#).

#### 13.133.4.16 push() [2/2]

```
int Fl_Tabs::push (
 Fl_Widget * o)
```

This is called by the tab widget's [handle\(\)](#) method to set the tab group widget the user last FL\_PUSH'ed on.

Set back to zero on FL\_RELEASE.

As of this writing, the value is mainly used by [draw\\_tab\(\)](#) to determine whether or not to draw a 'down' box for the tab when it's clicked, and to turn it off if the user drags off it.

See also

[push\(\)](#).

#### 13.133.4.17 redraw\_tabs()

```
void Fl_Tabs::redraw_tabs () [protected], [virtual]
```

Redraw all tabs (and only the tabs).

This method sets the Fl\_Tab's damage flags so the tab area is redrawn.

#### 13.133.4.18 resize()

```
void Fl_Tabs::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Make sure that we redraw all tabs when the widget size changes.

Reimplemented from [Fl\\_Group](#).

#### 13.133.4.19 show()

```
void Fl_Tabs::show () [override], [virtual]
```

Ensure proper placement of selected tab.

Reimplemented from [Fl\\_Widget](#).

#### 13.133.4.20 tab\_align() [1/2]

```
Fl_Align Fl_Tabs::tab_align () const [inline]
```

Gets the tab label alignment.

See also

[tab\\_align\(Fl\\_Align\)](#)

#### 13.133.4.21 tab\_align() [2/2]

```
void Fl_Tabs::tab_align (
 Fl_Align a) [inline]
```

Sets the tab label alignment.

The default is FL\_ALIGN\_CENTER so tab labels are centered, but since the label space is measured (per label) to fit the labels, there wouldn't be any difference if labels were aligned left or right.

If you want to show an image (icon) next to the group's label you can set a different label alignment. FL\_ALIGN\_IMAGE\_NEXT\_TO\_TEXT is the recommended alignment to show the icon left of the text.

#### 13.133.4.22 tab\_height()

```
int Fl_Tabs::tab_height () [protected], [virtual]
```

Return space (height) in pixels usable for tabs.

The calculated height is the largest space between all children and the upper and lower widget boundaries, respectively. If the space at the bottom is larger than at the top, the value will be negative and the tabs should be placed at the bottom.

Returns

Vertical space that can be used for the tabs.

Return values

>0	To put the tabs at the top of the widget.
<0	To put the tabs on the bottom.
Full	height, if <a href="#">children()</a> == 0.

#### 13.133.4.23 tab\_positions()

```
int Fl_Tabs::tab_positions () [protected], [virtual]
```

Calculate tab positions and widths.

This protected method calculates the horizontal display positions and widths of all tabs. If the number of children 'nc' (see below) is > 0 three internal arrays are allocated, otherwise the arrays are free'd and the pointers are set to NULL. Note that the first array is larger (nc+1).

- `tab_pos[nc+1]` : The left edges of each tab plus a fake left edge for a tab past the right-hand one.
- `tab_width[nc]` : The width of each tab
- `tab_flags[nc]` : Flags, bit 0 is set if the tab is compressed

If needed, these arrays are (re)allocated.

These positions are actually of the left edge of the slope. They are either separated by the correct distance or by EXTRASPACE or by zero.

In OVERFLOW\_COMPRESS mode, tab positions and widths are compressed to make the entire tabs bar fit into the width of [Fl\\_Tabs](#) while keeping the selected tab fully visible.

In other overflow modes, the tabs area may be dragged horizontally using [tab\\_offset](#). The `tab_pos` array is not adjusted to the horizontal offset, but starts at this->x() plus the box's left margin.

The protected variable `tab_count` is set to the currently allocated size, i.e. the number of children (nc).

Returns

Index of the selected item

## Return values

-1	If the number of children is 0 (zero).
----	----------------------------------------

## Note

Return values in 1.3 were not documented. Return values before Sep 2023 were documented as 1 based index and 0 if there were no children. This was actually never the case. It always returned a 0 based index and the (useless) value of also 0 if there were no children. The current version returns -1 if there are no children.

For this method to work, only a single child should be selected. Calling the method [value\(\)](#) before calling [tab\\_positions\(\)](#) will ensure that exactly one child is selected and return a pointer to that child.

## See also

[clear\\_tab\\_positions\(\)](#)

**13.133.4.24 take\_focus()**

```
void Fl_Tabs::take_focus (
 Fl_Widget * o) [protected]
```

Take keyboard focus if o is not NULL.

## Parameters

in	<i>o</i>	selected tab
----	----------	--------------

**13.133.4.25 value() [1/3]**

```
Fl_Widget * Fl_Tabs::value ()
```

Gets the currently visible widget/tab.

The [Fl\\_Tabs::value\(\)](#) method returns a pointer to the currently visible child widget of the [Fl\\_Tabs](#) container. The visible child is the first child that is currently being displayed, or the last child if none of the children are being displayed.

If child widgets have been added, moved, or deleted, this method ensures that only one tab is visible at a time.

## Returns

a pointer to the currently visible child

**13.133.4.26 value() [2/3]**

```
int Fl_Tabs::value (
 Fl_Widget * newvalue)
```

Sets the widget to become the currently visible widget/tab.

The [Fl\\_Tabs::value\(\)](#) method allows you to set a particular child widget of the [Fl\\_Tabs](#) container to be the currently visible widget. If the specified widget is a child of the [Fl\\_Tabs](#) container, it will be made visible and all other children will be hidden. The method returns 1 if the value was changed, and 0 if the specified value was already set.

## Parameters

in	<i>newvalue</i>	a pointer to a child widget
----	-----------------	-----------------------------

## Returns

1 if a different tab was chosen

0 if there was no change (new value already set)

**13.133.4.27 value()** [3/3]

```
int Fl_Tabs::value (
 int ix)
```

Sets the widget to become the currently visible tab.

**Parameters**

<i>in</i>	<i>ix</i>	index of the child widget to show
-----------	-----------	-----------------------------------

**Returns**

1 if a different tab was chosen

0 if there was no change (new value already set, ix out of range)

**13.133.4.28 which()**

```
Fl_Widget * Fl_Tabs::which (
 int event_x,
 int event_y) [virtual]
```

Return a pointer to the child widget with a tab at the given coordinates.

The [Fl\\_Tabs::which\(\)](#) method returns a pointer to the child widget of the [Fl\\_Tabs](#) container that corresponds to the tab at the given event coordinates. If the event coordinates are outside the area of the tabs or if the [Fl\\_Tabs](#) container has no children, the method returns NULL.

**Parameters**

<i>event_x, event_y</i>	event coordinates
-------------------------	-------------------

**Returns**

pointer to the selected child widget, or NULL

**13.133.5 Member Data Documentation****13.133.5.1 overflow\_type**

```
int Fl_Tabs::overflow_type [protected]
```

**See also**

[OVERFLOW\\_COMPRESS](#), [OVERFLOW\\_CLIP](#), etc.

**13.133.5.2 tab\_count**

```
int Fl_Tabs::tab_count [protected]
```

Array size of tab positions etc.

**See also**

[tab\\_positions\(\)](#)

**13.133.5.3 tab\_flags**

```
int* Fl_Tabs::tab_flags [protected]
```

Array of tab flag of tabs per child.

See also

[tab\\_positions\(\)](#)

#### 13.133.5.4 tab\_pos

```
int* Fl_Tabs::tab_pos [protected]
```

Array of x-offsets of tabs per child + 1.

## 13.134 Fl\_Terminal Class Reference

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

```
#include <Fl_Terminal.H>
```

Inheritance diagram for Fl\_Terminal:

### Classes

- class [CharStyle](#)
- class [Cursor](#)
- class [EscapeSeq](#)
- class [Margin](#)
- class [PartialUtf8Buf](#)
- class [RingBuffer](#)
- class [Selection](#)
- class [Utf8Char](#)

### Public Types

- enum [Attrib](#) {  
**NORMAL** = 0x00 , **BOLD** = 0x01 , **DIM** = 0x02 , **ITALIC** = 0x04 ,  
**UNDERLINE** = 0x08 , **\_RESERVED\_1** = 0x10 , **INVERSE** = 0x20 , **\_RESERVED\_2** = 0x40 ,  
**STRIKEOUT** = 0x80 }

*Bits for the per-character attributes, which control text features such as italic, bold, underlined text, etc.*

- enum `CharFlags` {  
`FG_XTERM` = 0x01 , `BG_XTERM` = 0x02 , `EOL` = 0x04 , `RESV_A` = 0x08 ,  
`RESV_B` = 0x10 , `RESV_C` = 0x20 , `RESV_D` = 0x40 , `RESV_E` = 0x80 ,  
`COLORMASK` = (`FG_XTERM` | `BG_XTERM`) }

*Per-character 8 bit flags (uchar) used to manage special states for characters.*

- enum `OutFlags` { `OFF` = 0x00 , `CR_TO_LF` = 0x01 , `LF_TO_CR` = 0x02 , `LF_TO_CRLF` = 0x04 }

*Output translation flags for special control character translations.*

- enum `RedrawStyle` { `NO_REDRAW` = 0 , `RATE_LIMITED` , `PER_WRITE` }

*Determines when `FI_Terminal` calls `redraw()` if new text is added.*

- enum `ScrollbarStyle` { `SCROLLBAR_OFF` = 0x00 , `SCROLLBAR_AUTO` = 0x01 , `SCROLLBAR_ON` = 0x02 }

*Behavior of scrollbars.*

## Public Member Functions

- void `ansi` (bool val)  
*Enable/disable the ANSI mode flag.*
- bool `ansi` (void) const  
*Return the state of the ANSI flag.*
- void `append` (const char \*s, int len=-1)  
*Appends string `s` to the terminal at the current cursor position using the current text color/attributes.*
- void `append_ascii` (const char \*s)  
*Append NULL terminated ASCII string to terminal, slightly more efficient than `append_utf8()`.*
- void `append_utf8` (const char \*buf, int len=-1)  
*Append NULL terminated UTF-8 string to terminal.*
- void `box` (`FI_Boxtype` val)  
*Sets the box type, updates terminal margins et al.*
- `FI_Boxtype` `box` (void) const  
*Returns the current box type.*
- void `clear` (`FI_Color` val)  
*Clears the screen to a specific color `val` and homes the cursor.*
- void `clear` (void)  
*Clears the screen to the current `textbgcolor()`, and homes the cursor.*
- void `clear_history` (void)  
*Clears the scroll history buffer and adjusts scrollbar, forcing it to `redraw()`.*
- void `clear_screen` (bool scroll\_to\_hist=true)  
*Clear the terminal screen only; does not affect the cursor position.*
- void `clear_screen_home` (bool scroll\_to\_hist=true)  
*Clear the terminal screen and home the cursor.*
- void `color` (`FI_Color` val)  
*Sets the background color for the terminal's `FI_Group::box()`.*
- `FI_Color` `color` (void) const  
*Return base widget `FI_Group`'s `box()` color()*
- int `cursor_col` (void) const  
*Return the cursor's current column position on the screen.*
- void `cursor_home` (void)  
*Move cursor to the home position (top/left).*
- int `cursor_row` (void) const  
*Return the cursor's current row position on the screen.*
- void `cursorbgcolor` (`FI_Color` val)  
*Set the cursor's background color used for the cursor itself.*
- `FI_Color` `cursorbgcolor` (void) const

- Get the cursor's background color used for the cursor itself.*

  - void **cursorfgcolor** ([Fl\\_Color](#) val)
- Set the cursor's foreground color used for text under the cursor.*

  - [Fl\\_Color](#) **cursorfgcolor** (void) const
- Get the cursor's foreground color used for text under the cursor.*

  - void [display\\_columns](#) (int val)
- Set terminal's display width in columns of text characters.*

  - int [display\\_columns](#) (void) const
- Return terminal's display width in columns of text characters.*

  - void [display\\_rows](#) (int val)
- Set terminal's display height in lines of text (rows).*

  - int [display\\_rows](#) (void) const
- Return terminal's display height in lines of text (rows).*

  - void [draw](#) (void) override
- Draws the entire [Fl\\_Terminal](#).*

  - void [error\\_char](#) (const char \*val)
- Sets the "error character" UTF-8 string shown for invalid UTF-8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.*

  - const char \* [error\\_char](#) (void) const
- Returns the "error character" UTF-8 string, which is shown for invalid UTF-8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.*

  - [Fl\\_Terminal](#) (int X, int Y, int W, int H, const char \*L, int rows, int cols, int hist)
- Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.*

  - [Fl\\_Terminal](#) (int X, int Y, int W, int H, const char \*L=0)
- The constructor for [Fl\\_Terminal](#).*

  - int [handle](#) (int e) override
- Handle FLTK events.*

  - void [history\\_lines](#) (int val)
- Set the number of lines of screen history.*

  - int **history\_lines** (void) const
- Return the number of lines of screen history.*

  - void **history\_rows** (int val)
- Set terminal's scrollbar history buffer size in lines of text (rows).*

  - int **history\_rows** (void) const
- Return terminal's scrollbar history buffer size in lines of text (rows).*

  - int [history\\_use](#) (void) const
- Returns how many lines are "in use" by the screen history buffer.*

  - void [hscrollbar\\_style](#) ([ScrollbarStyle](#) val)
- Set the horizontal scrollbar behavior style.*

  - [ScrollbarStyle](#) [hscrollbar\\_style](#) (void) const
- Get the horizontal scrollbar behavior style.*

  - void **margin\_bottom** (int val)
- Set the bottom margin; see [Margins](#).*

  - int **margin\_bottom** (void) const
- Return the bottom margin; see [Margins](#).*

  - void **margin\_left** (int val)
- Set the left margin; see [Margins](#).*

  - int **margin\_left** (void) const
- Return the left margin; see [Margins](#).*

  - void **margin\_right** (int val)
- Set the right margin; see [Margins](#).*

- int **margin\_right** (void) const  
*Return the right margin; see [Margins](#).*
- void **margin\_top** (int val)  
*Set the top margin; see [Margins](#).*
- int **margin\_top** (void) const  
*Return the top margin; see [Margins](#).*
- void **output\_translate** (FL\_Terminal::OutFlags val)  
*Sets the combined output translation flags to val.*
- FL\_Terminal::OutFlags **output\_translate** (void) const  
*Return the current combined output translation flags.*
- void **plot\_char** (char c, int drow, int dcol)  
*Plot the ASCII character c at the terminal's display position (drow,dcol).*
- void **plot\_char** (const char \*text, int len, int drow, int dcol)  
*Plot the UTF-8 character text of length len at display position (drow,dcol).*
- void **print\_char** (char c)  
*Prints single ASCII char c at current cursor position, and advances the cursor.*
- void **print\_char** (const char \*text, int len=-1)  
*Prints single UTF-8 char text of optional byte length len at current cursor position, and advances the cursor if the character is printable.*
- void **printf** (const char \*fmt,...)  
*Appends printf formatted messages to the terminal.*
- void **redraw\_rate** (float val)  
*Set the maximum rate redraw speed in floating point seconds if [redraw\\_style\(\)](#) is set to RATE\_LIMITED.*
- float **redraw\_rate** (void) const  
*Get max rate redraw speed in floating point seconds.*
- void **redraw\_style** (RedrawStyle val)  
*Set how FL\_Terminal manages screen redrawing.*
- RedrawStyle **redraw\_style** (void) const  
*Get the redraw style.*
- void **reset\_terminal** (void)  
*Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.*
- void **resize** (int X, int Y, int W, int H) override  
*Handle widget resizing, such as if user resizes parent window.*
- int **scrollbar\_actual\_size** (void) const  
*Returns the scrollbar's actual "trough size", which is the width of FL\_VERTICAL scrollbars, or height of FL\_HORIZONTAL scrollbars.*
- void **scrollbar\_size** (int val)  
*Set the pixel size of both horizontal and vertical scrollbar's "trough" to val.*
- int **scrollbar\_size** (void) const  
*Get current pixel size of all the scrollbar's troughs for this widget, or zero if the global [Fl::scrollbar\\_size\(\)](#) is being used (default).*
- const char \* **selection\_text** (void) const  
*Return text selection (for copy()/paste() operations)*
- int **selection\_text\_len** (void) const  
*Return byte length of all UTF-8 chars in selection, or 0 if no selection.*
- void **selectionbgcolor** (FL\_Color val)  
*Set mouse selection background color.*
- FL\_Color **selectionbgcolor** (void) const  
*Get mouse selection background color.*
- void **selectionfgcolor** (FL\_Color val)  
*Set mouse selection foreground color.*

- **FI\_Color selectionfgcolor** (void) const  
*Get mouse selection foreground color.*
- void **show\_unknown** (bool val)  
*Set the "show unknown" flag.*
- bool **show\_unknown** (void) const  
*Return the "show unknown" flag.*
- const char \* **text** (bool lines\_below\_cursor=false) const  
*Return a string copy of all lines in the terminal (including history).*
- **uchar textattrib** () const  
*Get text attribute bits (underline, inverse, etc).*
- void **textattrib** (uchar val)  
*Set text attribute bits (underline, inverse, etc).*
- void **textbgcolor** (FI\_Color val)  
*Set text background color to fltk color val used by any new text added.*
- **FI\_Color textbgcolor** (void) const  
*Return text's current background color.*
- void **textbgcolor\_default** (FI\_Color val)  
*Set the default text background color used by any new text added after a reset (<ESC>c, <ESC>[0m, or reset\_terminal()).*
- **FI\_Color textbgcolor\_default** (void) const  
*Return text's default background color.*
- void **textbgcolor\_xterm** (uchar val)  
*Sets the background text color as one of the 8 'xterm color' values.*
- void **textcolor** (FI\_Color val)  
*Set the text color for the terminal.*
- **FI\_Color textcolor** (void) const  
*Return textcolor(). This is a convenience method that returns textfgcolor\_default()*
- void **textfgcolor** (FI\_Color val)  
*Set text foreground drawing color to fltk color val used by any new text added.*
- **FI\_Color textfgcolor** (void) const  
*Return text's current foreground color.*
- void **textfgcolor\_default** (FI\_Color val)  
*Set the default text foreground color used by <ESC>c, <ESC>[0m, and reset\_terminal().*
- **FI\_Color textfgcolor\_default** (void) const  
*Return text's default foreground color.*
- void **textfgcolor\_xterm** (uchar val)  
*Sets the foreground text color as one of the 8 'xterm color' values.*
- void **textfont** (FI\_Font val)  
*Sets the font used for all text displayed in the terminal.*
- **FI\_Font textfont** (void) const  
*Return text font used to draw all text in the terminal.*
- void **textsize** (FI\_Fontsize val)  
*Sets the font size used for all text displayed in the terminal.*
- **FI\_Fontsize textsize** (void) const  
*Return text font size used to draw all text in the terminal.*
- void **vprintf** (const char \*fmt, va\_list ap)  
*Appends printf formatted messages to the terminal.*
- **~FI\_Terminal** (void)  
*The destructor for FI\_Terminal.*

## Public Member Functions inherited from [FL\\_Group](#)

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* [array](#) () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* [as\\_group](#) () const override
- [FL\\_Group](#) \* [as\\_group](#) () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*

- `FL_Widget * resizable () const`  
*Returns the group's resizable widget.*
- `void resizable (FL_Widget &o)`  
*Sets the group's resizable widget.*
- `void resizable (FL_Widget *o)`  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- `virtual ~FL_Group ()`  
*The destructor also deletes all the children.*

## Public Member Functions inherited from FL\_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
*Activates the widget.*
- `unsigned int active () const`  
*Returns whether the widget is active.*
- `int active_r () const`  
*Returns whether the widget and all of its parents are active.*
- `FL_Align align () const`  
*Gets the label alignment.*
- `void align (FL_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FL_GI_Window * as_gi_window ()`  
*Returns an FL\_GI\_Window pointer if this widget is an FL\_GI\_Window.*
- `virtual class FL_GI_Window const * as_gi_window () const`
- `virtual FL_Window * as_window ()`  
*Returns an FL\_Window pointer if this widget is an FL\_Window.*
- `virtual FL_Window const * as_window () const`
- `void bind_deimage (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FL_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FL_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (FL_Boxtype new_box)`  
*Sets the box type for the widget.*
- `FL_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (FL_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (FL_Callback *cb, FL_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*

- void `callback` (`FI_Callback` \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` \*cb)  
*Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int `changed` () const  
*Checks if the widget value changed since the last callback.*
- void `clear_active` ()  
*Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()  
*Marks the value of the widget as unchanged.*
- void `clear_damage` (`uchar` c=0)  
*Clears or sets the damage flags.*
- void `clear_output` ()  
*Sets a widget to accept input.*
- void `clear_visible` ()  
*Hides the widget.*
- void `clear_visible_focus` ()  
*Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const  
*Gets the background color of the widget.*
- void `color` (`FI_Color` bg)  
*Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)  
*Sets the background and selection color of the widget.*
- int `contains` (const `FI_Widget` \*w) const  
*Checks if w is a child of this widget.*
- void `copy_label` (const char \*new\_label)  
*Sets the current label.*
- void `copy_tooltip` (const char \*text)  
*Sets the current tooltip text.*
- `uchar` `damage` () const  
*Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)  
*Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)  
*Internal use only.*
- void `deactivate` ()  
*Deactivates the widget.*
- `FI_Image` \* `deimage` ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` \* `deimage` () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const

- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FL_Widget` \*widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FL_Widget` \*widget, void \*arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FL_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const

*Gets the widget height.*
- virtual void `hide` ()

*Makes a widget invisible.*
- int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- `FL_Image` \* `image` ()

*Gets the image that is used as part of the widget label when in the active state.*
- const `FL_Image` \* `image` () const

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FL_Image` &img)

*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FL_Image` \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FL_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FL_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FL_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FL_Color` c)

*Sets the label color.*
- `FL_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FL_Font` f)

*Sets the font to use.*
- `FL_Fonsize` `labelsize` () const

*Gets the font size in pixels.*

- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

- Returns if the widget is able to take events.*

  - int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const

*Gets the widget type.*
- void `type` (`uchar` t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (`uchar` i)

*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()

*Destroys the widget.*

## Public Attributes

- [Fl\\_Scrollbar](#) \* [hscrollbar](#)  
*Horizontal scrollbar.*
- [Fl\\_Scrollbar](#) \* [scrollbar](#)  
*Vertical scrollbar.*

## Protected Member Functions

- void **clear\_eod** (void)  
*Clear from cursor to End Of Display (EOD), like "<ESC>[J" or "<ESC>[0J".*
- void **clear\_eol** (void)  
*Clear from cursor to End Of Line (EOL), like "<ESC>[K".*
- void **clear\_line** (int row)  
*Clear entire line for specified row.*
- void **clear\_line** (void)  
*Clear entire line cursor is currently on.*
- void **clear\_mouse\_selection** (void)  
*Clear any current mouse selection.*
- void **clear\_sod** (void)  
*Clear from cursor to Start Of Display (SOD), like "<ESC>[1J".*
- void **clear\_sol** (void)  
*Clear from cursor to Start Of Line (SOL), like "<ESC>[1K".*
- void **current\_style** (const [CharStyle](#) &sty)  
*Set current style for rendering text.*
- [CharStyle](#) & **current\_style** (void) const  
*Return reference to internal current style for rendering text.*
- void **cursor\_col** (int col)  
*Move cursor to the specified column *col*.*
- void **cursor\_cr** (void)  
*Move cursor as if a CR (\r) was received.*
- void **cursor\_crlf** (int count=1)  
*Move cursor as if a CR/LF pair (\r\n) was received.*
- void **cursor\_down** (int count=1, bool do\_scroll=false)  
*Moves cursor down *count* lines.*
- void **cursor\_eol** (void)  
*Move cursor to the last column (at the far right) on the current line.*
- void **cursor\_left** (int count=1)  
*Moves cursor left *count* columns, and cursor stops (does not wrap) if it hits screen edge.*
- void **cursor\_right** (int count=1, bool do\_scroll=false)  
*Moves cursor right *count* columns.*
- void **cursor\_row** (int row)  
*Move cursor to the specified row *row*.*
- void **cursor\_sol** (void)  
*Move cursor to the first column (at the far left) on the current line.*
- void **cursor\_tab\_left** (int count=1)  
*Tab left, do not wrap beyond left edge.*
- void **cursor\_tab\_right** (int count=1)  
*Tab right, do not wrap beyond right edge.*
- void **cursor\_up** (int count=1, bool do\_scroll=false)  
*Moves cursor up *count* lines.*
- void **delete\_chars** (int drow, int dcol, int rep)

- Delete char(s) at (drow,dcol) for 'rep' times.*

  - void **delete\_chars** (int rep)
- Delete char(s) at cursor position for 'rep' times.*

  - void **delete\_rows** (int count)
- Delete (count) rows at cursor position.*

  - int **disp\_cols** (void) const
- Return the number of columns in the display area.*

  - int **disp\_erow** (void) const
- Return the ending row# in the display area.*

  - int **disp\_rows** (void) const
- Return the number of rows in the display area.*

  - int **disp\_srow** (void) const
- Return the starting row# in the display area.*

  - void **draw\_buff** (int Y) const
- Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.*

  - void **draw\_row** (int grow, int Y) const
- Draw the specified global row, which is the row in ring\_chars[].*

  - void **draw\_row\_bg** (int grow, int X, int Y) const
- Draw the background for the specified ring\_chars[] global row grow starting at FLTK coords X and Y.*

  - bool **get\_selection** (int &srow, int &scol, int &erow, int &ecol) const
- Return mouse selection's start/end position in the ring buffer, if any.*

  - int **h\_to\_row** (int H) const
- Given a height in pixels, return number of rows that "fits" into that area.*

  - int **handle\_unknown\_char** (int drow, int dcol)
- Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show\_unknown().*

  - int **handle\_unknown\_char** (void)
- Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of show\_unknown().*

  - int **hist\_cols** (void) const
- Return the number of columns in the scrollbar history.*

  - int **hist\_erow** (void) const
- Return the ending row# of the scrollbar history.*

  - int **hist\_rows** (void) const
- Return the number of rows in the scrollbar history.*

  - int **hist\_srow** (void) const
- Return the starting row# of the scrollbar history.*

  - int **hist\_use** (void) const
- Return number of rows in use by the scrollbar history.*

  - int **hist\_use\_srow** (void) const
- Return the starting row of the "in use" scrollbar history.*

  - void **insert\_char** (char c, int rep)
- Insert char 'c' at the current cursor position for 'rep' times.*

  - void **insert\_char\_eol** (char c, int drow, int dcol, int rep)
- Insert char 'c' for 'rep' times at display row 'drow' and column 'dcol'.*

  - void **insert\_rows** (int count)
- Insert (count) rows at current cursor position.*

  - bool **is\_inside\_selection** (int row, int col) const
- Is global row/column inside the current mouse selection?*

  - bool **is\_selection** (void) const
- Returns true if there's a mouse selection.*

- int **offset** (void) const  
*Returns the current offset into the ring buffer.*
- void **restore\_cursor** (void)  
*Restore previously saved cursor position, if any. Used by ESC [ u.*
- int **ring\_cols** (void) const  
*Return the number of columns in the ring buffer.*
- int **ring\_erow** (void) const  
*Return the ending row# in the ring buffer (Always [ring\\_rows\(\)](#)-1)*
- int **ring\_rows** (void) const  
*Return the number of rows in the ring buffer.*
- int **ring\_srow** (void) const  
*Return the starting row# in the ring buffer. (Always 0)*
- void **save\_cursor** (void)  
*Save current cursor position. Used by ESC [ s.*
- void **scroll** (int rows)  
*Scroll the display up(+) or down(-) the specified rows.*
- void **select\_line** (int grow)  
*Select the entire row.*
- void **select\_word** (int grow, int gcol)  
*Select the word around the given row and column.*
- bool **selection\_extend** (int X, int Y)  
*Extend selection to FLTK coords X,Y.*
- [Utf8Char](#) \* **u8c\_cursor** (void)  
*Return the [Utf8Char](#)\* for character under cursor.*
- [Utf8Char](#) \* **u8c\_disp\_row** (int drow)  
*Return pointer to the first [u8c](#) character in row drow of the display.*
- const [Utf8Char](#) \* **u8c\_disp\_row** (int drow) const  
*See docs for non-const version of [u8c\\_disp\\_row\(int\)](#)*
- [Utf8Char](#) \* **u8c\_hist\_row** (int hrow)  
*Return [u8c](#) for beginning of a row inside the scrollbar history.*
- const [Utf8Char](#) \* **u8c\_hist\_row** (int hrow) const  
*See docs for non-const version of [u8c\\_hist\\_row\(int\)](#)*
- const [Utf8Char](#) \* **u8c\_hist\_use\_row** (int hrow) const  
*See docs for non-const version of [u8c\\_hist\\_use\\_row\(int\)](#)*
- [Utf8Char](#) \* **u8c\_hist\_use\_row** (int hurow)  
*Return [u8c](#) for beginning of row hurow inside the 'in use' part of the scrollbar history.*
- [Utf8Char](#) \* **u8c\_ring\_row** (int grow)  
*Return UTF-8 char for row grow in the ring buffer.*
- const [Utf8Char](#) \* **u8c\_ring\_row** (int grow) const  
*See docs for non-const version of [u8c\\_ring\\_row\(int\)](#)*
- const [Utf8Char](#) \* **utf8\_char\_at\_disp** (int drow, int dcol) const  
*Return [Utf8Char](#)\* for char at specified display row and column.*
- const [Utf8Char](#) \* **utf8\_char\_at\_glob** (int grow, int gcol) const  
*Return [Utf8Char](#)\* for char at specified global (grow,gcol).*
- int **w\_to\_col** (int W) const  
*Given a width in pixels, return number of columns that "fits" into that area.*
- const [Utf8Char](#) \* **walk\_selection** (const [Utf8Char](#) \*u8c, int &row, int &col) const  
*Walk the mouse selection one character at a time from beginning to end, returning a [Utf8Char](#)\* to the next character in the selection, or NULL if the end was reached, or if there's no selection.*

## Protected Member Functions inherited from FL\_Group

- `FL_Rect * bounds ()`  
*Returns the internal array of widget sizes and positions.*
- `void draw_child (FL_Widget &widget) const`  
*Forces a child to redraw.*
- `void draw_children ()`  
*Draws all children of the group.*
- `void draw_outside_label (const FL_Widget &widget) const`  
*Parents normally call this to draw outside labels of child widgets.*
- `virtual int on_insert (FL_Widget *, int)`  
*Allow derived groups to act when a widget is added as a child.*
- `virtual int on_move (int, int)`  
*Allow derived groups to act when a widget is moved within the group.*
- `virtual void on_remove (int)`  
*Allow derived groups to act when a child widget is removed from the group.*
- `int * sizes ()`  
*Returns the internal array of widget sizes and positions.*
- `void update_child (FL_Widget &widget) const`  
*Draws a child only if it needs it.*

## Protected Member Functions inherited from FL\_Widget

- `void clear_flag (unsigned int c)`  
*Clears a flag in the flags mask.*
- `void draw_backdrop () const`  
*If FL\_ALIGN\_IMAGE\_BACKDROP is set, the image or deimage will be drawn.*
- `void draw_box () const`  
*Draws the widget box according to its box style.*
- `void draw_box (FL_Boxtype t, FL_Color c) const`  
*Draws a box of type t, of color c at the widget's position and size.*
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`  
*Draws a box of type t, of color c at the position X,Y and size W,H.*
- `void draw_focus () const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`  
*Draws a focus rectangle around the widget.*
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`  
*Draws a focus box for the widget at the given position and size.*
- `void draw_label () const`  
*Draws the widget's label at the defined label position.*
- `void draw_label (int, int, int, int) const`  
*Draws the label in an arbitrary bounding box.*
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`  
*Creates a widget at the given position and size.*
- `unsigned int flags () const`  
*Gets the widget flags mask.*
- `void h (int v)`  
*Internal use only.*
- `void set_flag (unsigned int c)`  
*Sets a flag in the flags mask.*
- `void w (int v)`

*Internal use only.*

- void `x` (int v)

*Internal use only.*

- void `y` (int v)

*Internal use only.*

### Additional Inherited Members

### Static Public Member Functions inherited from `FI_Group`

- static `FI_Group * current` ()  
*Returns the currently active group.*
- static void `current` (`FI_Group *g`)  
*Sets the current group.*

### Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget *widget`, void \*data)  
*The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char \*t)  
*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### Protected Types inherited from `FI_Widget`

### 13.134.1 Detailed Description

Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control.

### 13.134.2 The FI\_Terminal Widget

Figure 13.54 FI\_Terminal widget showing a linux manual page

[FI\\_Terminal](#) is an output-only text widget supporting ASCII and UTF-8/Unicode. It supports most terminal text features, such as most VT100/xterm style escape sequences (see [The Escape Codes FI\\_Terminal Supports](#)), text colors/attributes, scrollback history, mouse selection, etc.

It is recommended that accessing features such as setting text colors and cursor positioning is best done with ANSI/XTERM escape sequences. But if one sets `ansi(false)` then this is not possible, so the public API can be used for common operations, e.g.

Public API	ESC code equivalent	Description
<a href="#">clear_screen_home()</a>	ESC [ H ESC [ 2 J	Clear screen, home cursor
<a href="#">cursor_home()</a>	ESC [ H	Home the cursor
<a href="#">clear_history()</a>	ESC [ 3 J	Clear scrollback history
<a href="#">reset_terminal()</a>	ESC c	Reset terminal

To access more advanced API calls, one can derive a class from [FI\\_Terminal](#) to access protected methods and manipulate the terminal more directly, e.g.

Protected API	ESC code equiv.	Description
<a href="#">current_style()</a>	ESC [ # m	Set text attributes
<a href="#">clear_eod()</a>	ESC [ 0 J	Clear from cursor to end of display
<a href="#">clear_sod()</a>	ESC [ 1 J	Clear from cursor to start of display
<a href="#">clear_eol()</a>	ESC [ 0 K	Clear from cursor to end of line
<a href="#">clear_sol()</a>	ESC [ 1 K	Clear from cursor to start of line
<a href="#">clear_line()</a>	ESC [ 2 K	Clear line cursor is on
<a href="#">scroll(int)</a> // >0 for up	ESC [ 1 S	Scroll up one line
<a href="#">scroll(int)</a> // <0 for down	ESC [ 1 T	Scroll down one line
<a href="#">cursor_left()</a>	ESC [ 1 D	Move cursor left (no wrap)
<a href="#">cursor_right()</a>	ESC [ 1 C	Move cursor right (no wrap)
<a href="#">cursor_up()</a>	ESC [ 1 A	Move cursor up (no scroll or wrap)
<a href="#">cursor_down()</a>	ESC [ 1 B	Move cursor down (no scroll or wrap)
<a href="#">cursor_row()</a> <a href="#">cursor_col()</a>	ESC [ # ; # H	Move cursor to row# / column#
<a href="#">insert_char()</a>	ESC [ # @	Insert a char at cursor position
<a href="#">delete_chars()</a>	ESC [ # P	Delete chars at cursor position
<a href="#">insert_rows()</a>	ESC [ # L	Insert rows at cursor position
<a href="#">delete_rows()</a>	ESC [ # M	Delete rows at cursor position
etc...	etc...	etc...

Many commonly used API functions are public, such as `textfgcolor()` for setting text colors. Others, such as `cursor_up()` are protected to prevent common misuse, and are available only to subclasses.

Some common operations:

- Set the terminal's background color, see `color(Fl_Color)`
- Set the terminal's default text color, see `textfgcolor_default(Fl_Color)`
- Printing text to the terminal, see `Fl_Terminal::printf()` and `Fl_Terminal::append()`
- Clearing the screen, see `clear()`
- Getting the terminal's buffer contents, see `text()`
- Getting single UTF-8 characters by row/col from the terminal display, see `utf8_char_at_disp()`
- Getting the text from a text selection, see `get_selection()`

For applications that need input support, the widget can be subclassed to provide keyboard input, and advanced features like pseudo ttys, termio, serial port I/O, etc., as such features are beyond the scope of FLTK.

### 13.134.2.1 Examples

```
//
// Fl_Terminal: Simple Use
//
Fl_Terminal *tty = new Fl_Terminal(...);
:
tty->append("Hello world.\n"); // simple strings
tty->append("\033[31mThis text is red.\033[0m\n"); // colored text
tty->append("\033[32mThis text is green.\033[0m\n");
tty->printf("The value of x is %.02f\n", x); // printf() formatting
```

There are also public methods for doing what most "\033[" escape codes do, so that if `ansi(bool)` is set to "false", one can still change text colors or clear the screen via application control, e.g.

```
tty->cursor_home(); // home the cursor
tty->clear_screen(); // clear the screen
tty->textfgcolor(0xff000000); // change the text color to RED
tty->textbgcolor(0x0000ff00); // change the background color to BLUE
//
// R G B
```

When creating the widget, the width/height determine the default column and row count for the terminal's display based on the current font size. The column width determines where text will wrap.

You can specify wider column sizes than the screen using `display_columns(colwidth)`. When this value is larger than the widget's width, text will wrap off-screen, and can be revealed by resizing the widget wider.

### 13.134.2.2 Writing To Terminal From Applications

An application needing terminal output as part of its user interface can instance `Fl_Terminal`, and write text strings with:

- `append()` to append strings
- `printf()` to append formatted strings

Single character output can be done with:

- `print_char()` to print a single ASCII/UTF-8 char at the cursor
- `plot_char()` to put single ASCII/UTF-8 char at an x,y position

### 13.134.2.3 Text Attributes

The terminal's text supports these attributes:

- Italic - italicized text: `\033[3m`
- Bold - brighter/thicker text: `\033[1m`
- Dim - lower brightness text: `\033[2m`
- Underline - text that is underlined: `\033[4m`
- Strikeout - text that has a line through the text: `\033[9m`
- Inverse - text whose background and foreground colors are swapped: `\033[7m`
- Normal - normal text: `\033[0m`

Figure 13.55 FI\_Terminal screen

### 13.134.2.4 Text and Background Colors

There's at least two ways to specify colors for text and background colors:

- 3-bit / 8-color values
- Full 24-bit R/G/B colors

Example of 3-bit colors:

Figure 13.56 FI\_Terminal 3-bit colors

Example application source code using 3-bit colors:

```
//
// Text colors
//
tty->append("\033[31m Red text.\033[0m\n"); // Print red text..
tty->append("\033[32m Green text.\033[0m\n");
:
tty->append("\033[36m Cyan text.\033[0m\n");
tty->append("\033[37m White text.\033[0m\n");
//
// Background colors
//
tty->append("\033[41m Red Background.\033[0m\n"); // background will be red
tty->append("\033[42m Green Background.\033[0m\n");
:
tty->append("\033[46m Cyan Background.\033[0m\n");
tty->append("\033[47m White Background.\033[0m\n");
```

Example of 24-bit colors:

Figure 13.57 FI\_Terminal 24-bit colors

Example application source code using 24-bit colors:

```
//
// 24-bit Text Color
//
tty->append("\033[38;2;0;0;255m Text is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255
tty->append("\033[38;2;255;0;0m Text is RED.\033[0m\n"); // RGB: R=255, G=0, B=0
tty->append("\033[38;2;127;64;0m Text is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
//
// 24-bit Background Color
//
tty->append("\033[48;2;0;0;255m Background is BLUE.\033[0m\n"); // RGB: R=0, G=0, B=255
tty->append("\033[48;2;255;0;0m Background is RED.\033[0m\n"); // RGB: R=255, G=0, B=0
tty->append("\033[48;2;127;64;0m Background is DARK ORANGE.\033[0m\n"); // RGB: R=127, G=64, B=0
```

For more on the ANSI escape codes, see [The Escape Codes FI\\_Terminal Supports](#).

### 13.134.2.5 Features

Most standard terminal behaviors are supported, e.g.

- ASCII + UTF-8/Unicode
- scrollback history management
- mouse selection + copy/paste (^C, ^A)
- autoscroll during selection

Most popular ANSI/DEC VT100/Xterm escape sequences are supported (see [The Escape Codes Fl\\_Terminal Supports](#)), including:

- per-character colors for text and background
- per-character text attributes: bold/dim, underline, strikeouts
- scrolling up/down
- character insert/delete for characters/rows/screen
- clearing characters/rows/screen

Does not (yet) support:

- programmable regions (scroll regions and attribute blocks)
- dynamic line wrap (where resizing display dynamically re-wraps long lines)

Will likely never implement as part of this widget:

- pty/termio management (such features should be *subclassed*)
- Different per-character font family + sizes (font family/size is global only)
- variable width fonts

Regarding the font family+size; the way the terminal is currently designed, the font family and size must not vary within text; rows have to be consistent height. Varying widths are tricky too, esp. when it comes to moving the cursor up/down within a column; varying *widths* are supported (due to Unicode characters sometimes being "wide", but not heights).

### 13.134.2.6 Margins

The margins define the amount of space (in pixels) around the outside of the text display area, the space between the widget's inner edge (inside the [box\(\)](#)) and the text display area's outer edge. The margins can be inspected and changed with the [margin\\_left\(\)](#), [margin\\_right\(\)](#), [margin\\_top\(\)](#) and [margin\\_bottom\(\)](#) methods.

### 13.134.3.3 OutFlags

enum [Fl\\_Terminal::OutFlags](#)

Output translation flags for special control character translations.

Enumerator

OFF	no output translation
CR_TO_LF	carriage return generates a vertical line-feed ( <code>\r</code> -> <code>\n</code> )
LF_TO_CR	line-feed generates a carriage return ( <code>\n</code> -> <code>\r</code> )
LF_TO_CRLF	line-feed generates a carriage return line-feed ( <code>\n</code> -> <code>\r\n</code> )

### 13.134.3.4 RedrawStyle

enum [Fl\\_Terminal::RedrawStyle](#)

Determines when [Fl\\_Terminal](#) calls [redraw\(\)](#) if new text is added.

RATE\_LIMITED is the recommended setting, using [redraw\\_rate\(float\)](#) to determine the maximum rate of redraws.

See also

[redraw\\_style\(\)](#), [redraw\\_rate\(\)](#)

Enumerator

NO_REDRAW	app must call <a href="#">redraw()</a> as needed to update text to screen
RATE_LIMITED	timer controlled redraws. (DEFAULT)
PER_WRITE	redraw triggered after <i>every</i> <a href="#">append()</a> / <a href="#">printf()</a> / etc. operation

### 13.134.3.5 ScrollbarStyle

enum [Fl\\_Terminal::ScrollbarStyle](#)

Behavior of scrollbars.

Enumerator

SCROLLBAR_OFF	scrollbar always invisible
SCROLLBAR_AUTO	scrollbar visible if widget resized in a way that hides columns (default)
SCROLLBAR_ON	scrollbar always visible

## 13.134.4 Constructor & Destructor Documentation

### 13.134.4.1 Fl\_Terminal() [1/2]

```
Fl_Terminal::Fl_Terminal (
 int X,
 int Y,
 int W,
 int H,
 const char * L = 0)
```

The constructor for [Fl\\_Terminal](#).

This creates an empty terminal with defaults:

- white on black text; see [textfgcolor\(Fl\\_Color\)](#), [textbgcolor\(Fl\\_Color\)](#)
- rows/cols based on the W and H values, see [display\\_rows\(\)](#), [display\\_columns\(\)](#)

- scrollbar history of 100 lines, see [history\\_rows\(\)](#)
- [redraw\\_style\(\)](#) set to RATE\_LIMITED, [redraw\\_rate\(\)](#) set to 0.10 seconds

Note: While [Fl\\_Terminal](#) derives from [Fl\\_Group](#), it's not intended for user code to use it as a parent for other widgets, so [end\(\)](#) is called.

#### Parameters

in	<i>X,Y,W,H</i>	position and size.
in	<i>L</i>	label string (optional), may be NULL.

#### 13.134.4.2 Fl\_Terminal() [2/2]

```
Fl_Terminal::Fl_Terminal (
 int X,
 int Y,
 int W,
 int H,
 const char * L,
 int rows,
 int cols,
 int hist)
```

Same as the default FLTK constructor, but lets the user force the rows, columns and history to specific sizes on creation.

Since the row/cols/hist are specified directly, this prevents the widget from auto-calculating the initial text buffer size based on the widget's pixel width/height, bypassing calls to the font system before the widget is displayed.

#### Note

fluid uses this constructor internally to avoid font calculations that open the display, useful for when running in a headless context. (issue 837)

#### 13.134.4.3 ~Fl\_Terminal()

```
Fl_Terminal::~~Fl_Terminal (
 void)
```

The destructor for [Fl\\_Terminal](#).

Destroys the terminal display, scroll history, and associated widgets.

### 13.134.5 Member Function Documentation

#### 13.134.5.1 ansi() [1/2]

```
void Fl_Terminal::ansi (
 bool val)
```

Enable/disable the ANSI mode flag.

If true, ANSI and VT100/xterm codes will be processed. If false, these codes won't be processed and will either be ignored or print the error character "¿", depending on the value of [show\\_unknown\(\)](#).

#### See also

[show\\_unknown\(\)](#), [The Escape Codes Fl\\_Terminal Supports](#)

#### 13.134.5.2 ansi() [2/2]

```
bool Fl_Terminal::ansi (
 void) const
```

Return the state of the ANSI flag.

See also

[ansi\(bool\)](#)

### 13.134.5.3 append()

```
void Fl_Terminal::append (
 const char * s,
 int len = -1)
```

Appends string *s* to the terminal at the current cursor position using the current text color/attributes.

If *s* is NULL, the UTF-8 character cache is cleared, which is recommended before starting a block reading loop, and again after the block loop has completed.

If *len* is not specified, it's assumed *s* is a NULL terminated string. If *len* IS specified, it can be used for writing strings that aren't NULL terminated, such as block reads on a pipe, network, or other block oriented data source.

Redraws of the terminal widget are by default handled automatically, but can be changed with [redraw\\_rate\(\)](#) and [redraw\\_style\(\)](#).

#### Block I/O

When reading block oriented sources (such as pipes), [append\(\)](#) will handle partial UTF-8 chars straddling the block boundaries. It does this using an internal byte cache, which should be cleared before and after block I/O loops by calling `append(NULL)` as shown in the example below, to prevent the possibilities of partial UTF-8 characters left behind by an interrupted or incomplete block loop.

```
// Example block reading a command pipe in Unix

// Run command and read as a pipe
FILE *fp = popen("ls -la", "r");
if (!fp) { ..error_handling.. }

// Enable non-blocking I/O
int fd = fileno(fp);
fcntl(fd, F_SETFL, O_NONBLOCK);

// Clear UTF-8 character cache before starting block loop
G_tty->append(NULL); // prevents leftover partial UTF-8 bytes

// Block read loop
while (1) {
 Fl::wait(0.05); // give fltk .05 secs of cpu to manage UI
 ssize_t bytes = read(fd, s, sizeof(s)); // read block from pipe
 if (bytes == -1 && errno == EAGAIN) continue; // no data yet? continue
 if (bytes > 0) G_tty->append(s, bytes); // append output to terminal
 else break; // end of pipe?
}

// Flush cache again after block loop completes
G_tty->append(NULL);

// Close pipe, done
pclose(fp);
```

#### Note

- String can contain ASCII or UTF-8 chars
- *len* is optional; if unspecified, expects *s* to be a NULL terminated string
- Handles partial UTF-8 chars split between calls (e.g. block oriented writes)
- If *s* is NULL, this clears the "partial UTF-8" character cache
- Redraws are managed automatically by default; see [redraw\\_style\(\)](#)

### 13.134.5.4 append\_ascii()

```
void Fl_Terminal::append_ascii (
 const char * s)
```

Append NULL terminated ASCII string to terminal, slightly more efficient than [append\\_utf8\(\)](#).

- If *s* is NULL, behavior is to do nothing
- Redraws are triggered automatically, depending on [redraw\\_style\(\)](#)

**13.134.5.5 append\_utf8()**

```
void Fl_Terminal::append_utf8 (
 const char * buf,
 int len = -1)
```

Append NULL terminated UTF-8 string to terminal.

- If buf is NULL, UTF-8 cache buffer is cleared
- If optional len isn't specified or is -1, strlen(buf) is used.
- If len is 0 or <-1, no changes are made
- Handles UTF-8 chars split across calls (e.g. block writes from pipes, etc)
- Redraws are triggered automatically, depending on [redraw\\_style\(\)](#)

**13.134.5.6 box()**

```
void Fl_Terminal::box (
 Fl_Boxtype val) [inline]
```

Sets the box type, updates terminal margins et al.

Default is FL\_DOWN\_FRAME.

FL\_XXX\_FRAME types are handled in a special way by this widget, and guarantee the background is a flat field.

FL\_XXX\_BOX may draw gradients as inherited by [Fl::scheme\(\)](#).

**13.134.5.7 clear() [1/2]**

```
void Fl_Terminal::clear (
 Fl_Color val)
```

Clears the screen to a specific color val and homes the cursor.

See also

[clear\\_screen\(\)](#), [clear\\_screen\\_home\(\)](#), [cursor\\_home\(\)](#)

**13.134.5.8 clear() [2/2]**

```
void Fl_Terminal::clear (
 void)
```

Clears the screen to the current [textbgcolor\(\)](#), and homes the cursor.

See also

[clear\\_screen\(\)](#), [clear\\_screen\\_home\(\)](#), [cursor\\_home\(\)](#)

**13.134.5.9 clear\_screen()**

```
void Fl_Terminal::clear_screen (
 bool scroll_to_hist = true)
```

Clear the terminal screen only; does not affect the cursor position.

Also clears the current mouse selection.

If 'scroll\_to\_hist' is true, the screen is cleared by scrolling the contents into the scrollbar history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollbar history is unchanged.

Similar to the escape sequence "<ESC>[2J".

See also

[clear\\_screen\\_home\(\)](#)

**13.134.5.10 clear\_screen\_home()**

```
void Fl_Terminal::clear_screen_home (
 bool scroll_to_hist = true)
```

Clear the terminal screen and home the cursor.

Also clears the current mouse selection.

If 'scroll\_to\_hist' is true, the screen is cleared by scrolling the contents into the scrollback history, where it can be retrieved with the scrollbar. This is the default behavior. If false, the screen is cleared and the scrollback history is unchanged.

Similar to the escape sequence "<ESC>[2J<ESC>[H".

See also

[clear\\_screen\(\)](#)

**13.134.5.11 color()**

```
void Fl_Terminal::color (
 Fl_Color val)
```

Sets the background color for the terminal's [Fl\\_Group::box\(\)](#).

If the [textbgcolor\(\)](#) and [textbgcolor\\_default\(\)](#) are set to the special "see through" color 0xffffffff when any text was added, changing [color\(\)](#) affects the color that shows through behind that existing text.

Otherwise, whatever specific background color was set for existing text will persist after changing [color\(\)](#).

To see the effects of a change to [color\(\)](#), follow up with a call to [redraw\(\)](#).

The default value is 0x0.

**13.134.5.12 cursor\_col()**

```
void Fl_Terminal::cursor_col (
 int col) [protected]
```

Move cursor to the specified column *col*.

This value is clamped to the range (0..[display\\_columns\(\)](#)-1).

**13.134.5.13 cursor\_cr()**

```
void Fl_Terminal::cursor_cr (
 void) [protected]
```

Move cursor as if a CR (\r) was received.

Same as [cursor\\_sol\(\)](#)

**13.134.5.14 cursor\_down()**

```
void Fl_Terminal::cursor_down (
 int count = 1,
 bool do_scroll = false) [protected]
```

Moves cursor down *count* lines.

If cursor hits screen bottom, it either stops (does not wrap) if *do\_scroll* is false, or wraps and scrolls up if *do\_scroll* is true.

Parameters

<i>count</i>	Number of lines to move cursor down
<i>do_scroll</i>	Enable scrolling if set to true

**13.134.5.15 cursor\_right()**

```
void Fl_Terminal::cursor_right (
 int count = 1,
```

```
bool do_scroll = false) [protected]
```

Moves cursor right `count` columns.

If cursor hits right edge of screen, it either stops (does not wrap) if `do_scroll` is false, or wraps and scrolls up one line if `do_scroll` is true.

#### 13.134.5.16 `cursor_row()`

```
void Fl_Terminal::cursor_row (
 int row) [protected]
```

Move cursor to the specified row `row`.

This value is clamped to the range (0..`display_rows()`-1).

#### 13.134.5.17 `cursor_up()`

```
void Fl_Terminal::cursor_up (
 int count = 1,
 bool do_scroll = false) [protected]
```

Moves cursor up `count` lines.

If cursor hits screen top, it either stops (does not wrap) if `do_scroll` is false, or scrolls down if `do_scroll` is true.

#### 13.134.5.18 `delete_rows()`

```
void Fl_Terminal::delete_rows (
 int count) [protected]
```

Delete (`count`) rows at cursor position.

Causes rows to scroll up, and empty lines created at bottom of screen. Lines deleted by scroll up are NOT moved into the scroll history.

#### 13.134.5.19 `display_columns()` [1/2]

```
void Fl_Terminal::display_columns (
 int dcols)
```

Set terminal's display width in columns of text characters.

This value is normally managed automatically by `resize()` based on the current font size, and should not be changed. You CAN make the `display_columns()` larger than the width of the widget; text in the terminal will simply run off the screen edge and be clipped; the only way to reveal that text is if the user enlarges the widget, or the font size made smaller.

To change the display width, it is best to use `resize()` instead.

#### 13.134.5.20 `display_columns()` [2/2]

```
int Fl_Terminal::display_columns (
 void) const
```

Return terminal's display width in columns of text characters.

This value is normally managed automatically by `resize()` based on the current font size.

#### 13.134.5.21 `display_rows()` [1/2]

```
void Fl_Terminal::display_rows (
 int drows)
```

Set terminal's display height in lines of text (rows).

This value is normally managed automatically by `resize()` based on the current font size, and should not be changed.

To change the display height, use `resize()` instead.

#### 13.134.5.22 `display_rows()` [2/2]

```
int Fl_Terminal::display_rows (
 void) const
```

Return terminal's display height in lines of text (rows).

This value is normally managed automatically by [resize\(\)](#) based on the current font size.

#### 13.134.5.23 draw()

```
void Fl_Terminal::draw (
 void) [override], [virtual]
```

Draws the entire [Fl\\_Terminal](#).

Lets the group draw itself first (scrollbars should be only members), followed by the terminal's screen contents.

Reimplemented from [Fl\\_Group](#).

#### 13.134.5.24 draw\_buff()

```
void Fl_Terminal::draw_buff (
 int Y) const [protected]
```

Draws the buffer position we are scrolled to onto the FLTK screen starting at pixel position Y.

This can be anywhere in the ring buffer, not just the 'active display'; depends on what position the scrollbar is set to.

Handles attributes, colors, text selections, cursor.

##### Parameters

in	Y	top position of top left character in the window in FLTK coordinates
----	---	----------------------------------------------------------------------

#### 13.134.5.25 draw\_row()

```
void Fl_Terminal::draw_row (
 int grow,
 int Y) const [protected]
```

Draw the specified global row, which is the row in `ring_chars[]`.

The global row includes history + display buffers.

##### Parameters

in	<i>grow</i>	row number
in	Y	top position of characters in the row in FLTK coordinates

#### 13.134.5.26 draw\_row\_bg()

```
void Fl_Terminal::draw_row_bg (
 int grow,
 int X,
 int Y) const [protected]
```

Draw the background for the specified `ring_chars[]` global row `grow` starting at FLTK coords X and Y.

Note we may be called to draw display, or even history if we're scrolled back. If there's any change in bg color, we draw the filled rects here.

If the bg color for a character is the special "see through" color 0xffffffff, no pixels are drawn.

##### Parameters

in	<i>grow</i>	row number
in	X,Y	top left corner of the row in FLTK coordinates

#### 13.134.5.27 error\_char() [1/2]

```
void Fl_Terminal::error_char (
```

```
const char * val) [inline]
```

Sets the "error character" UTF-8 string shown for invalid UTF-8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true. Default: "?". This method internally makes a copy of the specified string. `val` must be a valid null terminated UTF-8 string containing exactly one character of at most four bytes, or undefined behavior will result.

See also

[show\\_unknown\(bool\)](#)

### 13.134.5.28 error\_char() [2/2]

```
const char * Fl_Terminal::error_char (
 void) const [inline]
```

Returns the "error character" UTF-8 string, which is shown for invalid UTF-8 or bad ANSI sequences if [show\\_unknown\(\)](#) is true.

See also

[show\\_unknown\(bool\)](#)

### 13.134.5.29 get\_selection()

```
bool Fl_Terminal::get_selection (
 int & srow,
 int & scol,
 int & erow,
 int & ecol) const [protected]
```

Return mouse selection's start/end position in the ring buffer, if any.

Ensures (start <= end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom. The row/col values are indexes into the entire ring buffer.

Example: walk the characters of the mouse selection:

```
// Get selection
int srow,scol,erow,ecol;
if (get_selection(srow,scol,erow,ecol)) { // mouse selection exists?
 // Walk entire selection from start to end
 for (int row=srow; row<=erow; row++) { // walk rows of selection
 const Utf8Char *u8c = u8c_ring_row(row); // ptr to first character in row
 int col_start = (row==srow) ? scol : 0; // start row? start at scol
 int col_end = (row==erow) ? ecol : ring_cols()-1; // end row? end at ecol
 u8c += col_start; // include col offset (if any)
 for (int col=col_start; col<=col_end; col++,u8c++) { // walk columns
 ..do something with each char at *u8c..
 }
 }
}
```

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

See also

[walk\\_selection\(\)](#), [is\\_selection\(\)](#)

#### Parameters

<i>srow</i>	starting row for selection
<i>scol</i>	starting column for selection
<i>erow</i>	ending row for selection
<i>ecol</i>	ending column for selection

**13.134.5.30 h\_to\_row()**

```
int Fl_Terminal::h_to_row (
 int H) const [protected]
```

Given a height in pixels, return number of rows that "fits" into that area.  
This is used by the constructor to size the row/cols to fit the widget size.

**13.134.5.31 handle()**

```
int Fl_Terminal::handle (
 int e) [override], [virtual]
```

Handle FLTK events.

Reimplemented from [Fl\\_Group](#).

**13.134.5.32 handle\_unknown\_char() [1/2]**

```
int Fl_Terminal::handle_unknown_char (
 int drow,
 int dcol) [protected]
```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of [show\\_unknown\(\)](#).

This writes the "unknown" character to the display position (drow,dcol) if [show\\_unknown\(\)](#) is true.

Returns 1 if tty modified, 0 if not.

See also

[show\\_unknown\(\)](#)

**13.134.5.33 handle\_unknown\_char() [2/2]**

```
int Fl_Terminal::handle_unknown_char (
 void) [protected]
```

Handle an unknown char by either emitting an error symbol to the tty, or do nothing, depending on the user configurable value of [show\\_unknown\(\)](#).

This writes the "unknown" character to the output stream if [show\\_unknown\(\)](#) is true.

Note: This method uses [print\\_char\(\)](#) to emit the [error\\_char\(\)](#); if [ansi\(\)](#) is enabled and an ansi sequence is in progress, the [error\\_char\(\)](#) may be consumed as part of the ANSI sequence. It is therefore best to call [escseq.reset\(\)](#) first.

Returns 1 if tty modified, 0 if not.

See also

[show\\_unknown\(\)](#)

**13.134.5.34 history\_lines()**

```
void Fl_Terminal::history_lines (
 int val)
```

Set the number of lines of screen history.

Large values can be briefly heavy on cpu and memory usage.

**13.134.5.35 history\_use()**

```
int Fl_Terminal::history_use (
 void) const
```

Returns how many lines are "in use" by the screen history buffer.

This value will be 0 if history was recently cleared with e.g. [clear\\_history\(\)](#) or "<ESC>c".

Return value will be in the range 0 .. [history\\_lines\(\)](#).

**13.134.5.36 hscrollbar\_style()** [1/2]

```
void Fl_Terminal::hscrollbar_style (
 ScrollbarStyle val)
```

Set the horizontal scrollbar behavior style.  
This determines when the scrollbar is visible.

ScrollbarStyle enum	Description
<a href="#">SCROLLBAR_ON</a>	Horizontal scrollbar always displayed.
<a href="#">SCROLLBAR_OFF</a>	Horizontal scrollbar never displayed.
<a href="#">SCROLLBAR_AUTO</a>	Horizontal scrollbar displayed whenever widget width hides columns.

The default style is SCROLLBAR\_AUTO.

See also

[ScrollbarStyle](#)

**13.134.5.37 hscrollbar\_style()** [2/2]

```
Fl_Terminal::ScrollbarStyle Fl_Terminal::hscrollbar_style (
 void) const
```

Get the horizontal scrollbar behavior style.  
This determines when the scrollbar is visible.  
Value will be one of the [Fl\\_Terminal::ScrollbarStyle](#) enum values.

See also

[hscrollbar\\_style\(Fl\\_Terminal::ScrollbarStyle\)](#)

**13.134.5.38 insert\_char()**

```
void Fl_Terminal::insert_char (
 char c,
 int rep) [protected]
```

Insert char 'c' at the current cursor position for 'rep' times.  
Does not wrap; characters at end of line are lost.

**13.134.5.39 insert\_rows()**

```
void Fl_Terminal::insert_rows (
 int count) [protected]
```

Insert (count) rows at current cursor position.  
Causes rows below to scroll down, and empty lines created. Lines deleted by scroll down are NOT moved into the scroll history.

**13.134.5.40 is\_inside\_selection()**

```
bool Fl_Terminal::is_inside_selection (
 int grow,
 int gcol) const [protected]
```

Is global row/column inside the current mouse selection?

Returns

- true – (grow, gcol) is inside a valid selection.
- false – (grow, gcol) is outside, or no valid selection.

**13.134.5.41 output\_translate()**

```
void Fl_Terminal::output_translate (
 Fl_Terminal::OutFlags val)
```

Sets the combined output translation flags to `val`.

`val` can be sensible combinations of the OutFlags bit flags.

The default is `LF_TO_CRLF`, so that `\n` will generate both carriage-return (CR) and line-feed (LF).

For `\r` and `\n` to be handled literally, use `output_translate(Fl_Terminal::OutFlags::OFF)`;

To disable all output translations, use 0 or `Fl_Terminal::OutFlags::OFF`.

**13.134.5.42 plot\_char() [1/2]**

```
void Fl_Terminal::plot_char (
 char c,
 int drow,
 int dcol)
```

Plot the ASCII character `c` at the terminal's display position (`drow`,`dcol`).

The character **MUST** be printable (in range 0x20 - 0x7e), and is displayed using the current text color/attributes.

Characters outside that range are either ignored or print the error character (`?`), depending on `show_unknown(bool)`.

This is a very low level method.

No range checking is done on `drow`,`dcol`:

- `drow` must be in range 0..`(display_rows()-1)`
- `dcol` must be in range 0..`(display_columns()-1)`
- Does not trigger redraws
- Does NOT handle control codes, ANSI or XTERM escape sequences.

See also

`show_unknown(bool)`, `handle_unknown_char()`, `is_printable()`

**13.134.5.43 plot\_char() [2/2]**

```
void Fl_Terminal::plot_char (
 const char * text,
 int len,
 int drow,
 int dcol)
```

Plot the UTF-8 character `text` of length `len` at display position (`drow`,`dcol`).

The character is displayed using the current text color/attributes.

This is a very low level method.

No range checking is done on `drow`,`dcol`:

- `drow` must be in range 0..`(display_rows()-1)`
- `dcol` must be in range 0..`(display_columns()-1)`
- Does not trigger redraws
- Does not handle control codes, ANSI or XTERM escape sequences.
- Invalid UTF-8 chars show the error character (`?`) depending on `show_unknown(bool)`.

See also

`handle_unknown_char()`

**13.134.5.44 print\_char()** [1/2]

```
void Fl_Terminal::print_char (
 char c)
```

Prints single ASCII char `c` at current cursor position, and advances the cursor.

The character is displayed at the current cursor position using the current text color/attributes.

- `c` must be ASCII, not UTF-8
- Does not trigger redraws

**13.134.5.45 print\_char()** [2/2]

```
void Fl_Terminal::print_char (
 const char * text,
 int len = -1)
```

Prints single UTF-8 char `text` of optional byte length `len` at current cursor position, and advances the cursor if the character is printable.

Handles ASCII and control codes (CR, LF, etc).

The character is displayed at the current cursor position using the current text color/attributes.

Handles control codes and can be used to construct ANSI/XTERM escape sequences.

- If optional `len` isn't specified or `<0`, `fl_utf8len1(*text)` is used.
- `text` must not be NULL.
- `len` must not be 0.
- `text` must be a single char only (whether UTF-8 or ASCII)
- `text` can be an ASCII character, though not as efficient as [print\\_char\(\)](#)
- Invalid UTF-8 chars show the error character (`¿`) depending on [show\\_unknown\(bool\)](#).
- Does not trigger redraws

See also

[show\\_unknown\(bool\)](#), [handle\\_unknown\\_char\(\)](#)

**13.134.5.46 printf()**

```
void Fl_Terminal::printf (
 const char * fmt,
 ...)
```

Appends printf formatted messages to the terminal.

The string can contain UTF-8, crlf's, and ANSI sequences are also supported. Example:

```
#include <FL/Fl_Terminal.H>
int main(..) {
 :
 // Create a terminal, and append some messages to it
 Fl_Terminal *tty = new Fl_Terminal(..);
 :
 // Append three lines of formatted text to the buffer
 tty->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
 tty->printf("The current PID is %ld.\n", (long)getpid());
 :
}
```

Note

The expanded string is currently limited to 1024 characters (including NULL). For longer strings use [append\(\)](#) which has no string limits.

**13.134.5.47 redraw\_rate()**

```
void Fl_Terminal::redraw_rate (
 float val)
```

Set the maximum rate redraw speed in floating point seconds if [redraw\\_style\(\)](#) is set to RATE\_LIMITED.

When output is sent to the terminal, rather than calling [redraw\(\)](#) right away, a timer is started with this value indicating how long to wait before calling [redraw\(\)](#), causing the output to be shown. 0.10 is recommended (1/10th of a second), to limit redraws to no more than 10 redraws per second.

The value that works best depends on how fast data arrives, and how fast the font system can draw text at runtime. Values too small cause too many redraws to occur, causing the terminal to get backlogged if large bursts of data arrive quickly. Values too large cause realtime output to be too "choppy".

**13.134.5.48 redraw\_style() [1/2]**

```
void Fl_Terminal::redraw_style (
 RedrawStyle val)
```

Set how [Fl\\_Terminal](#) manages screen redrawing.

This setting is relevant when [Fl\\_Terminal](#) is used for high bandwidth data; too many redraws will slow things down, too few cause redraws to be 'choppy' when realtime data comes in.

Redrawing can be cpu intensive, depending on how many rows/cols are being displayed; worst case: large display + small font. Speed largely depends on the end user's graphics hardware and font drawing system.

RedrawStyle enum	Description
<a href="#">NO_REDRAW</a>	App must call <a href="#">redraw()</a> as needed to update text to screen
<a href="#">RATE_LIMITED</a>	Rate limited, timer controlled redraws. (DEFAULT) See <a href="#">redraw_rate()</a>
<a href="#">PER_WRITE</a>	Redraw triggered <i>every</i> call to <a href="#">append()</a> / <a href="#">printf()</a> / etc.

The default style is RATE\_LIMITED, which is the easiest to use, and automates redrawing to be capped at 10 redraws per second max. See [redraw\\_rate\(float\)](#) to control this automated redraw speed.

See also

[redraw\\_rate\(\)](#), [RedrawStyle](#)

**13.134.5.49 redraw\_style() [2/2]**

```
Fl_Terminal::RedrawStyle Fl_Terminal::redraw_style (
 void) const
```

Get the redraw style.

This determines when the terminal redraws itself while text is being added to it.

Value will be one of the [Fl\\_Terminal::RedrawStyle](#) enum values.

See also

[redraw\\_style\(Fl\\_Terminal::RedrawStyle\)](#)

**13.134.5.50 reset\_terminal()**

```
void Fl_Terminal::reset_terminal (
 void)
```

Resets terminal to default colors, clears screen, history and mouse selection, homes cursor, resets tabstops.

Same as "<ESC>c"

**13.134.5.51 `resize()`**

```
void Fl_Terminal::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Handle widget resizing, such as if user resizes parent window.

This may increase the column width of the widget if the width of the widget is made larger than it was.

**Note**

Resizing currently does not rewrap existing text. Currently enlarging makes room for longer lines, and shrinking the size lets long lines run off the right edge of the display, hidden from view. This behavior may change in the future to rewrap.

Reimplemented from [Fl\\_Group](#).

**13.134.5.52 `scroll()`**

```
void Fl_Terminal::scroll (
 int rows) [protected]
```

Scroll the display up(+) or down(-) the specified rows.

- Negative value scrolls "down", clearing top line, and history unaffected.
- Postive value scrolls "up", clearing bottom line, rotating top line into history.

**13.134.5.53 `scrollbar_actual_size()`**

```
int Fl_Terminal::scrollbar_actual_size (
 void) const
```

Returns the scrollbar's actual "trough size", which is the width of FL\_VERTICAL scrollbars, or height of FL\_↔ HORIZONTAL scrollbars.

If `scrollbar_size()` is zero (default), then the value of the global [Fl::scrollbar\\_size\(\)](#) is returned, which is the default global scrollbar size for the entire application.

**13.134.5.54 `scrollbar_size()` [1/2]**

```
void Fl_Terminal::scrollbar_size (
 int val)
```

Set the pixel size of both horizontal and vertical scrollbar's "trough" to `val`.

Setting `val` to the special value 0 causes the widget to track the global [Fl::scrollbar\\_size\(\)](#).

Use non-zero values *only* if you need to override the global [Fl::scrollbar\\_size\(\)](#) size.

**See also**

[Fl::scrollbar\\_size\(\)](#), [scrollbar\\_actual\\_size\(\)](#)

**13.134.5.55 `scrollbar_size()` [2/2]**

```
int Fl_Terminal::scrollbar_size (
 void) const
```

Get current pixel size of all the scrollbar's troughs for this widget, or zero if the global [Fl::scrollbar\\_size\(\)](#) is being used (default).

If this value returns zero, this widget's scrollbars are using the global [Fl::scrollbar\\_size\(\)](#), in which case use [scrollbar\\_actual\\_size\(\)](#) to get the actual (effective) pixel scrollbar size being used.

**Returns**

Scrollbar trough size in pixels, or 0 if the global [Fl::scrollbar\\_size\(\)](#) is being used.

See also

[Fl::scrollbar\\_size\(int\), scrollbar\\_actual\\_size\(\)](#)

#### 13.134.5.56 selection\_extend()

```
bool Fl_Terminal::selection_extend (
 int X,
 int Y) [protected]
```

Extend selection to FLTK coords X,Y.

Returns true if extended, false if nothing done (X,Y offscreen)

#### 13.134.5.57 selection\_text()

```
const char * Fl_Terminal::selection_text (
 void) const
```

Return text selection (for copy()/paste() operations)

- Returns allocated NULL terminated string for entire selection.
- Caller must free() this memory when done.
- Unicode safe.

#### 13.134.5.58 selection\_text\_len()

```
int Fl_Terminal::selection_text_len (
 void) const
```

Return byte length of all UTF-8 chars in selection, or 0 if no selection.

NOTE: Length includes trailing white on each line.

#### 13.134.5.59 show\_unknown() [1/2]

```
void Fl_Terminal::show_unknown (
 bool val)
```

Set the "show unknown" flag.

If true, invalid UTF-8 and invalid ANSI sequences will be shown with the error character "¿".

If false, error characters won't be shown.

See also

[handle\\_unknown\\_char\(\), error\\_char\(const char\\*\)](#).

#### 13.134.5.60 show\_unknown() [2/2]

```
bool Fl_Terminal::show_unknown (
 void) const
```

Return the "show unknown" flag.

See also

[show\\_unknown\(bool\), error\\_char\(const char\\*\)](#).

#### 13.134.5.61 text()

```
const char * Fl_Terminal::text (
 bool lines_below_cursor = false) const
```

Return a string copy of all lines in the terminal (including history).

The returned string is allocated with `strdup(3)`, which the caller must `free(3)`.

If 'lines\_below\_cursor' is false (default), lines below the cursor on down to the bottom of the display are ignored, and not included in the returned string.

If 'lines\_below\_cursor' is true, then all lines in the display are returned including any below the cursor, even if all are blank.

Example use:

```
Fl_Terminal *tty = new Fl_Terminal(..);
:
const char *s = tty->text(); // get a copy of the terminal's contents
printf("Terminal's contents is:\n%s\n", s);
free((void*)s); // free() the copy when done!
```

#### Parameters

in	<i>lines_below_cursor</i>	include lines below cursor, default: false
----	---------------------------	--------------------------------------------

#### Returns

A string allocated with `strdup(3)` which must be `free()`ed, text is UTF-8.

#### 13.134.5.62 textattrib() [1/2]

```
uchar Fl_Terminal::textattrib () const
```

Get text attribute bits (underline, inverse, etc).

This is the default attribute used for all newly printed text.

#### See also

[textattrib\(uchar\)](#), [Fl\\_Terminal::Attrib](#)

#### 13.134.5.63 textattrib() [2/2]

```
void Fl_Terminal::textattrib (
 uchar val)
```

Set text attribute bits (underline, inverse, etc).

This will be the default attribute used for all newly printed text.

#### See also

[Fl\\_Terminal::Attrib](#)

#### 13.134.5.64 textbgcolor()

```
void Fl_Terminal::textbgcolor (
 Fl_Color val)
```

Set text background color to fltk color `val` used by any new text added.

Use this for temporary color changes, similar to `<ESC>[48;2;<R>;<G>;<B>m`

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textbgcolor\\_xterm\(uchar\)](#) instead.

This setting does *not* affect the 'default' text colors used by `<ESC>[0m`, `<ESC>c`, [reset\\_terminal\(\)](#), etc. To set that too, also set [textbgcolor\\_default\(Fl\\_Color\)](#), e.g.

```
// Set both 'current' and 'default' colors
Fl_Color darkamber = 0x20100000;
tty->textbgcolor(darkamber); // set 'current' bg color
tty->textbgcolor_default(darkamber); // set 'default' bg color used by ESC[0m reset
```

The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own [Fl\\_Group::color\(\)](#) show through behind the text. This special text background color is the *default*, and is what most situations need.

See also

[textbcolor\\_default\(Fl\\_Color\)](#), [textbcolor\\_xterm\(uchar\)](#)

#### 13.134.5.65 textbcolor\_default() [1/2]

```
void Fl_Terminal::textbcolor_default (
 Fl_Color val)
```

Set the default text background color used by any new text added after a reset (<ESC>c, <ESC>[0m, or [reset\\_terminal\(\)](#)).

Does not affect the 'current' text background color; use [textbcolor\(Fl\\_Color\)](#) to set that.

The special color value 0xffffffff (all ff's) is the "see through" color, which lets the widget's own [Fl\\_Group::color\(\)](#) show through behind the text. This special text background color is the *default*, and is what most situations need.

See also

[textbcolor\(Fl\\_Color\)](#)

#### 13.134.5.66 textbcolor\_default() [2/2]

```
Fl_Color Fl_Terminal::textbcolor_default (
 void) const [inline]
```

Return text's default background color.

See also

[textbcolor\(\)](#)

#### 13.134.5.67 textbcolor\_xterm()

```
void Fl_Terminal::textbcolor_xterm (
 uchar val)
```

Sets the background text color as one of the 8 'xterm color' values.

This will be the background color used for all newly printed text, similar to the <ESC>[#m escape sequence, where # is between 40 and 47.

This color will be reset to the default bg color if [reset\\_terminal\(\)](#) is called, or by <ESC>c, <ESC>[0m, etc.

The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. <ESC>[1m, [textattrib\(\)](#), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.

The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also

[textbcolor\\_default\(Fl\\_Color\)](#)

**13.134.5.68 textcolor()**

```
void Fl_Terminal::textcolor (
 Fl_Color val)
```

Set the text color for the terminal.

This is a convenience method that sets *both* [textfgcolor\(\)](#) and [textfgcolor\\_default\(\)](#), ensuring both are set to the same value.

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textfgcolor\\_xterm\(\)](#) instead.

See also

[textfgcolor\(Fl\\_Color\)](#), [textfgcolor\\_default\(Fl\\_Color\)](#), [textbgcolor\\_xterm\(uchar\)](#)

**13.134.5.69 textfgcolor()**

```
void Fl_Terminal::textfgcolor (
 Fl_Color val)
```

Set text foreground drawing color to fltk color `val` used by any new text added.

Use this for temporary color changes, similar to `<ESC>[38;2;<R>;<G>;<B>m`

Colors set this way will NOT be influenced by the xterm Dim/Bold color intensity attributes. For that, use [textfgcolor\\_xterm\(uchar\)](#) instead.

This setting does *not* affect the 'default' text colors used by `<ESC>[0m`, `<ESC>c`, [reset\\_terminal\(\)](#), etc. To change both the current *and* default fg color, also use [textfgcolor\\_default\(Fl\\_Color\)](#). Example:

```
// Set both 'current' and 'default' colors
Fl_Color amber = 0xd0704000;
tty->textfgcolor(amber); // set 'current' fg color
tty->textfgcolor_default(amber); // set 'default' fg color used by ESC[0m reset
```

See also

[textfgcolor\\_default\(Fl\\_Color\)](#), [textfgcolor\\_xterm\(uchar\)](#)

**13.134.5.70 textfgcolor\_default()** [1/2]

```
void Fl_Terminal::textfgcolor_default (
 Fl_Color val)
```

Set the default text foreground color used by `<ESC>c`, `<ESC>[0m`, and [reset\\_terminal\(\)](#).

Does not affect the 'current' text foreground color; use [textfgcolor\(Fl\\_Color\)](#) to set that.

See also

[textfgcolor\(Fl\\_Color\)](#)

**13.134.5.71 textfgcolor\_default()** [2/2]

```
Fl_Color Fl_Terminal::textfgcolor_default (
 void) const [inline]
```

Return text's default foreground color.

See also

[textfgcolor\(\)](#)

**13.134.5.72 textfgcolor\_xterm()**

```
void Fl_Terminal::textfgcolor_xterm (
 uchar val)
```

Sets the foreground text color as one of the 8 'xterm color' values.

This will be the foreground color used for all newly printed text, similar to the `<ESC>[#m` escape sequence, where `#` is between 30 and 37.

This color will be reset to the default fg color if [reset\\_terminal\(\)](#) is called, or by `<ESC>c`, `<ESC>[0m`, etc.

The xterm color intensity values can be influenced by the Dim/Bold/Normal modes (which can be set with e.g. `<ESC>[1m`, [textattrib\(\)](#), etc), so the actual RGB values of these colors allow room for Dim/Bold to influence their brightness. For instance, "Normal Red" is not full brightness to allow "Bold Red" to be brighter. This goes for all colors except 'Black', which is not influenced by Dim or Bold; Black is always Black.

The 8 color xterm values are:

- 0 = Black
- 1 = Red
- 2 = Green
- 3 = Yellow
- 4 = Blue
- 5 = Magenta
- 6 = Cyan
- 7 = White

See also

[textfgcolor\\_default\(Fl\\_Color\)](#)

**13.134.5.73 textfont()**

```
void Fl_Terminal::textfont (
 Fl_Font val)
```

Sets the font used for all text displayed in the terminal.

This affects all existing text (in display and history) as well as any newly printed text.

Only monospace fonts are recommended, such as `FL_COURIER` or `FL_SCREEN`. Custom fonts configured with [Fl::set\\_font\(\)](#) will also work, as long as they are monospace.

**13.134.5.74 textsize()**

```
void Fl_Terminal::textsize (
 Fl_Fontsize val)
```

Sets the font size used for all text displayed in the terminal.

This affects all existing text (in display and history) as well as any newly printed text.

Changing this will affect the [display\\_rows\(\)](#) and [display\\_columns\(\)](#).

**13.134.5.75 u8c\_disp\_row()**

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_disp_row (
 int drow) [protected]
```

Return pointer to the first u8c character in row `drow` of the display.

- 'drow' is indexed relative to the beginning of the display buffer.

- This can be used to walk all columns in the specified row, e.g.

```
// Print all chars in first row of display (ASCII and UTF-8)
Utf8Char *u8c = u8c_disp_row(0); // first char of first display row
int scol = 0, ecol = disp_cols(); // start/end for column loop
for (int col=scol; col<ecol; col++,u8c++) { // loop from first char to last
 char *text = u8c->text_utf8(); // text string for char
 int len = u8c->length(); // text string length for char
 ::printf("<%.*s>", len, text); // print potentially multibyte char
}
```

- This can also be used to walk all rows on the display screen up to the cursor row, e.g.

```
// Write all chars in display up to cursor row to stdout
for (int row=0; row<disp_rows() && row<=cursor_row(); row++) {
 const Utf8Char *u8c = u8c_disp_row(row); // first char in row
 for (int col=0; col<disp_cols(); col++,u8c++) { // walk columns left-to-right
 // ..Do things here with each u8c char..
 ::printf("%.*s", u8c->length(), u8c->text_utf8()); // write each utf8 char to stdout
 }
 ::printf("\n");
}
```

See also

[u8c\\_hist\\_use\\_row\(\)](#) for examples of walking the screen history

### 13.134.5.76 u8c\_hist\_row()

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_row (
 int hrow) [protected]
```

Return u8c for beginning of a row inside the scrollbar history.

'hrow' is indexed relative to the beginning of the scrollbar history buffer.

See also

[u8c\\_disp\\_row\(int\)](#) for example use.

### 13.134.5.77 u8c\_hist\_use\_row()

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_hist_use_row (
 int hurow) [protected]
```

Return u8c for beginning of row hurow inside the 'in use' part of the scrollbar history.

'hurow' is indexed relative to the beginning of the 'in use' part of the scrollbar history buffer. This may be different from [u8c\\_hist\\_row\(int\)](#) if the history was recently cleared, and there aren't many (or any) rows in the history buffer that have been populated with scrollbar text yet.

Example to walk all "in use" lines of the history buffer:

```
// Walk the entire screen history ("in use") and display to stdout
for (int row=0; row<hist_use(); row++) {
 const Utf8Char *u8c = u8c_hist_use_row(row); // first char in row
 for (int col=0; col<hist_cols(); col++,u8c++) { // walk columns left-to-right
 // ..Do things here with each u8c char..
 ::printf("%.*s", u8c->length(), u8c->text_utf8()); // show each utf8 char to stdout
 }
 ::printf("\n"); // end of each line
}
```

See also

[u8c\\_disp\\_row\(int\)](#) for example use.

### 13.134.5.78 u8c\_ring\_row()

```
Fl_Terminal::Utf8Char * Fl_Terminal::u8c_ring_row (
 int grow) [protected]
```

Return UTF-8 char for row grow in the ring buffer.

grow is globally indexed relative to the beginning of the ring buffer, so this method can access ANY character in the entire ring buffer (hist or disp) by the global index.

Scrolling offset is NOT applied; this is raw access to the ring's rows.

Should really ONLY be used for making a complete copy of the ring.

Example:

```
// Walk ALL rows and cols in the raw ring buffer..
// These will not necessarily be in order as they appear
// on-screen.
// For walking the terminal lines in order, see examples
// for u8c_hist_use_row() and u8c_disp_row().
//
for (int row=0; row<ring_rows(); row++) {
 Utf8Char *u8c = u8c_ring_row(row);
 for (int col=0; col<ring_cols(); col++,u8c++) {
 ..make use of u8c->xxx() methods..
 }
}
```

#### 13.134.5.79 utf8\_char\_at\_disp()

```
const Fl_Terminal::Utf8Char * Fl_Terminal::utf8_char_at_disp (
 int drow,
 int dcol) const [protected]
```

Return Utf8Char\* for char at specified display row and column.

This accesses any character in the display part of the ring buffer.

No range checking done on drow,dcol:

- drow must be in range 0..[\(disp\\_rows\(\)-1\)](#)
- dcol must be in range 0..[\(disp\\_cols\(\)-1\)](#)

See also

[u8c\\_disp\\_row\(\)](#)

#### 13.134.5.80 utf8\_char\_at\_glob()

```
const Fl_Terminal::Utf8Char * Fl_Terminal::utf8_char_at_glob (
 int grow,
 int gcol) const [protected]
```

Return Utf8Char\* for char at specified global (grow,gcol).

This accesses any character in the ring buffer (history + display).

No range checking done on grow,gcol:

- grow must be in range 0..[\(ring\\_rows\(\)-1\)](#)
- gcol must be in range 0..[\(ring\\_cols\(\)-1\)](#)

See also

[u8c\\_ring\\_row\(\)](#)

#### 13.134.5.81 vprintf()

```
void Fl_Terminal::vprintf (
 const char * fmt,
 va_list ap)
```

Appends printf formatted messages to the terminal.

Subclasses can use this to implement their own [printf\(\)](#) functionality.

The string can contain UTF-8, crlf's, and ANSI sequences are also supported when [ansi\(bool\)](#) is set to 'true'.

Note

The expanded string is currently limited to 1024 characters (including NULL). For longer strings use [append\(\)](#) which has no string limits.

## Parameters

<i>fmt</i>	is a printf format string for the message text.
<i>ap</i>	is a <code>va_list</code> created by <code>va_start()</code> and closed with <code>va_end()</code> , which the caller is responsible for handling.

**13.134.5.82 w\_to\_col()**

```
int Fl_Terminal::w_to_col (
 int W) const [protected]
```

Given a width in pixels, return number of columns that "fits" into that area.  
This is used by the constructor to size the row/cols to fit the widget size.

**13.134.5.83 walk\_selection()**

```
const Fl_Terminal::Utf8Char * Fl_Terminal::walk_selection (
 const Utf8Char * u8c,
 int & row,
 int & col) const [protected]
```

Walk the mouse selection one character at a time from beginning to end, returning a `Utf8Char*` to the next character in the selection, or NULL if the end was reached, or if there's no selection.

This is easier to use for walking the selection than [get\\_selection\(\)](#).

`u8c` should start out as NULL, rewinding to the beginning of the selection. If the returned `Utf8Char*` is not NULL, `row` and `col` return the character's row/column position in the ring buffer.

```
// EXAMPLE: Walk the entire mouse selection, if any
int row,col; // the returned row/col for each char
Utf8Char *u8c = NULL; // start with NULL to begin walk
while ((u8c = walk_selection(u8c, row, col))) { // loop until end char reached
 ..do something with *u8c..
}
```

## See also

[get\\_selection\(\)](#), [is\\_selection\(\)](#)

## Parameters

<i>u8c</i>	NULL on first iter
<i>row</i>	returned row#
<i>col</i>	returned col#

**13.134.6 Member Data Documentation****13.134.6.1 hscrollbar**

```
Fl_Scrollbar* Fl_Terminal::hscrollbar
```

Horizontal scrollbar.

This is public so it can be accessed directly, e.g.

- `hscrollbar->value()` returns the column offset position from the left edge of the display; 0 being the left edge (default).
- `hscrollbar->value(int)` similarly sets the column offset, which should be in the range [0 .. `Fl_Scrollbar::maximum()`].
- `hscrollbar->step(double)` sets the smoothness of scrolling, default is 0.25 for 4 steps of motion per column.

### 13.134.6.2 scrollbar

`Fl_Scrollbar*` `Fl_Terminal::scrollbar`

Vertical scrollbar.

This is public so it can be accessed directly, e.g.

- `scrollbar->value()` returns the row offset from the bottom of the display, 0 being the bottom (default).
- `scrollbar->value(int)` similarly sets the row offset, which should be in the range [0 .. `Fl_Scrollbar::maximum()`].
- `scrollbar->step(double)` sets the smoothness of scrolling, default is 0.25 for 4 steps of motion per row.

**Todo** Support `scrollbar_left/right()` - See `Fl_Browser_::scrollbar` docs  
Support new `ScrollbarStyle`

The documentation for this class was generated from the following files:

- `Fl_Terminal.H`
- `Fl_Terminal.cxx`

## 13.135 Fl\_Text\_Buffer Class Reference

This class manages Unicode text displayed in one or more `Fl_Text_Display` widgets.

```
#include <Fl_Text_Buffer.H>
```

### Public Member Functions

- void `add_modify_callback` (`Fl_Text_Modify_Cb` bufModifiedCB, void \*cbArg)  
*Adds a callback function that is called whenever the text buffer is modified.*
- void `add_predelete_callback` (`Fl_Text_Predelete_Cb` bufPredelCB, void \*cbArg)  
*Adds a callback routine to be called before text is deleted from the buffer.*
- char \* `address` (int pos)  
*Convert a byte offset in buffer into a memory address.*
- const char \* `address` (int pos) const  
*Convert a byte offset in buffer into a memory address.*
- void `append` (const char \*t, int addedLength=-1)  
*Appends the text string to the end of the buffer.*
- int `appendfile` (const char \*file, int buflen=128 \* 1024)  
*Appends the named file to the end of the buffer.*
- char `byte_at` (int pos) const  
*Returns the raw byte at the specified position pos in the buffer.*
- void `call_modify_callbacks` ()  
*Calls all modify callbacks that have been registered using the `add_modify_callback()` method.*
- void `call_predelete_callbacks` ()  
*Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.*
- bool `can_redo` () const  
*Check if undo is enabled and if the last undo action can be redone.*
- bool `can_undo` () const  
*Check if undo is enabled and if the last action can be undone.*
- void `canUndo` (char flag=1)  
*Enable or disable undo actions for this text buffer.*
- unsigned int `char_at` (int pos) const  
*Returns the character at the specified position pos in the buffer.*
- void `copy` (`Fl_Text_Buffer` \*fromBuf, int fromStart, int fromEnd, int toPos)

- Copies text from another [FI\\_Text\\_Buffer](#) to this one.*

  - int [count\\_displayed\\_characters](#) (int lineStartPos, int targetPos) const

*Count the number of displayed characters between buffer position `lineStartPos` and `targetPos`.*
- int [count\\_lines](#) (int startPos, int endPos) const

*Counts the number of newlines between `startPos` and `endPos` in buffer.*
- int [estimate\\_lines](#) (int startPos, int endPos, int lineLen) const

*Estimate the number of newlines between `startPos` and `endPos` in buffer.*
- int [findchar\\_backward](#) (int startPos, unsigned int searchChar, int \*foundPos) const

*Search backwards in buffer `buf` for character `searchChar`, starting with the character before `startPos`, returning the result in `foundPos`.*
- int [findchar\\_forward](#) (int startPos, unsigned searchChar, int \*foundPos) const

*Finds the next occurrence of the specified character.*
- [FI\\_Text\\_Buffer](#) (int requestedSize=0, int preferredGapSize=1024)

*Create an empty text buffer of a pre-determined size.*
- int **highlight** () const

*Returns a non-zero value if text has been highlighted, 0 otherwise.*
- void **highlight** (int start, int end)

*Highlights the specified text within the buffer.*
- int **highlight\_position** (int \*start, int \*end) const

*Highlights the specified text between `start` and `end` within the buffer.*
- const [FI\\_Text\\_Selection](#) \* **highlight\_selection** () const

*Returns the current highlight selection.*
- char \* [highlight\\_text](#) () const

*Returns the highlighted text.*
- void [insert](#) (int pos, const char \*text, int insertedLength=-1)

*Inserts null-terminated string `text` at position `pos`.*
- int [insertfile](#) (const char \*file, int pos, int buflen=128 \*1024)

*Inserts a file at the specified position.*
- bool [is\\_word\\_separator](#) (int pos) const

*Returns whether character at position `pos` is a word separator.*
- int [length](#) () const

*Returns the number of bytes in the buffer.*
- int [line\\_end](#) (int pos) const

*Finds and returns the position of the end of the line containing position `pos` (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).*
- int [line\\_start](#) (int pos) const

*Returns the position of the start of the line containing position `pos`.*
- char \* [line\\_text](#) (int pos) const

*Returns the text from the entire line containing the specified character position.*
- int [loadfile](#) (const char \*file, int buflen=128 \*1024)

*Loads a text file into the buffer.*
- int [next\\_char](#) (int pos) const

*Returns the index of the next character.*
- int **next\_char\_clipped** (int pos) const
- int [outputfile](#) (const char \*file, int start, int end, int buflen=128 \*1024)

*Writes the specified portions of the text buffer to a file.*
- int [prev\\_char](#) (int pos) const

*Returns the index of the previous character.*
- int **prev\_char\_clipped** (int pos) const

*As [prev\\_char\(\)](#) but returns 0 if the beginning of the buffer is reached.*
- [FI\\_Text\\_Selection](#) \* **primary\_selection** ()

- Returns the primary selection.*

  - const **FI\_Text\_Selection** \* **primary\_selection** () const

*Returns the primary selection.*
- void **printf** (const char \*fmt,...)

*Appends printf formatted messages to the end of the buffer.*
- int **redo** (int \*cp=0)

*Redo previous undo action.*
- void **remove** (int start, int end)

*Deletes a range of characters in the buffer.*
- void **remove\_modify\_callback** (FI\_Text\_Modify\_Cb bufModifiedCB, void \*cbArg)

*Removes a modify callback.*
- void **remove\_predelete\_callback** (FI\_Text\_Predelete\_Cb predelCB, void \*cbArg)

*Removes a callback routine `bufPreDeleteCB` associated with argument `cbArg` to be called before text is deleted from the buffer.*
- void **remove\_secondary\_selection** ()

*Removes the text from the buffer corresponding to the secondary text selection object.*
- void **remove\_selection** ()

*Removes the text in the primary selection.*
- void **replace** (int start, int end, const char \*text, int insertedLength=-1)

*Deletes the characters between `start` and `end`, and inserts the null-terminated string `text` in their place in the buffer.*
- void **replace\_secondary\_selection** (const char \*text)

*Replaces the text from the buffer corresponding to the secondary text selection object with the new string `text`.*
- void **replace\_selection** (const char \*text)

*Replaces the text in the primary selection.*
- int **rewind\_lines** (int startPos, int nLines) const

*Finds and returns the position of the first character of the line `nLines` backwards from `startPos` (not counting the character pointed to by `startpos` if that is a newline) in the buffer.*
- int **savefile** (const char \*file, int buflen=128 \* 1024)

*Saves a text file from the current buffer.*
- int **search\_backward** (int startPos, const char \*searchString, int \*foundPos, int matchCase=0) const

*Search backwards in buffer for string `searchString`, starting with the character at `startPos`, returning the result in `foundPos`.*
- int **search\_forward** (int startPos, const char \*searchString, int \*foundPos, int matchCase=0) const

*Search forwards in buffer for string `searchString`, starting with the character `startPos`, and returning the result in `foundPos`.*
- void **secondary\_select** (int start, int end)

*Selects a range of characters in the secondary selection.*
- int **secondary\_selected** () const

*Returns a non-zero value if text has been selected in the secondary text selection, 0 otherwise.*
- const **FI\_Text\_Selection** \* **secondary\_selection** () const

*Returns the secondary selection.*
- int **secondary\_selection\_position** (int \*start, int \*end) const

*Returns the current selection in the secondary text selection object.*
- char \* **secondary\_selection\_text** () const

*Returns the text in the secondary selection.*
- void **secondary\_unselect** ()

*Clears any selection in the secondary text selection object.*
- void **select** (int start, int end)

*Selects a range of characters in the buffer.*
- int **selected** () const

*Returns a non-zero value if text has been selected, 0 otherwise.*

- int **selection\_position** (int \*start, int \*end) const  
*Gets the selection position.*
- char \* **selection\_text** () const  
*Returns the currently selected text.*
- int **skip\_displayed\_characters** (int lineStartPos, int nChars) const  
*Count forward from buffer position *startPos* in displayed characters.*
- int **skip\_lines** (int startPos, int nLines) const  
*Finds the first character of the line *nLines* forward from *startPos* in the buffer and returns its position.*
- int **tab\_distance** () const  
*Gets the tab width.*
- void **tab\_distance** (int tabDist)  
*Set the hardware tab distance (width) used by all displays for this buffer, and used in computing offsets for rectangular selection operations.*
- char \* **text** () const  
*Get a copy of the entire contents of the text buffer.*
- void **text** (const char \*text)  
*Replaces the entire contents of the text buffer.*
- char \* **text\_range** (int start, int end) const  
*Get a copy of a part of the text buffer.*
- std::string **text\_str** () const  
*Get a copy of the entire contents of the text buffer.*
- int **undo** (int \*cp=0)  
*Undo text modification according to the undo variables or insert text from the undo buffer.*
- void **unhighlight** ()  
*Unhighlights text in the buffer.*
- void **unselect** ()  
*Cancels any previous selection on the primary text selection object.*
- int **utf8\_align** (int) const  
*Align an index into the buffer to the current or previous UTF-8 boundary.*
- void **vprintf** (const char \*fmt, va\_list ap)  
*Can be used by subclasses that need their own *printf()* style functionality.*
- int **word\_end** (int pos) const  
*Returns the position corresponding to the end of the word.*
- int **word\_start** (int pos) const  
*Returns the position corresponding to the start of the word.*
- ~**FI\_Text\_Buffer** ()  
*Frees a text buffer.*

### Public Attributes

- int **input\_file\_was\_transcoded**  
*true if the loaded file has been transcoded to UTF-8.*
- void(\* **transcoding\_warning\_action** )(FI\_Text\_Buffer \*)  
*Pointer to a function called after reading a non UTF-8 encoded file.*

### Static Public Attributes

- static const char \* **file\_encoding\_warning\_message**  
*This message may be displayed using the *fl\_alert()* function when a file which was not UTF-8 encoded is input.*

### Protected Member Functions

- int **apply\_undo** (FI\_Text\_Undo\_Action \*action, int \*cursorPos)  
*Apply the current undo/redo operation, called from [undo\(\)](#) or [redo\(\)](#).*
- void **call\_modify\_callbacks** (int pos, int nDeleted, int nInserted, int nRestyled, const char \*deletedText) const  
*Calls the stored modify callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.*
- void **call\_predelete\_callbacks** (int pos, int nDeleted) const  
*Calls the stored pre-delete callback procedure(s) for this buffer to update the changed area(s) on the screen and any other listeners.*
- int **insert\_** (int pos, const char \*text, int insertedLength=-1)  
*Internal (non-redisplaying) version of [insert\(\)](#).*
- void **move\_gap** (int pos)  
*Move the gap to start at a new position.*
- void **reallocate\_with\_gap** (int newGapStart, int newGapLen)  
*Reallocates the text storage in the buffer to have a gap starting at newGapStart and a gap size of newGapLen, preserving the buffer's current contents.*
- void **redisplay\_selection** (FI\_Text\_Selection \*oldSelection, FI\_Text\_Selection \*newSelection) const  
*Calls the stored redisplay procedure(s) for this buffer to update the screen for a change in a selection.*
- void **remove\_** (int start, int end)  
*Internal (non-redisplaying) version of [remove\(\)](#).*
- void **remove\_selection\_** (FI\_Text\_Selection \*sel)  
*Removes the text from the buffer corresponding to sel.*
- void **replace\_selection\_** (FI\_Text\_Selection \*sel, const char \*text)  
*Replaces the text in selection sel.*
- char \* **selection\_text\_** (const FI\_Text\_Selection \*sel) const
- void **update\_selections** (int pos, int nDeleted, int nInserted)  
*Updates all of the selections in the buffer for changes in the buffer's text.*

### Protected Attributes

- char \* **mBuf**  
*allocated memory where the text is stored*
- char **mCanUndo**  
*if this buffer is used for attributes, it must not do any undo calls*
- void \*\* **mCbArgs**  
*caller arguments for modifyProcs above*
- int **mCursorPosHint**  
*hint for reasonable cursor position after a buffer modification operation*
- int **mGapEnd**  
*points to the first character after the gap*
- int **mGapStart**  
*points to the first character of the gap*
- FI\_Text\_Selection **mHighlight**  
*highlighted areas*
- int **mLength**  
*length of the text in the buffer (the length of the buffer itself must be calculated: gapEnd - gapStart + length)*
- FI\_Text\_Modify\_Cb \* **mModifyProcs**  
*procedures to call when buffer is modified to redisplay contents*
- int **mNModifyProcs**  
*number of modify-redisplay procs attached*
- int **mNPredeleteProcs**

- number of pre-delete procs attached*
- void \*\* **mPredeleteCbArgs**  
*caller argument for pre-delete proc above*
- Fl\_Text\_Predelete\_Cb \* **mPredeleteProcs**  
*procedure to call before text is deleted from the buffer; at most one is supported.*
- int **mPreferredGapSize**  
*the default allocation for the text gap is 1024 bytes and should only be increased if frequent and large changes in buffer size are expected*
- [Fl\\_Text\\_Selection](#) **mPrimary**  
*highlighted areas*
- Fl\_Text\_Undo\_Action\_List \* **mRedoList**  
*List of redo event.*
- [Fl\\_Text\\_Selection](#) **mSecondary**  
*highlighted areas*
- int [mTabDist](#)  
*equiv.*
- Fl\_Text\_Undo\_Action \* **mUndo**  
*local undo event*
- Fl\_Text\_Undo\_Action\_List \* **mUndoList**  
*List of undo event.*

### 13.135.1 Detailed Description

This class manages Unicode text displayed in one or more [Fl\\_Text\\_Display](#) widgets.

All text in [Fl\\_Text\\_Buffer](#) must be encoded in UTF-8. All indices used in the function calls must be aligned to the start of a UTF-8 sequence. All indices and pointers returned will be aligned. All functions that return a single character will return that in an unsigned int in UCS-4 encoding.

The [Fl\\_Text\\_Buffer](#) class is used by the [Fl\\_Text\\_Display](#) and [Fl\\_Text\\_Editor](#) to manage complex text data and is based upon the excellent NEdit text editor engine - see <https://sourceforge.net/projects/nedit/>.

### 13.135.2 Constructor & Destructor Documentation

#### 13.135.2.1 Fl\_Text\_Buffer()

```
Fl_Text_Buffer::Fl_Text_Buffer (
 int requestedSize = 0,
 int preferredGapSize = 1024)
```

Create an empty text buffer of a pre-determined size.

#### Parameters

<i>requestedSize</i>	use this to avoid unnecessary re-allocation if you know exactly how much the buffer will need to hold
<i>preferredGapSize</i>	Initial size for the buffer gap (empty space in the buffer where text might be inserted if the user is typing sequential characters)

### 13.135.3 Member Function Documentation

#### 13.135.3.1 add\_modify\_callback()

```
void Fl_Text_Buffer::add_modify_callback (
 Fl_Text_Modify_Cb bufModifiedCB,
 void * cbArg)
```

Adds a callback function that is called whenever the text buffer is modified.

The callback function is declared as follows:

```
typedef void (*Fl_Text_Modify_Cb)(int pos, int nInserted, int nDeleted,
 int nRestyled, const char* deletedText,
 void* cbArg);
```

### 13.135.3.2 address() [1/2]

```
char * Fl_Text_Buffer::address (
 int pos) [inline]
```

Convert a byte offset in buffer into a memory address.

#### Parameters

<i>pos</i>	byte offset into buffer
------------	-------------------------

#### Returns

byte offset converted to a memory address

### 13.135.3.3 address() [2/2]

```
const char * Fl_Text_Buffer::address (
 int pos) const [inline]
```

Convert a byte offset in buffer into a memory address.

#### Parameters

<i>pos</i>	byte offset into buffer
------------	-------------------------

#### Returns

byte offset converted to a memory address

### 13.135.3.4 append()

```
void Fl_Text_Buffer::append (
 const char * t,
 int addedLength = -1) [inline]
```

Appends the text string to the end of the buffer.

#### Parameters

<i>t</i>	UTF-8 encoded text
<i>addedLength</i>	number of bytes to append, or -1 to indicate <i>t</i> is null-terminated

### 13.135.3.5 appendfile()

```
int Fl_Text_Buffer::appendfile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Appends the named file to the end of the buffer.

See also [insertfile\(\)](#).

### 13.135.3.6 byte\_at()

```
char Fl_Text_Buffer::byte_at (
 int pos) const
```

Returns the raw byte at the specified position `pos` in the buffer.  
Positions start at 0.

#### Parameters

<code>pos</code>	byte offset into buffer
------------------	-------------------------

#### Returns

unencoded raw byte

#### 13.135.3.7 `can_redo()`

```
bool Fl_Text_Buffer::can_redo () const
```

Check if undo is enabled and if the last undo action can be redone.  
Check if undo is enabled and if the last undo action can be redone.

#### See also

[canUndo\(\)](#)

#### 13.135.3.8 `can_undo()`

```
bool Fl_Text_Buffer::can_undo () const
```

Check if undo is enabled and if the last action can be undone.

#### See also

[canUndo\(\)](#)

#### 13.135.3.9 `canUndo()`

```
void Fl_Text_Buffer::canUndo (
 char flag = 1)
```

Enable or disable undo actions for this text buffer.

Undo actions are enable for text buffer by default. If used as a style buffer in [Fl\\_Text\\_Display](#), undo actions are disabled as they are handled by the text buffer.

#### See also

[can\\_undo\(\)](#)

#### 13.135.3.10 `char_at()`

```
unsigned int Fl_Text_Buffer::char_at (
 int pos) const
```

Returns the character at the specified position `pos` in the buffer.  
Positions start at 0.

#### Parameters

<code>pos</code>	byte offset into buffer, <code>pos</code> must be at a UTF-8 character boundary
------------------	---------------------------------------------------------------------------------

**Returns**

Unicode UCS-4 encoded character

**13.135.3.11 copy()**

```
void Fl_Text_Buffer::copy (
 Fl_Text_Buffer * fromBuf,
 int fromStart,
 int fromEnd,
 int toPos)
```

Copies text from another [Fl\\_Text\\_Buffer](#) to this one.

**Parameters**

<i>fromBuf</i>	source text buffer, may be the same as this
<i>fromStart</i>	byte offset into buffer
<i>fromEnd</i>	byte offset into buffer
<i>toPos</i>	destination byte offset into buffer

**13.135.3.12 count\_displayed\_characters()**

```
int Fl_Text_Buffer::count_displayed_characters (
 int lineStartPos,
 int targetPos) const
```

Count the number of displayed characters between buffer position `lineStartPos` and `targetPos`.

Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

**13.135.3.13 count\_lines()**

```
int Fl_Text_Buffer::count_lines (
 int startPos,
 int endPos) const
```

Counts the number of newlines between `startPos` and `endPos` in buffer.

The character at position `endPos` is not counted.

**13.135.3.14 estimate\_lines()**

```
int Fl_Text_Buffer::estimate_lines (
 int startPos,
 int endPos,
 int lineLen) const
```

Estimate the number of newlines between `startPos` and `endPos` in buffer.

This call takes line wrapping into account. It assumes a line break at every `lineLen` characters after the beginning of a line.

**13.135.3.15 findchar\_backward()**

```
int Fl_Text_Buffer::findchar_backward (
 int startPos,
 unsigned int searchChar,
 int * foundPos) const
```

Search backwards in buffer `buf` for character `searchChar`, starting with the character *before* `startPos`, returning the result in `foundPos`.

Returns 1 if found, 0 if not. The difference between this and [search\\_backward\(\)](#) is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

## Parameters

<i>startPos</i>	byte offset to start position
<i>searchChar</i>	UCS-4 character that we want to find
<i>foundPos</i>	byte offset where the character was found

## Returns

1 if found, 0 if not

**13.135.3.16 findchar\_forward()**

```
int Fl_Text_Buffer::findchar_forward (
 int startPos,
 unsigned searchChar,
 int * foundPos) const
```

Finds the next occurrence of the specified character.

Search forwards in buffer for character *searchChar*, starting with the character *startPos*, and returning the result in *foundPos*. Returns 1 if found, 0 if not. The difference between this and [search\\_forward\(\)](#) is that it's optimized for single characters. The overall performance of the text widget is dependent on its ability to count lines quickly, hence searching for a single character: newline.

## Parameters

<i>startPos</i>	byte offset to start position
<i>searchChar</i>	UCS-4 character that we want to find
<i>foundPos</i>	byte offset where the character was found

## Returns

1 if found, 0 if not

**13.135.3.17 highlight\_text()**

```
char * Fl_Text_Buffer::highlight_text () const
```

Returns the highlighted text.

When you are done with the text, free it using the `free()` function.

**13.135.3.18 insert()**

```
void Fl_Text_Buffer::insert (
 int pos,
 const char * text,
 int insertedLength = -1)
```

Inserts null-terminated string *text* at position *pos*.

## Parameters

<i>pos</i>	insertion position as byte offset (must be UTF-8 character aligned)
<i>text</i>	UTF-8 encoded text
<i>insertedLength</i>	number of bytes to insert, or -1 to indicate <i>text</i> is null-terminated

**13.135.3.19 insert\_()**

```
int Fl_Text_Buffer::insert_ (
 int pos,
 const char * text,
 int insertedLength = -1) [protected]
```

Internal (non-redisplaying) version of [insert\(\)](#).

Returns the length of text inserted (this is just `strlen(text)` if `insertedLength == -1`, however this calculation can be expensive and the length will be required by any caller who will continue on to call `redisplay`). `pos` must be contiguous with the existing text in the buffer (i.e. not past the end).

**Returns**

the number of bytes inserted

**13.135.3.20 insertfile()**

```
int Fl_Text_Buffer::insertfile (
 const char * file,
 int pos,
 int buflen = 128*1024)
```

Inserts a file at the specified position.

**Returns**

- 0 on success
- non-zero on error (`strerror()` contains reason)
- 1 indicates open for read failed (no data loaded)
- 2 indicates error occurred while reading data (data was partially loaded)

File can be UTF-8 or CP1252 encoded. If the input file is not UTF-8 encoded, the [Fl\\_Text\\_Buffer](#) widget will contain data transcoded to UTF-8. By default, the message [Fl\\_Text\\_Buffer::file\\_encoding\\_warning\\_message](#) will warn the user about this.

**See also**

[input\\_file\\_was\\_transcoded](#) and [transcoding\\_warning\\_action](#).

**13.135.3.21 is\_word\_separator()**

```
bool Fl_Text_Buffer::is_word_separator (
 int pos) const
```

Returns whether character at position `pos` is a word separator.

Pos must be at a character boundary.

**13.135.3.22 length()**

```
int Fl_Text_Buffer::length () const [inline]
```

Returns the number of bytes in the buffer.

**Returns**

size of text in bytes

**13.135.3.23 line\_end()**

```
int Fl_Text_Buffer::line_end (
 int pos) const
```

Finds and returns the position of the end of the line containing position `pos` (which is either a pointer to the newline character ending the line or a pointer to one character beyond the end of the buffer).

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to line end

**13.135.3.24 line\_start()**

```
int Fl_Text_Buffer::line_start (
 int pos) const
```

Returns the position of the start of the line containing position *pos*.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to line start

**13.135.3.25 line\_text()**

```
char * Fl_Text_Buffer::line_text (
 int pos) const
```

Returns the text from the entire line containing the specified character position. When you are done with the text, free it using the `free()` function.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

copy of UTF-8 text, must be free'd

**13.135.3.26 loadfile()**

```
int Fl_Text_Buffer::loadfile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Loads a text file into the buffer.

See also [insertfile\(\)](#).

**13.135.3.27 next\_char()**

```
int Fl_Text_Buffer::next_char (
 int pos) const
```

Returns the index of the next character.

This function processes an emoji sequence (see [fl\\_utf8\\_next\\_composed\\_char](#)) as a single character. Returns [length\(\)](#) if the end of the buffer is reached.

## Parameters

<i>in</i>	<i>pos</i>	index to the current character
-----------	------------	--------------------------------

**13.135.3.28 outputfile()**

```
int Fl_Text_Buffer::outputfile (
 const char * file,
 int start,
 int end,
 int buflen = 128*1024)
```

Writes the specified portions of the text buffer to a file.

Returns

- 0 on success
- non-zero on error (strerror() contains reason)
- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

[savefile\(const char \\*file, int buflen\)](#)

**13.135.3.29 prev\_char()**

```
int Fl_Text_Buffer::prev_char (
 int pos) const
```

Returns the index of the previous character.

This function processes an emoji sequence (see [fl\\_utf8\\_next\\_composed\\_char](#)) as a single character. Returns -1 if the beginning of the buffer is reached.

Parameters

<i>pos</i>	index to the current character
------------	--------------------------------

**13.135.3.30 printf()**

```
void Fl_Text_Buffer::printf (
 const char * fmt,
 ...)
```

Appends printf formatted messages to the end of the buffer.

Example:

```
#include <FL/Fl_Text_Display.H>
int main(..) {
 :
 // Create a text display widget and assign it a text buffer
 Fl_Text_Display *tdsp = new Fl_Text_Display(..);
 Fl_Text_Buffer *tbuf = new Fl_Text_Buffer();
 tdsp->buffer(tbuf);
 :
 // Append three lines of formatted text to the buffer
 tbuf->printf("The current date is: %s.\nThe time is: %s\n", date_str, time_str);
 tbuf->printf("The current PID is %ld.\n", (long)getpid());
 :
}
```

Note

The expanded string is currently limited to 1024 characters.

Parameters

<i>in</i>	<i>fmt</i>	is a printf format string for the message text.
-----------	------------	-------------------------------------------------

### 13.135.3.31 remove()

```
void Fl_Text_Buffer::remove (
 int start,
 int end)
```

Deletes a range of characters in the buffer.

#### Parameters

<i>start</i>	byte offset to first character to be removed
<i>end</i>	byte offset to character after last character to be removed

### 13.135.3.32 remove\_()

```
void Fl_Text_Buffer::remove_ (
 int start,
 int end) [protected]
```

Internal (non-redisplaying) version of [remove\(\)](#).

Removes the contents of the buffer between *start* and *end* (and moves the gap to the site of the delete).

### 13.135.3.33 replace()

```
void Fl_Text_Buffer::replace (
 int start,
 int end,
 const char * text,
 int insertedLength = -1)
```

Deletes the characters between *start* and *end*, and inserts the null-terminated string *text* in their place in the buffer.

#### Parameters

<i>start</i>	byte offset to first character to be removed and new insert position
<i>end</i>	byte offset to character after last character to be removed
<i>text</i>	UTF-8 encoded text
<i>insertedLength</i>	number of bytes to insert, or -1 to indicate <i>text</i> is null-terminated

### 13.135.3.34 rewind\_lines()

```
int Fl_Text_Buffer::rewind_lines (
 int startPos,
 int nLines) const
```

Finds and returns the position of the first character of the line *nLines* backwards from *startPos* (not counting the character pointed to by *startpos* if that is a newline) in the buffer.

*nLines* == 0 means find the beginning of the line.

### 13.135.3.35 savefile()

```
int Fl_Text_Buffer::savefile (
 const char * file,
 int buflen = 128*1024) [inline]
```

Saves a text file from the current buffer.

Returns

- 0 on success
- non-zero on error (*strerror()* contains reason)

- 1 indicates open for write failed (no data saved)
- 2 indicates error occurred while writing data (data was partially saved)

See also

[outfile\(const char \\*file, int start, int end, int buflen\)](#)

### 13.135.3.36 search\_backward()

```
int Fl_Text_Buffer::search_backward (
 int startPos,
 const char * searchString,
 int * foundPos,
 int matchCase = 0) const
```

Search backwards in buffer for string `searchString`, starting with the character *at* `startPos`, returning the result in `foundPos`.

Returns 1 if found, 0 if not.

#### Parameters

<i>startPos</i>	byte offset to start position
<i>searchString</i>	UTF-8 string that we want to find
<i>foundPos</i>	byte offset where the string was found
<i>matchCase</i>	if set, match character case

#### Returns

1 if found, 0 if not

### 13.135.3.37 search\_forward()

```
int Fl_Text_Buffer::search_forward (
 int startPos,
 const char * searchString,
 int * foundPos,
 int matchCase = 0) const
```

Search forwards in buffer for string `searchString`, starting with the character `startPos`, and returning the result in `foundPos`.

Returns 1 if found, 0 if not.

#### Parameters

<i>startPos</i>	byte offset to start position
<i>searchString</i>	UTF-8 string that we want to find
<i>foundPos</i>	byte offset where the string was found
<i>matchCase</i>	if set, match character case

#### Returns

1 if found, 0 if not

### 13.135.3.38 secondary\_selection\_text()

```
char * Fl_Text_Buffer::secondary_selection_text () const
```

Returns the text in the secondary selection.  
When you are done with the text, free it using the `free()` function.

#### 13.135.3.39 `selection_text()`

```
char * Fl_Text_Buffer::selection_text () const
```

Returns the currently selected text.  
When you are done with the text, free it using the `free()` function.

#### 13.135.3.40 `skip_displayed_characters()`

```
int Fl_Text_Buffer::skip_displayed_characters (
 int lineStartPos,
 int nChars) const
```

Count forward from buffer position `startPos` in displayed characters.  
Displayed characters are the characters shown on the screen to represent characters in the buffer, where tabs and control characters are expanded.

##### Parameters

<i>lineStartPos</i>	byte offset into buffer
<i>nChars</i>	number of bytes that are sent to the display

##### Returns

byte offset in input after all output bytes are sent

#### 13.135.3.41 `tab_distance()`

```
int Fl_Text_Buffer::tab_distance () const [inline]
```

Gets the tab width.  
The tab width is measured in characters. The pixel position is calculated using an average character width.

#### 13.135.3.42 `text()` [1/2]

```
char * Fl_Text_Buffer::text () const
```

Get a copy of the entire contents of the text buffer.  
Memory is allocated to contain the returned string, which the caller must free.

##### Returns

newly allocated text buffer - must be free'd, text is UTF-8

#### 13.135.3.43 `text()` [2/2]

```
void Fl_Text_Buffer::text (
 const char * text)
```

Replaces the entire contents of the text buffer.

##### Parameters

<i>text</i>	Text must be valid UTF-8. If null, an empty string is substituted.
-------------	--------------------------------------------------------------------

#### 13.135.3.44 `text_range()`

```
char * Fl_Text_Buffer::text_range (
 int start,
```

```
int end) const
```

Get a copy of a part of the text buffer.

Return a copy of the text between `start` and `end` character positions from text buffer `buf`. Positions start at 0, and the range does not include the character pointed to by `end`. When you are done with the text, free it using the `free()` function.

#### Parameters

<i>start</i>	byte offset to first character
<i>end</i>	byte offset after last character in range

#### Returns

newly allocated text buffer - must be free'd, text is UTF-8

#### 13.135.3.45 text\_str()

```
std::string Fl_Text_Buffer::text_str () const
```

Get a copy of the entire contents of the text buffer.

#### Returns

text as a UTF-8 string

#### 13.135.3.46 undo()

```
int Fl_Text_Buffer::undo (
 int * cursorPos = 0)
```

Undo text modification according to the undo variables or insert text from the undo buffer.

Take the previous changes and undo them.

Return the previous cursor position in `cursorPos`. Returns 1 if the undo was applied. `CursorPos` will be at a character boundary.

#### 13.135.3.47 vprintf()

```
void Fl_Text_Buffer::vprintf (
 const char * fmt,
 va_list ap)
```

Can be used by subclasses that need their own [printf\(\)](#) style functionality.

#### Note

The expanded string is currently limited to 1024 characters.

#### Parameters

in	<i>fmt</i>	is a printf format string for the message text.
in	<i>ap</i>	is a <code>va_list</code> created by <code>va_start()</code> and closed with <code>va_end()</code> , which the caller is responsible for handling.

#### 13.135.3.48 word\_end()

```
int Fl_Text_Buffer::word_end (
 int pos) const
```

Returns the position corresponding to the end of the word.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to word end

**13.135.3.49 word\_start()**

```
int Fl_Text_Buffer::word_start (
 int pos) const
```

Returns the position corresponding to the start of the word.

## Parameters

<i>pos</i>	byte index into buffer
------------	------------------------

## Returns

byte offset to word start

**13.135.4 Member Data Documentation****13.135.4.1 file\_encoding\_warning\_message**

```
const char * Fl_Text_Buffer::file_encoding_warning_message [static]
```

**Initial value:**

```
=
 "Displayed text contains the UTF-8 transcoding\n"
 "of the input file which was not UTF-8 encoded.\n"
 "Some changes may have occurred."
```

This message may be displayed using the `fl_alert()` function when a file which was not UTF-8 encoded is input.

**13.135.4.2 mTabDist**

```
int Fl_Text_Buffer::mTabDist [protected]
```

equiv.

number of characters in a tab

**13.135.4.3 transcoding\_warning\_action**

```
void(* Fl_Text_Buffer::transcoding_warning_action) (Fl_Text_Buffer *)
```

Pointer to a function called after reading a non UTF-8 encoded file.

This function is called after reading a file if the file content was transcoded to UTF-8. Its default implementation calls `fl_alert()` with the text of [file\\_encoding\\_warning\\_message](#). No warning message is displayed if this pointer is set to NULL. Use [input\\_file\\_was\\_transcoded](#) to be informed if file input required transcoding to UTF-8.

The documentation for this class was generated from the following files:

- `Fl_Text_Buffer.H`
- `Fl_Text_Buffer.cxx`

**13.136 Fl\_Text\_Display Class Reference**

Rich text display widget.

```
#include <Fl_Text_Display.H>
```

Inheritance diagram for `Fl_Text_Display`:

## Classes

- struct [Style\\_Table\\_Entry](#)

*This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.*

## Public Types

- enum {  
[NORMAL\\_CURSOR](#) , [CARET\\_CURSOR](#) , [DIM\\_CURSOR](#) , [BLOCK\\_CURSOR](#) ,  
[HEAVY\\_CURSOR](#) , [SIMPLE\\_CURSOR](#) }  
*text display cursor shapes enumeration*
- enum { [CURSOR\\_POS](#) , [CHARACTER\\_POS](#) }  
*the character position is the left edge of a character, whereas the cursor is thought to be between the centers of two consecutive characters.*
- enum {  
[DRAG\\_NONE](#) = -2 , [DRAG\\_START\\_DND](#) = -1 , [DRAG\\_CHAR](#) = 0 , [DRAG\\_WORD](#) = 1 ,  
[DRAG\\_LINE](#) = 2 }  
*drag types - they match [Fl::event\\_clicks\(\)](#) so that single clicking to start a collection selects by character, double clicking selects by word and triple clicking selects by line.*
- enum { [WRAP\\_NONE](#) , [WRAP\\_AT\\_COLUMN](#) , [WRAP\\_AT\\_PIXEL](#) , [WRAP\\_AT\\_BOUNDS](#) }  
*wrap types - used in [wrap\\_mode\(\)](#)*
- enum {  
[ATTR\\_BGCOLOR](#) = 0x0001 , [ATTR\\_BGCOLOR\\_EXT\\_](#) = 0x0002 , [ATTR\\_BGCOLOR\\_EXT](#) = 0x0003 ,  
[ATTR\\_UNDERLINE](#) = 0x0004 ,  
[ATTR\\_GRAMMAR](#) = 0x0008 , [ATTR\\_SPELLING](#) = 0x000C , [ATTR\\_STRIKE\\_THROUGH](#) = 0x0010 ,

## Public Member Functions

- [Fl\\_Text\\_Buffer](#) \* [buffer](#) () const  
*Gets the current text buffer associated with the text widget.*
- void [buffer](#) ([Fl\\_Text\\_Buffer](#) &buf)  
*Sets the current text buffer associated with the text widget.*
- void [buffer](#) ([Fl\\_Text\\_Buffer](#) \*buf)  
*Attach a text buffer to display, replacing the current buffer (if any).*
- double [col\\_to\\_x](#) (double col) const  
*Convert a column number into an x pixel position.*
- int [count\\_lines](#) (int start, int end, bool start\_pos\_is\_line\_start) const  
*Count the number of lines between two positions.*
- [Fl\\_Color](#) [cursor\\_color](#) () const  
*Gets the text cursor color.*
- void [cursor\\_color](#) ([Fl\\_Color](#) n)

- Sets the text cursor color.*

  - int **cursor\_style** () const
  - void **cursor\_style** (int style)
- Sets the text cursor style.*

  - virtual void **display\_needs\_recalc** ()
- Schedule a **recalc\_display()** to be done on next **draw()**.*

  - **Fl\_Text\_Display** (int X, int Y, int W, int H, const char \*l=0)
- Creates a new text display widget.*

  - int **get\_absolute\_top\_line\_number** () const
- Returns the absolute (non-wrapped) line number of the first line displayed.*

  - **Fl\_Color** **grammar\_underline\_color** () const
- Gets the underline color for style attribute ATTR\_GRAMMAR.*

  - void **grammar\_underline\_color** (**Fl\_Color** color)
- Sets the underline color for style attribute ATTR\_GRAMMAR.*

  - int **handle** (int e) override
- Event handling.*

  - void **hide\_cursor** ()
- Hides the text cursor.*

  - void **highlight\_data** (**Fl\_Text\_Buffer** \*styleBuffer, const **Style\_Table\_Entry** \*styleTable, int nStyles, char unfinishedStyle, Unfinished\_Style\_Cb unfinishedHighlightCB, void \*cbArg)
- Attach (or remove) highlight information in text display and redisplay.*

  - int **in\_selection** (int x, int y) const
- Check if a pixel position is within the primary selection.*

  - void **insert** (const char \*text)
- Inserts "text" at the current cursor location.*

  - int **insert\_position** () const
- Gets the position of the text insertion cursor for text display.*

  - void **insert\_position** (int newPos)
- Sets the position of the text insertion cursor for text display.*

  - int **line\_end** (int startPos, bool startPosIsLineStart) const
- Returns the end of a line.*

  - int **line\_start** (int pos) const
- Return the beginning of a line.*

  - **Fl\_Align** **linenumber\_align** () const
- Returns the alignment used for line numbers (if enabled).*

  - void **linenumber\_align** (**Fl\_Align** val)
- Set alignment for line numbers (if enabled).*

  - **Fl\_Color** **linenumber\_bgcolor** () const
- Returns the background color used for line numbers (if enabled).*

  - void **linenumber\_bgcolor** (**Fl\_Color** val)
- Set the background color used for line numbers (if enabled).*

  - **Fl\_Color** **linenumber\_fgcolor** () const
- Return the foreground color used for line numbers (if enabled).*

  - void **linenumber\_fgcolor** (**Fl\_Color** val)
- Set the foreground color used for line numbers (if enabled).*

  - **Fl\_Font** **linenumber\_font** () const
- Return the font used for line numbers (if enabled).*

  - void **linenumber\_font** (**Fl\_Font** val)
- Set the font used for line numbers (if enabled).*

  - const char \* **linenumber\_format** () const
- Returns the line number printf() format string.*

- void [linenumber\\_format](#) (const char \*val)  
*Sets the printf() style format string used for line numbers.*
- [Fl\\_Fontsize linenumber\\_size](#) () const  
*Return the font size used for line numbers (if enabled).*
- void [linenumber\\_size](#) ([Fl\\_Fontsize](#) val)  
*Set the font size used for line numbers (if enabled).*
- int [linenumber\\_width](#) () const  
*Return the screen area width provided for line numbers.*
- void [linenumber\\_width](#) (int width)  
*Set width of screen area for line numbers.*
- int [move\\_down](#) ()  
*Moves the current insert position down one line.*
- int [move\\_left](#) ()  
*Moves the current insert position left one character.*
- int [move\\_right](#) ()  
*Moves the current insert position right one character.*
- int [move\\_up](#) ()  
*Moves the current insert position up one line.*
- void [next\\_word](#) (void)  
*Moves the current insert position right one word.*
- void [overstrike](#) (const char \*text)  
*Replaces text at the current insert position.*
- int [position\\_style](#) (int lineStartPos, int lineLen, int lineIndex) const  
*Find the correct style for a character.*
- int [position\\_to\\_xy](#) (int pos, int \*x, int \*y) const  
*Convert a character index into a pixel position.*
- void [previous\\_word](#) (void)  
*Moves the current insert position left one word.*
- virtual void [recalc\\_display](#) ()  
*Recalculate the display's visible lines and scrollbar sizes.*
- void [redisplay\\_range](#) (int start, int end)  
*Marks text from start to end as needing a redraw.*
- void [resize](#) (int X, int Y, int W, int H) override  
*Change the size of the displayed text area.*
- int [rewind\\_lines](#) (int startPos, int nLines)  
*Skip a number of lines back.*
- void [scroll](#) (int topLineNum, int horizOffset)  
*Scrolls the current buffer to start at the specified line and column.*
- int [scroll\\_col](#) () const
- int [scroll\\_row](#) () const
- [Fl\\_Align scrollbar\\_align](#) () const  
*Gets the scrollbar alignment type.*
- void [scrollbar\\_align](#) ([Fl\\_Align](#) a)  
*Sets the scrollbar alignment type.*
- int [scrollbar\\_size](#) () const  
*Gets the current size of the scrollbars' troughs, in pixels.*
- void [scrollbar\\_size](#) (int newSize)  
*Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- int [scrollbar\\_width](#) () const  
*Returns the global value [Fl::scrollbar\\_size\(\)](#) unless a specific scrollbar\_width\_ has been set.*
- void [scrollbar\\_width](#) (int width)

- Sets the global `Fl::scrollbar_size()`, and forces this instance of the widget to use it.*

  - `Fl_Color secondary_selection_color ()` const

*Gets the background color for the secondary selection block.*

- void `secondary_selection_color (Fl_Color color)`

*Sets the background color for the secondary selection block.*

- int `shortcut ()` const
- void `shortcut (int s)`
- void `show_cursor (int b=1)`

*Shows the text cursor.*

- void `show_insert_position ()`

*Scrolls the text buffer to show the current insert position.*

- int `skip_lines (int startPos, int nLines, bool startPosIsLineStart)`

*Skip a number of lines forward.*

- `Fl_Color spelling_underline_color ()` const

*Gets the underline color for style attribute `ATTR_SPELLING`.*

- void `spelling_underline_color (Fl_Color color)`

*Sets the underline color for style attribute `ATTR_SPELLING`.*

- `Fl_Text_Buffer * style_buffer ()` const

*Gets the current style buffer associated with the text widget.*

- `Fl_Color textcolor ()` const

*Gets the default color of text in the widget.*

- void `textcolor (Fl_Color n)`

*Sets the default color of text in the widget.*

- `Fl_Font textfont ()` const

*Gets the default font used when drawing text in the widget.*

- void `textfont (Fl_Font s)`

*Sets the default font used when drawing text in the widget.*

- `Fl_Fontsize textsize ()` const

*Gets the default size of text in the widget.*

- void `textsize (Fl_Fontsize s)`

*Sets the default size of text in the widget.*

- int `word_end (int pos)` const

*Moves the insert position to the end of the current word.*

- int `word_start (int pos)` const

*Moves the insert position to the beginning of the current word.*

- void `wrap_mode (int wrap, int wrap_margin)`

*Set the new text wrap mode.*

- int `wrapped_column (int row, int column)` const

*Nobody knows what this function does.*

- int `wrapped_row (int row)` const

*Nobody knows what this function does.*

- double `x_to_col (double x)` const

*Convert an x pixel position into a column number.*

- `~Fl_Text_Display ()`

*Free a text display and release its associated memory.*

## Public Member Functions inherited from FL\_Group

- [FL\\_Widget](#) \*[\\_ddfdesign\\_kludge](#) ()  
*This is for forms compatibility only.*
- void **add** ([FL\\_Widget](#) &)  
*The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL\\_Widget](#) \*o)  
*See void [FL\\_Group::add\(FL\\_Widget &w\)](#)*
- void **add\_resizable** ([FL\\_Widget](#) &o)  
*Adds a widget to the group and makes it the resizable widget.*
- [FL\\_Widget](#) \*const \* **array** () const  
*Returns a pointer to the internal array of children.*
- [FL\\_Group](#) const \* **as\_group** () const override
- [FL\\_Group](#) \* **as\_group** () override  
*Returns an [FL\\_Group](#) pointer if this widget is an [FL\\_Group](#).*
- void **begin** ()  
*Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL\\_Widget](#) \* **child** (int n) const  
*Returns the n'th child.*
- int **children** () const  
*Returns how many child widgets the group has.*
- void **clear** ()  
*Deletes all child widgets from memory recursively.*
- unsigned int **clip\_children** () const  
*Returns the current clipping mode.*
- void **clip\_children** (int c)  
*Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete\_child** (int n)  
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()  
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL\\_Widget](#) &o) const  
*See int [FL\\_Group::find\(const FL\\_Widget \\*w\)](#) const.*
- int **find** (const [FL\\_Widget](#) \*) const  
*Searches the children for the widget and returns the index.*
- [FL\\_Group](#) (int, int, int, int, const char \* = 0)  
*Creates a new [FL\\_Group](#) widget using the given position, size, and label string.*
- void **forms\_end** ()  
*This is for forms compatibility only.*
- void **init\_sizes** ()  
*Resets the internal array of widget sizes and positions.*
- void **insert** ([FL\\_Widget](#) &, int i)  
*The widget is removed from its current group (if any) and then inserted into this group.*
- void **insert** ([FL\\_Widget](#) &o, [FL\\_Widget](#) \*before)  
*This does *insert(w, find(before))*.*
- void **remove** ([FL\\_Widget](#) &)  
*Removes a widget from the group but does not delete it.*
- void **remove** ([FL\\_Widget](#) \*o)  
*Removes the widget o from the group.*
- void **remove** (int index)  
*Removes the widget at *index* from the group but does not delete it.*

- `FI_Widget * resizable () const`  
*Returns the group's resizable widget.*
- `void resizable (FI_Widget &o)`  
*Sets the group's resizable widget.*
- `void resizable (FI_Widget *o)`  
*The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- `virtual ~FI_Group ()`  
*The destructor also deletes all the children.*

## Public Member Functions inherited from `FI_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`  
*Activates the widget.*
- `unsigned int active () const`  
*Returns whether the widget is active.*
- `int active_r () const`  
*Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`  
*Gets the label alignment.*
- `void align (FI_Align alignment)`  
*Sets the label alignment.*
- `long argument () const`  
*Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`  
*Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_GL_Window * as_gl_window ()`  
*Returns an `FI_GL_Window` pointer if this widget is an `FI_GL_Window`.*
- `virtual class FI_GL_Window const * as_gl_window () const`
- `virtual FI_Window * as_window ()`  
*Returns an `FI_Window` pointer if this widget is an `FI_Window`.*
- `virtual FI_Window const * as_window () const`
- `void bind_deimage (FI_Image *img)`  
*Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`  
*Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FI_Image *img)`  
*Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`  
*Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FI_Boxtype box () const`  
*Gets the box type of the widget.*
- `void box (FI_Boxtype new_box)`  
*Sets the box type for the widget.*
- `FI_Callback_p callback () const`  
*Gets the current callback function for the widget.*
- `void callback (FI_Callback *cb)`  
*Sets the current callback function for the widget.*
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`  
*Sets the current callback function and managed user data for the widget.*

- void [callback](#) ([FI\\_Callback](#) \*cb, void \*p)  
*Sets the current callback function and data for the widget.*
- void [callback](#) ([FI\\_Callback0](#) \*cb)  
*Sets the current callback function for the widget.*
- void [callback](#) ([FI\\_Callback1](#) \*cb, long p=0)  
*Sets the current callback function for the widget.*
- unsigned int [changed](#) () const  
*Checks if the widget value changed since the last callback.*
- void [clear\\_active](#) ()  
*Marks the widget as inactive without sending events or changing focus.*
- void [clear\\_changed](#) ()  
*Marks the value of the widget as unchanged.*
- void [clear\\_damage](#) ([uchar](#) c=0)  
*Clears or sets the damage flags.*
- void [clear\\_output](#) ()  
*Sets a widget to accept input.*
- void [clear\\_visible](#) ()  
*Hides the widget.*
- void [clear\\_visible\\_focus](#) ()  
*Disables keyboard focus navigation with this widget.*
- [FI\\_Color](#) [color](#) () const  
*Gets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg)  
*Sets the background color of the widget.*
- void [color](#) ([FI\\_Color](#) bg, [FI\\_Color](#) sel)  
*Sets the background and selection color of the widget.*
- int [contains](#) (const [FI\\_Widget](#) \*w) const  
*Checks if w is a child of this widget.*
- void [copy\\_label](#) (const char \*new\_label)  
*Sets the current label.*
- void [copy\\_tooltip](#) (const char \*text)  
*Sets the current tooltip text.*
- [uchar](#) [damage](#) () const  
*Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)  
*Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)  
*Sets the damage bits for an area inside the widget.*
- int [damage\\_resize](#) (int, int, int, int)  
*Internal use only.*
- void [deactivate](#) ()  
*Deactivates the widget.*
- [FI\\_Image](#) \* [deimage](#) ()  
*Gets the image that is used as part of the widget label when in the inactive state.*
- const [FI\\_Image](#) \* [deimage](#) () const  
*Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) &img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FI\\_Image](#) \*img)  
*Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage\\_bound](#) () const

- Returns whether the inactive image is managed by the widget.*

  - void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with default arguments.*
- void `do_callback` (`FI_Widget` \*widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FI_Widget` \*widget, void \*arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)

*Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FI_Align`) const

*Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const

*Gets the widget height.*
- virtual void `hide` ()

*Makes a widget invisible.*
- int `horizontal_label_margin` ()

*Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)

*Set the spacing between the label and the horizontal edge of the widget.*
- `FI_Image` \* `image` ()

*Gets the image that is used as part of the widget label when in the active state.*
- const `FI_Image` \* `image` () const

*Gets the image that is used as part of the widget label when in the active state.*
- void `image` (`FI_Image` &img)

*Sets the image to use as part of the widget label when in the active state.*
- void `image` (`FI_Image` \*img)

*Sets the image to use as part of the widget label when in the active state.*
- int `image_bound` () const

*Returns whether the image is managed by the widget.*
- int `inside` (const `FI_Widget` \*wgt) const

*Checks if this widget is a child of wgt.*
- int `is_label_copied` () const

*Returns whether the current label was assigned with `copy_label()`.*
- const char \* `label` () const

*Gets the current label text.*
- void `label` (const char \*text)

*Sets the current label pointer.*
- void `label` (`FI_Labeltype` a, const char \*b)

*Shortcut to set the label text and type in one call.*
- int `label_image_spacing` ()

*Return the gap size between the label and the image.*
- void `label_image_spacing` (int gap)

*Set the gap between the label and the image in pixels.*
- `FI_Color` `labelcolor` () const

*Gets the label color.*
- void `labelcolor` (`FI_Color` c)

*Sets the label color.*
- `FI_Font` `labelfont` () const

*Gets the font to use.*
- void `labelfont` (`FI_Font` f)

*Sets the font to use.*
- `FI_Fontsize` `labelsize` () const

*Gets the font size in pixels.*

- void [labelsize](#) ([Fl\\_Fontsize](#) pix)  
*Sets the font size in pixels.*
- [Fl\\_Labeltype](#) [labeltype](#) () const  
*Gets the label type.*
- void [labeltype](#) ([Fl\\_Labeltype](#) a)  
*Sets the label type.*
- void [measure\\_label](#) (int &ww, int &hh) const  
*Sets width ww and height hh accordingly with the label size.*
- bool [needs\\_keyboard](#) () const  
*Returns whether this widget needs a keyboard.*
- void [needs\\_keyboard](#) (bool needs)  
*Sets whether this widget needs a keyboard.*
- unsigned int [output](#) () const  
*Returns if a widget is used for output only.*
- [Fl\\_Group](#) \* [parent](#) () const  
*Returns a pointer to the parent widget.*
- void [parent](#) ([Fl\\_Group](#) \*p)  
*Internal use only - "for hacks only".*
- void [position](#) (int X, int Y)  
*Repositions the window or widget.*
- void [redraw](#) ()  
*Schedules the drawing of the widget.*
- void [redraw\\_label](#) ()  
*Schedules the drawing of the label.*
- [Fl\\_Color](#) [selection\\_color](#) () const  
*Gets the selection color.*
- void [selection\\_color](#) ([Fl\\_Color](#) a)  
*Sets the selection color.*
- int [send](#) (int event)  
*Sends the specified event to the widget.*
- void [set\\_active](#) ()  
*Marks the widget as active without sending events or changing focus.*
- void [set\\_changed](#) ()  
*Marks the value of the widget as changed.*
- void [set\\_output](#) ()  
*Sets a widget to output only.*
- void [set\\_visible](#) ()  
*Makes the widget visible.*
- void [set\\_visible\\_focus](#) ()  
*Enables keyboard focus navigation with this widget.*
- int [shortcut\\_label](#) () const  
*Returns whether the widget's label uses '&' to indicate shortcuts.*
- void [shortcut\\_label](#) (int value)  
*Sets whether the widget's label uses '&' to indicate shortcuts.*
- virtual void [show](#) ()  
*Makes a widget visible.*
- void [size](#) (int W, int H)  
*Changes the size of the widget.*
- int [take\\_focus](#) ()  
*Gives the widget the keyboard focus.*
- unsigned int [takeevents](#) () const

- Returns if the widget is able to take events.*

  - int `test_shortcut` ()

*Returns true if the widget's label contains the entered '&x' shortcut.*
- const char \* `tooltip` () const

*Gets the current tooltip text.*
- void `tooltip` (const char \*text)

*Sets the Tooltip Text for a Widget.*
- `Fl_Window` \* `top_window` () const

*Returns a pointer to the top-level window for the widget.*
- `Fl_Window` \* `top_window_offset` (int &xoff, int &yoff) const

*Finds the x/y offset of the current widget relative to the top-level window.*
- `uchar` `type` () const

*Gets the widget type.*
- void `type` (`uchar` t)

*Sets the widget type.*
- int `use_accents_menu` ()

*Returns non zero if MAC\_USE\_ACCENTS\_MENU flag is set, 0 otherwise.*
- void \* `user_data` () const

*Gets the user data for this widget.*
- void `user_data` (`Fl_Callback_User_Data` \*v, bool auto\_free)

*Sets the user data for this widget.*
- void `user_data` (void \*v)

*Sets the user data for this widget.*
- int `vertical_label_margin` ()

*Get the spacing between the label and the vertical edge of the widget.*
- void `vertical_label_margin` (int px)

*Set the spacing between the label and the vertical edge of the widget.*
- unsigned int `visible` () const

*Returns whether a widget is visible.*
- unsigned int `visible_focus` () const

*Checks whether this widget has a visible focus.*
- void `visible_focus` (int v)

*Modifies keyboard focus navigation.*
- int `visible_r` () const

*Returns whether a widget and all its parents are visible.*
- int `w` () const

*Gets the widget width.*
- `Fl_When` `when` () const

*Returns the conditions under which the callback is called.*
- void `when` (`uchar` i)

*Sets the flags used to decide when a callback is called.*
- `Fl_Window` \* `window` () const

*Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const

*Gets the widget position in its window.*
- int `y` () const

*Gets the widget position in its window.*
- virtual `~Fl_Widget` ()

*Destroys the widget.*

*Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test\\_shortcut](#) (const char \*, const bool require\_alt=false)  
*Returns true if the given text t contains the entered '&x' shortcut.*

### 13.136.1 Detailed Description

Rich text display widget.

This is the FLTK text display widget. It allows the user to view multiple lines of text and supports highlighting, word wrap, mixes of font faces and colors, line numbers and scrolling. The buffer that is displayed in the widget is managed by the [Fl\\_Text\\_Buffer](#) class. A single Text Buffer can be displayed by multiple Text Displays.

Figure 13.58 [Fl\\_Text\\_Display](#) widget

Figure 13.59 Fl\_Text\_Display widget with line numbers enabled

**Example Use**

```
#include <FL/Fl_Text_Display.H>
...
int main() {
 ...
 Fl_Text_Buffer *buff = new Fl_Text_Buffer();
 Fl_Text_Display *disp = new Fl_Text_Display(10, 10, 640, 480);
 disp->buffer(buff); // attach text buffer to display widget
 buff->text("line one\nline two"); // add some text to buffer
 ...
}
```

**Features**

- Word wrap: [wrap\\_mode\(\)](#), [wrapped\\_column\(\)](#), [wrapped\\_row\(\)](#)
- Font control: [textfont\(\)](#), [textsize\(\)](#), [textcolor\(\)](#)
- Font styling: [highlight\\_data\(\)](#)
- Cursor: [cursor\\_style\(\)](#), [show\\_cursor\(\)](#), [hide\\_cursor\(\)](#), [cursor\\_color\(\)](#)
- Line numbers: [linenumber\\_width\(\)](#), [linenumber\\_font\(\)](#), [linenumber\\_size\(\)](#), [linenumber\\_fgcolor\(\)](#), [linenumber\\_bgcolor\(\)](#), [linenumber\\_align\(\)](#), [linenumber\\_format\(\)](#)

Note that other features may be available via [Fl\\_Text\\_Editor](#) and [Fl\\_Text\\_Buffer](#) classes.

**Note**

Line numbers were added in FLTK 1.3.3.

**See also**

**13.136.2 Member Enumeration Documentation****13.136.2.1 anonymous enum**

anonymous enum

text display cursor shapes enumeration

**Enumerator**

NORMAL_CURSOR	I-beam.
---------------	---------

## Enumerator

CARET_CURSOR	caret under the text
DIM_CURSOR	dim I-beam
BLOCK_CURSOR	unfilled box under the current character
HEAVY_CURSOR	thick I-beam
SIMPLE_CURSOR	as cursor as <a href="#">Fl_Input</a> cursor

**13.136.2.2 anonymous enum**

anonymous enum

wrap types - used in [wrap\\_mode\(\)](#)

## Enumerator

WRAP_NONE	don't wrap text at all
WRAP_AT_COLUMN	wrap text at the given text column
WRAP_AT_PIXEL	wrap text at a pixel position
WRAP_AT_BOUNDS	wrap text so that it fits into the widget width

**13.136.2.3 anonymous enum**

anonymous enum

attribute flags in [Style\\_Table\\_Entry.attr](#)

## Enumerator

ATTR_BGCOLOR	use the background color in the <code>bgbcolor</code> field
ATTR_BGCOLOR_EXT_	(internal use)
ATTR_BGCOLOR_EXT	extend background color to the end of the line
ATTR_UNDERLINE	a single underline, underline types are mutually exclusive
ATTR_GRAMMAR	grammar suggestion (blue dotted underline)
ATTR_SPELLING	spelling suggestion (red dotted underline)
ATTR_STRIKE_THROUGH	line through the middle of the text
ATTR_LINES_MASK	the mask for all underline and strike through types

**13.136.3 Constructor & Destructor Documentation****13.136.3.1 Fl\_Text\_Display()**

```
Fl_Text_Display::Fl_Text_Display (
 int X,
 int Y,
 int W,
 int H,
 const char * l = 0)
```

Creates a new text display widget.

## Parameters

<i>X,Y,W,H</i>	position and size of widget
<i>l</i>	label text, defaults to none

**13.136.3.2 ~Fl\_Text\_Display()**

```
Fl_Text_Display::~~Fl_Text_Display ()
```

Free a text display and release its associated memory.

**Note**

The text buffer that the text display displays is a separate entity and is not freed, nor are the style buffer or style table.

**See also**

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

**13.136.4 Member Function Documentation****13.136.4.1 absolute\_top\_line\_number()**

```
void Fl_Text_Display::absolute_top_line_number (
 int oldFirstChar) [protected]
```

Re-calculate absolute top line number for a change in scroll position.

Does nothing if the absolute top line number is not being maintained.

**13.136.4.2 buffer() [1/3]**

```
Fl_Text_Buffer * Fl_Text_Display::buffer () const [inline]
```

Gets the current text buffer associated with the text widget.

Multiple text widgets can be associated with the same text buffer.

**Returns**

current text buffer

**See also**

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer& buf\)](#)

**13.136.4.3 buffer() [2/3]**

```
void Fl_Text_Display::buffer (
 Fl_Text_Buffer & buf) [inline]
```

Sets the current text buffer associated with the text widget.

Multiple text widgets can be associated with the same text buffer.

**Parameters**

<i>buf</i>	new text buffer
------------	-----------------

**See also**

[Fl\\_Text\\_Display::buffer\(Fl\\_Text\\_Buffer\\* buf\)](#)

**13.136.4.4 buffer() [3/3]**

```
void Fl_Text_Display::buffer (
 Fl_Text_Buffer * buf)
```

Attach a text buffer to display, replacing the current buffer (if any).

Multiple text widgets can be associated with the same text buffer.

**Note**

The caller is responsible for the old (replaced) buffer (if any). This method does not delete the old buffer.

**Parameters**

<i>buf</i>	attach this text buffer
------------	-------------------------

**13.136.4.5 buffer\_modified\_cb()**

```
void Fl_Text_Display::buffer_modified_cb (
 int pos,
 int nInserted,
 int nDeleted,
 int nRestyled,
 const char * deletedText,
 void * cbArg) [static], [protected]
```

This is called whenever the buffer is modified.

Callback attached to the text buffer to receive modification information.

This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

**Parameters**

<i>pos</i>	starting index of modification
<i>nInserted</i>	number of bytes we inserted (must be UTF-8 aligned!)
<i>nDeleted</i>	number of bytes deleted (must be UTF-8 aligned!)
<i>nRestyled</i>	??
<i>deletedText</i>	this is what was removed, must not be NULL if nDeleted is set
<i>cbArg</i>	"this" pointer for static callback function

**13.136.4.6 buffer\_predelete\_cb()**

```
void Fl_Text_Display::buffer_predelete_cb (
 int pos,
 int nDeleted,
 void * cbArg) [static], [protected]
```

This is called before any characters are deleted.

Callback attached to the text buffer to receive delete information before the modifications are actually made.

This callback can be used to adjust the display or update other setting. It is not advisable to change any buffers or text in this callback, or line counting may get out of sync.

**Parameters**

<i>pos</i>	starting index of deletion
<i>nDeleted</i>	number of bytes we will delete (must be UTF-8 aligned!)
<i>cbArg</i>	"this" pointer for static callback function

**13.136.4.7 calc\_last\_char()**

```
void Fl_Text_Display::calc_last_char () [protected]
```

Update last display character index.

Given a [Fl\\_Text\\_Display](#) with a complete, up-to-date lineStarts array, update the lastChar entry to point to the last

buffer position displayed.

#### 13.136.4.8 calc\_line\_starts()

```
void Fl_Text_Display::calc_line_starts (
 int startLine,
 int endLine) [protected]
```

Update the line starts array.

Scan through the text in the Text Display's buffer and recalculate the line starts array values beginning at index "startLine" and continuing through (including) "endLine". It assumes that the line starts entry preceding "startLine" (or mFirstChar if startLine is 0) is good, and re-counts newlines to fill in the requested entries. Out of range values for "startLine" and "endLine" are acceptable.

##### Parameters

<i>startLine,endLine</i>	range of lines to scan as line numbers
--------------------------	----------------------------------------

#### 13.136.4.9 clear\_rect()

```
void Fl_Text_Display::clear_rect (
 int style,
 int X,
 int Y,
 int width,
 int height) const [protected]
```

Clear a rectangle with the appropriate background color for *style*.

##### Parameters

<i>style</i>	index into style table
<i>X,Y,width,height</i>	size and position of background area

#### 13.136.4.10 col\_to\_x()

```
double Fl_Text_Display::col_to_x (
 double col) const
```

Convert a column number into an x pixel position.

##### Parameters

<i>col</i>	an approximate column number based on the main font
------------	-----------------------------------------------------

##### Returns

number of pixels from the left margin to the left of an average sized character

##### See also

[x\\_to\\_col\(\)](#)

#### 13.136.4.11 count\_lines()

```
int Fl_Text_Display::count_lines (
 int startPos,
 int endPos,
 bool startPosIsLineStart) const
```

Count the number of lines between two positions.

Same as `Fl_Text_Buffer::count_lines()`, but takes into account wrapping if wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

#### Parameters

<i>startPos</i>	index to first character
<i>endPos</i>	index after last character
<i>startPosIsLineStart</i>	avoid scanning back to the line start

#### Returns

number of lines

#### 13.136.4.12 `cursor_color()` [1/2]

```
Fl_Color Fl_Text_Display::cursor_color () const [inline]
```

Gets the text cursor color.

#### Returns

cursor color

#### 13.136.4.13 `cursor_color()` [2/2]

```
void Fl_Text_Display::cursor_color (
 Fl_Color n) [inline]
```

Sets the text cursor color.

#### Parameters

<i>n</i>	new cursor color
----------	------------------

#### 13.136.4.14 `cursor_style()`

```
void Fl_Text_Display::cursor_style (
 int style)
```

Sets the text cursor style.

Sets the text cursor style to one of the following:

- `Fl_Text_Display::NORMAL_CURSOR` - Shows an I beam.
- `Fl_Text_Display::CARET_CURSOR` - Shows a caret under the text.
- `Fl_Text_Display::DIM_CURSOR` - Shows a dimmed I beam.
- `Fl_Text_Display::BLOCK_CURSOR` - Shows an unfilled box around the current character.
- `Fl_Text_Display::HEAVY_CURSOR` - Shows a thick I beam.

This call also switches the cursor on and may trigger a redraw.

#### Parameters

<i>style</i>	new cursor style
--------------	------------------

**13.136.4.15 display\_insert()**

```
void Fl_Text_Display::display_insert () [protected]
```

Scroll the display to bring insertion cursor into view.

Note: it would be nice to be able to do this without counting lines twice ([scroll\\_\(\)](#) counts them too) and/or to count from the most efficient starting point, but the efficiency of this routine is not as important to the overall performance of the text display.

**13.136.4.16 display\_needs\_recalc()**

```
void Fl_Text_Display::display_needs_recalc () [virtual]
```

Schedule a [recalc\\_display\(\)](#) to be done on next [draw\(\)](#).

Call this from methods that might be called repeatedly, to defers potentially CPU intensive [recalc\\_display\(\)](#) until it's actually needed just before [draw\(\)](#).

**13.136.4.17 draw()**

```
void Fl_Text_Display::draw (
 void) [override], [protected], [virtual]
```

Draw the widget.

This function tries to limit drawing to smaller areas if possible.

Reimplemented from [Fl\\_Group](#).

**13.136.4.18 draw\_cursor()**

```
void Fl_Text_Display::draw_cursor (
 int X,
 int Y) [protected]
```

Draw a cursor with top center at X, Y.

**Parameters**

<i>X,Y</i>	cursor position in pixels
------------	---------------------------

**13.136.4.19 draw\_line\_numbers()**

```
void Fl_Text_Display::draw_line_numbers (
 bool clearAll) [protected]
```

Refresh the line number area.

**Parameters**

<i>clearAll</i>	– (currently unused) If False, only draws the line number text, does not clear the area behind it. If True, clears the area and redraws the text. Use False to avoid a 'flash' for single buffered windows.
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**13.136.4.20 draw\_range()**

```
void Fl_Text_Display::draw_range (
 int startpos,
 int endpos) [protected]
```

Draw a range of text.

Refresh all of the text between buffer positions *startpos* and *endpos* not including the character at the position *endpos*.

If *endpos* points beyond the end of the buffer, refresh the whole display after *startpos*, including blank lines which are not technically part of any range of characters.

## Parameters

<i>startpos</i>	index of first character to draw
<i>endpos</i>	index after last character to draw

**13.136.4.21 draw\_string()**

```
void Fl_Text_Display::draw_string (
 int style,
 int X,
 int Y,
 int toX,
 const char * string,
 int nChars) const [protected]
```

Draw a text segment in a single style.

Draw a string or blank area according to parameter *style*, using the appropriate colors and drawing method for that style, with top left corner at *X*, *Y*. If style says to draw text, use *string* as source of characters, and draw *nChars*, if style is FILL, erase rectangle where text would have drawn from *X* to *toX* and from *Y* to the maximum *y* extent of the current font(s).

## Parameters

<i>style</i>	index into style lookup table
<i>X,Y</i>	drawing origin
<i>toX</i>	rightmost position if this is a fill operation
<i>string</i>	text if this is a drawing operation
<i>nChars</i>	number of characters to draw

**13.136.4.22 draw\_text()**

```
void Fl_Text_Display::draw_text (
 int left,
 int top,
 int width,
 int height) [protected]
```

Refresh a rectangle of the text display.

## Parameters

<i>left,top</i>	are in coordinates of the text drawing window.
<i>width,height</i>	size in pixels

**13.136.4.23 draw\_vline()**

```
void Fl_Text_Display::draw_vline (
 int visLineNum,
 int leftClip,
 int rightClip,
 int leftCharIndex,
 int rightCharIndex) [protected]
```

Draw a single line of text.

Draw the text on a single line represented by *visLineNum* (the number of lines down from the top of the display), limited by *leftClip* and *rightClip* window coordinates and *leftCharIndex* and *rightCharIndex* character positions (not including the character at position *rightCharIndex*).

## Parameters

<i>visLineNum</i>	index of line in the visible line number lookup
<i>leftClip, rightClip</i>	pixel position of clipped area
<i>leftCharIndex, rightCharIndex</i>	index into line of segment that we want to draw

**13.136.4.24 empty\_vlines()**

```
int Fl_Text_Display::empty_vlines () const [protected]
```

Return true if there are lines visible with no corresponding buffer text.

## Returns

1 if there are empty lines

**13.136.4.25 extend\_range\_for\_styles()**

```
void Fl_Text_Display::extend_range_for_styles (
 int * startpos,
 int * endpos) [protected]
```

I don't know what this does!

Extend the range of a redraw request (from \*start to \*end) with additional redraw requests resulting from changes to the attached style buffer (which contains auxiliary information for coloring or styling text).

## Parameters

<i>startpos</i>	??
<i>endpos</i>	??

**Todo** Unicode?

**13.136.4.26 find\_line\_end()**

```
void Fl_Text_Display::find_line_end (
 int startPos,
 bool startPosIsLineStart,
 int * lineEnd,
 int * nextLineStart) const [protected]
```

Finds both the end of the current line and the start of the next line.

Why? In continuous wrap mode, if you need to know both, figuring out one from the other can be expensive or error prone. The problem comes when there's a trailing space or tab just before the end of the buffer. To translate an end of line value to or from the next lines start value, you need to know whether the trailing space or tab is being used as a line break or just a normal character, and to find that out would otherwise require counting all the way back to the beginning of the line.

## Parameters

	<i>startPos</i>	
	<i>startPosIsLineStart</i>	
out	<i>lineEnd</i>	
out	<i>nextLineStart</i>	

**13.136.4.27 find\_wrap\_range()**

```
void Fl_Text_Display::find_wrap_range (
 const char * deletedText,
 int pos,
 int nInserted,
 int nDeleted,
 int * modRangeStart,
 int * modRangeEnd,
 int * linesInserted,
 int * linesDeleted) [protected]
```

Wrapping calculations.

When continuous wrap is on, and the user inserts or deletes characters, wrapping can happen before and beyond the changed position. This routine finds the extent of the changes, and counts the deleted and inserted lines over that range. It also attempts to minimize the size of the range to what has to be counted and re-displayed, so the results can be useful both for delimiting where the line starts need to be recalculated, and for deciding what part of the text to redisplay.

**Parameters**

<i>deletedText</i>	
<i>pos</i>	
<i>nInserted</i>	
<i>nDeleted</i>	
<i>modRangeStart</i>	
<i>modRangeEnd</i>	
<i>linesInserted</i>	
<i>linesDeleted</i>	

**13.136.4.28 find\_x()**

```
int Fl_Text_Display::find_x (
 const char * s,
 int len,
 int style,
 int x) const [protected]
```

Find the index of the character that lies at the given x position / closest cursor position.

**Parameters**

<i>s</i>	UTF-8 text string
<i>len</i>	length of string
<i>style</i>	index into style lookup table
<i>x</i>	position in pixels - negative returns closest cursor position

**Returns**

index into buffer

**13.136.4.29 get\_absolute\_top\_line\_number()**

```
int Fl_Text_Display::get_absolute_top_line_number () const
```

Returns the absolute (non-wrapped) line number of the first line displayed.

Returns 0 if the absolute top line number is not being maintained.

**13.136.4.30 grammar\_underline\_color()** [1/2]

`Fl_Color` Fl\_Text\_Display::grammar\_underline\_color ( ) const [inline]  
Gets the underline color for style attribute ATTR\_GRAMMAR.

**Returns**

underline color

**13.136.4.31 grammar\_underline\_color()** [2/2]

```
void Fl_Text_Display::grammar_underline_color (
 Fl_Color color) [inline]
```

Sets the underline color for style attribute ATTR\_GRAMMAR.

**Parameters**

<i>color</i>	underline color
--------------	-----------------

**13.136.4.32 handle()**

```
int Fl_Text_Display::handle (
 int e) [override], [virtual]
```

Event handling.

Reimplemented from [Fl\\_Group](#).

Reimplemented in [Fl\\_Text\\_Editor](#).

**13.136.4.33 handle\_rmb()**

```
int Fl_Text_Display::handle_rmb (
 int readonly) [protected]
```

Handle right mouse button down events.

**Returns**

0 for no op, 1 to cut, 2 to copy, 3 to paste

**13.136.4.34 handle\_vline()**

```
int Fl_Text_Display::handle_vline (
 int mode,
 int lineStartPos,
 int lineLen,
 int leftChar,
 int rightChar,
 int Y,
 int bottomClip,
 int leftClip,
 int rightClip) const [protected]
```

Universal pixel machine.

We use a single function that handles all line layout, measuring, and drawing

- draw a text range
- return the width of a text range in pixels
- return the index of a character that is at a pixel position

## Parameters

in	<i>mode</i>	DRAW_LINE, GET_WIDTH, FIND_INDEX, FIND_INDEX_FROM_ZERO, or FIND_CURSOR_INDEX
in	<i>lineStartPos</i>	index of first character
in	<i>lineLen</i>	size of string in bytes
in	<i>leftChar,rightChar</i>	
in	<i>Y</i>	drawing position
in	<i>bottomClip,leftClip,rightClip</i>	stop work when we reach the clipped area. rightClip is the X position that we search in FIND_INDEX.

## Return values

<i>DRAW_LINE</i>	index of last drawn character
<i>GET_WIDTH</i>	width in pixels of text segment if we would draw it
<i>FIND_INDEX</i>	index of character at given x position in window coordinates
<i>FIND_INDEX_FROM_ZERO</i>	index of character at given x position without scrolling and widget offsets

**Todo** we need to handle hidden hyphens and tabs here!

we handle all styles and selections

we must provide code to get pixel positions of the middle of a character as well

**13.136.4.35 highlight\_data()**

```
void Fl_Text_Display::highlight_data (
 Fl_Text_Buffer * styleBuffer,
 const Style_Table_Entry * styleTable,
 int nStyles,
 char unfinishedStyle,
 Unfinished_Style_Cb unfinishedHighlightCB,
 void * cbArg)
```

Attach (or remove) highlight information in text display and redisplay.

Highlighting information consists of a style buffer which parallels the normal text buffer, but codes font and color information for the display; a style table which translates style buffer codes (indexed by buffer character - 'A') into fonts and colors; and a callback mechanism for as-needed highlighting, triggered by a style buffer entry of "unfinished↵ Style". Style buffer can trigger additional redisplay during a normal buffer modification if the buffer contains a primary [Fl\\_Text\\_Selection](#) (see [extend\\_range\\_for\\_styles\(\)](#) for more information on this protocol).

Style buffers, tables and their associated memory are managed by the caller.

Styles are ranged from 65 ('A') to 126.

**Note**

Style information in the style buffer must have the same byte offset as the corresponding character in the text buffer. UTF-8 characters can have a maximum length of four bytes. Style information must take this into account and fill the unused bytes with 0. See [fl\\_utf8len\(\)](#).

Text: "*\*g\* r ü \*n\**", where normal style is 'A', and bold is 'B'

Text Buffer(hex): 67 72 c3 bc 6e : gr..n  
Style Buffer(hex): 42 41 41 00 42 : BAA.B

## Parameters

<i>styleBuffer</i>	this buffer works in parallel to the text buffer. For every character in the text buffer, the style buffer has a byte at the same offset that contains an index into an array of possible styles.
--------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Parameters

<i>styleTable</i>	a list of styles indexed by the style buffer
<i>nStyles</i>	number of styles in the style table
<i>unfinishedStyle</i>	if this style is found, the callback below is called
<i>unfinishedHighlightCB</i>	if a character with an unfinished style is found, this callback will be called
<i>cbArg</i>	an optional argument for the callback above, usually a pointer to the Text Display.

## See also

[Fl\\_Text\\_Display::style\\_buffer\(\)](#)

**13.136.4.36 in\_selection()**

```
int Fl_Text_Display::in_selection (
 int X,
 int Y) const
```

Check if a pixel position is within the primary selection.

## Parameters

<i>X,Y</i>	pixel position to test
------------	------------------------

## Returns

1 if position (X, Y) is inside of the primary [Fl\\_Text\\_Selection](#)

**13.136.4.37 insert()**

```
void Fl_Text_Display::insert (
 const char * text)
```

Inserts "text" at the current cursor location.

This has the same effect as inserting the text into the buffer using `insert(insert_position(),text)` and then moving the insert position after the newly inserted text, except that it's optimized to do less redrawing.

## Parameters

<i>text</i>	new text in UTF-8 encoding.
-------------	-----------------------------

**13.136.4.38 insert\_position()** [1/2]

```
int Fl_Text_Display::insert_position () const [inline]
```

Gets the position of the text insertion cursor for text display.

The insert position is the byte count (offset) from the beginning of the text buffer (starting with 0). Returns 0 (zero) if no buffer is associated to the text display. Returns `buffer()->length()` if the insert position is at the end of the buffer.

## Returns

insert position index into text buffer

## See also

[insert\\_position\(int\)](#)

#### 13.136.4.39 insert\_position() [2/2]

```
void Fl_Text_Display::insert_position (
 int newPos)
```

Sets the position of the text insertion cursor for text display.

Moves the insertion cursor in front of the character at `newPos`. This function may trigger a redraw.

##### Parameters

<i>newPos</i>	new caret position
---------------	--------------------

#### 13.136.4.40 line\_end()

```
int Fl_Text_Display::line_end (
 int startPos,
 bool startPosIsLineStart) const
```

Returns the end of a line.

Same as [buffer\(\)](#)->`line_end(startPos)`, but takes into account line breaks when wrapping is turned on. If the caller knows that `startPos` is at a line start, it can pass `startPosIsLineStart` as `True` to make the call more efficient by avoiding the additional step of scanning back to the last newline.

Note that the definition of the end of a line is less clear when continuous wrap is on. With continuous wrap off, it's just a pointer to the newline that ends the line. When it's on, it's the character beyond the last **displayable** character on the line, where a whitespace character which has been "converted" to a newline for wrapping is not considered displayable. Also note that a line can be wrapped at a non-whitespace character if the line had no whitespace. In this case, this routine returns a pointer to the start of the next line. This is also consistent with the model used by `visLineLength`.

##### Parameters

<i>startPos</i>	index to starting character
<i>startPosIsLineStart</i>	avoid scanning back to the line start

##### Returns

new position as index

#### 13.136.4.41 line\_start()

```
int Fl_Text_Display::line_start (
 int pos) const
```

Return the beginning of a line.

Same as [buffer\(\)](#)->`line_start(pos)`, but returns the character after last wrap point rather than the last newline.

##### Parameters

<i>pos</i>	index to starting character
------------	-----------------------------

##### Returns

new position as index

#### 13.136.4.42 linenumbers\_align()

```
void Fl_Text_Display::linenumbers_align (
 Fl_Align val)
```

Set alignment for line numbers (if enabled).

Valid values are FL\_ALIGN\_LEFT, FL\_ALIGN\_CENTER or FL\_ALIGN\_RIGHT.

**Version**

1.3.3

**13.136.4.43   linenumber\_bgcolor()**

```
void Fl_Text_Display::linenumber_bgcolor (
 Fl_Color val)
```

Set the background color used for line numbers (if enabled).

**Version**

1.3.3

**13.136.4.44   linenumber\_fgcolor()**

```
void Fl_Text_Display::linenumber_fgcolor (
 Fl_Color val)
```

Set the foreground color used for line numbers (if enabled).

**Version**

1.3.3

**13.136.4.45   linenumber\_font()**

```
void Fl_Text_Display::linenumber_font (
 Fl_Font val)
```

Set the font used for line numbers (if enabled).

**Version**

1.3.3

**13.136.4.46   linenumber\_format()**

```
void Fl_Text_Display::linenumber_format (
 const char * val)
```

Sets the printf() style format string used for line numbers.

Default is "%d" for normal unpadded decimal integers.

An internal copy of `val` is allocated and managed; it is automatically freed whenever a new value is assigned, or when the widget is destroyed.

The value of `val` must *not* be NULL.

Example values:

```
- "%d" -- For normal line numbers without padding (Default)
- "%03d" -- For 000 padding
- "%x" -- For hexadecimal line numbers
- "%o" -- For octal line numbers
```

**Version**

1.3.3

**13.136.4.47   linenumber\_size()**

```
void Fl_Text_Display::linenumber_size (
 Fl_Fontsize val)
```

Set the font size used for line numbers (if enabled).

**Version**

1.3.3

**13.136.4.48** `linenumber_width()`

```
void Fl_Text_Display::linenumber_width (
 int width)
```

Set width of screen area for line numbers.

Use to also enable/disable line numbers. A value of 0 disables line numbering, values >0 enable the line number display.

**Parameters**

<i>width</i>	The new width of the area for line numbers to appear, in pixels. 0 disables line numbers (default)
--------------	----------------------------------------------------------------------------------------------------

**13.136.4.49** `longest_vline()`

```
int Fl_Text_Display::longest_vline () const [protected]
```

Find the longest line of all visible lines.

**Returns**

the width of the longest visible line in pixels

**13.136.4.50** `maintain_absolute_top_line_number()`

```
void Fl_Text_Display::maintain_absolute_top_line_number (
 int state) [protected]
```

Line numbering stuff, currently unused.

In continuous wrap mode, internal line numbers are calculated after wrapping. A separate non-wrapped line count is maintained when line numbering is turned on. There is some performance cost to maintaining this line count, so normally absolute line numbers are not tracked if line numbering is off. This routine allows callers to specify that they still want this line count maintained (for use via [Fl\\_Text\\_Display::position\\_to\\_linecol\(\)](#)). More specifically, this allows the line number reported in the statistics line to be calibrated in absolute lines, rather than post-wrapped lines.

**13.136.4.51** `maintaining_absolute_top_line_number()`

```
int Fl_Text_Display::maintaining_absolute_top_line_number () const [protected]
```

Returns true if a separate absolute top line number is being maintained.

The absolute top line number is used for displaying line numbers in continuous wrap mode or showing in the statistics line (the latter is currently not available in FLTK).

**13.136.4.52** `measure_deleted_lines()`

```
void Fl_Text_Display::measure_deleted_lines (
 int pos,
 int nDeleted) [protected]
```

Wrapping calculations.

This is a stripped-down version of the `findWrapRange()` function above, intended to be used to calculate the number of "deleted" lines during a buffer modification. It is called *before* the modification takes place.

This function should only be called in continuous wrap mode with a non-fixed font width. In that case, it is impossible to calculate the number of deleted lines, because the necessary style information is no longer available *after* the modification. In other cases, we can still perform the calculation afterwards (possibly even more efficiently).

**Parameters**

<i>pos</i>	
<i>nDeleted</i>	

#### 13.136.4.53 measure\_proportional\_character()

```
double Fl_Text_Display::measure_proportional_character (
 const char * s,
 int xPix,
 int pos) const [protected]
```

Wrapping calculations.

Measure the width in pixels of the first character of string "s" at a particular column "colNum" and buffer position "pos". This is for measuring characters in proportional or mixed-width highlighting fonts.

A note about proportional and mixed-width fonts: the mixed width and proportional font code in nedit does not get much use in general editing, because nedit doesn't allow per-language-mode fonts, and editing programs in a proportional font is usually a bad idea, so very few users would choose a proportional font as a default. There are still probably mixed-width syntax highlighting cases where things don't redraw properly for insertion/deletion, though static display and wrapping and resizing should now be solid because they are now used for online help display.

##### Parameters

<i>s</i>	text string
<i>xPix</i>	x pixel position needed for calculating tab widths
<i>pos</i>	offset within string

##### Returns

width of character in pixels

#### 13.136.4.54 measure\_vline()

```
int Fl_Text_Display::measure_vline (
 int visLineNum) const [protected]
```

Returns the width in pixels of the displayed line pointed to by "visLineNum".

##### Parameters

<i>visLineNum</i>	index into visible lines array
-------------------	--------------------------------

##### Returns

width of line in pixels

#### 13.136.4.55 move\_down()

```
int Fl_Text_Display::move_down ()
```

Moves the current insert position down one line.

##### Returns

1 if the cursor moved, 0 if the beginning of the text was reached

#### 13.136.4.56 move\_left()

```
int Fl_Text_Display::move_left ()
```

Moves the current insert position left one character.

##### Returns

1 if the cursor moved, 0 if the beginning of the text was reached

**13.136.4.57 move\_right()**

```
int Fl_Text_Display::move_right ()
```

Moves the current insert position right one character.

**Returns**

1 if the cursor moved, 0 if the end of the text was reached

**13.136.4.58 move\_up()**

```
int Fl_Text_Display::move_up ()
```

Moves the current insert position up one line.

**Returns**

1 if the cursor moved, 0 if the beginning of the text was reached

**13.136.4.59 offset\_line\_starts()**

```
void Fl_Text_Display::offset_line_starts (
 int newTopLineNum) [protected]
```

Offset line start counters for a new vertical scroll position.

Offset the line starts array, mTopLineNum, mFirstChar and lastChar, for a new vertical scroll position given by new↔TopLineNum. If any currently displayed lines will still be visible, salvage the line starts values, otherwise, count lines from the nearest known line start (start or end of buffer, or the closest value in the mLineStarts array)

**Parameters**

<i>newTopLineNum</i>	index into buffer
----------------------	-------------------

**13.136.4.60 overstrike()**

```
void Fl_Text_Display::overstrike (
 const char * text)
```

Replaces text at the current insert position.

**Parameters**

<i>text</i>	new text in UTF-8 encoding
-------------	----------------------------

**Todo** Unicode? Find out exactly what we do here and simplify.

**13.136.4.61 position\_style()**

```
int Fl_Text_Display::position_style (
 int lineStartPos,
 int lineLen,
 int lineIndex) const
```

Find the correct style for a character.

Determine the drawing method to use to draw a specific character from "buf".

lineStartPos gives the character index where the line begins, lineIndex, the number of characters past the beginning of the line, and lineLen the number of displayed characters past the beginning of the line. Passing lineStartPos of -1 returns the drawing style for "no text".

Why not just: position\_style(pos)? Because style applies to blank areas of the window beyond the text boundaries, and because this routine must also decide whether a position is inside of a rectangular [Fl\\_Text\\_Selection](#), and do so efficiently, without re-counting character positions from the start of the line.

Note that `style` is a somewhat incorrect name, `drawing method` would be more appropriate.

If `lineIndex` is pointing to the last character in a line, and the second to last character has the `ATTR_BGCOLOR_EXT` set, the background color will extend into the remaining line.

#### Parameters

<i>lineStartPos</i>	beginning of this line
<i>lineLen</i>	number of bytes in line
<i>lineIndex</i>	position of character within line

#### Returns

style for the given character

### 13.136.4.62 position\_to\_line()

```
int Fl_Text_Display::position_to_line (
 int pos,
 int * lineNum) const [protected]
```

Convert a position index into a line number offset.

Find the line number of position `pos` relative to the first line of displayed text, counting from 0 to *visible lines* - 1. The line number is returned in `lineNum`.

Returns 0 if the line is not displayed. In this case `lineNum` is 0 as well.

Returns 1 if the line is displayed. In this case `lineNum` is the relative line number.

#### Parameters

in	<i>pos</i>	byte position in buffer
out	<i>lineNum</i>	relative line number of byte <code>pos</code> in buffer

#### Returns

whether the character at byte position `pos` is currently displayed

#### Return values

0	<code>pos</code> is not displayed; <code>lineNum</code> is invalid (zero)
1	<code>pos</code> is displayed; <code>lineNum</code> is valid

### 13.136.4.63 position\_to\_linecol()

```
int Fl_Text_Display::position_to_linecol (
 int pos,
 int * lineNum,
 int * column) const [protected]
```

Find the line and column number of position `pos`.

This only works for displayed lines. If the line is not displayed, the function returns 0 (without the `mLineStarts` array it could turn in to very long calculation involving scanning large amounts of text in the buffer). If continuous wrap mode is on, returns the absolute line number (as opposed to the wrapped line number which is used for scrolling).

#### Parameters

	<i>pos</i>	character index
out	<i>lineNum</i>	absolute (unwrapped) line number

## Parameters

out	<i>column</i>	character offset to the beginning of the line
-----	---------------	-----------------------------------------------

## Returns

0 if *pos* is off screen, line number otherwise

**Todo** a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

**13.136.4.64 position\_to\_xy()**

```
int Fl_Text_Display::position_to_xy (
 int pos,
 int * X,
 int * Y) const
```

Convert a character index into a pixel position.

Translate a buffer text position to the XY location where the top left of the cursor would be positioned to point to that character. Returns 0 if the position is not displayed because it is **vertically out** of view. If the position is horizontally out of view, returns the X coordinate where the position would be if it were visible.

## Parameters

	<i>pos</i>	character index
out	<i>X,Y</i>	pixel position of character on screen

## Returns

0 if character vertically out of view, X & Y positions otherwise

**13.136.4.65 recalc\_display()**

```
void Fl_Text_Display::recalc_display () [virtual]
```

Recalculate the display's visible lines and scrollbar sizes.

Beware calling this directly may cause a lot of CPU if called repeatedly (issue 300). Better to call [display\\_needs\\_recalc\(\)](#) to flag a recalc to be done during next [draw\(\)](#).

**13.136.4.66 redisplay\_range()**

```
void Fl_Text_Display::redisplay_range (
 int startpos,
 int endpos)
```

Marks text from start to end as needing a redraw.

This function will trigger a damage event and later a redraw of parts of the widget.

## Parameters

<i>startpos</i>	index of first character needing redraw
<i>endpos</i>	index after last character needing redraw

**13.136.4.67 reset\_absolute\_top\_line\_number()**

```
void Fl_Text_Display::reset_absolute_top_line_number () [protected]
```

Reestablish the absolute (non-wrapped) top line number.

Count lines from the beginning of the buffer to reestablish the absolute (non-wrapped) top line number. If mode is not continuous wrap, or the number is not being maintained, does nothing.

#### 13.136.4.68 `resize()`

```
void Fl_Text_Display::resize (
 int X,
 int Y,
 int W,
 int H) [override], [virtual]
```

Change the size of the displayed text area.

Calling this function will trigger a recalculation of all visible lines and of all scrollbar sizes.

##### Parameters

<i>X,Y,W,H</i>	new position and size of this widget
----------------	--------------------------------------

Reimplemented from [Fl\\_Group](#).

#### 13.136.4.69 `rewind_lines()`

```
int Fl_Text_Display::rewind_lines (
 int startPos,
 int nLines)
```

Skip a number of lines back.

Same as [buffer\(\)](#)->`rewind_lines(startPos, nLines)`, but takes into account line breaks when wrapping is turned on.

##### Parameters

<i>startPos</i>	index to starting character
<i>nLines</i>	number of lines to skip back

##### Returns

new position as index

#### 13.136.4.70 `scroll()`

```
void Fl_Text_Display::scroll (
 int topLineNum,
 int horizOffset)
```

Scrolls the current buffer to start at the specified line and column.

##### Parameters

<i>topLineNum</i>	top line number
<i>horizOffset</i>	column number

**Todo** Column numbers make little sense here.

#### 13.136.4.71 `scroll_()`

```
